Next, students must take part in the final self-learning session (sequence #4). This sequence involves procedural knowledge about rubrics design that must be supported by frequent opportunities for experimentation and testing in a real context. For students, this represents a challenge that is generally very demanding intellectually given that rubrics design is a process based on logic, reasoning and progressively valid assumptions; this process is more difficult to cope with if conceptual knowledge is not yet built. For this reason, we suggest that two brief and progressive declarative self-learning sessions be alternated with two procedural classroom sessions. While creating rubrics, students must solve problems of coherence, level of generality and choice of vocabulary in order to describe different levels of descriptive scales. Designing rubrics related to a complex task requires mastering the standards and criteria professionally prescribed, choosing criteria and indicators relevant to the task, and monitoring coherent choices during the entire process. This work takes a few weeks to be completed, and students need constant support to validate their choices and process.

Design of Pedagogical Specifications: Application of Teaching Methods and Approaches

The Knowledge and Skills Representation model allows us to identify different levels of knowledge that must be conveyed to students within a significant pedagogical context and supported by relevant instructions and guidance. The second axis of the MISA model, Design of Pedagogical Specifications, refers to the second set of questions posed by the SoTL approach: Who are the students and how do they learn? This axis also targets the third question that is asked in the SoTL approach: How can the student's learning process be efficiently supported?

Considering that in a flipped classroom format, students can choose to learn in an individual context or with peers, we assumed that we could not merely reproduce or simulate a "declarative teacher speech" with technological tools, but that we would also have to create a stimulating environment that would enable them to understand, memorize and test their comprehension and, finally, to prepare them to transfer the knowledge they have built individually or collectively in complex problem-solving situations. To enhance the development of such abilities, we made pedagogical choices based on the constructivist principle of prior knowledge activation and the socio-constructivist principles of co-construction of different kinds of knowledge (Jonnaert & Vanderborght, 2009), as well as the pedagogical differentiation principles (Galichet, 2007).

Preservice teachers are highly influenced by assessment practices observed in their previous internship or even by their own past experience of assessment (Tierney, 2006; Stiggins, 2007). We believe therefore that it is very important to give them opportunities to speak about their prior knowledge regarding assessment. When the first three self-learning units take place, it is already week 7 of the session, and the students are already working in teams to achieve their main homework, which is long and complex. This is why interactions with peers during the first self-learning sequence will be encouraged. There will be instructions to support the co-validation of peers' representations about assessment of complex tasks, criterion-referenced approach for competencies assessment and professional prescriptions about school report cards. Those three subjects are actually discussed intensively in professional contexts, and the influence of mentoring in-service teachers during previous internships creates potential cognitive conflicts that must be clearly exposed and collectively solved. For this reason, the first classroom session will allow them to validate their understanding of principles with some individual support as they work in teams to improve their ability to analyze and categorize different types of scales under a constructivist supervision (Adcock & Bolick, 2011). In light of these considerations, we decided that the professor must conceptually support the students during a 3-hours session in order to be prepared to learn the next set of procedural knowledge. Since we prefer to create a socio-constructivist and situated learning context, real rubrics will be used for this activity.

Preservice teachers have to learn how to do, and not only what to do, to assess pupils in a personal and self-determined way (Durand & Chouinard, 2012). As previously mentioned, although all teachers in Quebec are legally required to follow a structured set of criteria for assessing prescribed learning contents, they may choose the assessment tools that suit them. Given the diversity of student profiles, one of the most important pedagogical challenges in such a course is to differentiate rubrics examples in a significant way, which means creating a set of commented rubrics for each of the four core fields. The flipped classroom format not only gives us the opportunity to provide examples of rubrics in core content fields that are adapted to the students needs, but also to prepare them to solve problems in their future professional contexts. To create those examples, the didacticians (professors specializing in didactics related to the four content fields) were asked to fill in a questionnaire about their own conceptions of what a *complex assessment task* is in their field and about the characteristics of rubrics in their specific area. They were also consulted to establish guidelines for interpreting the set of prescribed criteria to which students must refer while building rubrics. Our analysis of those questionnaires allowed us to better define specific methodological training needs related to rubrics for each core content field. We intend to integrate this information to differentiate procedures and principles that must be considered specific learning incomes for each profile. Following the principles of pedagogical differentiation helped us design the last two flipped classroom sequences. So, on the one hand, sequence #3 (unit 5) and sequence #4 (unit 6) are structured by common principles to be used by all students in a convergent way and, on the other hand, by specific principles related to the core fields to be used in a divergent way. In a traditional classroom context, such pedagogical differentiation is incredibly time consuming and frankly quite impossible to manage without creating frustration or a feeling of unfulfilled achievement in students' minds.

In a context of traditional teaching (frontal pedagogy), we observed that some students could not cope by themselves with the procedural dimensions of learning without explicit support. They needed and requested many individual meetings outside of classroom time to obtain explanations and opportunities to validate their own understanding. Even with explicit exposure to concepts, principles and procedures in the classroom, they could not simply be asked to apply principles or procedures in order to achieve tasks. We believe therefore that it is crucial to allow students to build declarative and conditional knowledge at their own pace of learning before beginning the process of procedural knowledge learning. Students also need to share personal understanding with peers before testing principles and procedures in contextualized and real problem-solving situations. Learning in a flipped classroom context does not mean learning alone; therefore, during the final flipped classroom sequence, students are also asked to understand principles and co-construct their understanding with peers in order to transfer learning into their team homework. In the next classroom session, they will have the opportunity to build rubrics with the support of the core field tutors (Classroom session 2).

Our reflections about students' characteristics and their pedagogical needs are a direct outcome of observations made over the last two years: because our own practices are deeply influenced by external constraints, such as lack of time, specific didactic needs, the need to coach students along their path of procedural training, we hope that integrating our proposed approach into flipped classroom sequences and supporting it with explicit guidance instructions will help students learn more effectively. Furthermore, because this new approach could make students more insecure and potentially cause some unexpected consequences with regard to learning efficiency, we must promote and support their autonomy with specific guidelines. Our aim is to limit negative side effects, such as lack of motivation and commitment towards the required learning task. On another level, we aim to help students develop greater autonomy and self-monitoring abilities.

Design of Materials: Specification of Learning Materials

The third axis of the MISA model, Design of Materials, also refers to the third question posed by the SoTL approach: How can the student's learning process be efficiently supported? Since pedagogical assumptions were already made to answer this question in the last section, the concept of specification and design of learning materials refers to technological assumptions about relevant mediation using audio and visual communication tools.

In order to make pedagogically structuring choices, we distinguished four levels of knowledge building as described below (Design of Content model) and associated specific mediation tools with each level in order to create a mediation design that constantly supports the appropriation of learning content.

We identified four distinct typical learning events to be mediated with technological support:

- Recall of previously learned knowledge;
- New simple declarative knowledge (concepts and categories);
- New complex declarative knowledge (principles and samples); and
- New procedural knowledge (declarative description of rules and procedures).

New procedural knowledge transfer (methodological and technical training in preparation for real problem solving) will be done in the classroom.

In order to mediate the recall of competency concepts and describe and explain the assessment process and the role of rubrics in the evaluation of complex tasks, which represent the first three self-learning units, we opted for a conceptual maps tool called CmapTools[2] (Novak & Cañas, 2008). Constraints related to school reports such as scoring and computing points with rubrics will also be explained with CmapTools. Hyperlinks to school report cards, criteria and indicators described in the official documents will be made to contextualize conceptual notions within professional realities. As visual demonstration is required to understand the relationships between the different elements to be integrated in a rubric - criteria, scale and scoring - video editing tools will be used to create Screencasts completed with voice-over to explain the CMaps (see Table 1).

In order to mediate simple declarative knowledge, we will create a more traditional Microsoft PowerPoint[3] presentation. It will show core concepts such as criteria and indicators, and will present different types of scales in simple lists labeled with visual prompts. Although PowerPoint is a very controversial mediation tool in learning contexts (Harris, 2011), it seems more convenient for linear and short sequences of learning and appears to be appropriate for small contents.

For the mediation of new complex declarative knowledge, we chose Prezi[4] (Knudson, 2011). This tools allows us to present comparisons between analytic and holistic rubrics. This point is really critical in professional contexts and requires cognitive commitment to be understood due to its complex terminology that is usually completely unfamiliar to students. Prezi allows learners to go back to the most specific and difficult items for them without losing the big picture. Indeed, it is designed like a set of mutually embedded maps. The zoom in and zoom out functions facilitate browsing from one concept to another in a way that engages the audience (Harris, 2011; Knudson, 2011). We chose the Prezi mediation tool especially because it seemed relevant for learning new information.

Table 1. Technological mediation choices

Typical Learning Events	Technological Mediation Products
Declarative Knowledge Recall	Cmaps, Hyperlinks, Multimedia presentations with voiceover and visual prompts, Screencast
New Simple Declarative Knowledge: Notions and concepts, categorization	PowerPoint, Multimedia presentations with voiceover and visual prompts, Hyperlinks
New Complex Declarative Knowledge: Principles and examples	Prezi, Multimedia presentations with voiceover and visual prompts
New Procedural Knowledge: Declarative description of rules and procedures, commented examples	Prezi, Pencast, Video, Screencast

The use of these two types of scales (analytical rubrics and holistic rubrics) is specific to the assessment needs, learning context and assessment objectives. Preservice teachers must learn specific principles that underlie the use of each of the scales, which basically means knowing *why* and *why not* to use them. As such, we believe that a dynamic visual support could help expose the students to demonstrations of situations in which each type could be used. Students must effectively decode real samples of rubrics used by inservice teachers. This is not done merely to reproduce common practices they have observed or will observe during internships. Rather, it is done so they can be prepared to analyze rubrics and ground arguments for choosing such tools in their future professional life. To give students the opportunity to clarify that, which is confusing even in professional contexts, discussions about *pros* and *cons* arguments should be encouraged while student teams view self-learning sessions.

In order to mediate new procedural knowledge, we chose some of the same mediation tools used previously, but also decided to add some SmartPen technology[5], and to create a pencast in order to simulate rubrics design directly for the student. As this design must be guided internally through the activation of principles, rules and specific procedures, we plan to add an audio explanation of the different internal processes to be played while a visual manual demonstration is done. To complete the demonstration, we will create a Prezi mixing frame containing the pencasts, videos of dynamic demonstrations by the course professor (to be edited with Microsoft MovieMaker[6]), and some visual prompts added to the audio discourse. Before going into the classroom for a supervised session of procedural transfer in real situations, the entire process of creating a rubric will be explained to students using examples and counter-examples. Videos of inservice teachers explaining the use of rubrics will be added to contextualize learning and motivate students.

Design of Delivery: Delivery Planning

As we mentioned at the beginning of this chapter, the terms of delivery have been more or less imposed on us because the technology distribution tools available at our university are subject to strict safety rules that are difficult to bypass. Therefore, the Moodle platform, which is the institutional digital learning environment to which all students have automatic access, is the platform through which content will be presented to students. Thus, all activities and multimedia resources like Prezi presentations, Youtubes videos, screencasts and other multimedia animations will be accessible via this channel only.

Despite this limitation, the choice of this channel is an advantage from our point of view because Moodle is actually known to students and is usually relatively well mastered. We believe that by making this choice, we will limit potential problems and cognitive and motivational barriers that might deviate students from the main pedagogical target. Moreover, for our initial experiment, we want only registered students to have access to these yet invalidated resources. By using Moodle and its managed access system, we can ensure such limited access.

As we mentioned earlier, we have chosen to distribute these flipped classroom activities over a period of two weeks of the session, i.e. weeks 7 and 8, because they are dedicated to these concepts in the syllabus approved by the program committee. It is generally expected that students invest about twice the time spent in class doing individual homework. In other words, in this course, students receive three hours of classroom instruction per week, to which they should add about six hours of homework. Given the magnitude and complexity of the knowledge to build and the skills to construct, it was not possible to distribute all of these resources and activities over a shorter period. On the other hand, if we had chosen to spread everything over a longer period, we believe that the students' focus and motivation would have been compromised, thereby undermining the effectiveness of our proposal. In addition, it would have required a redefinition and reorganization of the entire syllabus, which is not desirable at this stage of our experiment.

The delivery model of our flipped classroom is characterized as follows. During week 6, the professor will make a presentation about what a flipped classroom is and provide various instructions. Next, in preparation for the in-class session in week 7, students will view three capsules of about five to 10 minutes each (units 1-3). We believe that these capsules will require about 60 minutes of individual appropriation work for students. Together, this will represent a total of about 90 minutes of autonomous work.

Following this first sequence, and still in preparation for the in-class session in week 7, students will address sequence 2. This sequence will require students to view approximately 30 minutes of multimedia animations. We believe that these animations will require about 90 minutes of individual appropriation work. This will represent about a total of 120 minutes of autonomous work. During the in-class session in week 7, supervised exercises will be offered to students over the three-hour period.

Week 8 will follow the same pattern as week 7, which represents a total of 180 minutes of individual viewing of multimedia capsules, followed by a three-hour classroom session. After these two weeks of the flipped classroom, learning activities will resume in accordance with the more traditional yet still socio-constructivist model proposed until then.

Learning Events Net Matrix: A Guideline for Development

Applying teaching methods and technical specifications to specific learning content allowed us to design a matrix that describes the learning events net (LEN), structured on a chronological basis, in a way that catches in a glimpse the whole flipped classroom session. In order to develop a detailed scenario incorporating all flipped classroom sessions, we have described the different learning events specifically planned for each of them within the following structure: title, contents, resources, pedagogical strategies, duration and assessment, in a way to guarantee pedagogical alignment (Biggs, 1996). As previously stated, such a device is largely influenced by the introduction of innovation in a formal classroom context, wherein synchronous and asynchronous activities are planned (see Table 2). Such a context brings new challenges.

First, there is the integration of learning with respect to its theoretical, practical, individual and social aspects (Gibbons & Gray, 2002). We believe the flipped classroom must foster thorough learning and not merely expose students to “information” and then leave them alone with new knowledge. Integration of learning also means keeping in mind organizational and temporal dimensions (Schneider, 2005), so we intentionally planned *when* and *why* to introduce new different kinds of knowledge with asynchronous sequences. We bore in mind that creating such a training device in a traditional context would transform all pedagogical dimensions of classroom learning and the teaching process. It must definitely lead to a mutual enrichment of synchronous and asynchronous activities (Charlier et *al*., 2006).

Second, there is the mediation of knowledge using specific symbolic or technical artifacts in order to foster scaffolding learning from simple to complex knowledge. We chose specific tools to visually represent conceptual and procedural learning objects, schematize processes or demonstrate procedures. Although a clear understanding of the effects of such tools has not yet been largely established, but only explored in empirical field research and as an object of controversial discourses, our aim is to document those effects on students.

Third, there is the consideration of the students’ cognitive processes: incorporating the mediation of learning content into significant learning events

Table 2. Learning events net matrix

Title	Targeted Learning Contents	Resources	Pedagogical Strategies	Duration	Evaluation	Delivery Platform
Sequence 1 Prior Declarative Knowledge about assessment	**Unit 1** Assessment of complex tasks	Cmaps, Hyperlinks, Multimedia presentations with voiceover and visual prompts, Screencast	Self –Learning with Flipped Classroom session Activation of prior Knowledge Co-validation of understanding with peers	Week 7/10 30 min.	Self regulation with peers	Moodle
	Unit 2 Criteria approach to competencies assessment	Cmaps, Hyperlinks, Multimedia presentations with voiceover and visual prompts, Screencast	Self –Learning with Flipped Classroom session Activation of prior Knowledge Co-validation of understanding with peers	Week 7/10 30 min.	Self regulation with peers	
	Unit 3 Professional prescriptions about school report cards	Cmaps, Hyperlinks, Multimedia presentations with voiceover and visual prompts, Screencast	Self –Learning with Flipped Classroom session Activation of prior Knowledge Co-validation of understanding with peers	Week 7/10 30 min.	Self regulation with peers	
Sequence 2 Declarative Knowledge about professional judgment in school context	**Unit 4** Rubric's components: criterion, scales, scoring	PowerPoint, Multimedia presentations with voiceover and visual prompts, Hyperlinks	Self –Learning with Flipped Classroom session Visual Support Examples Discussion Conceptual co building Pedagogical differentiation	Week 7/10 2 h.	Self regulation with peers	
Classroom session 1 Supervised analysis of Rubrics	**Unit 4** Rubric's components: criterion, scales, scoring	Teacher	Coached analysis of Rubrics Transfer of declarative Knowledge	Week 7/10 3 h.	Formative	
Sequence 3 Declarative Knowledge about Rubrics design	**Unit 5** Validation of a core concepts synthesis	Multimedia presentations with voiceover and visual prompts, Screencast	Self –learning with Flipped Classroom session Activation of prior Knowledge Co-validation of understanding with peers	Week 8/10 30 min.	Self regulation with peers	
Teams	Exploring prescriptive documents to be used in Rubrics	All previous Flipped Classroom contents + prescriptive documents to be found on Internet (specific web site)		Week 8/10 2 h.	Self regulation with peers	
Sequence 4 Procedural Knowledge on Rubrics design	**Unit 6** Criteria selection Scale description Choice of a scoring mode	Prezi, Pencast, Video, Screencast	Self –learning with Flipped Classroom session Problem solving Assumptions making Monitoring coherent choices during all the process	Week 8/10 2 h.	Self regulation with peers	
Classroom session 2		Teacher and didactics laboratory assistants All Flipped Classroom session contents and prescriptive documents to be found on Internet (specific website)	Team-teaching with laboratory assistants Supervised Rubrics design Experimentation and testing choices in real context Transfer Problem solving Assumptions making Monitoring coherent choices during all the process	Week 8/10 3 h.	Formative	
Teams	Designing Rubrics			Week 9-10	Self regulation with peers	

not only means developing a clear understanding of the influence of the symbolic or technical artifacts chosen to facilitate knowledge comprehension, (Charlier et *al*., 2006; Jonassen, 1998) but also choosing cognitive tools as learning strategies to scaffold cognitive processes during asynchronous activities (Derry, 1990).

FUTURE RESEARCH DIRECTIONS AND CONCLUSION

To conclude the description of how to complete the planning of a flipped classroom session to be integrated into a university course in order to create an innovative hybrid context, we must remember the fourth issue of the SoTL cycle:

How do we know that the teaching and student's learning have been effective?

We will only be able to answer this question once the testing sequences of the flipped classroom have taken place. With that in mind, the production of capsules will be based on the planning of the different design models presented here, as well as a detailed script of the various capsules. These will be tested with two groups of students, but we can already anticipate that our systematic approach based on proven pedagogical and technological design principles will make this project a significant pedagogical innovation in a context of teacher training looking for sustainable and motivating training modalities.

As a team involved in a professional approach that combines research, pedagogy and development, testing this flipped classroom model will be an opportunity to collect data on the degree of satisfaction of students, their interest in the innovation and the effects on their learning. From the point of view of our own practice, experimenting with this type of pedagogy will allow us to capture the effect on our own coaching and instructional planning processes. These results will certainly be very useful and meaningful for trainers involved in training programs like ours who are challenged by pragmatic and praxeological issues related to teacher training courses that are rather theoretical in nature but who must generate significant practices in the professional field.

KEY TERMS AND DEFINITIONS

Analytic Rubric: An analytic rubric articulates levels of performance for each criterion so the teacher can assess student performance on each criterion (taken from http://jfmueller.faculty.noctrl.edu/toolbox/glossary.htm).

CMap Tools (cmap.com): A free application that allows the construction of concept maps.

Holistic Rubric: In contrast to an analytic rubric, a holistic rubric assigns a level of performance by assessing performance across multiple criteria as a whole (taken from http://jfmueller.faculty.noctrl.edu/toolbox/glossary.htm).

Méthode d'Ingénierie des Systèmes d'Apprentissage (MISA): An instructional design method developed in the province of Quebec.

Moodle (moodle.org): A free digital learning environment used in many higher education schools.

Pencasts: A multimedia animation that enables users to hear, see and retrieve notes exactly as they were recorded on paper. This is achieved with the aid of a smartpen.

Prezi (prezi.com): A website in which users can create dynamic and multimedia presentations.

Rubric: A tool used specifically to support the authentic assessment of competency. A rubric is composed of a scoring scale used to evaluate student work and of at least two criteria by which student work is to be judged and at least two levels of performance for each criterion (adapted from http://jfmueller.faculty.noctrl.edu/toolbox/glossary.htm).

Screencasts: A video capture of what is taking place on a computer screen that is usually accompanied by an audio narration.

SmartPen: An electronic ballpoint pen that digitizes, stores and transfers writings and drawings to a computer.

Chapter 34
Designing Quality Blended Courses

Amy M. Grincewicz
College of Mount St. Joseph, USA

ABSTRACT

Over the last few years, a growing number of courses have been incorporating online elements into traditional face-to-face instruction. This movement has led to the emergence of a blended teaching and learning approach, which, in turn, has increased the need to discuss the educational benefits and underlying challenges of this type of instructional delivery. When developing a blended course, a number of important principles should be kept in mind to ensure the effectiveness of the course. Effective blended design takes into consideration the differences between face-to-face and online learning and incorporates different learning and teaching strategies. The purpose of this chapter is to discuss designing a quality blended course. This chapter discusses designing activities to encourage interaction, motivation, and engagement within a blended course that can be used in the online components. In addition, how to structure a blended course and benefits of working with a development team are discussed.

INTRODUCTION

Over the last few years, a growing number of courses have been incorporating online elements into traditional face-to-face instruction. This movement has led to the emergence of a blended teaching and learning approach, which, in turn, has increased the need to discuss the educational benefits and underlying challenges of this type of instructional delivery. Blended learning mixes the best of face-to-face instruction with the best of online instruction. When developing a blended course, developers and designers should keep a number of important principles in mind to ensure the effectiveness of the course.

Teaching a course in a blended style does not mean simply trying to replicate a syllabus for a face-to-face class. Effective blended design takes into consideration the differences between face-to-face and online learning, and incorporates different learning and teaching strategies. The class "meets" over a period of time, and this must be taken into consideration in the timing and pacing of activities. Communication occurs through

DOI: 10.4018/978-1-4666-8246-7.ch034

written text in the online environment, and the faculty role shifts to more facilitating than presenting. Activities must be intentionally designed to encourage learner interaction, and learner work is often more "public," since it is appears in tools like threaded discussions.

In converting a face-to-face course to incorporate blended elements, developers and designers need to consider the reasons for moving elements into the online components of the course including which elements remain the face-to-face portions of the course and those that move to the online portion. Working with an instructional design team can help instructors plan the activities and incorporate learning management system (LMS) tools into the course.

The biggest challenge in designing a blended course is developing the entire course ahead of time. This can be challenging for many instructors since in developing a face-to-face course many instructors have course outcomes, weekly topics, and a list of assignments. However, in developing quality blended courses, developers and designers need to clearly identify and align course components before the course begins. Osguthorpe and Graham (2003) stated that instructional objectives, many different personal learning styles and learning experiences, the condition of online resources and the experience of trainers play an important role designing an effective blended learning environment. Course developers and instructional designers need to ensure alignment of these components for effective learning.

COURSE ALIGNMENT IN BLENDED LEARNING DESIGN

Educational technology focuses on aligning the critical course component such as learning objectives, assessments, instructional materials, learner engagement, and technology (Quality Matters, 2011). Each of these components enables learners to achieve the desired outcomes yielding effective learning. Effective learning requires constructive alignment of the curriculum, which ensures that the program, learning outcomes, instructional approaches, assessments, and course evaluation complement each other. However, many instructors and course developers lack training in educational technology (Bober, Sullivan, Lowther, & Harrison, 1998). A lack of training in educational technology may influence learners' mastery of the course outcomes. The Center for the Study of Higher Education (2011) discusses the importance of alignment of assessments and objectives for effective learning. The relationship shows a direct correlation between the course components that is crucial for learner mastery.

An achievable goal for developing and designing blended courses is to have the courses become Quality Matters certified (Quality Matters Program, 2011). Seven of the essential standards that all quality courses must possess focus on alignment. Course developers need training on alignment and backwards design, so that these courses are certified. Backwards design is an instructional design methodology created by Wiggins and McTighe and is part of the *Understanding by Design* framework (Wiggins & McTighe, 2004). Backwards design begins with the end in mind by focusing on the course outcomes and then working backwards to develop the module or weekly objectives, assessments, and learning activities.

Outcomes and objectives should include an action verb that is measurable and a noun (Krathwohl, 2002). Each outcome/objective should include the learning behavior, appropriate assessment methods, and specific learner performance criteria. Course developers should write these outcomes as precise statements describing what the learner will achieve by the end of the course. Course developers write outcomes/objectives with non-measurable verbs such as understand and learn. Second, these course developers struggle with visualizing the entire course. Many course developers focus on one week at a time rather than focusing on the entire scope of the course. When focusing on a single topic, many course developers design engaging activities and assessments for that topic that learners enjoy. However, when instructional designers align the critical course components the topical objectives and assessments fail to align with the course outcomes. Both of these challenges faced by many course developers in developing quality online courses derive from a lack of effective training on backwards design and alignment and an inability of the course developers to look collectively at the course rather than just a single module or week.

Understanding by design (UbD) is a program and course-planning framework that focuses on effective learning (Wiggins & McTighe, 2011). Backwards design begins with the end in mind by focusing on the course outcomes and then working backwards to develop the module or weekly objectives, assessments, and learning activities. The model has three stages 1) identifying learning outcomes 2) determining ways to assess the outcomes and 3) deciding on instructional materials. These stages of development coincide with ADDIE (analysis, design, development, implementation, and evaluation) model for the systematic design of instruction (Dick, Carey, & Carey, 2005). Researchers utilizing this model to redesign a face-to-face course into a blended format have had improved learner performance as a result of the redesign (Shibley, Amaral, Shank, & Shibley, 2011).

It is important to note that successful teaching begins with clarity of desired learning outcomes and ends with supporting evidence that shows how learning occurred. Understanding by design supports this view by following three-stage backwards design process connecting curriculum units with instructional materials, assessments, outcomes, and objectives. Effective learning requires constructive alignment of the curriculum, which ensures that the program, learning outcomes, instructional approaches, assessments, and course evaluation complement each other (Wittstrom, Cone, Salazar, Bond, & Dominguez, 2010). Curriculum alignment that focuses on backwards design begins with the end in mind by focusing on the course outcomes and then working backwards to develop the module or weekly objectives, assessments, and learning activities (Vitale, 2010; Wiggins & McTighe, 2004).

In aligned systems, all components work simultaneously to guide instruction and facilitate learning. Program and course developers should conduct an alignment analysis. The analysis can provide valuable information regarding content validity on the assessments, weak areas that need improving, accountability, balance between assessments, objectives and outcomes (Vitale, 2010; Wittstrom et al., 2010). Programs that have curriculum committees monitor both course and program alignment for continuous quality improvement (Wittstrom et al., 2010); however, not all programs have curriculum committees. In addition, having a curriculum committee does not guarantee alignment of course components. The University of New Mexico's College of Pharmacy has many program and course components aligned with the exception of written examinations (Wittstrom et al., 2010). Borrego and Cutler (2010) analyzed alignment based on 1) identifying desired results and outcomes 2) determining what constitutes acceptable evidence to support the outcomes and 3) planning instructional strategies and learning experiences to generate learner competencies for program alignment. Similarly, Jacobs and Murray (2010) utilized the framework for analyzing alignment in a specific course. Alignment occurs when the course instructor communicates the desired learning outcomes to the learners and course components align with the outcomes.

During the three-stage process, revised Bloom's taxonomy (RBT) of cognitive knowledge can assess the structure and cognitive abilities associated with the outcome and objectives (Jideani & Jideani, 2012). Another layer to alignment could be in assessing the quantity and quality of outcomes and objectives relating to cognitive skills.

Many courses and programs strive for learners to achieve high cognitive skills, but many outcomes and objectives are low-level (Borrego & Cutler, 2010; Jideani & Jideani, 2012). In addition, Outcome-Based Learning (OBL) alignment has the potential to coordinate with UbD as long as the OBL alignment follows the backwards design process. Course development utilizing OBL focuses on outcomes that are desirable for learners. The OBL framework maps program outcomes, course outcomes, and intended learning outcomes to create an effective aligned program for learners (Kaliannan & Chandran, 2012; Wittstrom et al., 2010).

Following the principles of understanding by design before developing a program and/or courses should happen. Course developers and instructional designers who follow backwards design are more likely to ensure alignment of critical course components rather than trying to adjust either specific courses or programs after development. Misalignment can occur if curriculum and program mapping does not occur leading to learners not achieving the desired outcomes (Borrego & Cutler, 2010; Jideani & Jideani, 2012). Alignment through the UbD framework allows learners to deepen their understanding and transfer of knowledge (Wiggins & McTighe, 2011). Curriculum and program planning through backwards design prevent textbook teaching and assessment that lead to unclear goals and purposes (Wiggins & McTighe, 2011).

ORGANIZATION OF INSTRUCTIONAL COMPONENTS IN BLENDED LEARNING

In completing the alignment of critical course components, placement of the instructional components needs to be discussed to decide which components are best suited for the face-to-face environment and those that are best suited for the online components. Rossett, Douglis, and Frazee (2003) discuss that for successful blending, instructional tools and design strategies are important components, and designers and developers need to integrate all the components within the instructional method. In designing blended learning environments, the goal is to design an environment that is both effective and adaptive (Abdelaziz, 2012) that utilizes many models for organizing materials, activities, and assessments into the face-to-face and online portions of the course. The right blend depends on instructional conditions and instructors' own judgment and decisions in applying their instructional strategies for their instructional needs (Rossett et al., 2003). The National Research Council (NRC) (2001) discusses that effective learning environments need to include four basic components. Effective learning environments need to be knowledge-centered, learner-centered, community-centered, and assessment-centered. Developers and instructional designers need to consider these four components when designing courses.

Bonk and Graham (2005) propose that blended learning environments find a balance between enabling blends, enhancing blends, and transforming blends. Enabling blends allow learners flexibility through access to information in different modalities. Enhancing blends allow for slight changes in the pedagogy, but do not drastically change the teaching and learning processes. Enhancing blends allow supplemental material to be included in the online portion of the course to enhance the face-to-face materials. Finally, transforming blends occur in the online components where the learner actively construct knowledge through interaction with other and the material. These blends focus on merging educational theories with technology.

Oh and Park (2009) surveyed blended faculty members and found that 64.4% utilized the online components of a blended course to supplement the face-to-face instruction. In addition, 19.7% faculty blended instruction with less than 50% of the instruction occurring online and 12.1% utilized online instruction more than 50% of the time (Oh

& Park, 2009). These faculty members also had positive attitudes about blending instruction and that the blending improved the quality of instruction and the course (Oh & Park, 2009). One reason for improved instruction is that blended courses allow for easier establishment of social identification, roles, and relationships due to the face-to-face components. Learners may find it easier to feel invested and connected to the course with the placement of face-to-face meetings. MacDonald (2006) identified three common blended models. The most common method is learners meeting on campus and participating in asynchronous activities throughout the course. Second, focuses on blended synchronous and asynchronous components with strategically places face-to-face sessions. A third blended model is a mixture of traditional learners and distance learners who interact, but are separated.

