

## Titration Curves

1. Volumetric technique used to determine quantities. Acid-base titrations are one application of titration.
2. In lab we will look at three types of acid-base titration curves. In lecture we will give an overview and highlight the main points for the different types of titrations.
3. We will also look at polyprotic acid titration curves.

The types of curves we will discuss:

1. Strong Acid titrated with a Strong Base
2. Strong Base titrated with a Strong Acid
3. Weak Acid titrated with a Strong Base
4. Polyprotic Acid Titrated with a Strong Base
5. Weak Base titrated with a Strong Acid

Definitions:

1. Equivalence point: moles Acid = moles Base.
2. End point: when the indicator changes color  $\neq$  equivalence pt.

## HCl Titrated with NaOH

## HCl Titrated with NaOH

Four regions:

1. HCl solution:  $\text{pH} = -\log[\text{HCl}]_{\text{initial}}$
2. Excess HCl:  $\text{pH} = -\log[\text{HCl}]_{\text{excess}}$
3. Equivalence pt:  $\text{pH} = 7.00$
4. Excess NaOH:  $\text{pOH} = -\log[\text{NaOH}]_{\text{excess}}$

Only HCl(aq) present before titration

© 2012 Pearson Education, Inc.

$\text{H}^+$  consumed as  $\text{OH}^-$  added, forming  $\text{H}_2\text{O}$  ( $\text{pH} < 7.0$ )

Excess HCl

$\text{H}^+$  completely neutralized by  $\text{OH}^-$  ( $\text{pH} = 7.0$ )

Other Aspects of Ionic Equilibria

No  $\text{H}^+$  left to react with excess  $\text{OH}^-$  ( $\text{pH} > 7.0$ )

Excess NaOH

3

## Strong Base Titrated with a Strong Acid

Identify the Four Regions:

- 1.
- 2.
- 3.
- 4.

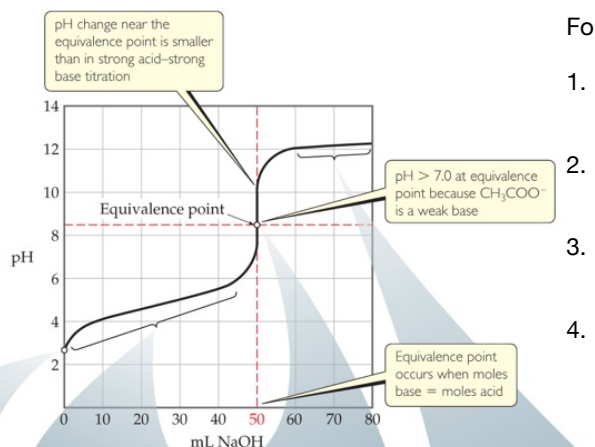

Other Aspects of Ionic Equilibria

4

## Acetic Acid Titrated with a Strong Base

Four regions:

1.  $\text{CH}_3\text{COOH}$  solution:  
pH from  $K_a$  and  $[\text{CH}_3\text{COOH}]_{\text{initial}}$
2. Buffer Region:  
pH from H-H equation
3. Equivalence pt: pH > 7.00  
pH from  $K_b$  and  $[\text{NaCH}_3\text{COO}]_{\text{eq. pt.}}$
4. Excess NaOH:  
 $\text{pOH} \approx -\log[\text{NaOH}]_{\text{excess}}$

$\text{CH}_3\text{COOH}(aq)$   
solution before titration

Added  $\text{OH}^-$  converts  
 $\text{CH}_3\text{COOH}(aq)$  into  
 $\text{CH}_3\text{COO}^-(aq)$ ,  
forming buffer solution

Acid completely  
neutralized by added  
base,  $\text{CH}_3\text{COONa}(aq)$   
salt solution results

No acid left to react  
with excess  $\text{OH}^-$

## The Effect of $K_a$ on a Weak Acid Titration Curve

Each curve represents titration of 50-mL of a 0.10 M acid with 0.10 M NaOH.

© 2012 Pearson Education, Inc.

**Questions: For acid solutions with the same concentration titrated with the same strong base solution:**

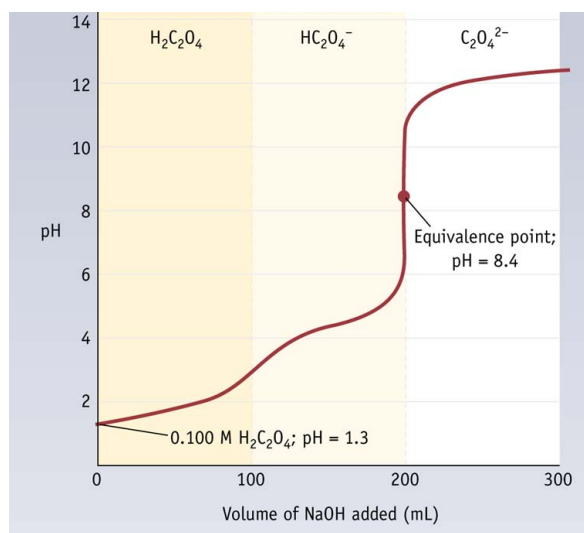

1. What is the trend for the initial pH of the acid solutions?
2. What is the trend for the magnitude of the rapid pH increase near the equivalence point.
3. What is the trend for the pH at the equivalence point of the titrated solutions?
4. What do you notice about the equivalence point volume?

