

EXERCISE 7

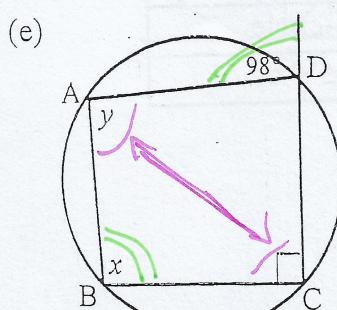

1. Calculate the value of the unknown angles. O is the centre.

$\angle C = 125^\circ$	ext L cyclic quad
$\angle Y = 90^\circ$	L's semi \odot
$\hat{B}_1 = 180 - 125^\circ = 55^\circ$	Ls on straight line
$Z = 180 - 90 - 55^\circ$	int Ls of Δ
$Z = 35^\circ$	

$a = 112^\circ$	ext L cyclic quad
$b + 92^\circ = 180^\circ$	opp Ls cyclic quad
$b = 88^\circ$	

$x = 98^\circ$	ext L cyclic quad
$y + 90 = 180$	opp L's cyclic quad.
$y = 90^\circ$