Many blended courses have their first session in a face-to-face format to establish social presence, establish roles, idea sharing, and discussion of the course components. For Quality Matters certification of blended courses, faculty need to clearly state the purpose of the online and face-to-face components as well as how the two components work together (Quality Matters, 2011). During an initial face-to-face meeting, the course instructor can explain the course structure by describing how the two formats work together. In addition, introductions to the course and classmates can occur during this meeting. In addition to an initial meeting, face-to-face meetings can be interjected throughout the course to discuss topic changes. Colucci and Koppel (2010) designed a blended course focused on business technologies that met at the beginning of the course and three times throughout the course for the instructor to provide a face-to-face lecture on specific content areas. Face-to-face lectures can be supplemented with pretests, posttests, and discussions in the online components to enhance learners understanding of the material (Du, 2011; Lim & Morris, 2009). However, other blended courses preferred to conduct the discussions face-to-face and use the online portions for learners to review the lecture portion of the course (Crouch, 2009). In both blended designs activities were developed to increase engagement and motivation in both the online and face-to-face components (Colucci & Koppel, 2010; Crouch, 2009; Du, 2011).

The author has taught and developed blended courses that fit into two different models. The first model had learners meeting face-to-face during the first and last week of the course. During the initial meeting, the author described the course components and structure of the course. During the last meeting, the author summarized the course and learners presented their group presentations. During the online components of the course, the author provided lectures using Articulate software with checks of understanding embedded into the content, weekly discussions, knowledge checks, quizzes, and other instructional materials. Midway through the course the author realized that learners needed more assistance with the content, so synchronous discussions were included into the online environment to enhance the material.

In addition, the author developed a 16-blended course designed into four modules that met four times throughout the semester. Face-to-face meetings occurred at the start of the course to explain the structure and organization of the course and at the beginning of each module. The author designed each module around a specific content area and included a major assignment to show mastery of the content area. The purpose of the face-to-face meetings was to introduce each new module, explain the assignment, and provide training in the technology tools needed to complete the assignment within each module. The online portion of the course consisted of lectures, instructional materials, quizzes, discussion, and blogs.

In designing both models, the author aligned the course outcomes with weekly/modular objectives and assessments to show mastery. Once the alignment was completed, the author integrated the face-to-face meetings where they would support the outcomes and objectives of the courses. Learners liked both models mainly because they had time to process the information before discussing the information and completing the activities.

USING ONLINE DISCUSSIONS IN BLENDED COURSES

Contemporary discussions of education in blended-learning environments increasingly emphasize the social nature of learning which emphasizes interactions among learners, or among learners and instructors. Discussion based instruction is based on Merrill's First Principles of instructor by creating a sense of community, honoring voices, instilling critical thinking and problem-solving skills, offer shared participation, and demographic participation (Gibson, 2009). Merrill's instructional theory focuses on learner engagement through authentic problems, activation of knowledge construction, demonstrations for training, learning application, and integration of knowledge (2002). This instruction activates conceptual thinking through recalling prior experiences, providing relevant examples, and stimulating mental models (Merrill, 2002). According to Merrill (2002), learning promotion occurs when learners are involved in solving complex tasks, cognitive structures are activated through coaching, learners observe demonstrations, learners apply new knowledge to prior knowledge, and learners integrate knowledge into other task.

Discussion based instruction incorporates learner experiences into the learning process rather than just focusing on content driven instruction. Effective discussions derive from properly constructed discussion prompts and adequate participation. Discussion based instruction can lead into problem-based instruction since many discussion prompts may focus on solving a problem. Applebee, Langer, Nystrand, and Gamoran (2003) investigated the usage of discussion-based instruction in acquiring literacy skills. The use of discussion-based instruction enabled students to acquire the complex literacy skills they needed for successful academic achievement (Applebee et. al, 2003). Discussion instruction encourages development of understanding of concepts, internalization of knowledge, and engagement (Applebee et al., 2003).

Discussion instruction can be used in all types of classroom settings. Asynchronous discussions are a common assessment tool utilized in distance education. Discussions are primarily learner driven; however, instructor participation may vary in courses and programs. The author recommends including both an initial prompt and response prompt to encourage learners to engage and interact with one another. The author has found that writing open-ended, high-level discussion prompts encourages a richer discussion of the material that focuses on learners improving their critical-thinking skills. In addition, the addition of response prompts enables learners to focus their response on creating a substantive response.

Learners' participation is an important element for active and engaged learning. Many times in a short face-to-face meeting, learners do not have enough time engage in class discussions. One benefit of the asynchronous online components is that online discussions allow learners more time to process information to assemble their knowledge into a thorough and substantive discussion post. In addition, learners are allowed time to reflect before responding to their peers and instructor. Many researchers view online discussion as a major advancement in teaching and learning because it facilitates the exchange of information and provides opportunities for all learners. Research shows that learners are generally satisfied participating in online discussions because the online discussion improved their understanding of course content (Blankson & Kyei-Blankson, 2008). This outcome may be from the learners having more time to reflect and internalize the information. In addition, online discussions help meet the learner-learner interaction component for Quality Matters certification (Quality Matters, 2011).

In a blended-learning environment, discussions among students and instructors may occur synchronously or asynchronously over the internet or is using a discussion board tool in the LMS. The majority of asynchronous discussions are text-based (Girasoli & Hannafin, 2008). Text-based discussions can help assess proper grammar and formatting principles needed in academic writing by providing formative writing assessments that learners can use to enhance their writing. Some learners may struggle with explaining complex concepts with text, while other learners maybe misrepresented by the lack of verbal cues (Hew & Hara, 2007). In addition, learners may find it difficult to read lengthy discussion posts .The author recommends including a word count for the initial post and responses posts. Word counts encourage learners to be concise to their posting.

An alternative to text-based discussion is utilizing voice-based asynchronous discussions using Voice Thread or Wimba Voice Board software (Hew & Cheung, 2012). Hew and Cheung (2012) conducted an investigation of asynchronous voice-based online discussions within a blended learning environment and found no statistical difference between text and voice-based discussions. However, learners reported that the voice-based discussions enabled them further enhance their understanding of another learner's post, increased originality of ideas, and helped create a sense of community in the online components.

Developing quality, blended courses involves more than just making sure outcomes, objectives, and learning materials are aligned and properly organized and including learner-learner interaction in the form of discussions. Osguthorpe and Graham (2003) discuss the importance of designing activities to meet a variety of learning styles.

USING LEARNING STYLES TO GUIDE THE DESIGN OF BLENDED COURSES

When designing the online components of a blended course, developers and designers need to incorporate adequate support strategies to meet the needs of a variety of learner needs and styles (Maddux, Ewing-Taylor, Johnson, 2002; Thiele, 2003). Incorporating attention to a variety of learner needs has received significant attention over the last several years with the push for Universal Design for Learning (UDL) (Rose & Meyer, 2002). Under UDL educators, provide instruction and materials that meet the needs of diverse populations of learners to utilize the best method to help all learners successfully master a course's outcomes and goals. Learning styles are a grouping of intellectual, affective, and physiological factors that combine to create a unique and individualized environment to satisfy learners' needs (Collinson, 2000). Lim and Morris (2009) discovered that individual learning differences are an important area to consider in designing blended courses.

Rose and Meyer discuss developing instruction to meet the needs of visual, verbal, and kinesthetic learners (2002). Visual learners prefer visual displays like written information, notes, diagrams and pictures to effective learn information. Visual learners prefer taking notes and writing down key points to facilitate their learning. They follow reading written instructions better than oral ones. These learners may also tend to prefer reading text to having text presented with multimedia components. Auditory learners prefer information in verbal formats such as listening to a lecture, participating in a discussion to learn effectively. These learners prefer to have information read to them rather than having written information and instruction. Auditory learners prefer to participate in verbal discussions, listen to lectures without notes, and have audio texts rather than reading materials. Kinesthetic learners prefer movement and learn best in action tasks that require a hands-on approach. UDL encourages all instruction and materials to combine a variety of strategies to meet these needs (Rose & Meyer, 2002).

Consideration of learning styles can enhance an educator's perception of their teaching ability through the use of incorporating a variety of instructional strategies and materials to meet the individualized needs of learners while maintaining academic rigor (Noble, 2004). Noble (2004) found that learners receiving instruction and materials to match their learning styles had positive attitudes and behaviors toward learning. However, more research is needed on focusing instruction to include a variety of learning styles (Evans & Waring, 2006).

Evans and Waring (2006) found that educators benefit from considering different learning styles when they design their instruction. In addition, Evans and Waring found that educators typically use instructional approaches on transmitting information rather than focusing on learner needs (2006). Research supports the notion that educators' understanding of their learners' preferred learning styles can influence their understanding of the information. In following the UDL framework, instructional designers develop instruction for all learner styles. However, instructional designers need to design instruction based on learner characteristics. Instructional designers who do not design courses with the aim of meeting all learning styles may waste time and resources on developing materials that are unnecessary. In assessing learning styles, instructional designers need real data on the learners' learning styles rather than on perceived characteristics. Therefore gathering data from learners is important in the design process.

Akkoyunlu and Soylu (2008) utilized Kolb's Learning Style Inventory (LSI) to measure learners' learning styles to analyze learner perceptions based on learning style within a blended learning environment. Results revealed that learners' views on blended learning process, such as ease of use of the web environment, evaluation, face-to-face environment differ according to their learning styles; learners' perceptions were high in situations where the blended aspects aligned with learner learning styles. . The data showed that designing blended courses to meet a variety of learner needs may result in enhanced motivation, engagement, and increase retention. In addition, designing courses to meet a variety of learning needs by being ADA compliant is an essential standard for Quality Matters (Quality Matters, 2011).

Table 1. Roles of Team Members

Team Member	Role
Instructional Designer	■ Acts as pedagogical and design consultant ■ Helps course developer with designing engaging content and activities and transitioning classroom content for online delivery ■ Ensures the course adheres to program guidelines including Quality Matters standards ■ Assists team with selecting instructional materials Ensures ADA compliance
Course Developer	■ Acts as subject matter expert ■ Identifies and designs course content, activities, and assessments in collaboration with the instructional designer ■ Completes the templates for online development in accordance with the Quality Matters guidelines
Instructional Technicians	■ Provides technical support in building the course with a learning management system (LMS) ■ Reviews course for design flaws (testing links, proofreading) ■ Loads course content into LMS ■ Manages general navigational and course settings
Librarian	■ Ensures copyright compliance ■ Locates readings, open source and other instructional materials ■ Participates as guest consultant in the courses
Multimedia Specialist	■ Assists instructional designer with developing activities ■ Assists course developer with audio and video ■ Ensures ADA compliance
Review Panel	■ Reviews course to ensure standards are met

RECOMMENDATIONS FOR INSTRUCTORS AND NSTRUCTIONAL DESIGN TEAMS

This chapter provides an overview on how to design a blended course that utilizes a combination of effective face-to-face meetings with online components to meet a variety of learning needs. Osguthorpe and Graham (2003) found that blended instruction methods improved pedagogy, increased access to knowledge, fostered social interaction, increased the amount of teacher presence during learning, improved cost effectiveness, and enhanced ease of revision.

Quality Matters, Backwards Design, and the ADDIE model are great models to follow when designing blended courses. Compiling an instructional design team can help disperse the workload since developing quality blended courses is time-consuming. In addition, team members can assist faculty content developers with many of the elements in designing a blended course. Instructional designers can provide expertise on alignment of critical course components and helping the content developer decide how to best utilize the two different instructional methodologies utilized in blended courses. Since many models exist for integrating online components into face-to-face courses, looking at the courses goals and outcomes is essential for utilizing the formats to allow learners mastery of the material. In designing activities, assessments, and instructional materials, the team needs to be cognizant of learner needs and design components, so that all learners can benefit from the course.

It is clear that designing and developing blended courses requires greater amounts of time than designing classroom instruction. In particular, blended courses should be more elaborately designed than online or classroom instruction only by balancing the portion of each delivery method (Oh & Park, 2009). Blended course design should be a collaborative effort amongst an instructional design team to disperse the workload to specialized individuals. Grincewicz (2012) and Puzziferro and Shelton (2008) discuss the team approach to course design. Each team member has a specific role (see Table 1) (Grincewicz, 2012; Puzziferro & Shelton, 2008). These roles are crucial for effective course development. During the course development, each team member is held accountability for a variety of tasks. It is crucial that all team members stay on task since each piece relates to another piece.

KEY TERMS AND DEFINITIONS

Blended Learning or Hybrid Learning Environments: Learning environments in which traditional face-to-face instruction is combined with learning opportunities delivered online.

Face-to-Face Learning: This type of learning occurs in traditional classroom environments where all class members meet together in the same physical space.

Objectives: Objectives are precise statements of what students are to master after the completion of a week or content module sometimes referred to as enabling objectives.

Online Course Components: These are activities and instructional materials that occur asynchronously through a learning management system or other web-technologies.

Outcomes: Outcomes are broad measurable statements of what students are to master after completing a course sometimes referred to as terminal objectives.

Chapter 35
A Framework for Promoting Complex Learning in a Blended Learning Environment

Jill E. Stefaniak
Old Dominion University, USA

ABSTRACT

Different learning outcomes warrant different learning strategies. Instructional sequencing is dependent upon the various learning outcomes that are intended for a particular course or instructional unit. Complex learning integrates a learner's knowledge, skills, and attitudes, newly obtained skillsets, and the transference of learning in an applied environment. A challenge that many educators face when teaching complex tasks is the ability to assist students to draw from prior knowledge from various subjects in order to approach problem solving. The intent of this chapter is to provide educators with strategies to promote complex learning within a blended learning environment.

INTRODUCTION

The demands of education are ever changing and the traditional classroom, as we know it, has been transforming into a digital learning environment. Online education has continued to grow with more and more educational institutions turning towards virtual schools. While many institutions still want to embrace the traditional classroom and face-to-face instruction, they are turning to a blended approach to instruction. Blended learning provides students with the opportunities to engage and interact with their instructors and peers in a more personal manner along with the convenience associated with self-directed online learning.

A challenge that many educators face is the ability to assist students with retrieving and drawing upon prior knowledge from various subjects in order to approach problem solving and critical thinking exercises. Students must be provided with supplantive learning opportunities to guide them through the process of organizing information that will foster complex learning skills. These instructional strategies are used to facilitate and

DOI: 10.4018/978-1-4666-8246-7.ch035

scaffold (van Merriënboer et al., 2003) information in order to assist the learner will the ability to transfer the information to other contexts. Instructors must find balance between "the need to require sufficient mental effort to lead toward learning, and the need to support the learners' processing sufficiently in a way that does not overload their working memory" (Smith & Ragan, 2005, p. 143).

The Four Component/Instructional Design (4C/ID) model provides a format for teaching complex learning by proceeding through 10 steps that are categorized within learning tasks, supportive information, procedural information, and part-task practice (van Merriënboer & Kirschner, 2007). This model can be incorporated within any education framework to teach students how to effectively solve problems utilizing a blended-learning approach. Teaching complex learning must be done using a scaffolded approach to alleviate intrinsic and extraneous cognitive load while identifying opportunities for students to engage in participatory and learner-centered activities in a blended learning environment.

The intent of this chapter is to provide educators with suggestions for instructional strategies to promote complex learning within a blended learning environment. The information discussed in this chapter will be applicable to educators in elementary, secondary, and higher education institutions.

BACKGROUND

Research has found that blended instruction significantly enhances learning outcomes compared to courses that are led solely online. Blended instruction provides the opportunity for both self-directed learning that can be achieved through online activities and face-to-face instruction where an instructor can have more interaction with a student and provide immediate feedback (Lim & Morris, 2009; Laurillard, 1993). Blended learning consists of a combination of traditional face-to-face instruction with learning technologies (Bielawski & Metcalf, 2003). Blended learning can consist of a mix of classroom instruction and online instruction that is taught in both synchronous and asynchronous formats. Synchronous and asynchronous instructional activities should be determined based on the learning goals for the course. Blended learning environments may consist of learning activities that are evenly distributed between face-to-face instruction and online learning activities or activities that are more heavily classroom-oriented. Carmen (2002) suggests that instructors must take into account the number of live instructional events they plan on incorporating within a course as well as the desired amount of self-paced activities and collaborative group learning experiences.

Research studies have identified a number of ways in which blended instruction improve or enhance the educational experience for students such as "improved pedagogy, increased access to knowledge, fostered social interaction, increased amount of teacher presence during learning, improved cost effectiveness, and enhanced ease of revision" (Lim & Morris, 2009, p. 282). Different learning outcomes warrant different instructional strategies regardless of whether they are being taught in a face-to-face traditional classroom, web-based, or blended learning environments. There are three premises that instructors must follow when selecting instructional strategies for a course: (1) there are different types of learning outcomes and each type calls for a different types of instruction; (2) instructional sequencing relies upon relationships among the various learning outcomes; and (3) instructional strategies should facilitate the internal process of learning (Richey, Klein, & Tracey, 2011, p. 105).

The sequencing of instructional activities is dependent upon the nature of the task and how that task fits into the greater picture of what is being taught. The alignment of instructional strategies and how they relate to one another must also be taken into consideration when sequencing instruction. The way in which instruction is presented to learners pertaining to complex tasks needs to be broken done into smaller components that integrate multiple sets of learning goals and performance objectives (van Merriënboer, Clark, & de Croock, 2002).

Complex learning involves "the integration of knowledge, skills, and attitudes; the coordination of qualitatively different constituent skills, and often the transfer of what is learned in the school or training setting to daily life and work" (van Merriënboer & Kirschner, 2013, p. 2). The Four Component/Instructional Design (4C/ID) model was developed to guide instructional designers and educators on the process required to teach novice learners complex tasks. The environments for complex learning can be described in terms of four learning processes:

1. Learning tasks.
2. Supportive information.
3. Procedural information.
4. Part-task practice (van Merriënboer & Kirschner, 2013).

The ability to master a complex task is a process that often takes a significant amount of time. The 4C/ID model was developed, keeping in mind, that it may take a learner several weeks, months, or even years, to fully master the complexity of the task presented to them. The four components (learning tasks, supportive information, procedural information, and part-task practice) have not been designed to be completed in a linear progression. In most cases, learning tasks will be comprised of the introductory knowledge that is presented to learners early in instruction; however, supportive information and procedural information are presented to the learners on an as needed basis. Keeping in mind that it may take a learner a significant amount of time to master a task, the supportive information phase may encounter a lengthy amount of time. Part-task practice should be introduced early in the instructional process so that the learner has an opportunity to familiarize himself or herself with the tasks and all of the sub-units or components that they've been broken down into. The 4C/ID model has been developed to assist instructors with categorizing instructional strategies as they increase in complexity and difficulty.

Issues, Controversies, Problems

The Four Component Instructional Design Model (4C/ID) was designed to address three deficits found in most instructional design models. The model:

1. Focuses on the integration and coordination of constituent skills that are task specific.
2. Distinguishes between procedural information and part-task practice.
3. Incorporates a mixture of part-task and whole-task practice (van Merriënboer et al., 2002).

Learning tasks consist of instructional experiences that present whole task experiences to a novice learner in order to promote schemata instruction. Tasks presented within this component of the 4C/ID model are led by the instructor and contain a high degree of learner-support. In order to promote schemata construction, mental models need to be constructed to assist the learner with organizing new information, and cognitive strategies need to be employed in order to facilitate problem-solving and the method by which problems are approached (van Merriënboer et al., 2002). "Mental models are declarative representations of how the world is organized and may contain both general, abstract knowledge and concrete cases that exemplify this knowledge" (van Merriënboer et al., 2002, p. 48). Learning tasks are organized in simple to complex tasks in order for the learner to construct a mental model and become comfortable with the task and it continues to grow in complexity.

Reigeluth's Elaboration Theory provides guidance on how to organize and sequence instruction from general units to more complex units. The Elaboration Theory suggests that instructors first provide a brief generic overview of the task being presented excluding any constraints and minute details when teaching learners a new task. As learners become more familiar with the content the instructor will gradually present more details related to the task in small segments or units until the detailed sequence has been presented to the learner (Reigeluth & Stein, 1983).

The second component of the 4C/ID model consists of supportive information. This phase consists of the instructor continuing to assist the learner with the development of mental models and providing the necessary support for their learning and performance. Instructors provide a great deal of support to learners early in the instruction as they are learning a new task and the instructor gradually diminishes their level of support so that by the end the learner is able to perform the task independently with no additional assistance. "This supportive information provides the bridge between what learners already know and their work on the learning tasks" (van Merriënboer et al., 2002, p. 46).

Examples of instructional strategies that promote supportive information may include the following:

- Asking the learners to compare and contrast different ideas pertaining to the task being presented.
- Asking the learners to make predictions of what may happen next depending on the solution that they choose to implement.
- Asking the learners to provide a generic description of the problem that is currently being presented to them.
- Asking the learners to provide a brief suggestion for how to organize the information that is being presented.
- Asking the learners to provide a more detailed suggestion by providing a list of steps of how to approach the problem.
- Having the instructor model how to perform a particular task.

Within the supportive information component, the instructor may deem it acceptable to demonstrate to the learner how to perform a particular task. Modeling how to perform a task provides a bridge between the learning task phase and the supportive information phase of the 4C/ID model. van Merriënboer et al. (2002) suggest that in order to be most effective at stimulating a learner's ability to think critically and develop problem-solving skills the example that is being modeled should be "interspersed with questions that require the learners to think critically about the problem-solving process that is being modeled" (p. 50).

Another element of supportive information to be considered is feedback. Instructors should be prepared to provide learners with continual immediate feedback as they are learning a new task. As the learner becomes more familiar with the task at hand, the instructor will begin to diminish the amount of feedback that is being provided. Feedback can be provided in the form of one-on-one discussions between the learner and the instructor, group discussions, written feedback, and debriefing sessions. Feedback sessions are most successful if the instructor is able to promote reflective practice amongst the learner so that they can critique the quality of their work and their approach to problem solving (van Merriënboer et al., 2002; Collins, Brown & Newman, 1989; Kluger & DiNisi, 1998).

The third component of the 4C/ID model is procedural information. Support is provided to learners within this component precisely when they need it and is a prerequisite to learning recurrent aspects of learning tasks. Instructors typically provide guidance to the learner on how to complete the routine tasks by providing them with "directive step-by-step instruction that is given by an instructor, a job aid, a quick reference guide, and so forth" (van Merriënboer, 2007, p. 79). Providing procedural instruction precisely when a learner needs it is also referred to as *just-in-time* information.

The fourth component of the 4C/ID model involves part-task practice. This component consists of the learner being all of the units or components of instruction together and practicing the task in its entirety. Within this component, the learner is expected to practice selective recurrent aspects of the task until he or she reaches a level of automaticity (van Merriënboer, 2007). Learners should engage in short part-task practice sessions that are spaced out over time as opposed to lengthy concentrated sessions. van Merriënboer et al. (2002) suggest that part-task practice sessions should be "intertwined with the learning tasks because this provides distributed practice and also enables the learners to relate the recurrent constituent skill to the whole complex skill" (p. 55).

It is important to remember that decisions we make as instructors pertaining to instructional sequencing are critical to the success of the learner in mastering the learning material. Instructors teaching in blended learning environments are challenged with determining what types of instructional support their learners need and which types of instructional strategies and instructional mediums are most appropriate for providing support. Drawing from the premises that guide conditions-based learning theory, several challenges come to mind when teaching in a blended learning environment (Table 1).

Challenges that many instructors may face while promoting complex learning within a blended environment include the following:

- Determining which activities will be taught during face-to-face instruction as opposed to online instruction.
- Providing prompt feedback to learners throughout the complex learning process.

Table 1. Challenges encountered adhering to the guiding premises of conditions-based theory in a blended-learning environment

Premises	Challenges
There are different types of learning outcomes, and each type of learning calls for different types of instruction	• Which learning activities are going to be presented in a face-to-face learning environment? • Which learning activities are going to be presented in an online learning environment? o Will the online format include asynchronous or synchronous learning activities • How are learning outcomes being assessed? • In what learning environment will learning outcomes be assessed?
Instructional sequencing relies upon relationships among the various learning outcomes	• Are instructional outcomes introduced during face-to-face instruction? • How will the instructor follow up with learners to determine their progress? • Will supportive information be provided in both face-to-face and online learning formats? • How frequently is feedback provided to learners?
Instructional strategies should facilitate the internal processes of learning	• How to assess students' learning? • Which instructional strategies best facilitate the internal processes of learning in a blended environment? o Which strategies are more suitable for face-to-face instruction versus online instruction? • How will feedback be provided to learners?

- Integrating enough time for practice in order for learners to familiarize themselves with the course material and reach a level of automaticity.
- Determining when to focus on part-task versus whole-task instruction.
- Selecting the appropriate instructional media to delivery instruction in both face-to-face and online environments.

The learning task component of the 4C/ID model encourages instructors to assist learners with organizing information in simple to complex tasks. Complex tasks are broken down into smaller components and presented to learners with a high degree of learner support. Key objectives within this component of the model are presenting instruction using a scaffolded approach, incorporating supplantive instructional strategies to provide learners with a general overview of the task being presented and gradually elaborated upon, and beginning to present opportunities for part-task practice. Instructional activities that are often incorporated within the learning task presentation require the learners to work with the constituent skills that contribute to the complex skill being taught. Tasks are broken down and presented to learners moving from simple to complex skills over time. Instructors often model examples for learners by demonstrating how to complete various tasks and then having the learner practice on their own. Worked examples are also used to promote the scaffolding of mental models during the learning process (van Merriënboer & Kirschner, 2013). It is important for the instructor to determine which instructional activities may be best suited for face-to-face instruction and which strategies a learner may feel more comfortable with participating in with more emphasis being placed on self-directed learning.

Supportive information needs to be woven into the learning process where the instructor is available to the learner to provide feedback and continue to assist with the construction of mental models. Within this component of complex learning, the instructor works with the student to build off of prior knowledge. As the instruction begins to grow in complexity, from simple to more complex tasks, the instructor is available to provide specific feedback on the smaller components of instruction that are being presented. In order to assist learners with constructing mental models, the instructor will begin bridging the foundational knowledge that was presented as a learning task to the expected performance outcomes that have been set for the learner. The amount of support that is provided within this component of complex learning will vary depending on the task as well as the individual learner. Instructional strategies may include prompting students to begin making connections and establishing relationships amongst the various sub-tasks that are being presented, presenting or demonstrating examples, distinguishing between different theories that are relevant to the complex task or making predictions of future states (van Merriënboer & Kirschner, 2013).

Supportive information is provided throughout the entire learning process. The expectation with teaching a complex task is that the instructor will reduce the amount of support as the learner begins to demonstrate competency. The goal is for the instructor to participate in this fading process so that eventually the learner is able to performance the complex task on their own without any guidance or support (van Merriënboer, et al., 2002).

Procedural information encompasses providing feedback to learners as needed throughout the learning process. Instructors may deem it necessary to provide feedback early in the instruction while the learner is engaged with the simple to complex breakdown of the learning tasks. The goals of procedural information to provide just-in-time training for learners in order to prevent them from making recurring mistakes (van Merriënboer et al., 2002). Instructors will intervene when they observe a learner making a mistake or if the learner has sought them out for assistance. Procedural information is another form of support that is provided to learners that is specific per recurrent constituent skill. van Merriënboer and Kirschner (2013) suggest that procedural support can be provided to learners in the form of job aids, information displays, demonstrations, and instant corrective feedback.

Practice sessions need to be interspersed throughout the entire learning process. A challenge for instructors teaching within blended learning environments is being able to determine when to focus on part-task versus whole-task instruction. It is imperative that instructors are able to provide prompt corrective feedback to their learners' and have a good understanding of where their learners are in terms of proficiency of performance. If learners have demonstrated competency, or even mastery, of a particular sub-task, the instructor may choose to have learners focus solely on the sub-tasks that they are experiencing difficulties mastering. Practice opportunities should be developed for both face-to-face and online environments so that there is a degree of flexibility for the learner to practice.

Solutions and Recommendations

The biggest decision an instructor teaching within a blended learning environment will face is determining how to divide the instruction of complex tasks between face-to-face instruction and online instruction. Learning tasks is the first component of the 4C/ID Model and warrants organizational skills on behalf of the instructor. It is within this component that the instructor designs the learning tasks that will be taught, identifies how tasks will be broken down into simple sub-tasks or learning units and sequences the aforementioned sub-tasks. Performance objectives are presented to the learner within this component early in the instruction so that expectations are clear as to what the learner is striving to complete by the end of the course.

Performance objectives should be presented and reiterated regularly in both face-to-face and online settings. Learners should be pre-briefed at the beginning of every instructional session in order to recap what the goals are for the session and what they have already accomplished. Pre-briefings can be used to assist learners with organizing information and constructing mental models. By reviewing what has already been accomplished, instructors are drawing from prior knowledge and ensuring that learners understand where they are at in the process. Performance objectives should be included with every online activity that is prepared for learners' to complete individually.

Modeling of complex tasks can be presented to learners in face-to-face learning environments by demonstrating how to perform or complete a complex task. Learners have an opportunity to watch the instructor and ask questions. Prerecorded videos can be provided to learners in online asynchronous learning environments. This will allow the flexibility for learners to view videos at their leisure. Online group discussion forums can be made available for learners to pose questions to the instructor that they may have after watching the video online. This is a great way for the instructor to gauge their learners' understanding of the material and potential difficulties they may experience throughout the course of instruction. The online discussion forums also allow for students to see what challenges their peers are encountering along with the instructor responses. While one or two students may pose a question to the instructor, other students may have encountered the same challenge and failed to seek advice on the matter.

One of the challenges with teaching complex tasks is that instruction will be variable depending upon the learners' abilities. Tasks are broken down and presented from simple to complex. While this allows for instructors to focus on particular sub-tasks that a learner may experience difficulty mastering, instructors cannot assume that all learners will experience difficulty with the same sub-tasks. The modeling of these sub-tasks is best suited for an online learning environment that can be self-regulated by the learner. Learners can focus on watching videos or instruction pertaining to the areas that are relevant to them. This allows for learner-centered customization of instruction that an instructor may have difficulty achieving in a traditional face-to-face classroom environment with multiple learners. The use of videos can allow for students to replay and watch demonstrations multiple times if needed.

Supportive information can be provided to learners in a variety of different formats. If an instructor is teaching complex learning within a blended learning environment, it is suggested that they provide supportive information in both face-to-face and online formats so that students can access information as they need it. Job aids can be presented in both traditional and online class formats. One form of supportive information involves the instructor prompting the students to answer particular questions prior to moving onto the next phase of instruction. The instructor may ask learners to provide their own examples to demonstrate particular concepts being taught within the course or distinguish between multiple theories to demonstrate their understanding. These prompts can be lead as a discussion in both a face-to-face classroom environment and a synchronous online environment where students are online at the same time as their instructor.

Online quizzes could also be developed for learners to practice and see their progress with how they are organizing the course information. Online quizzes could be used in an instructional environment but could be most beneficial to students in an asynchronous online learning environment where the instructor is not necessarily readily available. Quizzes could be programmed to provide learners with immediate feedback based on the answers that they provide. The instructor could make recommendations to different learners as to which instructional modules or quizzes they should practice based on their progress made during the class. This would allow the instructor to engage in the fading of feedback and customize instruction where learners do not necessarily have to complete the same online modules.

Part-task practice is the fourth component of the 4C/ID Model and needs to be integrated throughout the entire process of complex learning. Independent and dependent practice sessions should be provided to learners in a variety of different formats. van Merriënboer and Kirschner (2013) purport that independent part-task practice is easy to implement because it:

- Concerns only one well-defined recurrent skill or routine, with no need to organize the contents of the program for each individual learner.
- Often tasks the form of individual practice, with no need to form groups of learners on the fly.
- Can often be supported with drill-and-practice off-the-shelf computer programs, with no need to schedule teachers or instructors (p. 262).