Other Aspects of Ionic Equilibria

6

## Oxalic Acid Titrated with a Strong Base

$$(K_{a1} = 5.9 \times 10^{-2}; K_{a2} = 6.4 \times 10^{-5})$$

1. The pH before titration is determined by the weak acid concentration and  $K_{a1}$ . **Must use quadratic!**
2. After the titration begins until the first equivalence point has been reached, the pH is determined by the common ion effect and  $K_{a1}$ . **Must use quadratic! H-H equation DOES NOT apply in the case of oxalic acid.**
3. Locate the first equivalence point. What is left in solution at this point? Is the solution acidic or basic at this point? Explain why.
4. From the first equivalence point until the second equivalence point, the pH is determined by  $K_{a2}$ . Why? Is there a common ion effect?
5. At the second equivalence point the pH is basic. Why?
6. Beyond the second equivalence point the pH is determined by excess base added.

Other Aspects of Ionic Equilibria

7

## Weak Base Titrated with a Strong Acid

Four regions:

1.  $\text{NH}_3$  solution:  
pH from  $K_b$  and  $[\text{NH}_3]_{\text{initial}}$
2. Buffer Region:  
pH from H-H equation
3. Equivalence pt: pH < 7.00  
pH from  $K_a$  and  $[\text{NH}_4\text{Cl}]_{\text{eq. pt.}}$
4. Excess HCl:  
 $\text{pH} \approx -\log[\text{HCl}]_{\text{excess}}$

Other Aspects of Ionic Equilibria

8

## Acid-Base Indicators

Acid-base indicators are themselves weak acids or bases. Their color depends upon whether the acid (PROTONATED) or base (DEPROTONATED) form dominates in solution. This is pH dependent.

Using **HInd** to abbreviate a PROTONATED indicator:

(acid form)

(base form)

The acid and base forms **have different colors** in solution. We see a color change when one form is converted into another. As with all weak acids, the H-H equation applies where  $\text{pK}_a$  refers to the **HInd**.

$$\text{pH} = \text{pK}_a + \log \left( \frac{[\text{Ind}^-]}{[\text{HInd}]}\right)$$

$$\frac{[\text{Ind}^-]}{[\text{HInd}]} = \frac{K_a}{[\text{H}_3\text{O}^+]}$$

When  $\text{pH} < \text{pK}_a$

the color is determined by the acid form.

When  $\text{pH} \approx \text{pK}_a$

both forms exist and we see a blend of both colors.

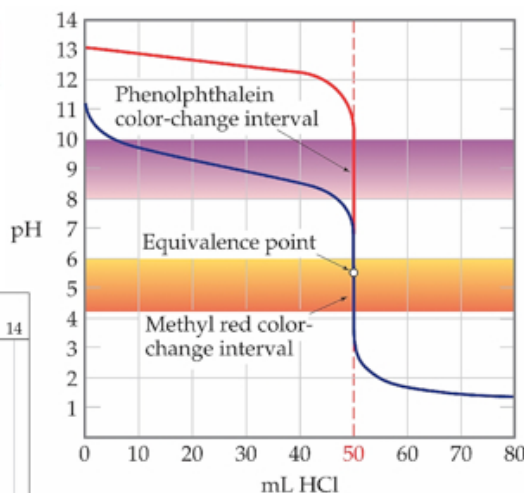

When  $\text{pH} > \text{pK}_a$

the color is determined by the base form.

Other Aspects of Ionic Equilibria

9

## Example - Phenolphthalein/Methyl Red Indicators

Which indicator(s) shown above would you choose for:  
the strong base titration?  
the weak base titration?

Are there other indicators that will work as well?

	pH range for color change													
	0	2	4	6	8	10	12	14						
Methyl violet	Yellow					Violet								
Thymol blue	Red		Yellow			Yellow		Blue						
Methyl orange		Red		Yellow										
Methyl red			Red		Yellow									
Bromthymol blue				Yellow		Blue								
Phenolphthalein						Colorless		Pink						
Alizarin yellow R							Yellow		Red

## Titration Calculations - Calculating the pH

To calculate the pH along a titration curve you need the following information:

1. Initial M and volume of species titrated.
2. M and volume of the titrant added.
3.  $K_a$  (or  $K_b$ ) of the weak acid (or base) in the system.

Steps to follow:

1. Write the acid-base reaction.
2. Set up a reaction table in moles.
3. Take the reaction 100% forward using limiting reactant principles.
  1. If the strong species is the limiting reagent:  
Find the M of remaining weak species and conjugate. Solve for pH as a common ion problem using  $K_a$ . (Can use H-H equation in "buffer region" if "x" is negligible.)
  2. At the equivalence point the pH is determined by conjugate species. Determine the M of the conjugate species and use  $K_{\text{conjugate}}$  to solve for pH.
  3. Past the equivalence point the concentration of excess titrant determines the pH.

## Sample Titration Calculations

Consider the titration of 20.0 mL of 0.244 M HClO with 0.150 M NaOH.  $K_a = 3.0 \times 10^{-8}$   
Write the balanced net-ionic titration reaction:

1. Calculate the starting pH of the 0.244 M HClO solution.
2. Calculate the pH when 10.0 mL of the 0.150 M NaOH is added.
3. Calculate the pH when half the equivalence point volume of NaOH is added.
4. Calculate the pH at the equivalence point.
5. Calculate the pH when an additional 3.0 mL of the 0.150 M NaOH is added past the equivalence point.
