PROBLEM-SOLVING IN CONSERVATION BIOLOGY AND WILDLIFE MANAGEMENT PDF, EPUB, EBOOK

James P. Gibbs | 344 pages | 15 Feb 2008 | John Wiley and Sons Ltd | 9781405152877 | English | Chicester, United Kingdom

Problem-solving in conservation biology and wildlife management

Ecosystems Island Biogeography: How park size and isolation affect the number of species protected. Forest Harvesting: Balancing timber production and parrot habitat. Edge Effects: Designing a nest predation experiment. Ecological Surveys: The basis for natural area management. Restoration Ecology: A chance to recoup? Land Use Planning: Working with your local government. Policy Overpopulation and Overconsumption: The key treats to biodiversity. Adversarial Proceedings: Conservation issues in an administrative court hearing. Conservation

Policy: Shaping your government. Literature cited. Malcolm J. He is also the former President of the Society for Conservation Biology.

Eleanor J. Much of this book is presented in term of timely and realistic questions or problems that many conservation biologists and wildlife managers face. Readers are given manageable data and the appropriate tools to address those questions. The Quarterly Review of Biology, March To see accurate pricing, please choose your delivery country. Help pages. We're still open for business - read our EU and Covid statements. Prothero Michael J.

This set of exercises has been created expressly for students and teachers of conservation biology and wildlife management who want to have an impact beyond the classroom.

The book presents a set of 32 exercises that are primarily new and greatly revised versions from the book's successful first edition. These exercises span a wide range of conservation issues: genetic analysis, population biology and management, taxonomy, ecosystem management, land use planning, the public policy process and more. All exercises discuss how to take what has been learned and apply it to practical, real-world issues. Table of contents Preface. Part 1. What Is Biodiversity?

Problem-Solving in Conservation Biology and Wildlife Management, 2nd edition

British Wildlife is the leading natural history magazine in the UK, providing essential reading for both enthusiast and professional naturalists and wildlife conservationists. Published eight times a year, British Wildlife bridges the gap between popular writing and scientific literature through a combination of long-form articles, regular columns and reports, book reviews and letters. Conservation Land Management CLM is a quarterly magazine that is widely regarded as essential reading for all who are involved in land management for nature conservation, across the British Isles.

CLM includes long-form articles, events listings, publication reviews, new product information and updates, reports of conferences and letters. This set of exercises has been created expressly for students and teachers of conservation biology and wildlife management who want to have an impact beyond the classroom. The book presents a set of 27 exercises spanning a wide range of conservation issues: genetic analysis, population biology and management, taxonomy, ecosystem management, land use planning, the public policy process and more. All exercises discuss how to take what has been learned and apply it to practical, real-world issues. Accompanied by a detailed instructor's manual and a student website with software and support materials, the book is ideal for use in the field, lab, or classroom. Introduction 1. Natural Resource Management and Conservation Biology: Understanding the niche of a diverse discipline.

Conservation Values: Assessing public attitudes. Regional Biodiversity: Exploring species and ecosystems in your own backyard. Populations 4. Population Viability Analysis: Management strategies for a small population of bandicoots. Life Table Analysis: Estimating the vital statistics of a population. Harvesting Populations: Sea turtles versus shrimp. Ecological Monitoring: Designing effective programs to track populations. Habitat Loss and Fragmentation: Ecological traps and population persistence. Dispersal: Movements in an altered landscape. Population Genetics: Diversity within versus among populations. Genetic Drift: Loss of alleles in small populations. Species Taxonomy and Conservation: An analysis of beetle communities. Natural History Study: From field observation to habitat model. Designing a Zoo: Ex situ centers for conservation, research, and education. Exotic Species: Documenting the invasion of alien plants. Plant Reintroductions: Reestablishing extirpated populations.

Ecosystems Island Biogeography: How park size and isolation affect the number of species protected. Why Is Biodiversity Important? Why Is It Threatened? Part 2. Higher resolution version of map used in exercise. Part 3. Longevity data. Fecundity data. Erratum: Table 8. An important note from an astute book user on the weighting procedure. Monitoring data. Ecological data. Program MARK. Program MARK input files. Part 4. Estimating "Biodiversity": Indices, Effort and Inference.