During independent part-task practice, the learner decides which tasks he or she would like to focus on. Providing feedback during the learning tasks and procedural information phase promptly will help learners begin to self-assess their performance. Independent part-task practice is controlled entirely by the learners. They decide when they are going to practice, which tasks they are going to focus on, how much time they are going to allocate to different tasks, and the frequency of continued practice sessions. The onus is placed on the learner and does not require the instructor to create any instructional activities for them to engage in.

While the majority of part-task practice sessions will most likely be independent in nature, instructors must be weary of the fact that continual practice leads to permanence. Checkpoints need to be placed within the instruction where learners are required to demonstrate their knowledge and skills in order for instructors to provide feedback. This will prevent learners from establishing bad habits or making recurring mistakes that reach automaticity due to frequent practice sessions that have not been monitored or observed. It is suggested that instructors provide opportunities for dependent part-task practice sessions early in the instruction when learners are more apt to make mistakes. Like all other forms of supportive information that is provided to learners along the way, dependent practice sessions can diminish over time as learners begin to demonstrate independence and competence learning the material.

Dependent part-task practice sessions can take multiple forms. Class time can be sent aside in tradition face-to-face learning environments where learners are provided with free time to practice familiarizing themselves with the tasks being taught. Instructors can be present during the session to provide corrective feedback if solicited by students. Additional guidelines and supportive information can also be provided to learners during the initial dependent part-task practice sessions to ensure that they understand what they should be practicing and where they should be at in terms of competency at various stages of instruction. Guidelines presented during part-task practice sessions are necessary for assisting learners with the organization of information and the construction of mental models.

Dependent part-task practice sessions can also be organized for learners to interact and practice with a peer or with a small group of students. This provides learners with a collaborative learning environment and opportunities to provide immediate feedback to one another. Dependent sessions can also be established for online learning environments. With today's technology, instructors have the capabilities to communicate with students using video chat software. It is important that the instructor is able to check in and observe learners intermittently to ensure that they are grasping the new tasks that they have been practicing. Part-task practice sessions not only assist with increasing the learners' familiarity with the task or subject at hand, but it also allows for the instructor to interject and correct learners' when they are struggling with a particular task.

Learners can demonstrate the skills they are practicing to their instructor through the use of video chat. This would allow the learner to interact with their instructor in a synchronous learning environment and be provided with immediate corrective feedback. Instructors could host online office hours or tutorial sessions where they could be made available to assist learners with any challenges they were encountering during their independent part-task practice sessions. Instructors could also provide learners with delayed corrective feedback in an asynchronous learning environment by asking learners to video tape themselves performing a task or by submitting a written assignment depending on the subject matter being taught. While the instructor may not be able to provide instant feedback, they could still provide customized feedback to the learner without having to schedule a face-to-face meeting.

The same type of feedback could also be incorporated within a group setting, Small groups of learners could be provided with a group discussion forum where they could post videos, questions, and suggestions to one another and seek feedback. This could be done in both synchronous and asynchronous learning environments. A challenge with this particular strategy is that the instructor must feel comfortable with their learners' progress in learning the material. This is not a good strategy is learners are too confused with the course material and are highly dependent on supportive information. Learners could provide inaccurate feedback and begin making mistakes. The instructor needs to use his or her discretion if selecting this instructional activity for group feedback and practice-sessions.

Regardless of whether learners participate in independent or dependent part-task practice sessions, instructors should be reminding learners of the importance of practice. Instructors need to be cognizant of the challenges that learners often experience while learning new material. Practice-sessions need to be woven within the instruction intermittently between various sub-tasks so that learners can begin practicing the simple tasks and later progress to the more complex. Instructors should also try to establish a routine for following up with students to see how comfortable they are becoming with the learning material, the amount of time they have spent practicing, and additional areas where they could benefit from corrective feedback.

FUTURE RESEARCH DIRECTIONS

Empirical studies of how the 4C/ID model has been applied in a variety of different training environments teaching complex learning have been conducted over the years (van Merriënboer et al., 2002; van Merriënboer & Kirschner, 2013) suggesting that the four components (learning tasks, supportive information, procedural information, and part-task practice) are all amendable in any learning environment. Many instructors face the challenge of allocating enough time in their instruction for students to engage in achieving proficiency while learning a complex task. van Merriënboer and Kirschner (2013) preface the 4C/ID model by stating that teaching complex skills takes an extended period of time. The 4C/ID model was not designed to teach an individual how to master a complex task within one instructional meeting. The various components of the 4C/ID model can be stretched out to cover several months or even years depending on the task. Many of the studies focusing on the application of the 4C/ID model have appeared to focus on either face-to-face instruction or online instruction. Further research is needed that not only focuses on teaching complex learning within a blended learning environment, but also provides insight as to the amount of time required to progress through the model using the blended approach.

A premise of conditions-based learning theory is that different learning outcomes warrant different instructional strategies. We are able to determine the success of instruction by the measurable outcomes it may produce. There is a paucity of empirical studies that provide evidence of how evaluative methods were aligned with the 4C/ID model. While we know that there are four components pertaining to complex learning (learning tasks, supportive information, procedural information, and part-task practice), it is unclear as to how an instructor is able to determine when a learner has reached success with any of the four components. Demonstrating how assessment can be integrated within the complex learning framework will only continue to justify the utility of the 4C/ID model when teaching complex tasks.

CONCLUSION

The teaching of complex learning will always pose a certain degree of challenges to instructors due to the level of difficulty of the task, the individual capabilities of the learners, and the environment within which the instruction is occurring. We can only assume that the demand for blended learning environments will continue to grow as instructional technology advances. Educators must be equipped with the necessary tools to address the four components of complex learning during their time with their learners.

Instructors must be adaptable to providing guidance and feedback in a variety of different instructional environments. They need to be careful when selecting instructional media and take into account the logistics involved when teaching in blended learning environments. Instructional strategies that are successful in traditional face-to-face instructional environments do not necessarily yield to being successful in online environments. This chapter aimed at identifying some of the challenges that instructors face while teaching complex tasks within a blended learning environment.

Instructional strategies that are adaptable to the 4C/ID Model were introduced to provide guidance to instructors and break down the process of learning into four components: learning tasks, supportive information, procedural information, and part-task practice (van Merriënboer & Kirschner, 2013). The four components serve as checkpoints for instructors to help promote a scaffolded approach to learning complex tasks that alleviates any intrinsic or extraneous load that may hinder learner performance. The incorporation of instructional design models to teach complex learning to students will better prepare learners to deal with the complexity of learning while adhering to sound instructional design practices.

KEY TERMS AND DEFINITIONS

Asynchronous Learning Environment: A group of learners enrolled in the same class do not have to participate online at the same time.

Constituent Skills: Subskills of a complex skill that are considered to be components of the skill as a whole.

Instructional Strategy: The instructional strategy entails the medium that will be used to deliver instruction.

Mental Model: A representation of how a task is organized.

Modeling: Demonstrating thought processes or tasks to a learner.

Scaffolding: Learning support that is provided during practice of learning tasks.

Sequencing: The ordering of instructional events.

Synchronous Learning Environment: A group of learners enrolled in the same class are required to participate in online activities at the same time.

Chapter 36
Shifting a Face-to-Face (F2F) Course to the Blended Environment:
A Framework for Transference

Tena B. Crews

Kelly Wilkinson
Indiana State University, USA

Alexandria Howard
University of South Carolina, USA

ABSTRACT

Many educational experts predict that in the future blended learning will become far more common than traditional Face-to-Face (F2F) or online learning. With this in mind, instructors are being asked or required to move F2F courses to a blended environment. When doing so, there are a variety of issues to consider. Thus, a framework for transference is necessary. This framework includes the seven principles for good practice for undergraduate education. This chapter covers the essential topics to help educators conduct a successful transference and uphold the quality of their courses.

INTRODUCTION

Blended learning is utilizing teaching practice that combine teaching methods which incorporate both face-to-face and online components (Blackboard K-12, 2009; Watson, 2008). Other terms such as "hybrid learning, distributed learning, connected learning, and outside-inside learning" (Eiter & Woll, 2011, p. 2) are used to identify blended learning. The challenge is to find the right mix of these two components for a successful blended learning environment (Kerres & DeWitt, 2003). This chapter will help educators have a clearer understanding of strategies for delivering content in a blended environment based on Chickering and Gamson's (1987) seven principles for good prac-

DOI: 10.4018/978-1-4666-8246-7.ch036

tice in undergraduate education. Information will also be provided to help educators learn to modify course content for blended delivery and engage students in the learning process. The chapter will be based on the following three objectives:

1. Compare and contrast learning methods for the blended environment.
2. Describe strategies for modifying course content for blended delivery.
3. Implement effective teaching methods in a blended environment.

The connection between F2F and online components in blending learning is necessary for a smooth transition. Good facilitation skills are essential elements; however, there are other key factors. It is essential to make sure the layout of the online course matches the instructor's teaching style. This will make it easier for the facilitator to guide students through the content. It is also important to evaluate course content and then look at the delivery methods to be used to deliver content. When moving the content from a F2F environment to a blended environment, these questions should be asked:

- What do I want the student to learn?
- What is the best way to present the content?
- How can I use the strengths of the online medium, while minimizing the weaknesses?
- How can I create interaction – student/content, student/student, student/instructor?
- How will I assess the success of the learning?
- What process will I use to assess the course structure and make appropriate changes?

In answering the preceeding questions, instructors perform a course audit. This audit includes analyzing the content to help determine how to answer each question. When changing course delivery from F2F to blended, the instructor cannot simply create PowerPoint presentations and hope students will review them, then read the book, and find success in learning. Instructors must also reflect on how they traditionally teach their F2F classes and how they will alter their teaching for the blended environment and connect all the elements.

BACKGROUND

It is important for instructors to do their homework before converting a course from a F2F environment to a blended environment. There are many factors to consider during the transference process. Moving content to a blended environment is not simply about transferring content - it is about transforming content.

The instructor should utilize the seven principles for good practice in undergraduate education (Chickering & Gamson, 1987) as they teach in any environment. The seven principles are listed below.

- Encourage contact between students and the instructor.
- Develop reciprocity and cooperation among students.
- Encourage active learning.
- Give prompt feedback.
- Emphasize time on task.
- Communicate high expectations.
- Respect diverse talents and ways of learning.

However, the instructor should keep in mind that the following items are crucial to the success of the blended course. A quality blended course should:

- Be student centered.
- Combine the best elements of online and F2F learning environments.
- Be well-organized, easy to navigate and have an aesthetic design which presents and communicates course information clearly throughout the course.

Table 1. F2F components: sample storyboard

	SELF (Student)	INTERACTION		
Activity/Test/Etc.	**S**	**S2S**	**S2I**	**I2S**
• Instructor Lectures.				X
• Class discussion.		X		X
• Lab work.	X			
• Students complete tutorials and submit for evaluation.			X	
• Students research in groups.		X		
• Student presentations.		X	X	
• Instructor formative feedback.				X
• Tests.			X	
• Etc.				
• Etc.				

(Stealth Consulting, 2008)

- Include a dynamic course syllabus that identifies and clearly delineates the role that the online environment will play in the overall course.
- Address accessibility issues throughout the course.

Course Audit

To understand the learning methods for the blended environment and implement effective teaching strategies, a course audit needs to be performed. The storyboard below is helpful in deciphering how to transfer best F2F components effectively. The instructor should first complete the storyboard for their F2F course to determine the self-paced components and the interactions involved in the course. Interactions include Student-to-Student (S2S), Student-to-Instructor (S2I), and Instructor-to-Student (I2S). Only then can they consider how to transfer the components and processes (see Table 1).

Once the storyboard is completed based on the F2F course, the instructor must then ask themselves some questions before transferring the course to a blended environment. These questions may include:

- What content is best to address F2F and which content can be addressed online?
- How will contact and interaction between students and the instructor be accomplished?
- How will students work cooperatively and actively?
- How will feedback be provided in a timely manner?
- How will students be encouraged to spend an appropriate amount of time on task?
- How will expectations be communicated?
- How will diversity and differing learning styles be addressed

The use of previous syllabi, course storyboarding, and answers to the questions above will provide a course audit that will give instructors a detailed analysis of the components of the course and good fit for delivery.

The online component of blended learning removes the traditional boundaries of time and location to offer students flexibility not often found in other academic situations. To determine which tools to use to develop a blended course, it is essential to consider the learning outcomes, what level of performance must be achieved, and how achievement will be measured. A delivery method must be selected which allows for the accomplishment of the learning outcomes. If performance cannot be measured with a particular delivery method, then the delivery method may be unsuitable.

The Four Os of Course Design

When transferring course content from a F2F learning environment to a blended environment, consider the "Four Os" of course design. These include origin, organization, orchestration, and outcomes assessment (McConnell & Schoenfeld-Tachner, 2001).

- **Origin:** Audience analysis and suitability of course content for blended delivery which include analyzing audience, and evaluating the suitability of course content for blended delivery.
- **Organization:** Appropriate delivery system and organization of the course which includes choosing delivery system, getting organized, and appropriate online course navigation.
- **Orchestration:** Develop materials and revise as necessary which includes developing materials, testing materials, continually editing and modifying, and keeping pace with emerging technologies.
- **Outcomes Assessment:** Assess and evaluate the course which includes assessing and evaluating the course and learning outcomes.

When contemplating origins, remember the audience is the students. Instructors must consider issues such as what is the appropriate delivery method - synchronous or asynchronous; how long students will have to take the course; and the course content. This will determine how the content is presented. The instructor must ensure the content is appropriate for blended delivery. Reviewing the content to ensure students can master the outcomes is essential. It may be easier to create a new course than to convert a F2F course. This must be evaluated early to make sure the content can be transferred to the blended environment.

Organization is also an important consideration in preparing content for blended instruction. The first issue to address when assessing organization is to choose how to deliver the course and what is needed to successfully deliver course content. First, the instructor should make a list of important characteristics such as controlling student access and ease of access to course content. The instructor must also decide upon necessary features such as test-generating capabilities, and other features that are deemed important (i.e., whiteboard, space for student presentations, etc.). The instructor must also determine what collaborative tools to incorporate in addition to the delivery system and how the students will navigate the online and F2F system.

The organization and delivery of the content are driven by questions such as: 1) How should the course be organized? 2) What components should be online and or F2F? The transference process may begin by creating a detailed "to-do" list and writing down the goals to accomplish, and then breaking them down into small manageable components. It is then that the orchestration of putting the pieces together and building the course that reflects the instructor's teaching style, while meeting the course outcomes and students' needs must begin.

When preparing materials, instructors should keep in mind that they do not have to reinvent the wheel. The goal is to create a blended class, not a F2F and online course. The key word is "blended." The two components should appropriately support each other. For example, chat rooms and discussion boards can be used to simulate a classroom environment, but it requires advanced planning. For example, a list of content questions should be prepared before engaging in an online chat, in case students need prompting to stay on task. Acknowledging the textbook for support information needed beyond the lecture is critical to integrate, blend, the content. Therefore, if students engage in an online discussion, bring it into the classroom component as well.

Have others test the materials before going live. This feedback will provide valuable information and ideas for improvement. Feedback, particularly from students is also essential to continue to improve and edit the course or methodologies to enhanced learning. Student feedback provides realistic data based on what works within the course and what does not work.

Orchestration also involves keeping pace with emerging technologies which is also critical. Updated technologies can be used to enhance your course content and present material in ways that will accommodate a variety of learning styles and enhance the F2F component. However, simply using technology just because it is available or too many bells and whistles can become a distraction from learning course content.

Teaching innovations need to be tested in order to validate academic outcomes and benefit. This is especially true in educational settings. Ongoing assessment and evaluation are critical to success. In order to understand students' level of learning and to demonstrate academic rigor, instructors must gather objective data such as scores on exams and subjective data such as student feedback and preference for learning.

Table 2. Traditonal and technology related delivery methods

Print	E-text, e-journals, textbooks, online databases, etc.
Audio/Video	Voice only, music, streaming video,, virtual classrooms, electronic whiteboard, etc.
Communication	Asynchronous: email, Listservs, discussion boards, blogs, wikis, etc. Synchronous: online chat, virtual office hours, videoconferencing, etc.

MAIN FOCUS OF THE CHAPTER

Principles of Good Practice in Undergraduate Education

As this chapter is based on the following three objectives and the seven principles for good undergraduate education, this section is divided into the seven sections based on the principles. The objectives include:

- Compare and contrast learning methods for the blended environment.
- Describe strategies for modifying course content for blended delivery.
- Implement effective teaching methods in a blended environment.

Principle 1: Encourage contact between students and the instructor.

Instructors must consider how to accomplish the transference of the content from a F2F environment to a blended environment to assist students in achieving learning outcomes. Common delivery methods include both traditional and technology-related methods to provide content related information. Most blended instructors use a combination of both. Table 2 provides examples of traditional and technology-related delivery methods.

It is important to compare and contrast synchronous and asynchronous methods of delivery and decide upon the most appropriate way to provide content and provide for engagement in the blended environment. Synchronous learning is defined as a group of individuals learning at the same time as they work toward a common goal or outcome. This type of learning is conducted simultaneously in a real-time online environment. Synchronous basically means "at the same time," but not in the same place. The instructor and students can participate in a virtual classroom while they communicate and complete activities. Synchronous learning typically includes some type of videoconference software, virtual classroom, or chat areas in which communities of learning are developed.

Synchronous learning typically involves student engagement and the motivation of learners. Within the synchronous learning environment, users have the opportunity to get to know each other, be involved in real-time, quick response systems, and work in groups to exchange ideas.. However,, the instructor must schedule a time that is convenient for all students to meet at the same time. This is not as difficult in a blended environment as a pure online environment because students have a designated course time. The instructor must decide if it is necessary to meet F2F and synchronously online to achieve the perfect blend of learning.

Many instructors use asynchronous learning in addition to F2F learning to create their blended learning environment. Asynchronous learning occurs over time in which the instructor and students do not interact at the same time. Like synchronous learning, the instructor and students are not in the same place; however, with asynchronous learning there is a time delay in the communication. For example, an instructor may post course content which students access at a later time. Learning is based on individuals being online at various times reviewing content or submitting assignments. Instructors may make it challenging to engage students and develop a community of learners outside of the classroom with asynchronous learning. However, asynchronous learning is designed to provide students with the ultimate anytime, anywhere learning environment. This type of environment is designed to be more of a "student responsibility" environment in which course information is provided to students and it is their responsibility to read, analyze, and learn the information. Asynchronous learning can be effectively implemented in a blended environment when the instructor brings the discussion, analysis, or whatever is assigned back to the F2F classroom to take learning to a higher level.

Determining the appropriate blend of F2F and synchronous or asynchronous learning is essential to the livelihood of the course. Both methods have their advantages and disadvantages, but must be investigated to determine the likelihood of success in a blended environment.

Whether using synchronous or asynchronous methods in addition to the F2F environment in the blended classroom, guidelines must be developed. These guidelines must include both instructor and student guidelines and they must be communicated clearly. These guidelines enhance the communication process and outline expectations for all stakeholders. For example, students should be provided with due dates for communication and the submission of assignments/projects whether engaged F2F, synchronously, or asynchronously.

For example, in an asynchronous environment, students may be expected to participate in online discussions through some type of discussion board. Guidelines must be set so students understand what constitutes "proper discussion." For example, a student's response should enhance the discussion and should not simply include responses such as "I agree" or "That is a good idea" or "Ditto." Students should be provided with examples of appropriate responses that lead to further discussion.

In a synchronous environment, additional guidelines may be necessary. For example, if holding a virtual classroom in which all students are "live" in the same online classroom at the same time (i.e., using Adobe Connect Professional or another type of virtual meeting space), technology tools may be available within the virtual classroom that allow students to electronically raise their hands and use a camera/microphone so they can be seen and heard. Typically, the more technology involved in the virtual classroom, the more guidelines need to be developed and communicated to students. However, remember to connect the synchronous or asynchronous learning to the F2F classroom as well.

As noted earlier, synchronous learning is typically less common for the online component in a blended course as there is also a F2F component. However, asynchronous learning provides instructors an opportunity to record training sessions for students and not schedule a predetermined time to review the information. Instructors incorporating asynchronous learning can broadcast information through some type of audio/video technology tool so students can access the information at anytime, anywhere they have Internet access. No matter what the method, the instructor must make sure guidelines for learning are provided to all students.

Examples of asynchronous tools include the following. These are all considered asynchronous as students do not have to be logged in to a computer or on their phone when the sender sends the message. The student can check the message at their own time paying particular attention to set deadlines.

Email: The most popular and most easily used asynchronous communication tool is email. When teaching and learning in the online environment, instructors and students may use email as a main way of contacting and communicating with each other. It is important to be timely in such communication to alleviate confusion and frustration. Instructors should establish a routine and explain their routine to students (i.e., check email every 24 hours, check email during office hours, etc.). Instructors teaching in a blended environment must remember they will also see students during the F2F component of the class.

Many Learning Management System) have email built in to allow for easy contact among students and between the students and the instructor. If possible, personalize email messages by including the student's name. If you are providing feedback on an assignment through email, be positive, yet include constructive feedback. Consider the "sandwich method" of feedback. Positive-constructive-positive. A blended course has several interaction channels. These channels are: instructor to student (I2S), student to instructor (S2I), student to student (S2S), and student to content (S2C). All can occur in the F2F or online component. These channels have unique opportunities and challenges regarding the process for interaction. Interaction occurs with each channel and also among the channels.

Communication is essential in the online environment and S2S, S2I, and I2S communications can all be accomplished through email. The LMS may serve as a portal to all communication with students.

Discussion Boards: Discussion boards are also called discussion forums, message boards, or online forums. Most LMSs provide a discussion board. Discussion boards may allow for contact between the students and instructor in an asynchronous environment. Students may login at various times, post ideas, ask questions, and/or give their response to another student's or instructor's post and/or comment. It is important to develop a threaded discussion, which is an integrated discussion consisting of all postings related to a particular discussion topic.

Students can also post questions on the discussion board and the instructor and/or other students can answer the question. Providing an incentive for students to answer each other's questions, helps alleviate many emails from the students to the instructor. A good guideline to provide to students is to post their question on a Frequently Asked Questions (FAQs) discussion board instead of emailing the instructor. As the online instructor, it is essential that you provide a timeline for when questions should be answered. The discussion board typically remains open for all students to view the answers posted or additional information is provided for clarification or further explanation.

Timely response will also help instructors manage the communication of students as well as help ease student anxiety within the online component. Responding quickly and efficiently will prevent multiple posts in discussion regarding the same issue as well as reduce the number of emails and possibly the number of questions in the F2F component.. However, responding should not fall on the shoulders of the instructor alone; students should play an active part in responding to others.

Students responding to other students will not only enhance S2S contact but will build community with the course. Students are typically capable of solving problems or answering procedural questions with an open discussion that allows for general posting. Blended instructors may give extra credit to students who answer other students' questions. This does not mean instructors do not have responsibility regarding responses; however, it encourages students to communicate more often and provide responses in a complete fashion. Instructors must monitor the traffic on the general discussion board and correct any misinformation posted. Using this technique will allow instructors to reduce email from students as the questions/answers on the discussion board are public. Instructors may also have to interrupt and correct students when communication and discussion is dominated by one student of there is bullying involved.

Blogs: Blogs, also known as Weblogs, may also be public or private. Blogs are typically used like a journal for reflection. They are open in nature and typically allow for communication. However, blog members do not edit postings within the blog, but can comment on the postings. Blogs are typically recognized by the way the content is organized. New content (postings) is typically displayed at the top of the blog and older content moves down toward the bottom as new content is posted - hence, reverse chronological order. This is an excellent technology to allow students to discuss a topic publicly or privately communicate only with the instructor typically as a reflection on previous or ongoing work.

An LMS may have a blog feature embedded or it may be necessary to develop a blog through other Web sites such as Blogger, WordPress, LiveJournal, etc. Typically blogs are used for personal reflection much like a journal., However, students may be instructed to use them to reflect on course content, outside readings, etc. Blogs help develop a community of support; if all students can see all postings. Students sharing post personal opinions and/or their opinion backed up by research is an effective way to build knowledge and community. It is important to lead by example when using blogs in a blended course as the instructor should participate in the blogging in addition to the students and extend f2f discussions.

Text Messaging: When using text messaging as a method of contact with students, the instructor must limit the amount of information being provided due to the restriction on the number of characters that can be included in the message. Instructors may use texting simply as an announcement of a class time change or reminder of a text or assignment.

The use of abbreviated words or vowels are removed from words must be addressed in the expectations as the reader must interpret the string of consonants, adding vowels or numbers to re-create the words as they read. For example keyboard would be texted as kybrd. Abbreviations are also used in texting to shorten messages. Examples include TTYL (talk to you later) and LOL (laugh out loud). This type of technology communication tool should be used only when short, quick information needs to be relayed to others. It's important to remember that this type of text language with its abbreviations is not appropriate for email communication.

Phone: When considering using telephone communication, remember it is beneficial for students to hear a human's voice to help them feel like they are a part of the class and/or help develop the S2I relationship. Instructors may want to call students at the beginning of the course to introduce themselves and/or provide an overview of the course. Instructors may also want to call students to discuss assignments, projects, etc. When teleconferencing with multiple students, make sure all parties can hear and communicate.

Course Announcements: Using course announcements frequently is an excellent way to accomplish I2S contact. Instructors may want to post one to four messages each week, based on the content and the students' needs. Initially students may need to be reminded in the F2F class to check the discussion board on a regular basis. Make it clear to the students what will be posted (reminders, class changes, important topics, etc.) and how often students should check the discussion board. Instructors should also take advantage of the discussion board. Most online instructors use a discussion board, but not all are active in participation. It is important to get involved in the discussion and engaged in the conversation, commenting on students' posts and guiding their learning. The instructor should always continue to explore how to use discussions effectively. Instructors may find they may want to try including both group and class discussions; having a group leader facilitate the group discussion; summarizing the group discussion; and sharing with the rest of the class, using a rubric to grade discussions.

This enhances student engagement. Immediacy is a critical element in student engagement, and communication in real time often enhances student engagement as well.

Students learning in a blended environment see meetings as a way to develop a relationship with the instructor and feel more a part of the learning community. Connecting all aspects of the blended class is essential to enhance learningand to extend the f2f effort into the online effort

One method to begin the development of a community of learners through I2S, S2S, and S2I contact is to develop a welcome letter and email it to students or post it on the discussion board at the beginning of the semester. This will make online learners feel welcome and sense the instructor's virtual presence (a key component of the blended learning environment) from the beginning of the course. A personalized introduction adds a personal touch to the blended environment which may be new to students. Use a concluding remark and best-wishes statement in the letter. After the final exam or other type of final learning assessment at the end of the semester, remember to send all students a final email or a class announcement. This message functions as a thank you and conclusion of the class wrapping-up the best-wishes statement in the initial welcome statement.

Principle 2: Develop reciprocity and cooperation among students.

Web 2.0 tools may be used for effective collaboration in a blended environment. Many instructors utilies wikis or other Web 2.0 tools as vehicles for content creation and communication to assist in a cooperative learning environment between students. "Along with the surge in online learning has come a realization by many faculty that they need to focus on techniques to increase participation and collaborative learning" (Palloff & Pratt, 2003, xiii).

Wikis: Wikis are simply Web pages that can be designed, modified, and viewed by students. Students need a Web browser, Internet access, and the rights to view and modify the wiki. Wikis support asynchronous communication and collaboration. They are basically built for repository of information, but are also suitable for more complex uses such as e-portfolios and collaboration on various projects. Students can edit each other's work and work in a group setting through wikis. They are typically simple to use and allow I2S, S2I, and S2S engagement.

Wikis can be designed very simply as one Web page or can include several interlinked Web pages. Wikipedia is probably the best known example of a wiki. Using it as an example, you can see how complex the wikis may become. Providing students with specific guidelines is helpful especially when using wikis for the first time in an online course. Keep in mind that instructors must give the students the necessary rights to access and edit the wiki; therefore, wikis can be accessible to the public or only to students in the specific class or within a specific group within the class.

During the reciprocity and cooperation development stage, a goal should be to help students develop skill in evaluating others' work, as well as, develop skills in providing constructive criticism. Students may not have experience in judging others and it may take time for them to develop these skills, but it also allows for good discussion,

Table 3. Sample partial rubric

Change Happens					
Objectives: The student(s) will be able to:	**Excellent 4 points**	**Average 2 points**	**Needs Improvement 0 points**	**Peer-Assess-ment Score**	**Instructor Assess-ment Score**
Identify human barriers when dealing with change	Barriers are clearly identified and reasonable and clearly explained	Barriers are identified, but are not clearly explained or reasonable	Barriers are not identifed		
…	…	…	…	…	…
COMMENTS:					

interaction, and communication among students. When students are provided with the rubric for peer-assessment, the importance of the objectives is emphasized and the designated criteria to others' work. As the instructor, you will need to model good constructive criticism for them.

With the opportunity to review and provide comments to peers for revision purposes, peer-assessment provides for the opportunity for students to judge the work of others prior to submitting the assignment/project to the instructor for summative evaluation. Students work should then be completed at a higher level than may have been accomplished in the first version of their work. As the instructor, this should, in turn, save time, as the resulting better work should contain fewer errors. Students must, however, be given clear instructions. The rubric may be adjusted to include two columns for assessment: one for peer-assessment and one for instructor assessment. The example below provides one row of criteria as an example. The rubric developed for assessment of the entire case would likely have several rows of objectives and criteria. The rubric could also be designed with a third column for self-assessment. A comment section should also be provided for formative and summative feedback (see Table 3).

Peer-assessment provides students with an opportunity to assess the work of others and learn from others in the process. Such reciprocity and cooperation provide students with 1) examples of others' work to encourage a deeper level of learning; 2) a chance to view others' and their own mistakes as opportunities to make revisions; 3) an opportunity to transfer learning to future assignments and/or projects; and 4) an opportunity to develop constructive feedback skills.

Peer-assessment may also be developed to provide for anonymity so students feel comfortable providing constructive criticism and a complete review of the assignment. With anonymity, students are more likely to be honest in their review and provide more feedback to their peers. Without anonymity, students may not only provide less information in the review, but may also develop more of a tutor role with the other student. If developing a peer-tutoring relationship is indeed the goal, students may build personal relationships while developing additional skills in evaluating and judging others' work.

An example of guidelines for peer-assessment include: During the review of your peer's assignment/project: 1) complete the rubric, 2) list 1-2 strengths of how your peer completed the assignment/project, 3) provide written constructive criticism – how could your peer's work be improved, 4) clearly indicate specific edits that should be made, 5) discuss the information provided in #1-2 with the peer (if not an anonymous review), and 6) review your own project again and implement what you learned from this peer review.

Principle 3: Encourage active learning.

There are several technology-based tools to facilitate active learning. Some tools are more public in nature, such as discussion boards, wikis, blogs, and chat rooms. These tools are typically designed to allow multiple students to participate in the learning process, although the instructor can restrict usage and availability. These technologies provide a host of ways to engage within the larger group. As a variety of technology communication tools may be used, it is important to remember to assess and reflect on the tool's effectiveness to ensure proper usage and effective communication. Assessing the effectiveness of technology tools allows the instructor to identify the impact on active learning. Instructors obtain feedback on whether or not the technology tool enhances active learning on an individual basis or in small or large groups.

Before a tool is chosen, it is essential to plan how to enhance active learning whether in the F2F or online component. Careful planning provides for a smooth transition for those not familiar with blended learning. After careful planning, the instructor should observe students, ask for formative feedback from students, and make necessary changes.

Not only should students work individually, but be assigned to work in groups as well. Developing good teamwork skills, whether in a traditional or virtual environment, is essential to enhancing active learning. The instructor should design communication areas that students can collaborate on projects and communicate about assignments. Such an area may be "off limits" to the instructor, or the instructor may monitor it on a regular basis. However, providing students with areas to meet on their own time increases their ability to engage in contact.

Students can be engaged in active learning through the course content and the course process as well as interaction and feedback. Content-related engagement includes the delivery of and interaction with the content and communication to enhance understanding. For example, online lectures may be recorded, but students may still have questions about the content to achieve full understanding. The instructor or other students may lead online discussions or summarize content in a way that clarifies the content more appropriately. The online lectures may also be designed with interactive quiz questions or questions to consider and answer prior to the F2F component to engage students in a discussion or provide for a basis for student presentations. Process-related engagement includes communication and interaction to ensure students understand how to find course documents, navigate the LMS, submit assignments, attach files to specific communication areas, and communicate and interact with each other.

Feedback includes responses to emails, discussion board postings, and peer-evaluation provided through the course. Through the process of managing the overall interaction and providing meaning with feedback, engagement occurs.

When selecting specific technologies for the course, make sure students can perform the necessary function desired for appropriate and effective interaction. Choosing the appropriate technology tool can make the difference between whether or not students can effectively interact. It is essential that the instructor understand what tools are available for interaction purposes and provide students with protocols for interaction.

When matching appropriate technology tools with function, it is important to note a tool may be designed for one function, but the instructor may find another way to use the tool that is more viable. In this way, the technology tool function is expanded. For example, Facebook was designed as a social networking site in which people from across the world can network and find each other. However, the instructor may set up a group just for a particular course so students can engage through this tool.

Social Networking: Social networking sites such as Facebook and Twitter function as another way to engage students. If instructors want to develop a site that functions as a discussion board to answer students' questions or allow students to answer each other's questions, Facebook or Twitter can serve in this manner. If a more interactive site or gathering site functionality is necessary, Facebook or other similar sites such as Ning are viable tools.

Social networking sites were developed to provide a highway for communication between individuals. Friends, classmates, and other individuals access social networks for general communication; however, they can also be used for educational purposes. The advantage in using social networking sites for education is that many students are already familiar with the software, and the sites can be used for posting information, pictures, and/or videos online. With this familiarity also come challenges, such as making sure only students in your class participate in the group that you designed. The instructor must take the time to set up the site and verify students can enter the space each time a student requests admission. This can be time consuming depending on the size of the class.

A technology tool may have several functions, but that does not mean the instructor must use every function. For example, video conference software such as Adobe Connect Professional includes the following functions: camera, microphone, chat area, presentation area, whiteboard, polling, breakout sessions, etc., but the instructor should use only the necessary functions to help students be active in the learning process. Consequently, it is essential to match the tool with the function that is appropriate for learning and engaging in the content. It is not necessary to use every function within a technology tool, but to examine specific functions that meet course needs, the needs of the students, and provide for engaging in the learning process. Whatever technology is chosen or is available, it should enhance the facilitation of active learning.

As technology tools assist with student engagement, it is essential to identify the pros and cons for each type of tool. Without investigating the tools thoroughly, the wrong tool may be selected and the engagement process will deteriorate or be non-existent. Small group and one-to-one meeting software are useful to assist with engagement between a few students. However, there are other technologies, such as wikis or social media, which may enhance engagement of larger groups of students.

Student engagement is vital to successful facilitation in a blended learning environment. Student engagement should be an essential part of the planning process for effective course interaction and facilitation. The instructor should engage students in the learning process, particularly in the beginning. This sets the stage for students as they learn quickly that they are expected to participate and be active in the learning process. Using appropriate questioning, listening, and feedback skills can assist in this process. Throughout the engagement and facilitation process, instructors should provide direction and support to learners, manage online discussions, facilitate relationship building and motivate students.

Application Sharing: Application sharing is another way to engage students. It is described as the co-development of documents. It allows several students to work on the same document at the same time. Google docs is a well-known application sharing software. Application sharing software is typically described as collaborative software as it allows for such collaboration. Such software is also called groupware and group support systems. These software packages are designed to help students work toward a common goal while working together typically from a distance and from different locations.

Chats: Chats, also called online chats or synchronous conferencing, are text-based online areas in which students key information and upon hitting the Enter key on the keyboard, the text appears on the screen. Thus, the messages instantaneously appear on the screen one after another. Chats are good for short, informal communication to help engage students in the content or discussions. Instructors utilize a chat session to allow students to key questions or answers after an online lecture or video. If a blended course uses chat rooms developed for content discussion, slow typists typically do not have their questions asked and therefore answered as frequently or they are not able to answer as many questions as they would prefer. Instructors should take this into consideration when using chats as an engagement technique.

Conferencing: There are several different types of synchronous conferencing for online courses. They include audio, video, and Web conferencing. Audio conferencing involves the voice only and is good for discussions and basic dialogue. Video conferencing can involve more interaction as the participants can see and hear each other and provides a format for more in-depth discussions and/or teaching.

Web conferencing provides the opportunity for the students to give oral presentations or provide other information and information online. This serves more as a virtual classroom, as the instructor can speak to students and interact at a higher level through audio, video, and the sharing of the computer desktop to display PowerPoint slide, other software, or Web resources. Web conferencing can also be used for "virtual office hours." This gives instructors the opportunity to provide assistance to students online from their office and engage them in asking questions outside the classroom. Elluminate and Adobe Connect Professional are two commonly used Web conferencing tools.

Instant Messaging: Skype is one example of an instant messaging service that allows users to have audio and video conversations with others. Many online instructors use Skype to communicate with students and "bring" guest speakers into the online classroom virtually to engage students in content outside the textbook. Instant messaging software is also referred to as Voice over IP or VoIP. These types of systems are typically free or less expensive than other types of synchronous communication tools, but may not be as sophisticated or additional charges may occur. This type of synchronous communication is typically used for one-to-one communication or small groups.

White Boarding: White boarding is typically thought of as a shared space similar to an online "whiteboard" or "notebook." The software involved in such technology allows the users to engage by marking-up information in a collaborative environment. Scriblink is one such white boarding software that allows several users to draw, diagram, or key text on an online whiteboard. One user must open the whiteboard and then send a URL to other users to invite them to collaborate. This collaboration occurs in real time, as with other synchronous tools. When using an online whiteboard in a blended course, remember that all students can mark-up, annotate, and draw on the screen. Therefore, it is important to provide instruction on how to use the tool effectively.

Instructors should work to provide a safe environment in which all students can engage with other students and the content. Monitoring interaction and being proactive planning for engagement is essential. Setting high expectations for engagement at the onset of the course, and, as an instructor, engaging with students yourself, is key to setting the stage.

Principle 4: Give prompt feedback.

One of the ultimate goals of an effectively designed course from a teaching perspective should be to assess learning. As students complete assignments and/or projects, they must understand how they will be assessed – what are the expectations and learning outcomes? Criteria must be used as the basis of a framework for measuring growth in the learning process. To effectively complete assessment, rubrics are a key component for providing meaningful feedback to help students improve. Rubrics also allow for a more prompt timeframe for feedback tied directly to the learning objectives.

Rubrics should include a set of criteria that connect to specific course learning outcomes. Rubrics allow for standardized evaluation and make the evaluation process more simple and transparent. Rubrics provide students (through peer evaluation) and the instructor with a guide with which to provide feedback to others through formative or summative assessment. Rubrics should provide specific criteria and a range of performance so students more clearly understand what they are doing well and how to improve if needed.

This framework should assist instructors with consistency in assessment. A well-written rubric, for example, can help provide timely useful feedback regarding the effectiveness of a student's participation in threaded discussions and other assignments and offer assessment benchmarks and document progress. Actual implementation of a rubric for assessment will largely depend upon the instructor's preference for feedback, type of assessment and time of assessment.

Rating scales within rubrics vary, but typically range from zero or one for the low category in the rubric to whatever high level of points is needed based on the project. Instructors vary on their opinion of students earning zero or one point for the low category. However, whatever is decided upon, the instructor should be consistent from assignment to assignment. Categories may also vary from "poor" to "excellent" or "needs improvement" to "mastery of the content."

In any environment, rubrics should be provided to students when the assignment is introduced. Instructors use rubrics, not only to evaluate work consistently, but also to clearly communicate expectations to students. In a blended environment, the instructor can provide the rubrics F2F or online. LMSs now provide access to electronic rubrics which allow for more prompt feedback.

When students receive rubrics beforehand, they better understand the evaluation criteria and can prepare accordingly. Developing a grid and making it available as a tool for students' use will provide the scaffolding necessary to improve the quality of their work and increase their knowledge. Therefore, prepare rubrics as guides students can use to build on current knowledge, consider rubrics as part of your planning time, not as an additional time commitment to your preparation, and provide prompt feedback through the rubrics. Assessment should be student-centered, outcome based, and frequent.

Table 4. Sample syllabus statements

GENERAL INFORMATION
Dr. Franklin will check email and course information via Blackboard during office hours and other times when available.
Dr. Franklin does not consistently check email on Saturday or Sunday.
Any question regarding course content, assignments, projects, etc. should first be posted on the Frequently Asked Questions (FAQ) discussion board. Anyone may answer the posted questions and extra credit may be earned for complete answers.
If you have specific questions pertaining to the course, assignments, projects, etc., ask questions early and at appropriate times/days during the week.
Your questions will be answered within 24 hours Monday – Friday.
FOR DISCUSSION BOARD RESPONSES
Example to put in the syllabus: "In any online course, participation is crucial. Every student is expected to participate in all discussion boards. Peers and the instructor will also provide feedback in these open areas. The instructor will be monitoring your responses. Acceptable responses include your expressed opinion, information from readings, and/or information from your research. Unacceptable responses include: 1) no response; 2) simply stating "I agree" or "You are right" or "Good answer" and 3) not adding to a body of knowledge. You must "add to the conversation." Texting language is not appropriate. The discussion board is a professional discussion and professional language and respect of others is required. As noted in the syllabus, your participation will be graded with these guidelines in mind."

Instructors should define their idea of prompt feedback and be clear about their practices for responding to students. There must be a way for students to ask questions and receive timely answers, but guidelines can be set so the instructor does not become a 24-7 online instructor. The syllabus must clearly communicate those guidelines. For example, the syllabus may include the information shown in Table 4.

The assignment/project may determine the method of prompt or immediate feedback. For example, if students are taking an online quiz or test, feedback can be provided immediately in the format of a final score. Embedding specific feedback in the test to provide automatic, immediate feedback, is easy to do. Another example of when an assignment/project may determine the method of feedback is when students are required to develop a Web page. Printing the Web pages and writing feedback on each print-out is not the best method of providing feedback. It would be essential with a Web page assignment to verify that links on the Web page work and animation is appropriate. These are items that cannot be graded via a printed page. To provide meaningful feedback on a Web page assignment, using a screen capture software such as Camtasia, Captivate, or Jing would allow you to record screen movement as you clicked on links and also allow you to record your voice as you provided auditory feedback at the same time. Providing auditory and visual feedback would be more meaningful to the student than written comments.

However, feedback also includes responses to emails, discussion board postings, and any other questions, comments, or suggestions that arise in any communication area provided through the course. As students ask questions about assignments, prompt and complete feedback is essential. Through the process of managing the overall communication and assessment processes within a blended environment, the instructor should begin to establish a pattern of communication and feedback. This pattern of communication should become obvious to students and should be easy to follow.

All feedback does not have to be individual feedback. Email can be used in three ways: class email, group email, and individual email. Class email is "email broadcast." It can be used as feedback for announcements, correcting misunderstandings, or misconceptions. Group email can be used to provide students with ideas, guidance, or feedback on group projects. Individual email can be used for many situations, such as answering individual questions, providing feedback on assignments, motivating students to learn, and following up with students for special situations.

Key components of prompt feedback include the following. The feedback provided on assignments/projects should be

- Connected to learning objectives.
- Frequent and prompt.
- Positive in tone.
- Automatic, if possible.
- Provided in a variety of ways:
  - Written Peer and/or Instructor Feedback.
  - Auditory Feedback.
  - Visual Feedback.
- Individualized.
- Specific and detailed.

Principle 5: Emphasize time on task.

As noted by Chickering and Gamson (1987), time plus energy equals learning. This is the key to emphasizing time on task. This can be done through the development of materials and processes that attract students to spend more time on the task, planning carefully to reduce wasted time, and effectively communicating how much time students should be spending on the task at hand (TLT Group, n.d.). Many times students do not understand the amount of time expected or needed to complete an assignment, project or discussion board question.

Bartoletti & Restine (2008) note that elements to assist in organization and time tracking are essential to emphasizing time on task. An electronic course calendar through the LMS can assist students in developing time management skills or, at least, serve as a reminder the students who need it. The syllabus also serves as an excellent tool to help students stay focused and on task. Providing a one page summary at the beginning or end of the syllabus with all of the tasks and appropriate due dates will help students complete assignments on time. A checklist can also be developed. As students complete assignments, they can easily check them off to ensure completion.

Course organization can actually assist in emphasizing time on task as well. Clear, easy course navigation enhances the students' ability to find assignment, complete them and attach for assessment in a timely manner. When students have to "hunt" to find what they are looking for, they are not as eager to continue searching and completing the assignment. Course organization may be dependent on the faculty's teaching style and course content; however, it can be organized by module, topics, or in a weekly fashion. Utilizing the ability to hide modules after they are completed or opening modules only when they are needed helps eliminate a "busy" environment in which students must search to find necessary components and eliminates barriers.

Time on task is also dependent on the F2F time and online time in the blended course. It is imperative for instructors to delineate expectations of the time spent in class and online. It is easy for instructors and students to fall into the trap of preparing only for the f2f portion of the course and neglect the interaction and the learning that must be a part of the online course. Purposeful course organization must look at time on task holistically with time on task in both environments complementing each other to achieve appropriate contact hours and to meet course objectives.

Principle 6: Communicate high expectations.

The syllabus should be the first place to establish the expectations for all students. Instructors should ensure that expectations are clear and communicate the benefits of the course learning outcomes. Whatever the content, students must also understand how they will be assessed as they work toward achieving course goal. This is very important in a blended course. There should NOT be two sets of goals, one for the F2F component and one for the online component. The outcomes are blended and students must understand the expectations of both components.

To achieve high expectations tied to the learning outcomes, assignments and/or projects should include: 1) clear instructions, 2) varied tasks, 3) tasks of appropriate length, 4) tasks at the appropriate level of learning, and 5) tasks at the appropriate degree of difficulty. Learning outcomes should be based on Bloom's Taxonomy which is a classification system for various levels of learning (Bloom & Krathwohl, 1956). Assignments and/or projects should also be developed on such a system. The Bloom's Taxonomy was revised (Anderson, Krathwohl, & Airasian, 2001) and is noted in Figure 1. There are various levels, which can be implemented to increase the level of learning.

As the level of learning is increased, the expectations are higher. Clear communication in the F2F and online components are necessary. Clear criteria in rubrics also help students identify a higher level of expectations. Whether the rubric is designed to assess performance, process or product, the same rubric will be used by the instructor can also be used for self- and peer-assessment. Students can complete the assignment and use the rubric to self-assess prior to turning in the assignments and then use the same rubric for a peer assessment of another student's project as well. Thus, if students self-assess using the rubric and a peer provides feedback using the same rubric, the student will more completely understand the expectations of the instructor and objectives of the project.

Figure 1. Revised Bloom's taxonomy

HIGH LEVEL

Level of Learning	The student will be able to. . .
Creating	Create, Invent, Compose, Construct, Combine, Hypothesize, Originate, Forecast, Formulate
Evaluating	Judge, Justify, Debate, Verify, Argue, Defend, Recommend, Assess, Critique
Analyzing	Analyze, Contrast, Separate, Differentiate, Deduce, Examine, Subdivide
Applying	Apply, Solve, Illustrate, Choose, Classify, Manipulate, Calculate, Modify, Examine, Construct
Understanding	Explain, Outline, Discuss, Distinguish, Compare, Describe, Demonstrate, Translate, Restate, Interpret
Remembering	List Describe, Locate, State, Name, Label, Define, Match, Select, Recite

LOW LEVEL

The assessment process plays a key part in communicating high expectations. The key idea behind assessment is that it is something we do with and for our students, rather than to our students. Viewing assessment as a way to judge not only what the students have learned, but also what has been taught is essential.

Principle 7: Respect diverse talents and ways of learning.

Remember students are human too. Instructors should be conscious of their tone and language and teaching style; but know that not all students learn alike. Effective teaching takes into account the students' perspective; therefore, try to look at it from their point of view. It is typical to think about students learning through auditory, visual or tactile means; however, students may have dual learning styles (Butler & Pinto-Zipp, 2006) and learn through various means. Therefore, it is important to provide content to students in a variety of ways such as audio-graphic, video, text chat, Web tools, and collaborative writing tools (Felix, 2003).

Student-centered learning can become an effective component of blended learning.

"In the past, students were often considered the receptacles of the information that educators provided through lectures and other directed learning experiences. Today, students play a more self-directed role, and educators focus more on the facilitation of learning, emphasizing cooperative and collaborative efforts, self-initiated research, and guided discovery learning" (Huebner & Wiener, 2001, para. 1). It is important for faculty to understand, however, what the students do not understand to more fully provide content and enhance learning. The following techniques can assist.

Exit Tickets: Exit tickets can be created on a discussion board as an anonymous submission. Students are simply probed with two questions at the end of a lesson or unit. The two questions should require students to: 1) provide an answer to a factual question that deals with the overall idea of the lesson and 2) provide more explanation of a concept from the lesson. This method provides you with an opportunity to analyze the ticket information and get a feel for whether or not students understand the material or have misconceptions about specific aspects.

One-Minute Essay: One-minute papers also give you an opportunity to determine the level of understanding of course content. One-minute essays stem from open-ended questions such as "What was the most important thing we discussed today?" The muddiest-point papers are similar; however, the questions are developed around what the students do not understand. For example, "What is the one thing from this lesson that is still confusing to you?"

In the blended environment accessibility must be achieved in both f2f and online environments. Both environments provide opportunities and challenges for accessibility. One needs to consider the accessibility of at least three layers of information and interaction: the accessibility of the basic units of content (e.g. blocks of text, mathematical or chemical formulae, pictures, diagrams, etc.); the accessibility of the medium in which this content is delivered (e.g. a Word or PowerPoint presentation,); and finally the accessibility of the learning environment; LMS. All of these can create their own accessibility barriers, which are different for each different student, staff member or even institution.

The first place to investigate accessibility services is through the LMS. The LMS is often the link between the F2F and the online environment in a blended course. Most LMS offer tutorials that explain different types of accessibility needed by students as well as types of accessibility software that works efficiently in with the LMS . Most LMS frameworks and Web sites follow universal design that aid in accessibility of special populations.

If a student has special needs, for example is visually impaired, auditory feedback is essential. If a student is hearing impaired, visual and text-based feedback are appropriate. Providing such feedback is not expensive. Web camera and microphones are inexpensive and some free or inexpensive software packages are available. Do not discount actually providing verbal feedback in person or over the phone. This type of feedback provides a human touch and helps develop a positive instructor/students relationship.

FUTURE RESEARCH DIRECTIONS

As technology changes and innovated instructors look for new and better ways of developing learning spaces, the "classroom" will continue to evolve into a blend of technology and persona. Classes will neither be completely F2F nor online but will be somewhere on the F2F/online continuum. As the use of this delivery and learning space model continues, programs will immerge that will give students more choice in their educational options.

As with all new learning innovations, challenges arise and "old beliefs die hard." Although the push for learning environments is for the content and the communication to be "student centered" the term "student responsible" needs to be added. In the blended classroom, the instructor is no longer the "pitcher pouring knowledge into student vessels." The student has to take responsibility of the learning. The blended environment allows for differentiated learning that can focus on students learning strengths, and mediate weaknesses. The variety of learning opportunities can transform the students from a passive to an active learner.

Instruction must follow this evolution. To be successful in this environment, instructors must evolve from "lecturer" to instructional guide. The f2f meetings as well as the instructional design of the digital content and communication must work in concert to provide a complete student centered/student responsible learning environment. This takes planning and work. With the tools and techniques described in this chapter, the conversion to blended learning can be successful.

CONCLUSION

Transforming a F2F course to a blended environment provide unique opportunities to provide students with a rich multimedia experience that "blends" the best of F2F and online environments. Creating a blended course that meets quality standards is not easy and will require the adherence to the framework of transference outlined throughout this chapter. This framework, based on Chickering and Gamson's *Seven Principles for Good Practice in Undergraduate Education* (1987), can ensure that the blended course have the important elements to ensure effective student learning.

Overall, the framework for transference is composed of these steps:

1. Conducting a course audit.
2. Considering the 4 Os.
3. Encouraging contact between students and the instructor.
4. Developing reciprocity and cooperation among students.
5. Encouraging active learning.
6. Giving prompt feedback.
7. Emphasizing time on task.
8. Communicating high expectations.
9. Respecting diverse talents and ways of learning.
10. Closing the loop.

Closing the loop includes taking into consideration all that has been learned through teaching the course, student formative feedback and course evaluation and using that information to cycle back to step on (conducting a course audit) to continue the revision process. This is a continual loop that must persist to continue to develop effective blended courses. As faculty works through these steps, a thoughtful, well-developed blended course, with rigorous student expectations in both F2F and online environments, will emerge to meet the needs of all types of learners.

KEY TERMS AND DEFINITIONS

Asynchronous: Not occurring at the same time, a time delay in communication, as students and the instructor do not interact at the same time, provides students with the ultimate anytime, anywhere learning environment.

Blended Learning: The utilization of teaching practices that combine teaching methods, which incorporate both face-to-face (F2) and online components.

Blog: Websites typically used like a journal for reflection, also known as Weblogs, can be public or private, in which members do not edit postings, but can comment on postings.

Bloom's Taxonomy: A classification system used for various levels of learning, includes the use of the revised six domains of complexity (remembering, understanding, applying, analyzing, evaluation, and creating).

Learning Management System (LMS): A software application used as a communication portal between students and the instructor, interact may occur through email, discussion forums, etc., information such as course content and classroom assessments (test and quizzes) may also be included in the LMS, other administrative classroom tasks may also be utilized.

Social Networking: Representation of a community of people who use an online area to communicate with other members of that site, communication can occur in various forms including posting messages and uploading photographs, communication can be informal or formal.

Synchronous: At the same time, but not in the same place, individuals learning at the same time as they work toward a common goal or outcome, learning conducted simultaneously in a real-time online environment, learning typically involves chat areas or videoconference software.

Whiteboarding: A technology tool feature typically included in videoconference software which allows users to collaborate (writing and drawing) on shared documents as if writing on a traditional whiteboard.

Wiki: A Web page that can be designed, viewed, and editedby users, many times used for collaborative assignments/projects.

Chapter 37
Impact of Technological Advancement on the Higher Education Curriculum and Program Development

ABSTRACT

The current educational structure was created in response to the demands of an industrial society, which, alongside workers, needed an elite of highly educated professionals. The knowledge revolution accelerated this trend: professionals are now not only the people who "have" the knowledge, but they should be also able to find it quickly and efficiently, and have the skills to apply knowledge in new situations, extending the scope of their initial field of expertise. With massive growth of free open educational resources, knowledge became available and accessible to everyone with a simple Internet connection. All these conditions currently call into question the role and operationalization of educational processes in Higher Education, since universities are no longer the one central source of knowledge generation. In this chapter, the authors analyze the current situation in Higher Education, in terms of why a demand for transformation of educational models has been almost entirely unable to generate sustainable changes in curriculum development. Aside from theoretical foundations, the authors also analyze literature and what the practitioners have to say in that respect. The ultimate goal of this chapter is to set the basis for an analytical framework for discussions about the transformative process of Higher Education in order to be able to bring curriculum development a step forward, in a sustainable way.

INTRODUCTION

Educational visionaries and reformers have long predicted a significant transformation of teaching and learning where technology would play a principal role. These visionary changes cover a spectrum that moves from cognitive approaches, such as customization of learning (e.g., Personal Learning Environments), to more socio-constructivist conceptions such as the latest challenges surrounding social learning and learning analytics. However, technological implementations in education have consistently fallen short of generating profound revolutions. Why have our most visionary dreams not been realized? Why hasn't technology dramatically transformed teaching and learning in Higher Education? The answer to these apparently simple questions is rooted in a complex combination of a variety of factors associated to the interplay between technological developments, scientific advancement and societal evolution.

The first strong impact of technology in higher education was at the time of the industrial revolution. Universities were changing their role from being scientific clusters towards being producers of highly qualified workers (professionalization and democratization of university studies), mainly specialists in the subjects' content, and hence the teacher's role was to be the expert in the subject. Professionals, including scientists and researchers, were expected to be 'experts' in their fields of expertise. When the advancement of Information and Communication Technologies (ICT) transformed industrial society into a networked and knowledge society (Castells, 2009), expert knowledge started to be at everyone's disposal. The demands from labor markets became more complex, since not only was expert knowledge needed, but also the development of social skills and autonomous learning, in order to cope with the new societal and workplace rules. The Bologna reform is a good example of changes in societal demands and those of the labor market (Leuven Communiqué, 2009). This is one of the biggest attempts to gather resources from all European higher education institutions, so as to cope with the complexity of educating professionals in a networked society and globalized market. One key point of this reform was the change from subject-centered curriculum toward a competences-based one. More than a superficial change, it turned to be a conceptual move from rooting formal education in behavioral and cognitivist learning theories, toward implementing socio-constructivist theories of learning as framework for understanding learning process and designing teaching practices. However, the appropriate implementation of socio-constructivist learning theories demands an adequate use of ICT and emerging technologies and devices. But most importantly: how do institutions cope with this demand, when their organizational and curriculum structures are rooted in the traditional behavioral understanding of learning? What shapes the understanding of teaching and educating? How is this competencies-based approach implemented? Which teaching competences are needed to successfully implement it? And what does faculty staff development look like in a competences-based era, settled in a subject or fields-centered institutional structure? These are questions that are still waiting for practical answers.

The transformation of teaching and learning in professional education nowadays certainly depends on the effective implementation of well-selected suitable technologies according to each educational situation. Although, innovation is the only clear learning outcome from the past 20 or 30 years of attempts to transform education by implementing different technologies. For achieving the dramatically different results that the educational community has longed for, innovators should change the rules, fundamentally altering the environment in which learning occurs. Particular technologies and technology standards are a key part of this process. However, no technology or standard has value in itself. Value comes from what is done through the implementation of those standards in the creation and use of effective and affordable learning materials; based on coherent and consistent implementation of learning theories, which will reflect how the learning processes is really understood.

In this chapter we will present an analysis of the impact of technology advancement in the evolution of curriculum and educational programs from the perspective of European and UK Higher Education. We will provide a review of the theoretical framework and existing applied research in order to define critical factors that influence the implementation of technology in curriculum development and a teacher's ability to successfully implement innovations in the classroom. Beyond seeking to answer key questions about the current use of technology (or the lack of it) in teaching practices, or the need of more transdisciplinary work in curriculum development, we also attempt to address some key research questions emergent from analyzing the current scientific results and practitioners' experiences reported in the literature.

Demand for Transformation

The interplay between science and technology, which intensified during the 90s and is constantly increasing due to the ICT revolution, has accelerated industry advancements exponentially. This advancement generated an escalation in demand for Higher Education, since it led to growth in occupations for which secondary school was no longer enough to fulfil the requirements of industry. The increase in technological skills demanded by the labor market (Hüsing et al., 2013), along with the increase in demands for professionalization, meant that access to Higher Education institutions was no longer reserved for an elite. In most Western countries, student numbers started to increase rapidly at the end of the 1960s and this tendency has not stopped until today. This phenomenon is the result of social and industrial structural changes, and has implications for the organization of modern services and activities offered by Higher Education. Trow (1973, 2000) has identified three phases in the evolution of Higher Education: elite system (participation less than 15% of the age group), massive system (participation between 15 - 50%) and universal system (participation of more than 50%). The OECD reported (2009) in 2009 that since 1998, tertiary attainment levels among young adults have increased significantly, to 34% among 25-34 year-olds on average across OECD countries.

Massification of Higher Education has an effect on almost all institutional aspects: financing, governance and administration, recruitment and selection of students, academic career programs and particularly on curricula and forms of instruction (Beerkens-Soo & Vossensteyn, 2010). The phenomenon of massification also has implications related to funding. Covering the expenses of Higher Education at mass level is a serious burden on a public budget. Although in most countries public funding in the period of massification increased, it did not keep up with the escalation of student numbers. As a result, funding per student dropped and staff per student ratio declined (Beerkens-Soo & Vossensteyn, 2010). John van der Baaren (2013) remarks that Higher Education today is too expensive, being one of the largest cost items for most national budgets. He also notes that education is the only major sector in society that has shown no increase in productivity in the past 50 years. On the contrary, costs have risen while the quality of output has remained the same (at best). The author concludes that Higher Education is of low quality regarding value for money that students receive, and has low relevance in terms of how prepared new professionals are to face the labor market demands; results expected of the formal curriculum do not correspond to labor market requirements.

Educating modern professionals for the high-tech industry and society is not the only demand that these institutions are facing. The fierce industrial economy demands scientific advancements and research to spearhead market innovation.

The new EU framework program for research and innovation Horizon 2020 echoes another demand of the desired transformation of Higher Education (European Commission, 2011). While Europe seems to be still leading in basic research, this new EU framework program focuses on innovation, "by helping to bridge the gap between research and the market." This emphasis on innovation as a driver for product development is more evidence of the stronger market orientation Higher Education is facing nowadays. Public education institutions have to learn to compete with research and development departments in the private sector.

As described by Ernst and Young (Bokor, 2012), Universities are "a thousand years old industry on the cusp of profound change." Higher education in general is nowadays facing tremendous challenges, fostering an historical demand for transformation. Most of these challenges emerge from heterogeneous demands of different sectors belonging to a society undergoing constant transformation and innovation. Different sectors are looking for solutions in Higher Education institutions, sometimes bringing into question the position they should take in the current and future societal and economic panorama. Still a core societal organization, when generating strategies, these institutions have to find an adequate balance between the different interest groups and their representatives, namely:

- **Science/Research/Innovation:** Higher Education institutions are still seen as a source for the generation of new scientific knowledge and independent research.
- **Administration/Business:** The administrative heads of the institutions have to react to a more competing environment and ensure their success. The definition of success is a problem of its own. For instance, traditionally there is a big difference between universities and universities of applied science. While the first assesses indicators from the scientific field (publications, award, grants), the latter is concerned with the number of students. But this difference is vanishing nowadays, since high research quality is usually perceived as an argument to attract more students.
- **Students/Professionals:** Are approaching Higher Education to build their personal future. The demands of students might be their longing for knowledge, but more often it is the demand for employability.
- **Economy/Market:** The economy requires employees and the market pursues innovations to keep up with competitors. How close this could be linked to the strategy of Higher Education depends on its goals and the local or global market.
- **Society/Citizens:** Ask for responsible citizens and political subjects. Because Higher Education is still a public task, this debate is not to be underestimated.

Higher education challenges no longer belong to the academic hegemony. Important actors of the economic sphere are also concerned with the future of this important institution. For instance, Ernst & Young have detected three broad lines of evolution for universities (Bokor, 2012).

- **Streamlined Status Quo:** Some established universities will continue to operate as broad-based teaching and research institutions, but will progressively transform the way they deliver their services and administer their organizations — with major implications for the way they engage with students, government, industry stakeholders, TAFEs, secondary schools, and the community.
- **Niche Dominators:** Some established universities and new entrants will fundamentally reshape and refine the range of services and markets they operate in, targeting particular 'customer' segments with tai-

lored education, research and related services — with a concurrent shift in the business model, organization and operations.

- **Transformers:** Private providers and new entrants will carve out new positions in the 'traditional' sector and also create new market spaces that merge parts of the Higher Education sector with other sectors, such as media, technology, innovation, venture capital and the like. This will create new markets, new segments and new sources of economic value.

Each of the aforementioned evolution lines imply different organizational strategies with different approaches to educational programs and curriculum development. Economic values and interests evidently drive this vision. To sum up, Higher education institutions, pulled by strong external and internal forces, have to make strategic decisions to defend or redefine their position in the societal and economical playground. One of the major challenges in Higher Education is to generate a new view on what its main purpose is.

Epistemology of Learning in the Knowledge Revolution

A clear task for Higher Education institutions is to educate modern professionals, including researchers and scientists that are able to cope with the industrial demands. Not only do adequate curricula and career programs have to be developed, but it is also necessary to prepare faculty staff to manage their time and resources to meet the demands of increasing teaching quality and scientific productivity.

The major driver of big European reforms is supplying the labor market with highly qualified professionals. Morrison (1997) already mentioned that educators need to rethink their basic assumptions about organizational structure and curricular programs. The Bologna agreement is the EU reform with the greatest impact in European Higher Education system (Terry, 2008). This reform has the focus on increasing the mobility of researchers, students and professionals around Europe. Facilitating the mobility of the 'users' of Higher Education aims to broaden the access to resources for education and research. Another aim of this reform is to increase professionals' availability in Europe. The standardization of the career path from undergraduate to PhD studies in all the participant institutions was designed to that end. This way it can be ensured that students and scientists have similar quality standards when they move around countries. This reform was created with the goal of providing responses to issues such as values and roles of Higher Education and research in modern, globalized, and increasingly complex societies with the most demanding qualification needs.

Departing from a labor market demands analysis, the Bologna process introduced one of the most relevant reforms regarding professional education: it represents a shift in the focus of curriculum design from subject-centered to competences-based. This is, with no doubts, the cornerstone of the professional education transformation (Hüsing et al., 2013), but also the source of a rainbow of questions on how to implement this curriculum development change and surrounding the role of the teacher. The emphasis on the development of skills and competences has become a headache for those charged with curriculum implementation (Leuven Communiqué, 2009).

In order to be able to implement competencies-based curricula, it would be necessary to make some fundamental institutional and organizational changes. The main problem faced in this regard is the inconsistency between the objectivist epistemology behind the current formal educational structures and the relativist socio-constructivist foundations that frame the design of the competences based curricula.

But why would the demands of society and industry need such deep changes in their education systems at all levels? Stephen Byers, former UK

Trade and Industry Secretary, described it to the Confederation of British Industry (CBI) in 1999 (as cited in Rikowski, 2005):

The first industrial revolution was based on investment in capital and machinery. The revolution we are going through now requires investment in human capital – skills, learning and education.

The current educational structure was created in response to the demands of an industrial society, which, alongside workers, needed an elite of highly educated professionals. These professionals had the role of experts in their subject matter and were a small part of the workforce. The knowledge society instead requires highly qualified professionals, who are able to find solutions, quickly and efficiently, with skills for applying new knowledge to new situations. This new knowledge has to be found or acquired by modern professionals and it most probably will extend its limits out of the scope of their initial field of expertise.

Access to scientific and practical knowledge is no longer a privilege of a few. The massive growth of free education offerings, online resources and open knowledge is not a secret (Wiley, 2007). Knowledge and information are freely available and accessible out there for anyone operating a simple Internet connection or who can afford a smartphone. This is one of the main changes in the epistemology of our society. Higher education institutions are no longer the one central source of knowledge generation, which implies that it is no longer the unique owner and distributor of knowledge either.

Knowledge Revolution

The fast evolution and expansion of ICT has progressively and dramatically steered the evolution from an industrial to a knowledge society. The knowledge revolution that steers the knowledge society is the result of an incremental reciprocal influence between technological developments and scientific advancement (Bell, 1999). The development of sophisticated ICTs from the 90s on allowed the general public and non-scientists to progressively collect, share and create their own knowledge (via online communities, social networks and lately the use of cloud computing for sharing and collaborating) (Sunstein, 2006). Scientists also use the same tools used by the non-scientific general public – as science2.0 - to expand their borders and generate scientific knowledge (Waldrop, 2008). Besides ICT, other technologies are also emerging as a product of this rapid knowledge access at all levels of society. The more technology evolves, the greater the number of tools there are for scientific exploration. New technologies are allowing all scientific fields a deeper and better understanding of natural and societal phenomena by using simulation and computer experiments (Gramelsberger, 2010). The better scientists understand their fields, the more refined are their technical demands so as to answer more complex scientific questions. This interplay between Science and Technology (S&T) is enabling the unprecedented creation of new materials and processes, which allows the design and implementation of ever more sophisticated technological tools at the service of science and society. The rapid dissemination of existing knowledge and know-how, coupled with the possibility to exchange ideas virtually with everyone everywhere, speed up the generation of new knowledge and know-how beyond the limits of the context in which it was originally created.

This expansive wave of knowledge generation is broadening the boundaries of the scientific field to such an extent that it intersects with the expanded limits of other fields. This phenomenon is creating new interdisciplinary territories of research and developments, giving rise to strong demands for transdisciplinary work (Gibbons et al., 1994). Researchers no longer have the image of the isolated scientist in a lab. The scientific fields are becoming so complex and vast that teamwork and networks are necessary. Hence, even in the academic area new skills are required even from junior researchers so as to be able to deal with economy's strong demands better and make the most of the knowledge and technology revolution.

The marriage between S&T is also creating new markets and generating new economic niches. Many of the technological developments created to resolve specific industry demands find their way to other markets. As it is the case with the 3D printer, which appeared in 1983 to meet a demand for cheap prototyping[1], and is nowadays entering the home printer sector, expanding the possibilities of general public for creating new tools and devices for their own use and purposes. Thus, new professional profiles are also required, either by the new academic research fields or by the new economic niches. But in any case, these new professionals should have the competences to be able to go beyond one specific knowledge field.

The aforementioned expanding S&T dynamics currently have an incremental momentum, which is very difficult for old and static organizations like big Higher Education institutions to follow. This is because the entire educational and administrative structure of these extremely traditional institutions has been historically rooted in the division of scientific fields and disciplines. Therefore, their internal organizational structure does not prepare them for meeting the increasing demand for interdisciplinary professionals (either academics or industrial professionals) (Robinson, 1996). The strong fields and discipline structures, which currently function as the skeleton of their research activity and their career offers, it is one of the most challenging situations to be resolved when implementing competences-based curricula.

Technology, Epistemology of Learning and Curriculum Development

We understand curriculum development as a framework that helps to structure instruction in formal educational contexts, and design that instruction pursuant to structuring a learning process in order to achieve determined learning goals. Hence, how instruction is conceptualized, designed and implemented has a direct relation with how the learning process is conceived, and has strong impact on how curriculum is developed. The relation between learning and knowledge depend on the epistemology taken. This is a fundamental conflict faced by curriculum development in the knowledge society, since the knowledge revolution has fundamentally modified the epistemology of our society.

On a theoretical level, epistemology of learning (and thus of teaching) has changed with the evolution of Web 2.0 and social media and its. Transition from individual and private exchange to social and public co-creation. and the current division of scientific fields and disciplines as the backbone of career programs and curriculum development is based on the epistemological belief that knowledge is an object, which is transferable from the head of the 'expert' or teacher to the head of the 'learner.' Learning is understood as the process of transmitting and receiving that knowledge in an individual and fragmented way. It is also based on the idea that knowledge can be segmented and separately delivered. Even the evaluations in the form of tests where the learner must be able to repeat the received information (the received object), reflect this 'knowledge as transferable object' epistemology. In this context, it is difficult to differentiate information from knowledge. The learning metaphor associated to this approach is known as "acquisition metaphor"(Paavola, Lipponen, & Hakkarainen, 2004), reflecting the idea that knowledge can be acquired from another one who has it. That is the reason why the curriculum design based on this metaphor of learning was subject-centered, since the learning process consisted of the transmission of the subject's content. When our current Higher Educational structures were designed, at the service of the industrial revolution (end of XVIII, beginning of XIX century), behaviorism could best explain how learning processes worked, since at that time the technology that nowadays helps us to understand learning process did not exist. No major attention was paid to individual cognitive processes, because there were no mechanisms or technologies to implement them, in terms of learning assessment. Thus, the only way to evaluate at that time was implementing summative assessment, which is based on the behavioral principle of punishment and reward (Harlen & James, 1997, pp. 365-379)

During all these decades, cognitivist and socio-constructivist theories of learning have had the opportunity to be explored more deeply, since technology is at the hand of social and human sciences. When technology first started to approach learning enhancement, the educational systems first tried to reproduce the role of experts in the learning processes of the learners, having their instructional design based in the classical behavioral methods of punishment (when answer is wrong) and reward (when answer is right). The microcomputer revolution in the late 70s and early 80s helped to revive computer-assisted instruction, where cognitivist approaches were implemented. Learning was about creating internal cognitive conflicts in the learner, to modify their internal cognitive structure resulting in learning. Thanks to the development of more advanced ways of combining multimedia interactive educational systems it was possible to create more complex learning scenarios with a broader range of interactions between the learner and the system. Due to the technology available at that time, educational technology was still thought as to be used in an individual way, because learning was also still understood as an individual process, more cognitive than only behaviorist, but still individual. It is at the end of the 90s when the concept of "Computer-Supported Collaborative Learning" or CSCL appears in the scientific scene (Stahl et al., 2006). It is not coincidence that this corresponds to the first boom of Internet based ICT (email, chat, Web 1.0, first eForums, etc.). It is then, when already existent constructivist learning theories, based on the socio-cultural constructivism lead by Vygotsky (Vygotsky, 1978) and its Zone of Proximal Development (ZPD) enter, to play an important role at the pedagogical scene.

Behaviorism, cognitivism and constructivism describe learning theories that are by no means new in the educational psychology field, they exist before the creation of current emergent technologies. However, it is the massification of ever new emerging ICTs and its influence in how communication processes in the daily life have changed that has recalled socio-constructivist theories and makes it nowadays possible (and desired) to put them into practice.

The recall for social-constructivist theories is not only related to the possibility of putting them into practice, but also related to the relativist epistemology underneath. Unlike behaviorism, where knowledge is something to be acquired from another one who has it, in constructivism knowledge has to be created. Here is where 'social learning' comes into play. However, to say: "knowledge is created and its creation is only possible in a social context," it says nothing about how the learning process can be fostered and supported in the practice. Why is social learning more than just getting students to work together? Why is the learning activity so important in order to reach learning goals? There are two general ways of understanding the social construction of knowledge. On the one side, the socio-cognitive constructivism explains that an individual needs the social interaction with the environment or others, in order to generate and resolve socio-cognitive conflicts and this way modify his/her cognitive structure, i.e. learn. From this perspective, although social contact is needed to foster learning, the knowledge creation process remains individual. Sfard (1998) called this the "participation" learning metaphor, where a dialogic process is needed between individuals in order to foster and support knowledge construction. On the other side, socio-cultural constructivism describes learning as a social process of co-creation of knowledge, where the knowledge created is distributed among the ones who participated in its creation, this approach talk about the existents of a 'distributed cognition.' It doesn't belong to one individual and it is represented by so called 'conceptual artifacts,' which are common understandings that allow the group to apply this knowledge and extend it in different situations. This process is called the "knowledge creation" learning metaphor. This process is also called '*trialogic*': since the conceptual artifacts are considered mediation tools of the dialogic process, there exists a third space of conversation where the knowledge is certainly created – the social space of co-creation (Paavola & Hakkarainen, 2004).

In both cases of constructivist approaches, what is needed to produce 'learning' is either generating the context where the individual-cognitive conflicts are created, or designing the appropriated activity where students are able to co-create knowledge. But, in spite of how the learning process is understood, or which learning metaphor is used to describe it, in both cognitive and socio-cultural constructivism, the learner needs to develop social competences or capabilities in order to create knowledge. Hence, even when content is important, the competences to be developed are what defines the most suitable design for the learning activity to be implemented. In this case, segmentation of fields and disciplines that shape the curriculum structure in Higher Education, is one of the main limitations for the appropriate implementation of new pedagogical approaches that allow new professionals to develop the social and knowledge creation competencies needed in the networked knowledge society and produce radical transformation at curriculum development and programs level.

Although the technologies exist for implementing more constructivist approaches, there is a need for changing fundamental structures of Higher Education systems in order to be able to use social learning technologies in an adequate way.

Current Situation Analysis

Universities have for a long time struggled with the use of digital technologies for educational purposes(Hall & Keynes, 2010; Pantò & Comas-Quinn, 2013; Sharples et al., 2012; Stahl, Koschmann, & Suthers, 2006). One of the biggest problems faced is that technological changes are happening faster than the reaction capacity of the educational institutions. The trends of technological development with potential educational uses are changing faster than the institutions' capacity to make decisions regarding cost investments and technological infrastructure. Institutional administrations do not really know the implications of adopting any given technology besides its economic implications. It is out of their scope to analyze pedagogical models and their relation to the institutional business model or goals. Hence a new trend is set before the institution had time to define which would be the most suitable technology for their institutional goals and strategies (Arassham, 2013, para. 2).

Unfortunately, most Higher Education institutions are trying to define their future business models in terms of what technology they will adopt. It has become more a marketing issue than a question of enhancing learning (Collins, 2002, pp. 181-202). Introduction of emerging technologies in Higher Education has broader implications than just selecting the kind of technology to be used. In first place, institutions have to make decisions on their role in the societal scene and define educational models accordingly.

One clear example is the complex decision making process on the arising trend of Massive Open Online Courses (MOOC). This could mean opening up distance learning units. This might be a way to approach new target groups. The idea seems to be simple: the content as well as the didactics are already developed, thus the university has to adapt it to these new technologies. Nonetheless, what that exactly means for the institution is to re-think their educational model, to make decisions on the possibility of offering distance learning besides their regular practice (which differs from the blended learning model). Not all organizations have the enormous structure that MIT has regarding availability of technology and human resources to support the production and distribution of MOOCs. Educational organizations have to make the decisions on where and how they invest their resources (economic, infrastructural and human resources) before defining if they will ride the MOOCs wave and, if so, how they will do it.

It is evident that massification of education challenges the education system in terms of accommodating alternative study needs and providing more flexible teaching modes, such as online learning activities, individualization of education, self-study activities and so forth. It is also clear that MOOCs seem to be a good alternative to face this challenge, but as in many other potential solutions, the implementation of MOOCs is going beyond the acquisition of technical infrastructure to produce and/or host massive online courses, it also has strong implications on the education model adopted by the institution, which of course has implications for curriculum development and teaching. The study Open Education 2030 – Part III Higher Education (2013), looks at open education as a way of to overcome the weaknesses of Higher Education today, and maintain its relevance in society, economics and science. The study points out that open education is, at the moment, to be considered a strategic development of modern Higher Education organizations and suggests an inclusion of open education practices as part of a strategic transformation and not the complete transformation of Higher Education institutions into open education ones. Nevertheless, open education has challenges of its own, for example how to incorporate always-emergent ICTs in their daily practice or how to deliver certifications in the online world (a problem related to online assessment).

Over the last few years, we can also see an rapid increase in the use of social computing applications for blogging, podcasting, collaborative content (e.g., Wikipedia), social networking (e.g. MySpace, Facebook), multimedia sharing (e.g., Flickr, YouTube), social tagging (e.g., Deli.cio.us) and social gaming (e.g., Second Life) among Internet users. Use of online tools and digital media is considered one of the possible opportunities for renovating education and training as well as for contributing to re-skilling and continuing professional development. Social computing applications (Web 2.0, Social Web) have a profound effect on behavior, particularly that of young people whose medium and métier it is. They inhabit it with ease and it has led them to a strong sense of communities of interest linked in their own Web spaces, and to a disposition to share and participate. The challenge for educational institutions is to locate relevant communities of interest since many of these communities of interest will operate across national borders (Higher Education in a Web 2.0 World, 2009, pp. 9-10).

There are many more projects trying to integrate Web 2.0 applications into the overall Higher Education institutional architecture. However, most of them are still at the pilot stage, which makes it difficult, at this point in time, to assess factors for failure and success. Drawing on the analysis of several UK universities' experiences with Web 2.0 applications, Franklin and van Harmelen (2007, pp. 5-6) point out that universities have to address a wide variety of issues in integrating Web 2.0 tools.

Several studies conducted in research project learning 2.0 (2008-2009) by the Institute for Prospective Technological Studies (IPTS) suggest that the high take-up of social media applications outside of formal educational settings provides new opportunities for innovating and modernizing Education and Training institutions and prepare learners for the 21st century. The study "Learning 2.0: The Impact of Web 2.0 Innovations on Education and Training in Europe" by Redecker and colleagues (2009, p. 49) investigates the ways in which social media are and can be used in formal educational settings and illustrates that social media can be, and are, used by Education and Training institutions to:

- Facilitate access by current and prospective students to information, making institutional processes more transparent and facilitating the distribution of educational material.
- Integrate learning into a wider community, reaching out to virtually meet people from other age-groups and socio-cultural backgrounds, linking to experts, researchers or practitioners in a certain field of study and thus opening up alternative channels for gaining knowledge and enhancing skills.
- Support the exchange of knowledge and material and facilitate community building and collaboration among learners and teachers.
- Increase academic achievement with the help of motivating, personalized and engaging learning tools and environments.
- Implement pedagogical strategies intended to support, facilitate, enhance and improve learning processes.

The second study, again by Redecker and colleagues (2010), relates learning to informal (online) learning networks and communities, concluding that social media applications provide easy, fast and efficient ways to access a great diversity of information and situated knowledge. Research on informal learning activities in online networks and communities further suggests that informal Learning 2.0 strategies facilitate the development of key competences for the 21st century.

While the evidence collected in both studies confirms that social media applications have not yet been exploited widely for learning purposes, the research identifies a substantial number of Learning 2.0 opportunities outside and inside formal Education and Training institutions, indicating that Learning 2.0 approaches facilitate the acquisition of key competences and foster technological, pedagogical and organizational innovation. Both IPTS research studies point to the fact that social media can lead to innovations in four different dimensions that have been labeled as the four C's of Learning 2.0 in IPTS research (Redecker et al., 2010, p. 8):

- **Content:** Supports learning and professional development in a lifelong learning continuum; contributes to equity and inclusion and puts pressure on Education and Training institutions to improve the quality and availability of their learning material.
- **Creation:** Digital content themselves and publish it online, giving rise to a huge resource of user-generated content from which learners and teachers can mutually benefit, also encouraging more active and pro-active approaches to learning.
- **Connecting:** Learners with one another, and to experts and teachers, allowing them to tap into the tacit knowledge of their peers and have access to highly specific and targeted knowledge in a given field of interest.
- **Collaboration:** Between learners and teachers on a given project or a joint topic of interest, pooling resources and gathering the expertise and potential of a group of people committed to a common objective.

Nowadays, with ICT being used in learning, classrooms are converted into "virtual" social spaces for learning, where students socialize when experimenting, reading, reflecting, discussing, creating and peer reviewing. Moreover, teaching spaces are becoming learning spaces and use of ICT in courses has become more natural. In practice both "distance" students and campus students are in the same courses. In the authors' opinion there is no suitable definition of the current process that is happening in Higher Education today. "Blended learning" is one of the few expressions that can be used to describe the current process in Higher Education, allowing new teacher-created, bottom-up interpretations, using both the online environment and the physical surroundings

(Sharpe, Benfield, & Francis, 2006, pp. 18-21). Most University courses today are a mix of "face-to-face" and online learning, focusing on online distribution of content and teaching in classrooms as a kind of "half-distance" education.

Even when technology is available, as for example in online courses, social networks analysis for learning analytics, or diversity of social media applications, there are still open questions about how to use it in an efficient and effective way. There is even the question of "what does successful deployment of technology mean when talking about teaching and learning processes in the knowledge society?" We try to answer these questions below.

Factors for a Successful Deployment of Technology in Higher Education

Digital technologies available to education have already expanded dramatically in recent years, but it takes more than technological infrastructure to transform a profession. Teaching staff of Higher Education organizations are trying to understand their new working context. On the one hand, they have to align their practice with institutional requirements like implementing competence-based curricula and using pre-defined institutional learning environments and technologies. On the other hand, they are trying to understand what teaching and learning in the knowledge society means, where students have free access to the information that they are supposed to deliver. Moreover, their knowledge can be put into question by any student on the basis a different perspective found in an expert online community. As a member of Higher Education teaching staff, the question should not be "how should I use the institutional technology?" or "what kind of technology should I look for?", but "what is my role in the learning process?" or better "what does teaching in the knowledge revolution mean?"

The educational researcher Laurillard (2012) in her book "Teaching as a design science," redefines teaching in Higher Education as a science. Laurillard recalls the times when teaching was considered an art, a product of pure inspiration. However, as happened with science, technology has expanded the limits of pedagogy, offering opportunities for implementing alternative learning approaches based on constructivist learning theories. These theories are indeed far from new. Vygotsky already introduced in the 1930s the idea of socio-cultural constructivism, but the possibility of putting it into practice has opened new research questions related to learning processes as well as individual and collective knowledge construction.

Historically, Higher Education teaching staff would deliver content and evaluate how much of this content was caught by students. Therefore, the first approach to the use of digital technologies was oriented to finding different ways of delivering content and evaluating its reception, in a more efficient, effective or even just more enjoyable way (from slides presentations to multiple choice Web-based tests). As Laurillard (2012, p. 2) remarked:

Education could easily be sidetracked into the inappropriate uses of technology if we are not clear what we want from it.

The author describes very well what the current problem that teachers face is, they simply do not know what they should expect from technology. Hence, they have to develop a vision of what they want from it. Furthermore, if we consider the rapid evolution of technologies, they should be able to make strategic decisions on what pedagogical models they will go for, and which kind of technologies will be the most suitable for it. This capability could also be called "foresight thinking."

While educational researchers will better understand what teaching in the knowledge society means, teachers could use those findings and their foresight thinking to imagine new technologies and pedagogical models. Scenario building seems to have a high potential to allow teaching staff also to make better choices about the combination of digital technologies and pedagogical models.

But teachers are not unattached to the organization, and they must be in line with its strategic plan. At the same time, organizations are not able to go forward without considering the teachers' ideas. This needs a good combination of top-down and button-up strategies, in order to better master the future of Higher Education organizations (Morrison, 1997). Therefore participatory methods are necessary in the case of Higher Education institutions, including not only experts but also teaching staff and technicians of the organization. The ultimate goal of the foresight process, besides supporting the strategy development process, would be bringing about a foresight organizational culture (Giaoutzi & Sapio, 2013).

FUTURE TRENDS

A shift in the conception of education has already begun to occur: from being largely governed by the intuitions of individual practitioners to a technology-enabled science of individualized learning. "If this transition signals the initial stages of the deconstruction and reinvention of the university then we are witnessing the educational equivalent of a Copernican revolution: a paradigm change from the previous millennium's orthodoxy of place-centric instruction toward a scientifically grounded network of technology-enabled learning" (Open Education 2030 – Part III Higher Education, 2013, pp. 27-31). In its 2011 Joint Research Centre Report, "The Future of Learning: Preparing for Change" the European Commission endorses a model "shaped by the ubiquity of Information and Communication Technologies (ICT)" as its "central learning paradigm" (Redecker et al., 2011). It predicts that embedding assessment "in the learning process and pedagogy will rely increasingly on interaction, including the interaction with rich technological environments, which will be responsive to learners' progress and needs" (Redecker et al., 2011b).

Using technology in ways that individualize learning will not only serve the educational needs of traditional school-age populations, but the lifelong and life-wide needs of adults as well as they seek flexible options for upgrading and expanding their knowledge, skills, and employment credentials.

"Life-long learning and "distance education" had been the University "project idea," driven by technology or political discourses, and its use of ICT focused as "transportation of education" to a broader range of students. Distance learning made some motivated students happy to finally access education, but other students ended up lonely and lost with half-completed courses, ensuring they would never try again. Teaching on campus went on like before, but with shrinking resources and with ICT as an "add-on" for rationalizing tedious functions in traditional courses. (Jahnke & Norberg, 2013, pp. 129-134)

People with older educational conceptions, meaning that relevant information should to be memorized, had almost all drowned in information already, but the associated teaching methods were still there, with the teaching classroom as the natural home. This model failed to succeed since Higher Education institutions did not come through these challenges.

With the rise of Open Educational Resources (OER) movement and MOOCs new possibilities for life–long learning outside of universities, self-directed and in communities, are produced. The new usage of the education material proposed by the Open Education model and the new associated facilities questions the traditional model of knowledge delivery and in particular the usual flow of material produced by the experts (from the academia or the practitioners) and delivered to the users (students or participants). This raises issues of quality but also changes the current landscape and relations *in* teaching and learning as new actors now appear within the science. The Open Education movement breaks down traditional barriers, which have favored the consolidation of

Table 1. Comparison of "final 12" topics across three NMC horizon research projects (technology outlook for community, technical, and junior colleges 2013-2018, 2013, p. 1)

Time-to-Adoption Horizon	NMC Horizon Report 2013 Higher Education Edition	Technology Outlook for Community, Technical, and Junior Colleges 2013-2018	Technology Outlook for STEM+ Education 2012-2017
One Year or Less	Flipped Classroom Massive Open Online Courses Mobile Apps Tablet Computing	BYOD Flipped Classroom Online Learning Social Media	Cloud computing Collaborative Environments Mobile Apps Social Networking
Two to Three Years	Augmented Reality Games and Gamification The Internet of Things Learning Analytics	Badges Games and Gamification Learning Analytics Next-Generation LMS	Augmented Reality Learning Analytics Massive Open Online Courses Personal Learning Environments
Four to Five Years	3D Printing Flexible Displays Next-Generation Batteries Wearable Technology	The Internet of Things Natural User Interfaces Virtual Assistants Virtual and Remote Laboratories	Collective Intelligence The Internet of Things Natural User Interfaces Wearable Technology

the closed education system, based on top-down provision and built around teacher-centered and classroom-based concepts of learning. The future of life-long learning will not be about MOOCs as they are today. But as MOOCs already show, new dimensions of flexibility and non-linearity are already within reach today.

More and more parts of what we today call "tacit knowledge" are being made explicit in metadata, and have to be shared with others. This means the discipline so essential to learning will be pervasive in all our activities. The authors of this paper argue that the learning activities we will do in the future will be self-explaining, like most software today which has become so user-friendly that even complex image enhancement can be done on a smartphone by virtually anyone taking a photo. This requires immersive learning approaches.

For instance, many people already use social media as informal learning settings or have created trusted networks of professionals using the Internet and other social tools to communicate, collaborate and share resources, experiences, knowledge and ideas. People can also use various online tools and their own devices (ranging from pen and paper to cameras and smartphones, iPads, etc.) to address their own learning and performance problems - particularly where access to formal education and public social sites has been blocked. As Floridi (2007) argues, we are the last generation to make a clear difference between online and offline worlds.

The New Media Consortium (NMC) Horizon Project, as the centerpiece of the NMC Emerging Technologies Initiative, charts the landscape of emerging technologies for teaching, learning, research, creative inquiry, and information management. The 2013 NMC Horizon Report Technology Outlook for Community, Technical, and Junior Colleges 2013-2018 (2013) identified the emerging technology trends and key drivers of technology adoption for the period of 2013 through 2018. When looking at Comparison of "Final 12" Topics Across Three NMC Horizon Research Projects (Table 1), we can see that 12 "technologies to watch" overlap in interesting ways among Higher Education, Community, Technical and Junior Colleges and STEM[2] Education.

Mobile learning, in some form, is a trend that will span Higher Education across much of the world within the next year. Researchers in three Advisory Boards are in consensus about learning analytics being positioned two to three years away from widespread adoption. However, the Internet of Things is in the far-term, except for the Higher Education group where this technology is more imminent and is predicted for adoption within two to three years. Current concrete examples of the Internet of Things are mainly taking place in research departments at four-year universities. Further we see that games and gamification did not have clear implications for teaching and learning in the STEM group. Online learning, whether in the form of MOOCs or other opportunities, is positioned on the near-term horizon. Also, there is a clear and mounting emphasis on online learning and more pervasive access to learning opportunities at two-year institutions.

A number of technologies distinguished the viewpoints expressed by the 2013 Horizon: BYOD, social media, badges, next-generation LMS, virtual assistants, and virtual and remote online laboratories, although mostly considered by other recent panels, were seen as likely developments for two-year institutions over the next five years. As online learning gains more traction, Higher Educational institutions will have to find ways to engage learning analytics in order to recognize student accomplishments and skill acquisition.

Meanwhile, virtual and remote laboratories are taking the pressure off of colleges to purchase and maintain expensive, high quality lab equipment, and allowing learners to conduct experiments with greater flexibility. We can say that a key trend is ubiquitous learning allowing learners to have the freedom to work and study from any location and on any device they choose. With the rise of mobile learning and social computing applications, educators will need to develop educational models that make learning experiences more personal.

For a long time, Universities used technology to record, broadcast, and recreate classroom practices and structures in virtual learning environments (VLE), streamlining them. But in future, the traditional teaching space may not be the central metaphor for education, and not meaningful to augment with technology. What is the place for future "open" Higher Education if we have to call it something? It won't be the "teaching place" any longer, nor the "classroom as learning place" (that was long ago), not only a "student collaboration place," not really all in the "cloud" but probably there will be a sort of "ICT-supported social information sphere" between teachers and learners, always using places as tools as well as books, OER, and social computing applications as tools.

CONCLUSION

Education in the 20th century was mainly oriented towards socialization as it is the "universal" gate to citizenship and social inclusion. While socialization dominated, individualization and professionalization were also important in a steadily growing economy. Nowadays education policy might be requested in the short-run to turn to professionalization and "employability" as its primary short-term goal. In the second decade of the 21st century, schools and education policy-making are trying to enhance their means to meet this challenge, by focusing somehow more on the autonomy of the learner and ownership of the learning process, preparing pupils to become autonomous, creative and critical learners (and thus citizens) rather than good re-producers of knowledge. Self-expression of the learners, in view of encouraging autonomy and creativity, is to be stimulated in classrooms; with multi-cultural integration representing the big challenge on the socialization side.

The knowledge society requires education to raise autonomous (lifelong) learners and critical citizens rather than recipients of content. It pushes towards more learner-centered processes - able to support individual differences and autonomy in learning. This includes active learning strategies, challenge and problem-based learning and collaborative learning experiences.

A university curriculum for the future should emphasize differentiation, flexibility and quality, it should provide students with the capacity for lifelong learning which will become more and more important in the competitive knowledge society of the future, it should develop key skills like critical thinking as well as specialized knowledge and it should combine theory and practice.

Education is rapidly approaching the time when educators of limited vision will be weeded out and instructors dedicated to life-long learning and educational advancement are left to design future curricula. In order to impact students in an effective manner, strategies must be developed which coincide with real-time and relevant information systems. Life-long education is the key for future successful educational delivery. The future is steeped in virtual pedagogy and educators must be able to integrate technology with curricular design in order to be successful contributors to the future of education. Addressing Web-based curricula is quickly becoming the new trend in educational mainstream thinking. “There is rapidly becoming a calling for educators who can facilitate online forums, navigate the Web for application, design and implement virtual curriculum, and come away with successful outcomes” (Eberwein, 2013, p. 5).

As mentioned in the Open education 2030 – Part III Higher Education (2013) report “Higher education may seem to be undergoing disruptive change, but is not yet undergoing radical innovation, at least not at scale” (p. 5). The analysis of emergent trends or scenario building seems to not have been exploited sufficiently for supporting organizational strategic development in Higher Education.

Future careers will require new levels of education compared with the past. That future education must enable individuals to discover what they need to know rather than just having static knowledge. Society will need college graduates with meta-cognitive skills, agility and adaptability to changing society needs.

If this is the goal of education, colleges and universities must re-examine how that goal is achieved. In current educational technology training for university teachers, theory is separated from practice, curriculum lacks a certain pertinence, means of evaluation are few and other such problems are prevalent. There are so many directions, disciplines, methodologies, and interpretations, the implications are staggering. One thing is for certain though: “The best instruction digitally and the best curriculum digitally can turn any resource-poor learning environment into a classroom of the future” (Rivero, 2006, p. 56). The integration of technology pedagogically is the true future of curricula and all prospects associated with educational direction. Educators are challenged with the necessity to keep pace or perish. There is actuality no choice in the direction for future educational doctrine, in the authors’ opinion. Teachers need to become proactive participants referencing their continued life-long education. There is no room for complacency, as the educational world now developing in cyberspace becomes the main delivery system for our very near future. So educational planners need to heed the obvious implications presented, and actively entertain a new era for pedagogical presentation.

KEY TERMS AND DEFINITIONS

Curriculum Development: Curriculum development is the process of designing and creating structures for instruction in formal education. It is based on pedagogical approaches and learning goals. It covers a broad spectrum from structuring a career program to designing classroom lesson activities.

Educational Technology: Educational technology is the area of study that focuses on effective processes to facilitate learning using technologies and understanding the impacts of technology on enhancing teaching practices and learning processes. The idea behind this term is that every kind of technology can be used for teachers or learners for educational purposes, and its effects on the learning process depend on the instructional design in which the technology is implemented.

E-Learning 2.0: E-learning 2.0 refers to a model of e-learning developed with the emergence of Social media applications and the influence of new practices in e-learning. E-learning 2.0 assumes that the traditional model of e-learning where content is produced by courseware authors, organized and structured into online courses, and consumed by students, is transformed. Increased use of social media applications has resulted in new practices in e-learning and social networks are used to foster online learning communities around learning subjects. From an e-learning 2.0 perspective knowledge is socially constructed so that content is used rather than read and is more likely to be produced by students than courseware authors.

Epistemology of Learning: Epistemology is a branch of philosophy that investigates the origin, nature, methods, and limits of human knowledge. Epistemology of learning is the understanding of what is knowledge acquisition, how knowledge is created and what shapes the understanding of the learning process.

Knowledge Revolution: Knowledge revolution refers to paradigmatic, societal change that affects most spheres of a society. The knowledge revolution is considered to follow the industrial revolution by changing the emphasis from labor, capital and resources towards knowledge as the basis of innovation, and innovation as the main driver of modern society.

MOOC: Massive Open Online Course provides open access without charge to an online course of study over the Web to a very large number of people. MOOCs provide learning and assessment materials, videos, readings and interactive features for users like forums that help build a community for the students and professors.

Online Learning (E-Learning): Online learning (e-learning) is the Web-based training model which uses Learning Management Systems (LMS) to create, design, and manage online courses, as well as supporting content delivery, user registration, monitoring, and certification. The focus of the system is on content delivery to learners, with less consideration for the learning process. There is not much scope for communication and collaboration. Even though tools for collaboration are available in LMS, their application in learning is negligible.

Open Education: Open education describes institutional policy and learning philosophy that eliminates barriers and brings opportunities to participation and recognition of learning resources traditionally offered through formal education systems. With the development of Web technologies, learning resources become accessible online through formal and informal open education programs.

Social Media Applications: The term "social media application" refers to the range of Web applications based on Web 2.0 technologies that enable users to socially interact with one another online. These applications allow users to gather, represent, process, use, and disseminate information online in diverse ways and through a variety of media, producing dynamic virtual spaces - "online communities" - which share information on the Web. Some examples of social media sites and applications include Facebook, YouTube, Del.icio.us, Twitter, Digg, blogs and other sites that have content based on user participation.

Chapter 38
Blending in the Humanities:
Course Model and Assessment Results

Astrid Klocke
Northern Arizona University, USA

Danielle Hedegard
Northern Arizona University, USA

ABSTRACT

Does technology de-place opportunities for meaningful engagement? Is the reduction of face-to-face time in a blended course a loss to students? And if so, what students are most affected by this shift? Can a blended course only work in disciplines that rely on teaching "facts" or can the recent emergence of digital humanities serve as a framework and provide disciplinary-specific insights for the use of teaching technology in the humanities? This chapter explores the use of learning technology and blended design in an introductory humanities course. Further, the chapter presents a blended course model, assessment data, and ideas for contextual reflection about how change in higher education paradigms is affecting the humanities in order to address them in a cooperative, non-disruptive way. Finally, the unique context, assumptions, and causes for resistance to change in the humanities with regard to technology and blended pedagogy are discussed. This chapter is intended to help readers anticipate and address particular disciplinary perceptions of blended learning.

INTRODUCTION

Why blend in the humanities? This chapter will explore the use of learning technology and blended design in an introductory cinema studies course offered in the humanities. Often it is asserted that technology does not allow for types of learning contexts deemed central to humanities such as social and communal interaction, spontaneity, and embodied presence. Does technology de-place opportunities for meaningful engagement? Is the reduction of face-to-face time in a blended course a loss to students? And if so, which students are most affected by this shift? Can a blended course only work in disciplines that rely on teaching "facts" or can the recent emergence of digital humanities serve as a framework and provide disciplinary-specific insights for the use of teaching technology in the humanities? Surveys of students, faculty and administrators have shown distinct perceptions of

DOI: 10.4018/978-1-4666-8246-7.ch038

the effectiveness of blended courses, in contrast to fully online courses (ECAR, 2013; Allen, Seaman, Gerrett, 2007).

This chapter will present a blended course model, assessment data, and ideas for contextual reflection about how change in higher education paradigms is affecting the humanities. The chapter seeks to address these issues in a cooperative, non-disruptive fashion. It will also discuss the unique context, assumptions, and causes for resistance to change in the humanities with regard to technology and blended pedagogy. It will help readers anticipate and address particular disciplinary perceptions of blended learning.

The pace of change in higher education is increasing. Competition to the traditional undergraduate residential model comes from more than for-profit universities; it comes from MOOCs, competency-based/personalized learning programs, and from online degree programs, some largely built by corporate partners of universities. This chapter will not discuss the merits or even pace of this change. Rather, the guiding questions are: How will the humanities be affected by the inevitable changes? How will the call for professionalization and the pressures to prepare students for specific careers with specific skills be answered? How can the core values of the humanities for all students' education be preserved while ongoing changes seemingly privilege "fact-based" knowledge? Furthermore, how can humanities scholars and teachers be in charge of the changes that affect the field? How can we answer the call to be more efficient while preserving the quality of instruction and student learning outcomes? The basic premise of this chapter is to enable colleagues in higher education to take charge of change rather than resign to passive resistance. Our blended course design model permits preservation of the essential core values of teaching the humanities for student success with institutional demands for efficiency in mind through the use of teaching technology.

COURSE MODEL: CINE 101, INTRODUCTION TO CINEMA, AND VISUAL CULTURE

At Northern Arizona University in 2012, a course in Cinema Studies was redesigned as a blended course in the first round of the President's Technology Initiative. The course has since served as a pilot and model across all disciplines, as faculty redesign more courses in the second and third rounds of the initiative. Total enrollment in the multi-section course (and thus the number of class sections offered) since the blended redesign was implemented has increased by over 1000%, from 31 to 347 in just two years, and helped bolster a small humanities program (Cinema Studies).

The course has increased efficiency in delivery—one of the main institutional goals of the President's Technology Initiative—through its hybrid schedule: it meets once a week, instead of twice, for 75 minutes of face-to-face time. The other half of the course is conducted online. The utilization of classroom space has thus increased by 100%, as the course can share a 150-minute time slot in the same classroom among pairs of its sections. The course has also been able to more than double enrollment capacity in each section (from 30 to 70), increasing efficiency for the university and the department. (However, it has not reached its goal of conserving faculty effort, as managing the higher number of students in each section has more than outweighed the in-class time saved for the instructor.)

The course was designed for two programs, and its design principles were aligned with their respective student learning outcomes: 1. The Liberal Studies program at Northern Arizona University and 2. The new interdisciplinary minor in Cinema Studies, housed in the Department of Comparative Cultural Studies.

1. Liberal Studies: Design for Student Success

The course bears Liberal Studies credit at Northern Arizona University, within the "Aesthetic and Humanistic Inquiry" (AHI) block, with a focus on the skill of effective writing. Courses in this block involve students in the study of the human condition through philosophical inquiry and in analysis of the various forms of creative expression. The course specifically focuses on film and the various forms of visual culture. Students develop an understanding of the relationship between the historical, political, social, and aesthetic context and the human creative expression of visual culture and cinema. The course makes use of major conceptual frameworks and concepts such as the theories of representation and agency. It explores the diversity of cinematic expressions informed by national, global, ethnic, and gender identities. Students also develop their capacities for analysis and ethical reasoning through a variety of means, including close reading of film texts and comparative explorations of the materials of visual culture. The course incorporates key design principles from the First Year Learning Initiative (FYLI) at Northern Arizona University, an innovative program that is geared toward socializing freshmen for success and excellence. (The course gained official FYLI certification during its initial redesign phase in summer 2012.)

The course explicitly addresses critical practices such as time management and study skills. The syllabus includes a section on the types of meetings to expect in this blended class. It also urges students not to fall behind. Class assignments are scheduled on a regular and thus predictable basis, due on the same day of the week, at the same time. This encourages routine and easier time management. There are no pop quizzes, additional assignments, or modifications to the assignments listed on the syllabus so students are not blindsided with a change in expectations or deadlines. (Revisions to the class assignments are made, if necessary, between semesters.) All class materials are easily accessible via BlackBoard Learn, including all films assigned for this class and additional ones mentioned in the textbook. Students can work at their own pace and complete tasks and assignments when it is convenient for them.

The course offers a realistic understanding of the time and effort that is needed to succeed. Students respond to a question about their expectation of time involved in taking this class in the initial survey. The instructor then directly addresses misconceptions during the first week of the semester. The learning activities and assignments are structured in a way that emphasizes their connection and scaffolding. Students have a clear understanding of progression. In addition, the headers on each BlackBoard Learn chapter page tell students what to expect in a chapter, how it relates to the last one, and what parts of it will be used later in the course, i.e. what will be on the exams and what will come in useful for the essay. Furthermore, all these future assignments are already visible at the beginning of the semester so that students can build realistic expectations about the effort involved in succeeding.

The course explains how to access class materials and other academic support programs. All class materials, except for the actual textbook, are made available to students in the class shell on BlackBoard Learn. This includes all supplemental readings, all films assigned for this class, all extra credit assignments, and optional online resources. Students also know from day one how to work with the teaching assistants. A paragraph is included on the syllabus in which it states that meetings with the teaching assistants have the status of "class meetings," i.e. they will be mandatory and should be expected on a regular basis (sometimes during scheduled class time, which the blended format allows for). This tactic focuses students' attention on the main skill this Liberal Studies course is supposed to build: writing. Instructors identify groups and individual students to work closely with the teaching assistants on editing and revising all their written assignments throughout the semester, not just the final essay.

The course work is challenging and rigorous: Within the first two weeks of class, students are required to invest considerable effort. Students are assigned to fixed groups for the semester and work with their peers on the experiential part of the course. In order to reinforce the importance of this group set-up and to engage students with their respective group's dynamics from the very beginning, the first group assignment has been designed to be both fun and connected to the interest in movies that most students bring to this class. As a group, they go to a commercial movie screening and report and reflect on the marketing strategies they were exposed to before they saw the movie. A short written report has to be handed in by all members of the group by the end of week 2. This assignment is low-stakes yet ensures that students engage from day one with the class material and, most importantly, with their peers. The assignment also requires basic writing, one of the focus areas of the class. During the same time, weeks 1 and 2, students also read the first textbook chapter and complete a basic reading comprehension quiz and a short written assignment. Both of these assignments are also low-stakes and students have the option of dropping the quiz grade should it prove to be the lowest of the semester.

Challenging and rigorous course work also maximizes student time on task. Readings and viewings are guided by and immediately reflected in the quizzes and assignments. All assignments are "open book." Students know what they have to do with the material before they start engaging with it. Similarly, students connect with a local film event/series/festival with the goal to develop a marketing strategy for an on-campus audience. This clear goal is set from the beginning and the outcome is later demonstrated in an oral group presentation. Students know the "what," the "where," and the "why"—before they start the project.

The course develops the experiences that students need to succeed in more complex tasks, assignments, or analyses. Within each class module, assignments are scaffolded: from reading comprehension quizzes to short written assignments to exams. The modules build on each other and culminate in module 4, which guides students toward putting the individual pieces together for a complex film analysis essay—the disciplinary signature assignment for a cinema studies class. In the experiential part of the class, the students at first describe their own response to movie advertising. In the next step they analyze the marketing needs of a local film event. And in the final step, they themselves create a targeted marketing strategy. They execute this marketing strategy and report on its effectiveness in their final group presentations during the last two weeks of the semester.

The class is designed to actively engage students in multiple ways: with each other, with the material, and with the instructor. In addition to the group work in the experiential part students also engage with each other during the peer editing phases of the essay in module 4. Students engage with the content material in a direct way, by scheduling assignments immediately following the readings and viewings. There is no lag time between completing a reading, for example, and applying the new knowledge to a written assignment. The blended format allows the instructor to meet with students individually and in small groups on a frequent basis, rather than solely in full-frontal discussions in the lecture hall or in limited office hours. Toward the end of each module, as students progress from basic comprehension to more complex, higher learning activities, the instructor is able to provide more guidance and feedback than in a regular lecture class.

The course requires attendance and/or participation to give students the best chance to succeed and to set up the expectations for success. In line with the university attendance policy, attendance in this class is mandatory and counts 12% of the final grade. Students are informed of this policy in the syllabus and also during class on the first day. They are also reminded of this policy via the Grade Performance Status (GPS) tracking system used at Northern Arizona University if they miss meetings. TAs report to the instructor about students who do not show up to scheduled meetings. In addition, attendance is taken the old-fashioned way in the face-to-face meetings and in meetings with the instructor. Furthermore, students have to "attend" virtually in a very structured fashion, and if they do not complete quizzes or chapter assignments the instructor intervenes immediately and contacts students about missed online sessions.

The course uses lectures strategically, if at all. Full-frontal lectures are used for part of the first class meeting: to give an introduction to the class format and content and to go over the class rules on the syllabus. After that, there are few traditional face-to-face lectures for the entire class. Content is processed online and students engage with the class material via tasks other than listening, such as group discussions, collaborative work, with in-class follow-up presentations.

To set clear expectations the course uses rubrics extensively and exclusively for the chapter assignments, for exams, and for the film analysis essay. These rubrics are presented on the syllabus and explained on the first day and again later in the semester, as students prepare for the exams and essay. The rubrics are used within BlackBoard Learn and linked to the assignments. They are used for online feedback.

The course offers early and formative feedback and frequent low stakes assessments. The chapter quizzes and assignments begin in week 1, build on each other, and are only worth 2% of the final grade for the class. Each module's chapter quizzes and assignments then lead to a more complex module assignment, the exams. Students thus receive not just regular but scaffolded, formative feedback, as assignments get more complex. Students also receive early feedback for their group work. The first project is due at the end of week 2. During weeks 3-10 the instructor checks in frequently with each group to see how they are progressing on the marketing project. The groups then present their final reports and receive peer feedback during the last third of the semester.

The course addresses the current interests and conceptions that shape how students approach the discipline. Students take a survey at the beginning of class that asks them to reflect on what interests and conceptions they bring to the class. They are asked a similar question about how their ideas have changed on the two midterm surveys. During the introductory lecture, the instructor addresses common ideas students have about the study of film and provides examples of what students can expect to do in this class. For example, most students expect to watch films during class meetings in a film class. We tell them that this passive activity will happen outside of class, online, and that the different types of class meetings are used for more active and especially collaborative types of tasks.

The course takes into account students' diverse cultural backgrounds. All online material has been designed and made accessible following Universal Design standards. All foreign films included in this class have subtitles to aid all students' comprehension. Films have been chosen from a variety of global cultural and language contexts. Peer TAs help students with English language problems on the written assignments.

The course assesses the critical skills and/or knowledge students have when they enter the course. The first group assignment challenges students to put to use the knowledge they have about the movie industry and its marketing. They have to reflect on a process that most of them have been exposed to in an unconscious fashion: advertising for blockbusters. They have the knowledge of what it is but might never have thought about what effect it has on them and their viewing experience through the creation of expectations. The instructors also assess students' level of proficiency in basic writing through this first assessment and guide selected students to use tools available to them through the university-wide MyWriting Lab as deemed necessary.

The course effectively utilizes student learning outside of the classroom. The experiential part takes place outside of the classroom. It is a learning experience in the form of a mini-internship with a local film festival, film series or film event. It counts for 10% of the total grade. Additional encouraged activities include campus film events and Cinema Studies Club. These events vary from semester to semester, as programming changes. The course thus promotes social interactions among students. Students work intensely in assigned groups and also meet with other groups. In addition, they interact with students outside of the class at film events, e.g. students talk to people in the audience, at the receptions, and post-screening discussions. As part of some of the internships, students interview attendees at those events. Students also give presentations in other classes and student clubs on campus about the film festivals and series where they function as interns. They field questions from other students about these events.

The coordination scheme is prescriptive for the whole semester and ensures consistency, alignment, and student success. One experienced faculty member coordinates all sections during a given semester. Each section instructor meets on an ongoing basis with the coordinator to discuss the structure of the class, to ask questions about the assignments or online modules, and also to report student performance to the coordinator. Communication as a team is accomplished for those involved in delivering the course through regular meetings with all instructors and TAs of the individual sections. Consistency in course outcomes or objectives is accomplished by all sections using the same master syllabus and master BlackBoard Learn shell. Individual sections' due dates of assignment vary, but the learning outcomes, modules, chapters, assignments, textbook, and other class projects are the same for each. All sections are taught in a blended format. In the case that individual instructors want to make changes to the course, they keep a log of ideas and thoughts for future semesters. An item that is invisible to students at the top of each chapter's BlackBoard Learn content page serves as a journal for this purpose. Any entries made during the semester are easily extracted from each section and compiled at the time that revisions are made for the next semester. The coordination scheme also allows coordinators to take advantage of meaningful, actionable data about student engagement, achievement, and progress in the course. All section instructors use the university's Grade Performance Status system at the same intervals during the semester (after each course module) so that students receive consistent and regular feedback. Assignments, grading rubrics, and attendance requirements are same for all sections and each instructor collects this data and shares it for reporting and assessment purposes.

2. Design for Disciplinary Conventions in Cinema Studies and Humanities

The course is the sole core, required course of a new interdisciplinary minor in Cinema Studies. It introduces students to the basic elements of formal composition, organizational structures, and historical periods of international filmmaking. The course provides a foundational understanding of discipline-specific terminology and conventions in the study of cinema and visual culture. Students also engage with cinema culture on the Northern Arizona University campus and in the larger Flagstaff community through mini-internships with film festivals and guided immersion in local film culture. The course prepares students for further study of film in Humanities, English, Philosophy, Electronic Media and Film, and Ethnic Studies, to name just the programs with the most popular film courses on campus. The course was also designed according to disciplinary conventions in cinema studies and humanities with regard to its signature assignment: the critical analysis essay, oriented to disciplinary expectations for effective writing in humanities courses. All other, shorter, written assignments prepare students for this signature assignment by focusing on particular elements of film analysis and essay writing.

In the signature assignment, students demonstrate the core learning outcomes of this course: reflection on a film's production and the impact of distribution, promotion, and exhibition on the film experience; application of film-specific technical concepts, such as mise-en-scène, cinematography, editing, lighting, sound, and genre. They also demonstrate the ability to critically evaluate the film's narrative plot, characterization, use of genre conventions, and historical context.

In terms of disciplinary modes of writing, students show that they are able to formulate a thesis that is easily identifiable, plausible, novel, sophisticated, insightful, and clear. Their analysis needs to be exciting, pose new ways of thinking about the material, and their work must avoid simple description or summary of information. Students' use of evidence from the films and readings demonstrates in-depth understanding of ideas and critically evaluates concepts in an analytical, persuasive manner. The structure of their essay is evident (e.g. through strong topic sentences) and appropriate for the thesis. Ideas flow logically. Arguments are identifiable and reasonable. And finally, the essay needs to be written with excellent grammar, sentence structure, and correct use of punctuation and spelling. These expectations correspond to the basic requirements of good writing in the humanities. The rubrics used for grading and assessment in this class elaborate these expectations.

3. Blended Design Principles

The preceding paradigms (liberal studies and humanities) are integrated through the flipped structure of the course content, learning activities, and assignments and guided by the principles of blended design, based on case studies presented in Glazer (2012) and guidelines from Garrison and Vaughan (2009) and with the use of the Blended Learning Toolkit provided by the University of Central Florida.

The course is divided into content modules that correspond to the student learning objectives. All student in-class tasks and online written assignments are scaffolded with the ultimate objective of writing the three-page analysis essay. Each week a different element of essay writing is the outcome of students' work. For example, in week 3, they focus on learning how to give evidence for a thesis. They are guided through the following stages, in accordance with Bloom's (revised) taxonomy of learning:

1. Students acquire basic factual and conceptual knowledge of mise-en-scène through reading an assigned textbook chapter. If needed, they consult with the peer tutor who has taken the class before and helps students with specific reading comprehension problems.
2. They then retrieve and check their memory and understanding by taking an online, open book, low-stakes, multiple-choice quiz that provides immediate feedback. If necessary, they can retake the quiz once.
3. They watch one of the films used as an example in the textbook to illustrate the elements of mise-en-scène: Spike Lee's *Do The Right Thing*.
4. In the online forum, due a few days later (but still before they come to class in person), students interpret and discuss the mise-en-scène of this particular film, applying basic knowledge. The online discussion posts are graded by the teaching assistant, with online rubrics.
5. Then, the next day in the face-to-face class meeting, students work in groups to analyze evidence from the film (again, with a focus on aspects of mise-en-scène) to support a thesis that the instructor has provided for them at the beginning of the face-to-face meeting.

6. At the end of class, the groups organize their findings and present the thesis and their evidence to the whole class for feedback and questions.
7. On the midterm exam, giving evidence for a thesis is one of the skills assessed, with formative feedback.
8. In the analysis essay, students demonstrate their skill of giving evidence for a thesis: they are asked to transfer their knowledge to an analysis and evaluation of another film.
9. They receive more formative feedback, through critiquing each other's essays (peer review) and individual tutoring with the teaching assistant, and revise their essay.
10. They create their final version of the essay and receive summative feedback from the instructor.

The blended and flipped design of the course allows more time for and focus on the higher learning tasks (5 - 10) than a course designed around lectures and discussion. Here, the basic content comprehension and application (1 - 4) is done online and requires relatively little intervention from the instructor. A peer tutor (focus on reading) and teaching assistant (focus on writing) help facilitate and assess at the lower stages. As the level of learning and stakes increases so does the level of face-to-face interaction of the instructors with students.

In summary, technology and the CMS BlackBoard Learn are used as a strategic tool to facilitate student learning. Online class activities take the place of traditional content lectures and ensure students' acquisition of knowledge. Assessment of basic levels of student learning also takes place online. Face-to-face activities (in a whole-class setting) focus on modeling and practice of critical film analysis, analysis of sample essays, student (group) presentations of group projects, and discussion/feedback. Individual or small group meetings take place face-to-face with the following goals: Instructor intervention to ensure student success, student consultations with instructor about writing projects, development of thesis statements for critical essay writing assignment, and discussions and organization of creative group projects, such as making short videos and guest presentations in other classes.

ASSESSMENT

1. Research Design

The course redesign included a rigorous assessment plan. The redesigned course was implemented over three semesters: fall 2012, spring 2013, and fall 2013. After each semester, data were analyzed, feedback was collected from the instructors, and revisions were made to the course. This implementation schedule allowed for a phased growth in class capacities: from 35 to 50 to 70 students on average in each section (with some variation due to classroom availability). As enrollment grew, more sections were offered. As a result, more freshmen and sophomores were able to enroll in the course—since they enroll later and over the summer—while seniors and juniors have early spring enrollment appointments and used to take most available seats in the only offered course section.

Each semester after the redesign, the teaching assistants evaluated the signature essays with the use of standard rubrics, for *assessment* purposes (whereas the instructor evaluated the same essays with the same rubrics in a separate step, for *grading* purposes). This allowed the course designers to standardize evaluation. To control for variation, the course coordinator held a training workshop with all teaching assistants on how to use the rubrics to guarantee consistency. As stated above, this signature assignment represents the culminating task of the course and measures students' ability to write effectively and integrate complex analyses into one assignment. As such it serves as the best indicator of student learning in a writing-focused Liberal Studies class in the humanities.

Data from these redesigned sections were compared to a control group: the pre-redesign section of this class taught in the fall of 2011, where the same signature essay assignment was given and the same assessment rubrics were used. The teaching assistants (of the fall 2012 redesigned course) were asked to re-evaluate all signature essays from the fall 2011 section with the same assessment rubrics, to establish the control group. Though the course had been offered in other past semesters (fall 09, fall 10, spring 12), these sections were not standardized—they used a variety of assignments, no assessment rubrics, and did not require electronic submission of the final papers. No means of comparing these sections with the redesigned course was available.

In addition to this assessment of student learning, official institutional data on course grades and DFW rates, as well as qualitative data from surveys and reflective essays were collected to assess the success of the course redesign. To control for variation in overall instructor grading across sections, each blended section (which varied by instructor and time of day) was compared to the Fall 2011 lecture course separately.

2. Methodology

Basic t-tests for statistical significance of independent samples were run to compare the Fall 2011 section with each blended section on the following outcomes: average course grade excluding those students that received a ‘W’ (withdrawal), average freshman course grade, average junior/senior course grade, and average scores on the signature assignment. Except for the signature assignment, data for the analysis were extracted from the NAU data warehouse Enterprise reporting, and all analyses were run in SPSS software.

3. Findings

Overall enrollment increased exponentially. In the unblended version enrollments had been steady around 35 per section. Since the blended redesign, enrollments have grown to 347 students in fall 2013, in 5 sections of 70+ students each. As more sections were opened, and thus available to freshmen and sophomores, the percentage of lower division students increased.

Overall, as Table 1 shows, scores on the signature assignment remained consistent or improved compared to the fall 2011 control section of the course. In both fall 2012, spring 2013, and fall 2013, scores on the signature assignment improved compared to the fall 2011 group in all sections of instructor #1. For the second course instructor,

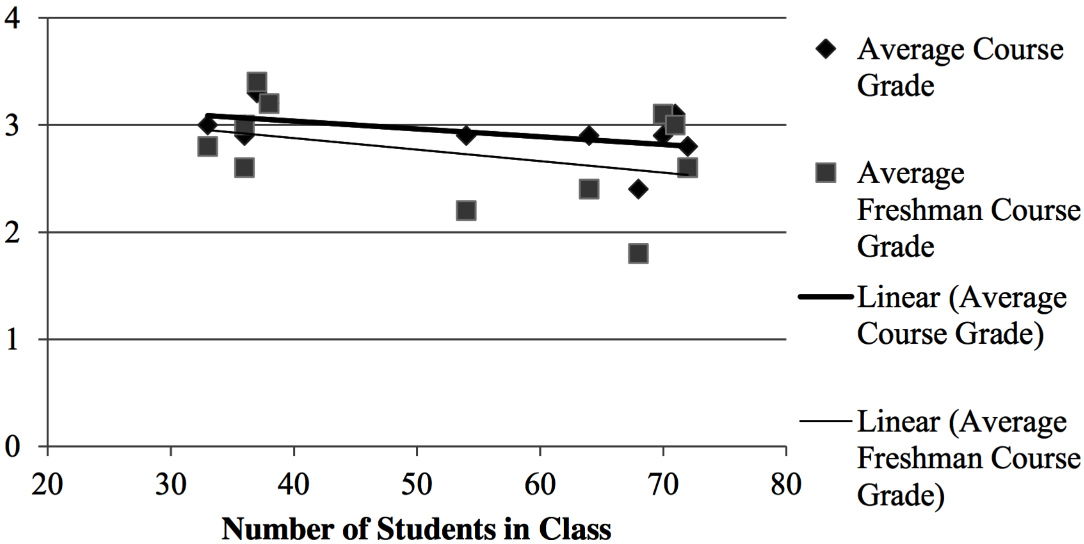
scores remained consistent with the fall 2011 section (taught by instructor #1) in fall 2012 and fall 2013, but declined in spring 2013. In fall 2013, a third instructor was added due to increased enrollment, and scores for this instructor also remained consistent with the fall 2011 section.

This shows that, despite reduced face-to-face classroom time, students are still able to accomplish the primary course learning objectives of demonstrating proficiency in writing critical film essays by producing an original interpretative analysis of a film in its historical context of production. The improved essay scores in instructor #1's sections further demonstrate that careful planning and scaffolding of assignments in blended courses can even improve student learning. This is likely due to increased time for meaningful interaction between faculty and students during f2f class meetings with regard to higher learning tasks such as analysis, evaluation and creation, rather than focusing on lower learning tasks such as content understanding and application.

While signature assignment scores showed improvement or consistence, overall course grades in blended sections revealed greater variation when compared to the fall 2011 control section. As Table 2 shows, average course grades for blended sections of the course, from fall 2012 and spring 2013, were statistically consistent with the fall 2011 lecture section. This was true for all instructors and sections. Average course grades for blended sections in fall 2013 were statistically lower than the fall 2011 lecture section. This was true for all but one section of the course in fall 2013. When all blended sections were considered together, average course grade in blended versions

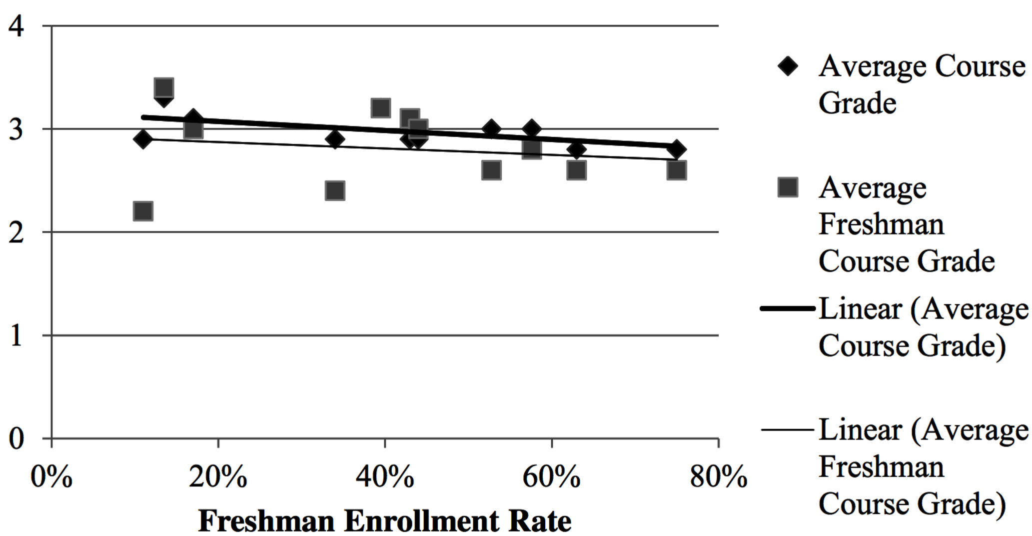
Figure 1. Correlation between class size and average course grade, hybrid sections



of the course were statistically lower than the fall 2011 lecture section. When average course grades for juniors/seniors were considered separately, no statistical difference was found between grades in the fall 2011 lecture and blended sections. Because the fall 2011 control section included only three freshmen, no conclusions can be drawn regarding the effect of the blended format on this student group.

We interpret this decline in average course grades in the fall 2013 sections to the interaction of both large class size and high freshman enrollment. While neither high freshman enrollment nor a large class size alone produces a steep decline in course grades (or assessment of student learning as evidenced by the assessment data), the combination of the two tips overall grades below those of the fall 2011 control section—which

Figure 2. Correlation between freshman enrollment and average course grade, hybrid sections



had neither high freshman enrollment nor high overall enrollment. Figure 1 relates class size to average course grade and average freshman grades. Overall average course grade and freshman average course grade both decline slightly as class size increases. DFW rates show a parallel relationship to class size—rising as class size increases. Figure 2 below relates freshman enrollment rate to average course grade. Again, both overall average course grade and freshman average course grade decline slightly as freshman enrollment increases. DFW rates show a parallel relationship to freshman enrollment—rising as freshman enrollment increases. This suggests that both class size and number of students in the class have a negative effect on grades for students of all class levels.

Factors we could not control for include: 1. Honors sections were taught concurrently with instructor #1's section 1 in fall 2012 and spring 2013 but no longer in fall 2013. Honors students received consistently high grades and had 0% DFW rates. As their number decreased, the overall average grade and DFW rates were affected. 2. Instructor #3 in fall 2013 had not previously taught at the college-level or with Blackboard Learn CMS. The high DFW rate in this section is most likely due to a lack of consistency and technical expertise common of new instructors, despite intensive mentoring by the course coordinator.

One of the design features of the course is learner self-reflection. Three multiple-choice surveys and a reflective essay are systematically built into the course and ask students to express and explain their expectations, preparation, performance, perceptions, and challenges with regard to the blended course. While an in-depth, systematic analysis of the data (1000+ survey responses) and written material (500+ essays) is beyond the scope of this article, some recurring comments speak directly to the blended course design. Students

- Like the flexibility of the blended format for their scheduling of classes, work, and personal time.
- Find the rigor challenging but see value in sticking to set due dates and frequent, low stakes assignments, which "made it feel like a real job".
- Experience frequent, short writing for the first time and see value in it for building up to the longer film analysis essay.
- Have taken online classes before and thus know the CMS well (sophomores and up) or can learn to use it quickly (freshmen).
- Appreciate being able to access class materials online and watch the assigned films multiple times, especially those with subtitles, while having personal access to each other and to the instructor in group and class meetings.
- Do generally not enjoy working in groups but experience the many collaborative tasks in this class as positive; they especially like the online group discussions and group project with the local film festival.
- Realize that preparing for class (online) helps them get more out of class (f2f).

WHY BLEND IN THE HUMANITIES?

Often reservations about the use of technology in (online and blended) humanities classes are voiced in terms of discipline-specific concerns about student learning and preferences. (Restad, 2013, Freeman, 2013) It is feared that students do not like online or blended classes and that offering them will drive students away from our programs. However, a recent large-scale "Study of Undergraduate Students and Information Technology" showed that students prefer blended courses over purely face-to-face or purely online courses (ECAR). Other claims made by opponents of online or blended learning include assertions that only face-to-face education can lead to paradigm-shift thinking and mental changes while online/blended education leads only to accumulation of skills and information. Also, face-to-face teaching is seen as the only way of engaging students socially, responsibly and spontaneously. It is hard to argue with these claims without establishing reliable ways of assessing student learning in all modalities. Yet humanities faculty are often the first to argue that such assessment is impossible and should not even be attempted, while maintaining that they know how and where learning happens.

In addition, how is the blended design of a humanities course justified, in terms of the humanities? First, blended learning is a paradigm shift in that it attempts to empower students and lead to creative projects that are based on solid knowledge of the discipline's core works (of literature, art, music, etc.), methods, disciplinary ways of thinking, and values. It starts with students' needs, objectives, and aspirations and emphasizes their learning. It does not privilege the instructor as the authority on knowledge in the classroom (Bransford, Brown, Cocking, 2000). It rather makes use of the instructor's training and experience for the purpose of selecting and providing content from a variety of sources and applying best practices to content delivery and processing that lead to higher student learning. Second, technology is both a means and a goal in this context. As students learn to use technology to retrieve, process, and create disciplinary content they reflect on the transformative changes brought on by it (Sands, 2010). In the field of Digital Humanities new technological tools and methods are applied to the work in traditional humanities and publically discussed in blogs (Frost Davis, 2013) and the forums of the Humanities, Arts, Sciences, and Technology Alliance and Collaboratory (HASTAC), at the Institute for Advanced Technology in the Humanities (IATH), the Maryland Institute for Technology in the Humanities (MITH), and funded by grants from the National Endowment for the Humanities, Office of Digital Humanities (NEH ODH) and the National Institute for Technology in Liberal Education (NITLE). Students benefit from critical reflection *about* these tools, both for career preparation and discipline-specific understanding (Parry, 2014). Meaningful exchanges of ideas mediated by technology are not inferior to social interaction and presence in the classroom, but different. Technology empowers different students and engages a generation of digital natives by using technology as a tool and to reflect on its values (Prensky, 2001).

Furthermore, blended learning integrates the content of the traditional humanities with the digital literacy needed by humanities graduates to succeed in their chosen professions. For example, one of the basic principles of blended course design is to engage a wide spectrum of students (Picciano, 2009) with technology in an active way (Prince, 2004). In the course described in this chapter, students learn about and reflect on the conditions of film distribution and exhibition in the United States, in module one of the course. They transfer that knowledge onto a group project that grows out of their mini internship with a film festival. They are asked to demonstrate rather than recount their grasp of the conditions of film exhibition and marketing. The goal of this active, collaborative, practical project is in line with the larger learning outcomes of the humanities: to guide students to a creative level of learning—beyond consumption and mere appreciation of cultural products. They also engage with the local community and apply knowledge to actual professional activities. The blended format of the course allows for time to do this internship, and the student projects presented during the last three semesters have all included online components (web pages, Facebook Pages, Twitter, Instagram, Pinterest, Tumblr).

How does the blended design of a humanities course benefit instructors? Technology is seen by many not as supplementing and enriching but as imposed by the administration, as driven by the corporate model of education, and as a way of disempowering tenured faculty "teachers" and ultimately replacing them with mere "mentors" of student learning. One of the goals of the President's Technology Initiative at Northern Arizona University had been to "conserve faculty effort." While well-intentioned in light of recent increases in teaching load (during the budget crisis) and promising to free up time for research and scholarship, this goal was perceived as yet another way to entice faculty to replace themselves—this time in terms of their presence in the classroom. Faculty who did participate in the initiative were scrutinized by colleagues in terms of their more flexible schedule—a perspective rooted in the notion that in-class seat time is more involved than time spent interacting with students online.

However, not only does the initial blended redesign require time for training and implementation/revision but the actual course delivery in a blended format requires as much time grading weekly assignments (despite the TA support), providing frequent formative feedback, and managing group tasks as a traditional lecture class requires for delivery of content and leading a full-class discussion. In addition, the initial learning curve is steep, as instructors have to learn to use the CMS effectively and rethink their role in the flipped classroom. Both require mentoring and support from the course coordinator on an ongoing basis. The increased flexibility, just like for students, is seen as an advantage by those involved in the teaching of blended courses. Highly experienced, trained, and full-time faculty leaders will always be needed to design, implement, coordinate, and assess blended courses.

CONCLUSION

Blended design of humanities courses opens up opportunities for embattled humanities programs to stay viable, current, and aligned with institutional priorities. They can serve as models for other programs on campus, provide valuable professional experience for students, and invigorate faculty teaching by incorporating active pedagogy and principles of student success. Most of all, blended design can help increase student learning, as our data have shown, a goal that any course design has to live up to.

KEY TERMS AND DEFINITIONS

Blended: The design principles and pedagogy underlying hybrid courses that combine face-to-face (f2f) and online class time.

Course Coordination: A way to organize multi-section courses so that student learning outcomes, materials, assignments, and rubrics are aligned. Allows for mentoring of new instructors and ensures consistency and predictability for students taking the same course in different semesters or from different instructors.

DFW Rate: Percentage of students whose recorded grades are D, F, or W (=Withdrawn after the deadline). Students do not get credit towards Liberal Studies or major requirements with these grades. Thus, this rate is used to assess student success: the higher the rate, the lower the success.

Digital Humanities: Newest field of the humanities that applies technology to the study of cultural products and also examines this use as a cultural product itself.

Engagement: Active, critical, and self-motivated work mode of students.

Flipped: The inversion of time spent by students in class and online on knowledge acquisition and higher learning activities such as analysis and creation.

Grade Performance Status (GPS): An online monitoring system used at Northern Arizona University to track student performance. It allows instructors to enter grades, messages, and automated notifications. Students, advisors, and academic support staff can access this information and act accordingly.

Master Syllabus: As part of a coordinated course it allows for consistency and reduces time for instructors to design a new course every time it is taught.

Scaffold: As principle of backward course design to align student learning outcomes, assignments, and tasks. Often represented in a diagram, resembling a construction scaffold.

Chapter 39
Optimizing Blended Teaching and Learning in Brick-and-Mortar Institutions

Joachim Jack Agamba
Idaho State University, USA

ABSTRACT

The increase of blended instructional offerings in brick-and-mortar institutions provides leverage for the appropriate utilization of technology for instruction to optimize learning and serve a generation of learners who prefer such environments. However, the question of appropriate use of technology to improve student performance rests on teacher belief. Where faculty believe that they are content experts who should be trusted to deliver instruction as they see fit, the integration of technology becomes a choice. Some faculty see a clear demarcation between curriculum development and instruction as two separate processes involving separate activities (Heinich, 2011). The missing link appears to be a lack of appreciation for the benefits of instructional design principles that increase learning outcomes as a result of interactivity. This chapter focuses on the need for the inclusion of instructional design principles for in-service and pre-service teacher professional development to assist faculty transition effectively to blended instructional delivery. Barriers that impede the appropriate use of technology for blended delivery need to be identified and alternative approaches need to be applied to assist instructors and increase the effective use of technology in blended learning environments that are more learner-centered.

INTRODUCTION

Rogers' (2003) observation that it takes time for a new innovation to be adopted and implemented appropriately is still relevant today, particularly with the integration of Course Management Systems (CMS), in brick-and-mortar institutions of higher education. In spite of the widespread use of CMS for blended instructional delivery, and the positive claims on learning gains associated with it, problems still abound on their proper implementation. For brick-and-mortar institutions, blended learning environments are a natural fit because they provide a bridge between traditional practice and online education. Blended instructional offerings also provide revenue (Yuan & Powell, 2013) as some students prefer the benefits of a traditional face-to-face and online combination.

DOI: 10.4018/978-1-4666-8246-7.ch039

Teaching and learning with blended formats provides a learning environment that enhances "real time" interaction with learning materials, discussions with instructors and among colleagues, and the facility of providing actionable feedback without having to wait until the "next class meeting", as is the case with the traditional learning environment alone. A driving factor for the increased use of blended learning environments is that majority of students currently attending college consist of a generation who are accustomed to experiencing real time results from interacting with technological tools (Hartman, Dziuban & Brophy-Ellison, 2007). Such learners have therefore come to expect the similar experiences of "convenience and flexibility" from their learning process (Lin, 2009, p. 58).

However, it is this expectation that is driving two competing legacies of thought and fundamental preferences, among others, on teaching and learning practices in the 21st century. This is mainly because many faculty who are accustomed to traditional delivery and have learned that way themselves, see nothing wrong with continuing the same practice (Heinich, 2011). Yet interaction with content, as made possible by the distance aspect of blended environments is central to learning outcomes (Rhode, 2009). This reality is consistent with expectations of the current generation of learners who prefer technology to play similar roles in their learning the way it does in their lives. Educational technology, through the use of CMS, provides essentials for these alternative learning environments, making learner interaction with knowledge objects possible (Nycz & Cohen, 2007). As a consequence, CMS also dictate alternative methods of instructional delivery that are necessary for their successful adoption.

The goal of this chapter is to focus on the use of Course Management Systems as a student-centered learning environment, particularly with regard to issues concerning its effective and appropriate use as a blended learning environment for instructional delivery in brick-and-mortar institutions. The discussion centers on current practices in the utilization of blended learning environments with a focus on values of "student-centered learning environments (SCLEs)" as discussed by Land, Hannafin and Oliver (2012, p. 3). I argue that faculty professional development on CMS use should first focus on assisting instructors understand technology tools and their inherent variations relative to applicable theoretical frameworks as a precursor to the standard practice of assisting faculty learn to implement those tools.

Course Management Systems, through a collection of software applications, provide a virtual environment for learning and interaction not only between instructors and students, but among students as well (Betrus, 2008). Course Management Systems therefore provide access to course materials such as syllabi, assignments and quizzes, grades, links to related websites, tracking tools, feedback, and discussion forums that facilitate communication. The range of CMS available in higher education include, but are not limited to, Blackboard®, Moodle®, CourseInfo®, Desire2Learn®, eCollege®, Moodle, Sakai®, and Brain Honey®. Course Management Systems is sometimes used interchangeably with Learning Management Systems (LMS) because the latter is a corporate version of the former (Betrus, 2008). Moodle, an abbreviation for Modular Object-Oriented Dynamic Learning Environment, is used to provide examples where necessary. Nonetheless, the discussion is applicable for other CMS.

In a recent study on mobile learning practices, Chen and Denoyelles (2013) reported that although students continue to own mobile devices at a higher rate, learning with those devices occur outside the classroom, mostly without guidance from instructors. However, these students are not accustomed to utilizing technological tools for learning. They expect guidance from instructors on such use. Higher education institutions have responded to such expectations by increasingly embracing technology for teaching and learning because the 21st century market place requires graduates who can compete in a technology-directed global market place (Oblinger & Murayama, 1996). Brick-and-mortar post-secondary institutions see the need to provide alternative, and improved methods of instructional delivery. However, many instructors continue to underutilize inherent instructional tools in blended environments, which in essence is inappropriate use, thereby underserving their students.

The question of appropriate use of technology to improve student performance rests on: a) teacher belief, and b) the quality of support available for appropriate technology integration. Where faculty believe that they are content experts who should be trusted to deliver instruction as they see fit, then the use of technology becomes a choice. Such faculty see a clear demarcation between curriculum development and instruction as two separate processes involving separate activities (Heinich, 2011). The other inhibiting factor can be found in the level and quality of support provided by administrators through technology support centers. In both cases, the missing link appears to be a lack of appreciation for the benefits of instructional design principles. This is particularly more so in an era where collaboration between instructional designers and subject matter experts has almost disappeared. The need for the inclusion of instructional design principles for in-service and pre-service teacher professional development is therefore evidenced.

Assisting faculty, regardless of their notions on teaching with technology, can remove barriers that impede the appropriate use of technology and thereby increase its effectiveness in blended learning environments (Jonassen & Easter, 2012). Technology is increasingly shaping how we learn and teach in the 21st century at a faster pace partly because it drives innovation in educational practice. For brick-and-mortar institutions, blended learning environments are a natural fit, as they complement traditional delivery methods and meet the needs of different types of learners.

With regard to outcome-based instruction, evidence from studies on the efficacy of traditional delivery versus blended or distance delivery indicates the former is no more beneficial than the latter (Simonson, 2011; Land & Hannafin, 2000). It seems reasonable, therefore, to focus on the *appropriateness* of technology use. Betrus (2008) observed that “a shared focus of the field of educational technology remains on the *appropriate* use of emerging *technological resources* to facilitate learning and improve performance” (p. 238). As such, it is the limited use or non-use of CMS features by faculty which can impair its effectiveness as a learning environment and consequently compromise its potential to enrich learners’ experiences.

TEACHER BELIEF

To begin with, university and college faculty for the most part have no say in which CMS their institution chooses for them. Administrators may choose particular technologies based on financial reasons (Hall, 2010) while faculty may choose to integrate such technologies based on convenience (Surry & Land, 2000). As a consequence, faculty may feel compelled (pushed but not ordered) to use CMS as directed by administrators. This can lead to ineffective use of CMS which results in undesirable learning outcomes and can frustrate learners and instructors alike (Hirumi & Kidney, 2011). More so, ineffective or inappropriate use of CMS translates into missed opportunities to capitalize on improved forms of delivery. Perhaps for such reasons, the capacity of teachers as individuals and as a group to adapt and implement technological innovations at an optimal level has been a focus of several research studies which have resulted in the proposal of several models on the process of effective implementation for increased learning outcomes (Jonassen & Land, 2012; Hirumi & Kidney, 2011; Pollard, 2005).

A focus on changing teacher belief resides in the comparison of the fundamental aspects of teaching and learning between traditional and blended learning environments and the associated modification of behaviors that are necessary (Power, 2014). In addition, evidence of desirable learning outcomes from distance education need to be a part of the conversation, as faculty who believe in the efficacy of traditional face-to-face instruction do not see the advantages of technology-mediated instruction. As a result, some teachers still prefer the physical presence of learners and the direct interaction that results from it (Simonson, 2011). Repurposing instruction for the distance aspect of delivery and facilitation for blended delivery may therefore not appeal to them, including the fact that the current generation of learners prefer to learn and communicate differently from traditional practice. Such beliefs are at the core of faculty resistance to transition from face-to-face to blended environments.

FACULTY RESISTANCE TO CHANGE

Two factors affecting the appropriate use of technology in education that highlight this chapter are faculty resistance to change and the need for alternative forms of appropriate support in the utilization of CMS for blended instructional delivery (Jonassen & Land, 2000; Reigeluth, 1999; Januszewski & Molenda, 2008). Faculty resistance to change is an endearing reason for the underuse of technology (Simonson, 2011). Such faculty are therefore likely to utilize CMS mainly as a repository of learning materials and for convenient access by their students (Heinich, 2011).

Faculty who resist change discount the benefits of distance education, partly because they fail to see how effective instruction can take place outside of the physical classroom where the learner and teacher are separate (Simonson, 2011). Those faculty fail to see that learning experiences supersede that of mastering goals and objectives (Tessmer, 1998). As a consequence, the role of technology as an enabler of teaching and learning is dismissed. For reasons such as this, it is necessary to include relevant theoretical frameworks that support and validate the appropriate use of technological tools in a CMS, as part of faculty professional development on technology integration.

Rogers' (2003) classic analysis of how people adopt innovations is relevant to this discussion in that he describes instances affecting such adoption that are relevant to the adoption and appropriate integration of CMS for blended delivery. The first instant is that of time. The literature is replete with arguments that time is a constraining factor that impedes the appropriate application of technology. Although universities and colleges provide technology centers and personnel to assist faculty (Heinich, 2011; Betrus, 2008), not all faculty members take advantage of such resources. Rogers' (2003, p. 20) analysis of time as an impeding factor in the adoption of an innovation is applicable to the adoption of CMS but even more complicated because it is not rejected outright but used inappropriately at various stages and dimensions. Faculty adopt CMS at varying rates with varying quality. So even though numbers may paint a bright picture, in terms of faculty who use a CMS on a given campus, the quality of adoption may not. Resistance, as such, therefore relates to several variables besides time, as Rogers' (2003) indicated.

Knowledge and attitudes toward an innovation such as CMS use is another factor that aligns with the resistance to use CMS for blended delivery. According to Rogers (2003), "knowledge" (learning about and understanding how it works), "persuasion" (whether an individual is convinced or not of the innovation), "decision" (activities leading to adoption or rejection), "implementation" (putting an innovation to use), and "confirmation" (seeking reinforcement to improve quality of use) may work in sequence, as a process of innovation (p. 20). However, for faculty, such a sequence may not occur. "Conflicting messages" may occur sooner, even though the adopter wants to use it but does not have the expertise to make it happen. The certainty that faculty need in order to fully adopt a CMS is sometimes lacking. In such a case, the advantages of the innovation are not fully conveyed because thought-process was not a part of the professional development PD process, if that indeed took place.

ALTERNATIVE SUPPORT FOR FACULTY

The second discussion in the literature that informs this chapter is that of the provision of PD on CMS integration. There is a need for faculty PD frameworks to shift from a predominant focus on how to apply technological tools to that of first assisting faculty understand the utility of CMS tools and their inherent benefits over traditional delivery methods. Only by first understanding the benefits of each tool for instruction, can faculty then become stakeholders and want to learn their application.

While universities and colleges provide technology centers and personnel to assist faculty members with technology use (Heinich, 2011; Betrus, 2008), the necessary changes in instructional practice required for the optimal implementation of this new framework for teaching and learning, which Abel, Brown, and Suess (2013, p. 1) describe as "a new architecture for learning" has been undermined, partly leading to or reinforcing faculty resistance. Some faculty view the time associated with taking advantage of these resources as a constraint. The need for continued efforts to hypothesize strategies for instructional improvement and to conduct research and intervention to achieve such (Richey & Morrison, 2011) is therefore necessary.

In the race to join the for-profit higher education sector in the virtual delivery of education, traditional brick-and-mortar institutions will serve their students well, if not better, by re-envisioning how to effectively assist faculty embrace CMS technology just as online learning rethinks areas for improvement (Bowen, 2013). Such a focus would reside in the design, delivery, mediation, and assessment of learning materials and technological tools that have been proven to enhance student learning outcomes. This can be achieved through "sound design principles" in how content is organized for distance delivery (Mohammed, 2004, p. 2). Existing frameworks for best practices such as design principles found in Danielson (2007) and the Quality Matters Rubric, for example, are not fully exploited to improve course design. By understanding alternative methods, faculty can embrace options that work for them. Such an effort would also go beyond current predominant practice of simply providing virtual platforms such as CMS and expecting faculty to adapt.

The time has never been more pressing, but yet ripe, for higher education faculty to become more comfortable with exploring and using available technology, especially through CMS, for alternative technology-mediated instruction because it can be more effective in reaching college students. Yet the factors that impeded distance education in the past, as documented by Simonson (2011) persist and confound the appropriate adoption and integration of blended delivery in the 21st century.

First, faculty have to be convinced that teaching a blended course requires a paradigm shift in the conceptual framework that guides traditional planning and delivery of instruction. This requires behavioral change toward embracing the fact that instructional delivery will involve face-to-face instruction and facilitation as well as distance guidance and communication. Faculty who are already enthusiastic about the benefits of blended delivery and have varying degrees of experience, would require PD that focuses on optimizing CMS integration. That form of assistance resides in elevating the knowledge base. For faculty who dismiss blended instructional delivery, it requires PD that will distinguish traditional face-to-face instructional practice from blended delivery.

For this group of faculty, the practical demands of added time and work required for planning, organizing, designing and delivery of content (Simonson, 2011) for blended instruction is a significant consideration.

Two impeding factors, among others, play a fundamental role that affect the optimal or appropriate use of CMS for instructional delivery. First, is the critical role that faculty support systems on technology use (i.e., technology support centers, deans, heads of department, and administrators) need to play to assist faculty transition from a belief in traditional face-to-face delivery to that of technology-mediated delivery. The second factor resides in practical alternative approaches that are faculty-centered and data-driven.

LIMITATIONS OF A ONE-SIZE-FITS-ALL PD APPROACH

Technology centers that assist faculty on blended and online course development have the tendency to focus on a one-size-fits-all approach to their faculty development programs. Although teaching faculty on how to implement CMS tools (usually the basic ones) is necessary, that manner of approach requires revision. Typically, technology centers provide a calendar on topics that will be covered each week or month during each school term. Such instruction and activities are usually focused on assisting faculty navigate and apply CMS tools. In addition, technology centers are also open for consultation with faculty on their varying needs. In spite of these accommodations, time to devote to learning and or improving instructional design for delivery remains a key confounding factor that impedes faculty ability to attend training workshops (Heinich, 2011; Betrus, 2008). Conflicts with instructional time and preparation impede faculty attendance of such workshops. As such, faculty only go to technology support centers physically or call for assistance via phone when the need arises.

Although technology support centers are undergoing transformation due to faculty demands and input, much still remains to be done to make faculty stakeholders of appropriate technology use. Much of these changes reside in first making faculty stakeholders of the benefits of the appropriate use of technology tools in CMS over traditional instructional methods. This will involve a process of diffusion (Rogers, 2003) whereby faculty at various stages of CMS tool use can observe demonstrations on tools and their inherent variations with specific emphasis on differing circumstance of use based on learning objectives and the pedagogical underpinnings of such use. Faculty exposure to relevant pedagogical frameworks and theories that justify the selection of CMS tools is likely to appeal to them. Every CMS has tools with variations that can serve the needs of different types and levels of learners, for example. Abel (2013) has noted how a particular use of technology can be appropriate for foundational courses or concepts but not suitable for advanced courses or concepts. An example is the use of the "Q & A" choice for discussion forums for upper division or graduate courses in favor of other options in Moodle because that particular option requires that students first post their discussion before they can see other posts. Therefore, it is by understanding the rationale for the utility of each tool that faculty are then likely to embrace and try them out. In order for this to occur, however, it would require technology support personnel who are not only knowledgeable in how the tools of a CMS works but conversant in the different circumstances of appropriate use in order to persuade such utility. When faculty are exposed to the differing functions of CMS technology tools, especially with regard to the attainment of desirable learning outcomes, skepticism on the value of technology for teaching and learning is more likely to change. This type of support for faculty can also lead to collaboration and useful feedback to administrators on what works and what does not.

The analysis here is that if, for instance, faculty only go to technology centers to get assistance with uploading syllabi and course materials at the beginning of the term, and pay another visit to learn how to enter grades at mid-term or toward the end of term, then what perpetuates is that faculty are not even aware of the other beneficial tools in a CMS that could enhance teaching and learning and make them become more learner-centered. If technology support staff are not familiar with pedagogical frameworks and their relevance to CMS tools, they fail to promote optimal use by not making the case for links between the two and why their utility in certain circumstances provide more desirable results over traditional face-to-face practice. As a consequence, "the concepts and principles related to 'using technological *resources*'" as explained by Molenda (2008, pp. 141-156) get undermined.

For this reason, it is necessary for some technology support personnel to be trained in the pedagogical rationale for the utility of CMS tools to provide initial training that will then be complement by training on tool implementation.

The second reason why technology support personnel need to go to faculty at their own departments is that colleges and departments in any given institution will have differing needs even on the same CMS. Even where such needs do not vary much, faculty exposure to relevant pedagogical frameworks and theories that justify the selection of CMS tools could influence improved application significantly. For example, faculty within a college or department of education can be expected to be knowledgeable in learning theory and its role in education, instructional alignment principles, and the philosophy of being learner centered as compared to faculty in other disciplines because the former receive training in writing goals and objectives, in addition to frameworks for designing instruction. This is in part because the former is expected to teach these skills to pre-service teachers as part of their curriculum. Such faculty are therefore more likely to embrace more appropriate tools in a CMS whereas faculty who are not immersed in learning theory and its practical relevance to CMS may become content with utilizing tools that only provide the convenience of a repository for course materials.

Faculty are subject matter experts but they may lack the complementary expertise to select appropriate CMS tools that can best meet the pedagogical needs of instruction (Gentry, 2011). As such, it would require technology support staff who are not only knowledgeable in guiding faculty on how to navigation the various tools in a CMS but in addition, be knowledgeable in the practical applications of learning theory, including andragogy.

A quick exposure of faculty, where necessary, to the differing utilities of a CMS tool that reflect perceived differences or intersections between the behaviorist and cognitivist perspectives versus the constructivist perspectives (Molenda, 2008), for example, have implications for appropriateness of use. In addition, such choice of use reflects the difference between teacher-centered practice which is predominant in traditional delivery versus the constructivist perspective which is learner-centered and which appropriate use of CMS tools tends to espouse. Understanding the different types of use for one CMS tool therefore lays the foundation for appropriateness of choices based on faculty content management. It is the manner of content management with a CMS which establishes the difference between traditional delivery practices and learner-centered, technology-directed practice. Providing answers to the following questions by an instructor who uses a CMS for instructional delivery puts this analogy in perspective:

- Is there alignment between course objectives and utility of choice tools?
- Is there evidence of interactive opportunities for learners to make meaning?
- Is faculty optimizing use of tools based on manner of use? Where is the evidence?

- How does the material gain or maintain the learner's attention with regard to interactivity?
- How is productive feedback provided?

ALTERNATIVE APPROACHES FOR CMS USE

The following processes for appropriate tool use are available, however, it would take their implementation by technology support centers for success to happen. First, it is necessary to identify the baseline of CMS tools and their inherent variations in order to foreground their use. Such identification should go beyond ordinary practice such as how to add an activity, file or folder to a course, setting up quizzes, using grade book or adding a discussion forum. Different ways of utilizing a tool through its variations should first be established. Following this, it would be appropriate to verify tools that faculty actually use. Utilizing Hall's (2010) innovation configuration mapping concept, for example, can place faculty with regard to current use of CMS tools and therefore, form the basis for providing appropriate and effective assistance toward optimal use. Such a framework would help to explore faculty integration of CMS to: (a) describe the manner of use; (b) choice processes; and (c) faculty perceptions of optimal use (i.e., how they think they utilize CMS resources). Such theoretical/pedagogical rationales for CMS tool selection and alignment reflects views of best practices (Heinich, 2011; Betrus, 2008).

Professional development training workshops on selecting CMS resources based on performance objectives and established learning outcomes would provide faculty with opportunities for a focused examination of their CMS course sites and help to validate any alternative recommendations for resource selection. Such an approach is also likely to win faculty receptivity to alternative resource utility and integration. Effects of such efforts by technology support centers would also lead to data-driven information on faculty choice selection of CMS tools and provide accurate information on barriers, concerns, and constraints that impede optimal implementation of technology tools, and register impacts of PD on appropriate CMS use for learner-centered instruction. Also, by identifying and classifying faculty use of each CMS tools and their variation of use, it is possible to collect data that would verify individual as well as general faculty use for analysis. The analysis of such would also provide data for the comparison of CMS tool use from one school term or year to another, for noticeable differences, especially for faculty who teach the same course(s) with such frequency. This practice will also make it possible for the type of feedback interactions at a micro level that Jacobsen and Kapur (2011, p. 304) discuss with regard to theoretical application of learning environments.

CONCLUSION

A significant body of students who are immersed in information technology populates traditional brick-and-mortar universities and colleges. Technology and modern media have shaped the environment that this generation of learners live in. The efficient and reliable technological devices and associated software afford this generation a latitude and convenience to communicate, access information and interact at unprecedented rates. Universities and colleges, in response to the need to provide technology-mediated environments to support learning, have generally embraced CMS to optimize learning (Nycz & Cohen, 2007). However, faculty in post-secondary institutions provide technology-mediated platforms such as CMS to support blended learning, faculty are yet to utilize CMS tools appropriately to enhance learning and increase learning outcomes are As a result, their lives are driven by mobile devices which they largely use within the context of social media. Consequently, technology, with particular regard to blended delivery in particular and online learning in general, provides opportunities that also pose problems. It appears that the problem lies in how to connect with, not discourage the social connections that students have with their world (Abel, Brown, & Seus, 2014). In spite of these inherent problems, many (Bowen, 2013; Carr-Chellman, 2011; Chen & Denoyelles, 2013) are optimistic about the appropriate use of technology to increase learning outcomes that reflect the needs of our society today.

For brick-and-mortar institutions of higher education, it means taking advantage of alternative delivery methods to serve students who are physically on campus as well as those who choose to study from distance. The key to success for these traditional institutions is to focus on assisting faculty design courses that are student-centered that also meet "best practices" with their stipulated CMS. Designing and delivering instruction for traditional teaching and learning environments are different from that of blended environments. The paradigm shift in assisting higher education faculty transition from traditional to blended environments is to empower instructors with the necessary resources and incentives to take ownership of technology-mediated instructional design as they do with their traditional processes (Carr-Chellman, 2011).

Blended environments provide opportunities for brick-and-mortar institutions to expand their student outreach through optimal assistance to faculty. The focus must be on how to increase the number of students who succeed through the achievement of desirable learning outcomes. For this to occur there is a need to go beyond the traditional face-to-face learning environment alone. The mantra must be that "A" students are made and not born. For this to be realized, it means that traditional delivery modalities alone will not assist in this endeavor. The increasing success of distance learning, and as an emerging force in education, must not be lost in the current debate on MOOCs. Heed must be paid to students as consumers, for they will ultimately decide where to pursue their education. For brick-and-mortar institutions, technology is not a threat if faculty are properly assisted on the appropriate use of technology-mediated blended environments. The actual and potential benefit of students depends on how faculty have been prepared to utilize blended environments for learner-centered instructional delivery and facilitation to achieve desirable learning outcomes.

KEY TERMS AND DEFINITIONS

Adoption: The process or act of using something new.

Blended Instruction: The combination of traditional face-to-face with online instruction.

Course Management System (CMS): The utilization of technology platforms for the delivery and assessment of learning. This is synonymous with Learning Management System (LMS).

Instructional Design: A framework for organizing instructional content.

Instructional Technology: The utilization of technological tools to assist learning. Synonymous with educational technology.

Learning Environment: Conditions that influence the acquisition of knowledge, skills and attitudes or their improvement.

Optimize: Increasing outcome to high level(s) as possible.

Professional Development: Assistance provided to an individual or group of people that leads to growth and enhancement in their work.

Technology Tools: Applications within a Course Management System (CMS) for selection and implementation.

Chapter 40
Designing Sustainability Curricula:
A Case Following Chemical Engineering Curriculum Redesign

Madoc Sheehan
James Cook University, Australia

ABSTRACT

Developing an engineering student's awareness of sustainability through the embedding of sustainability curricula is widely considered to be essential to modernising chemical engineering degree programs. In this chapter, the chemical engineering program at James Cook University is used as a case study to illustrate the design and sequencing of embedded curricula associated with developing a students' awareness of sustainability. There are a wide range of examples of skills, techniques, and characteristics associated with developing this awareness. In this chapter, an approach is described whereby a set of generic and interdisciplinary capabilities are developed to provide a degree of flexibility in how sustainability is interpreted and taught. A cognitive learning matrix is utilised as a design tool that facilitates determination of new subject learning outcomes aligned with the sustainability capabilities. A variety of curriculum examples are introduced and described.

INTRODUCTION

Sustainability is widely acknowledged to be essential to creating a more equitable future. An ability to incorporate sustainability into engineering design is also important for engineering graduates to be able to innovate and deliver improvements in the economic, environmental, and social impacts of industry and business. At James Cook University (JCU) in Australia, sustainability has become a key element in the University's Strategic Intent, and over the past 5 to 10 years, an alignment to an ethos of sustainable practice has occurred across the teaching, research, and facilities management sectors. For example, a new sustainability degree program aligned with agricultural sciences is in its second year of offering, algae-based bio-fuel and bio-mimicry research is a recognised strength for the university, and a recent state of the art centralised cooling-water installation

DOI: 10.4018/978-1-4666-8246-7.ch040

has received National awards in sustainability practice. Parallel with these developments, JCU's School of Engineering and Physical Sciences have been developing and embedding curricula within the undergraduate engineering degree program (particularly chemical engineering) that develops an engineering student's "awareness of sustainability".

Internationally, engineering educators and engineering leaders across the globe have recognised that engineering graduates should be aware of sustainability and should be able to incorporate sustainability into their designs. Over the past 10 years or more, sustainability and sustainable design has been an emerging feature of engineering and particularly chemical engineering higher education degrees. Key accreditation bodies such as Engineers Australia (EA), in consultation with industry, have strengthened their emphasis on sustainability, ethics, health and safety, interdisciplinary knowledge, innovation, systems approaches, contextual understanding, and emotional intelligence. These are all characteristics which are commonly aligned with the broad principles of sustainability. Even more so, the Institution of Chemical Engineers (IChemE) have provided a number of vision statements outlining their commitment to sustainability, health and safety, innovation, reduced resource consumption, and minimised waste production. For example, in their recent review of the "Roadmap for the 21st century" are the Vice President's (Ed Daniels) opening remarks:

The future is challenging and uncertain. The puzzle is complex, but chemical engineering remains central to the delivery of sustainable energy, water, food, and wellbeing in all parts of the world. (IChemE, 2013)

Furthermore, the IChemE's traditional design prize has been reformed into a sustainability design prize. The specific objectives of which are to encourage students to think of sustainable development as a key element of their design projects and also to influence chemical engineering departments to position sustainable development at the heart of the curriculum.

In Australia, James Cook University, Royal Melbourne Institute of Technology, and Monash University, are examples of Universities where progress in embedding sustainability across the chemical engineering degree program has been most comprehensive. Murphy et al. (2009) and Allenby et al. (2009) both provide details on the progress in embedding sustainability into both research and teaching areas in higher education in the United States of America. Allenby et al. (2009) in particular, provides an interesting summary of the philosophical challenges and motivations in embedding sustainability. Although many institutions are shifting toward the incorporation of sustainability content into their degree programs, in the USA the University of Texas and Rowan University (Slater et al., 2007) provide exemplars of best practice in this area. In Europe, the progress made at Delft University to embed sustainability within engineering degree programs also provides a good case study (see for example: Mulder, (2006) and Segalàs et al. (2009)).

Apart from some exemplars of best practice and despite professional accreditation bodies such as Engineers Australia (EA) and The Institute of Chemical Engineers (IChemE) expecting that university graduates demonstrate an "awareness of sustainability" (in the EA's case, from 2014), there has actually been relatively minor progress made to update and modernise engineering training. As noted in Steiner's (2010) description of the state of Australian engineering education: "*There is little evidence of sustainability being embedded at the heart of the engineering curriculum*". Chemical engineering academics such as Azapagic et al., (2007), Davidson et al. (2005) and Byrne and Fitzpatrick (2009), have concluded in the past that most chemical engineering programmes have made limited progress in increasing student's exposure to sustainability issues, let alone embedding sustainability as a contextual basis for engineering design and decision making. One reason for the lack of progress is because embedding sustainability is a challenging task for engineering educators. The challenge relates to the need for leadership, and personal commitment, as well as to more practical challenges associated with pedagogy and curriculum development. For example, "*some engineering lecturers are not receptive to including sustainability in their engineering subjects sometimes because it is thought 'nebulous and partly ideological' and does not appear to have immediate practical application*" (Hopkinson & James, 2010). Others feel it is "beyond their comfort zone" Bryce et al. (2004). To modernise context and embed sustainability requires staff support and effective leadership that places importance on sustainability and provides opportunities for staff personal and professional development. A personal connection to sustainability coupled to an understanding and appreciation of sustainable engineering applications is also essential to embedding sustainability throughout the curricula so that sustainability becomes a theme which is woven throughout traditional discipline practice and theory.

The broad requirements or general approach to developing students understanding and awareness of sustainability are well-described in the literature. Furthermore, national and international case studies in this area have generally followed a similar process of curriculum renewal, with common characteristics. An example is the model proposed by Desha and Hargroves (2011) which they called Rapid Curriculum Renewal for Sustainability. Their model was categorised into:

- Awareness raising & developing a common understanding amongst staff.
- Identifying graduate attributes.
- Auditing and mapping each program against graduate attributes.
- Embark on strategic content development & renewal.
- Bridging & outreach with industry & education.
- Integrating curriculum with campus & community opportunities.

The third and fourth elements in the rapid curriculum renewal model, involving development and mapping of strategic content or curricula, are the most significant challenges in this process. Currently there is a lack of detail and clarity regarding the content type, program location, or the methodology required to develop curricula to best achieve these aims. For example, in a survey of 1368 USA engineering departments, curriculum development in sustainability was found to require more structure and organisation (Davidson et al., 2007). It is hoped that the work we present in this chapter addresses some of these deficiencies.

When it comes to teaching an awareness of sustainability there is a common understanding that sustainability should be integrated into a degree and not necessarily taught as a separate subject. However, the task of embedding sustainability is not straightforward and would be benefit if content were able to be sourced within traditional teaching resources, such as core discipline textbooks. Unfortunately, taking chemical engineering as an example, there are only a handful of textbooks that are dedicated to engineering sustainability, but to this authors knowledge no examples of core discipline textbooks that have embedded sustainability within the traditional content. Furthermore, many if not all academics will not have been exposed to this content as part of their own formative engineering training. As such, the most common examples of teaching sustainability in undergraduate engineering programs are either at a base level: by introducing definitions of sustainability into general engineering courses (for example); or the development of entire stand-alone subjects that might deal only with typical sustainability tools and techniques, such as life cycle analysis. Other approaches include the creation of new postgraduate courses in "sustainable engineering" that lead to Masters level qualifications. Whilst laudable, these approaches also run the risk of students (and academic staff) perceiving sustainability as an "add on" feature to extend traditional engineering approaches, instead of considering it as an intrinsic feature, integral to good engineering design and practice.

In this submission I will describe the efforts being undertaken within James Cook University's chemical engineering program to source and develop curricula that embeds sustainability. Five key sustainability attributes which provide a framework for understanding and staging whole-program curriculum reform will be described. The scaffolded nature of the attributes will be emphasised as a students' progressive development of the attribute capabilities was helpful in undertaking broad-scale program sequencing and also finer-scale curriculum design and development. A fine-scale curriculum design methodology which utilises a modified form of Bloom's taxonomy (Nightingale et al., 2007) will be described. A sequence of first, second, third and final year core chemical engineering subjects are used to illustrate use of the methodology to design curricula. Brief curricula examples are described to emphasise subject connectivity and also to introduce the use of non-traditional teaching methods in embedding sustainability.

ORGANISATIONAL BACKGROUND

In order to provide clarity to the discussion that follows, a number of terminology definitions are provided. The term "program" refers to the entire sequence of 32 individual "subjects" that are usually delivered over a four year period and lead a student graduating with a named engineering degree, such as chemical engineering. Each subject within a degree program runs over a 13 week semester and broadly speaking, will typically involve students being exposed to lectures, practicals and tutorials relating to the subject content. The specific materials that are delivered by the lecturer or provided to students for review (i.e. lecture materials, multi-media, tutorial/assignment question sheets, practical and field trip information details) are referred to individually as curriculum and collectively as curricula. The demonstration of a students' mastery of the subject curricula is determined by submission of aligned assessments.

James Cook University's School of Engineering and Physical Sciences is a small and highly integrated School with 25 person staff offering a four-year Bachelor of Engineering degree program comprising 32 subjects (15 discipline specific, 17 multi-disciplinary), with four discipline-major program options (chemical, mechanical, civil and electrical engineering). New engineering minor program options set to begin in 2015 include among others, sustainability, automatic control, water and waste water, and asset management. The School's total student number comprises approximately 600 - 700 students at any one time, of which there are approximately 20-30 chemical engineering students per year level. Engineering students undertake a common first year before choosing a major in their second year of study. The key capstone subjects in chemical engineering are full year subjects in the student's final year of study and include Engineering Research Thesis Project and Chemical Engineering Design. All students are also required to undertake at least 10 weeks of vacation work practice prior to graduation.

SETTING THE STAGE

Initial subject and curriculum development to embed sustainability began in an ad hoc manner in 2007 via the introduction of sustainability definitions and environmental ethics into a second year chemical engineering subject taught by the Author. In 2009 a systematic, research-led process to embed sustainability began via a funded (Australian Department of Education, Employment and

Workplace Relations, 2009) collaboration between James Cook University engineering academics and involving a sustainability think tank - The Natural Edge Project. An additional funded fellowship scheme in 2012 was used to continue the curriculum design and embedding process and to fund professional development in sustainability for involved staff. Over the course of the project more than 12 of the School's academic staff members have undertaken the design and implementation of new sustainability aligned curriculum in first, second, third and fourth year engineering subjects across all major disciplines. More than 15 separate subject offerings now include sustainability aligned curriculum with 7 of these subjects being specific to chemical engineering students. The School is currently in the process of designing a new sustainability subject to offer to students from other parts of the university. The Engineering School was reviewed for EA Accreditation in 2012 and was commended both for its broad focus on sustainability as well as specific components of the curriculum involving interdisciplinary project work. In a recent external review of the engineering school's progress in embedding sustainability (Skamp, 2012), it was noted that in the Australian context, the progress that has been made to embed sustainability is "*well advanced compared to many engineering disciplines in other universities* ".

CASE DESCRIPTION

In the literature there are many different tools and techniques that are invoked as a recipe for defining and teaching sustainability to engineering students. Even the term sustainability is fraught with ambiguity and many alternatives definitions abound. The term green engineering design and the Principles of Green Engineering have been used in the past (Anastas & Zimmerman, 2003 and Slater et al., 2007). Readers are also referred to a review of a selection of techniques and sustainability definitions by Garcia-Serna et al. (2007). Key elements of a engineering student's understanding of sustainability that are common themes in the literature include definitions of sustainability, exposure to examples of sustainable design and practice, a deep understanding of the systems approach, knowledge of the interactions between engineered and other (social and ecological) systems, usage of life cycle thinking, and quantification of impacts using techniques such as sustainability metrics or the triple bottom line approach. Additional elements that may also be aligned to sustainability have included health, safety and risk analysis, innovation and creativity, as well as students who are exposed to inter- and multidisciplinary teams and who develop cross-cultural understanding and awareness. Unfortunately the criteria and objectives in sustainability evolve rapidly and news tools and techniques multiply as our familiarity and understanding of sustainability increases. For example, aspects of risk assessment and social sustainability quantification are anticipated to become critical to sustainability assessment, yet examples of their application and development are rare, and their adoption within engineering higher education is still in its infancy. As such there needs to be an acceptance that there is flexibility in how sustainability curriculum is developed and taught to engineers.

It has been suggested in an Australian Learning and Teaching Council report (King, 2007) that engineering curriculum development would benefit from a top-down, systematic approach founded in consideration of specific objectives and graduate attributes. In this work, we emphasise the determination of the required generic capabilities that lead to a students' development of the generic attribute: *awareness of sustainability*. The literature is unfortunately sparse when it comes to the development of engineering competencies and attributes in relation to sustainability. Segalàs et al. (2009) provides an example comparing sustainability attributes at three European universities and classified them under three descriptors:

knowledge and understanding, skills and abilities, and attitudes. Brennan (2009) provides a more practical overview by introducing the type of content required, similar to the green engineering principles. However he also categorises learning areas, provides examples of supporting project-based activities, and suggests an approach that scaffolds curriculum. For example, Brennan (2009) suggests introducing concepts and knowledge early in the degree.

In the following sections, the case study project to embed sustainability across the JCU engineering degree program is described, with emphasis on chemical engineering. The description begins with the determination of interdisciplinary program-wide generic sustainability attributes that provide the framework for the development work that followed. The use of the attribute capabilities in broadly mapping content/topic areas and the planning of scaffolded learning pathways is then presented. The curriculum design tools that were used to both review and then to design specific sustainability curricula are described, before finally providing examples of ways to integrate sustainability applications into engineering subjects.

Generic Sustainability Attributes

At JCU a series of preliminary activities were undertaken prior to embarking on whole-scale curriculum design and program mapping. These activities included collaborative staff and local industry forums and whole-teaching-staff attribute design workshops. This would be an appropriate time to raise the general awareness of sustainability amongst staff through professional development opportunities such as guest seminars and targeted conference attendance. The attribute design workshops involved all engineering disciplines and were used to develop, in alignment with the teaching staff's understanding of sustainability, five capabilities that defined a JCU engineering student's "awareness of sustainability". The capabilities were initially discipline-based, but were later simplified through a review process into common interdisciplinary attributes which were deliberately more general in terminology and better suited to the recognised characteristics of sustainability. The five generic capabilities are shown in Table 1, and broadly match what has been typically proposed across the literature. One of the key advantages of this development process is that the staff felt a sense of ownership of the attributes and could more easily interpret them to fit their own expectations and experience. The common set of attributes also formed a solid framework to use to begin progress toward whole-scale program mapping and curricula design. In particular the simplicity of the attribute capabilities made them adaptable and flexible across disciplines. The scaffolded nature of the capabilities (i.e. knowledge generally precedes conceptualising systems and quantifying impacts, which precedes optimising a system) helped to facilitate the later stages of curriculum design and reform.

Table 1. Generic graduate attributes in sustainability (Reproduced from Sheehan et al., Proceedings of Chemeca 2012, Wellington, New Zealand

Graduate Attribute Description	Capability Keyword
Knowledge of sustainability including definitions, discipline context, relevance, and importance.	Knowledge
Discipline specific exposure to sustainability applications including examples of sustainable practice and design.	Applications
Ability to conceptualise complex systems and their interaction across ecological, social, and environmental dimensions.	Systems
Ability to use tools to quantify sustainability of products, processes, and designs.	Quantify
Ability to optimise engineering designs to trade off across the three dimensions of sustainability (environment, equity, economy)	*Optimise*

Broad Scale Mapping

The typical approach to introducing sustainability into chemical engineering programs has been to introduce new curriculum in the first year of a degree program that broadly aligns with the *knowledge* attribute. This might involve an introduction to definitions of sustainability (most often the Brundtland definition) and introduction to methods that enable the definition of the characteristics of sustainability (such as the triple bottom line approach: economy, ecology, society). More sophisticated curriculum might introduce students to the wicked problems faced by industry and society. This can include an introduction to nutrient and element cycles, including carbon, nitrogen and water, and discussion that begins to address key environmental issues such as climate change, air and water borne pollution, and energy constraints in engineered systems. These latter issues can also be classified as the required knowledge that enables student's further understanding of the environmental impacts that would be described and quantified in life cycle and sustainability assessment methodologies, such as the IChemE's sustainability metrics (IChemE, 2013). Knowledge of social and equity issues is certainly considered to be important but is not commonly within the realm or experience of engineering academics and as such the location and details of this content is less clear. At JCU, social issues are addressed through the introduction of ethics at both first and second year levels and then extended in third year via project management examples. This is certainly a challenging area to identify and design curriculum.

More advanced curricula is required to address the latter capabilities and to develop students understanding of interactions between systems and also to expose them to methodologies for quantifying impacts. Chemical engineering students are well-placed to take on board this curriculum because of their extensive exposure to and reliance on systems skills and methodologies. In fact, systems analysis courses such as those that deal with the application of mass and energy balances on engineered systems are very well-suited to including introductions to Life Cycle Assessment (LCA) and extending student's systems thinking to include interacting systems (be they social or environmental). Life cycle systems thinking and examples of LCA's are valuable in the curricula because they can be extended or modified to cover other LC concepts such carbon and ecological footprints, embedded energy, and also provide context for the use of thermodynamic properties such as exergy.

Whilst the introduction of LCA into the curriculum addresses the systems capability, it also provides a convenient framework with which to begin to address the quantify capability. Many of the previous examples make use of environmental impact categories such as water use and Global Warming Potential (GWP), the later being typically expressed as an aggregated impact (i.e. kg CO_2 equivalents). Thus there is a requirement to include quantification of different impacts and also to outline techniques such as data aggregation. A range of LC approaches and environmental impact categories and aggregation techniques can be spaced throughout a degree program in relevant subjects. For example, embedded energy would be a good LC concept to introduce in the materials science course, whereas eutrophication potential and PO_4^{3-} equivalents would be suited for introduction in a wastewater treatment subject.

There are some excellent examples of LCA that can and have been incorporated into chemical engineering education. Issues of recyclability and impact on energy consumption can be discussed by referring to systems diagrams that describe the cradle to grave aluminium life cycle. Other examples include an LCA comparison of air dried and paper towel dried hand washing (Evans et al., 2008), and an LCA-based assessment of the use of fly ash in cement manufacturing (O'Brien et al., 2009). Recent LCA examples of alternative by-product technologies in sugar production can also be interesting and topical providing insights into alternative fuels such as bagasse fibre (Renouf et al., 2011 and 2012). Simpler examples that introduce LCA thinking to students might include an examination of life cycle carbon emissions comparison between six different products (beer, washing powder, car, shoes, milk, jacket) (Ball, 2008). The sustainable design textbook by Azapagic and Perdan (2011) contains a lengthy discussion of sustainability indicators and impacts, and offers excellent overview of sustainability as it relates to the process industries. Brennan (2013) also describes LCA methodology and provides a number of case studies relevant to the process industries. However, whilst there are good LCA and sustainability examples spread throughout various dedicated journal and conference articles, there is a distinct lack of integration of sustainability examples within fundamental chemical engineering textbooks. This integration would make embedding of sustainability into traditional subjects easier.

The final capability is highly scaffolded and relates to a student's ability to use learned knowledge, as well as systems and quantification skills in order to optimise designs across the dimensions of sustainability. Like the wicked or complex problems that engineers will face in the workplace, this is a very difficult capability to reach within a four year degree program. It is suggested that this capability be most effectively addressed in a Masters degree program or in a five year engineering degree. Here at JCU we make minor inroads into capability via curricula in the two full-year capstone subjects: Engineering Research Thesis Project and Chemical Engineering Design.

Table 2 illustrates a program mapping tool for the chemical engineering discipline that has been updated and modified over time as our understanding and development of the new curricula evolves. The map aligns curricula descriptions with each of the five capabilities associated with the generic sustainability attribute. In the beginning of the curriculum reform process, the map was used to brainstorm appropriate subjects and also brainstorm possible embedded curricula (using broad terms such as those deemed locally or disciplinarily important: water and energy). The scaffolded nature of the capabilities was important in this stage. In the early phase of mapping, there was limited detail on actual curricula and more emphasis on mapping an appropriate progression of the attribute. In essence, the map was a convenient tool to "visualise" the progression of the attribute. In this way the map could be used, where necessary, to identify and target professional development opportunities for teaching staff. To illustrate the inherent progression, a subject in first year might be identified as an appropriate location for the embedding curricula aligned with the *knowledge* capability, a third year subject might be identified as an appropriate location for the embedding curricula aligned with the *quantify* capability and a fourth year subject might be identified as an appropriate location for the embedding curricula aligned with the *optimise* capability. In this case study, professional development funds were provided as an incentive for the relevant teaching staff to learn about techniques to enable the quantification of sustainability (in the third year subject for example).

Over the course of three years of progressive but somewhat ad hoc curriculum development at JCU, the program map has been updated to reflect increased awareness of the attribute progression and increased specificity in the developed curricula. To date, more than 15 subjects across the entire engineering degree program have embedded sustainability curricula. At JCU we have chosen to concentrate attribute development and convey the majority of sustainability curricula within a handful of key subjects. This is particularly the case in developing the capabilities of *systems, quantify,* and *optimise*. The attainment of the *knowledge* capability is more widely distributed. The key subjects for delivering this curriculum are a second year subject on process systems (energy balance, sustainability, LCA, design and

Table 2. Generic sustainability graduate attribute program map illustrating the progression of attribute capabilities (Adapted from Sheehan et al., Proceedings of Chemeca 2012, Wellington, New Zealand)

Attribute capability	Introduction to engineering	Material balances & fundamentals of chemistry	Energy balances, LCA & process design	Engineering materials	Fluid mechanics	Thermodynamics of fluids
knowledge	Sustainability definitions, LCA categories, ethics	Carbon cycle, Nutrient cycles, climate change, pollution prevention	Definitions & ethics, data aggregation, LCA: scope, impact category			
application	Carbon footprint product comparisons	Process examples	Energy efficiency: MED, cooling tower, scale effects...etc	Material selection, sustainable materials, thermal efficiency	Energy efficiency, pumping systems	Energy efficiency, heat recovery systems
systems		LCA: diagrams, systems representation	LCA: boundary, con- ceptalisation	LCA: Embedded energy and recyclability		
quantify			CO_2eq, GWP, sustainability metrics	Energy Rate of return, efficiency		
optimise

quantify		Exergy analysis	Social sustainability metrics	Metrics: air and water impacts, risk assessment	Enviro impact/risk assessment, sustainability metrics analysis
optimise					Technology selection
	3rd Year			4th Year	

process dynamics), third year engineering project management (social impacts), fourth year process safety (advanced LCA, water pollution, risk assessment) and a fourth year chemical process design subject (sustainable technology selection, process sustainability indicators/metrics).

Up until this point, the *applications* capability has not been described in relation to specific subjects and curriculum. This is because based on our experience in curriculum development and also our own interpretation of this attributes practical impact on teaching, it is a mechanism for using "more sustainable" engineering designs and applications as examples for reinforcing and presenting existing (i.e. traditional or foundation) content. It can be seen as a measure by which an academic recognises how sustainability can impact on their own teaching domain. The effective integration of this capability within a subject might require an academic to have a pre-existing focus or understanding about the impact of sustainability on their subject. Alternatively, professional development such as targeted conferences might facilitate the development of new examples to illustrate more sustainable designs to students. It is anticipated that after a period of program reform and staff development, all subjects in a degree program would present material and examples that include sustainability as the context for problem solving, technology selection, design, and engineering analysis.

Fine Scale Curriculum Design

After using the broad scale program mapping process to identify potential subjects and topic areas, a finer-scale curriculum design tool was necessary. A design tool was utilised in order to both review and to design new curricula, including identifying assessments and student learning outcomes. A matrix-based methodology based on a modified form of Blooms taxonomy was utilised (adapted from Nightingale et al., 2007). A key starting point in this methodology was to describe for an existing subject, in as much detail as possible, the specific subject learning outcomes (SLO's) that were aligned with the sustainability attribute. The process of defining the sustainability-related SLO's is worthwhile as it encourages teaching staff to formalise and clearly define student learning. Three different subject SLO's are provided below, as examples of this development process. In a first year subject covering material balances & fundamentals of chemistry (course code: EG1010) are the following four sustainability aligned subject learning outcomes, with attribute keywords underlined. For clarity in latter discussion, the course code is included as an identifier for each subject learning outcome:

EG1010 SLO1: To demonstrate a *knowledge* of common element cycles (C, N, P).

EG1010 SLO2: To use *systems* diagrams to represent the Carbon cycle.

EG1010 SLO3: To demonstrate a *knowledge* of the impacts of CO_2 within the context of climate change.

EG1010 SLO4: To demonstrate a *knowledge* of the environmental interactions between common engineered systems and the environment.

In the follow-on second year subject on energy balances, LCA & process design (course code: CL2501) are the following five sustainability aligned subject learning outcomes, with attribute keywords underlined:

CL2501 SLO1: To develop *knowledge* of the definitions of sustainability, sustainable design and the roles and responsibilities of engineers in sustainable development.

CL2501 SLO2: To develop a broader *knowledge* of the environmental impacts and environmental sustainability performance measures of chemical processes.

CL2501 SLO3: To develop *knowledge* of the life cycle assessment approach to product and process design.

CL2501 SLO4: To propose life cycle *systems* diagrams for products and chemical processes

CL2501 SLO5: To be able to *quantify* the impact of chemical processes in terms of aggregated $CO_{2\,eq}$ emissions.

In a parallel second year subject on materials engineering (course code: EG2010) are the following three proposed sustainability aligned subject learning outcomes, with attribute keywords underlined:

Table 3. Constructive alignment of sustainability learning objectives and subject assessment tasks in a first year subject (EG1010) on material balances and fundamentals of chemistry (A: assignments, E: exams, T: tutorials, P: practicals).

Knowledge Domain ↓ Type of Learning	Cognitive Process Domain → Depth of Learning				
	Remember	**Understand**	**Apply**	**Evaluate**	**Create**

Procedural Knowledge	SLO3 (E)				
Meta-Cognitive Knowledge					

EG2010 SLO1: To develop knowledge of the definitions of sustainability metrics relevant to materials selection (embedded energy, carbon footprint).

EG2010 SLO2: To understand and describe a materials life cycle impacts using systems diagrams.

EG2010 SLO3: To be abl To quantify the life cycle impacts of a material using embedded energy/carbon footprint.

Subject Curriculum Review

For each subject the specific subject learning outcomes (SLO's) described above can be mapped in two dimensions. The first dimension is the type of learning, which includes the progressive development of factual, conceptual, procedural, and meta-cognitive learning. The second dimension includes the depth of learning and is identified by progressive descriptions such as a student being able to recall and then understand knowledge, all the way to being able to apply, evaluate, and eventually, create new knowledge. The terminology used in the learning matrix was also considered to blend well with the desire to embed a gradual progression in students exposure to the curricula associated with sustainability (i.e. to scaffold learning across the degree program). In the example matrices that follow (Tables 3 and 4), the types of assessments where each subject learning outcome is evidenced are also indicated. A learning matrix for the first year subject (EG1010) is shown in Table 3. This subject provided one of the first instances where students were exposed to sustainability curricula, so it seems reasonable that all of the noted subject learning outcomes are grouped into the top left hand corner of the matrix (i.e. remembering and understanding factual knowledge).

Table 4 illustrates the mapping of the second year subjects SLO's (CL2501) to the learning matrix. Particular emphasis is placed on this subject (CL2501) because it is the first subject in the degree program that cuts across both the *quantify* and *systems* attributes. This subject introduces a basic level of procedural knowledge in systems analysis (i.e. LCA methodology) and this procedural knowledge is targeted for scaffolding and development (i.e. extending the depth of learning) in later courses (such as third year and fourth year subjects).

A few specific comments are provided below on the curricula that we have developed to teach the SLO's and also curricula (assessments) that have been developed to demonstrate a student's attainment of the SLO's. In EG1010, content is primarily lecture driven and is mostly assessed via typical exam questions. In lectures, the students are introduced to systems diagrams describing the carbon, nitrogen and phosphorous cycles. As well as a range of other products and processes, aluminium production is used as a case study to illustrate the use of a systems approach to quantify the impact of aluminium recycling (on life cycle energy use). A relevant assignment question involves students assessing the following carbon cycle issues: the quality and relevance of literature sourced CO_2-temperature correlations; describing the importance of ocean storage and CO_2 solubility; deriving a simplified process model of the planet in order to predict the effects on temperature of increasing industrial emissions of CO_2; reflecting on the reliability of their conclusions.

In the second year subject on energy balances, LCA and process design (CL2501), the sustainability curricula is more extensively developed and both the type and the depth of learning are increased. An important component of the learning approach used in this subject is group-based tutorial work. The sustainability curricula involves a series of tutorial worksheets that groups of up to four students work on over a period of two weeks. The tutorials were interspersed with the associated lecture content (30% time allocated to lectures) and involved ethical role play requiring alternative points of view, development of data aggregation techniques, technology investigation and qualitative sustainability assessment, systems diagram development and LCA based comparative assessment of different fuels (coal, natural gas and bagasse fibre) in terms of GWP. Teacher observations of these sessions indicated that students were highly engaged with the content and found the tutorial workshops to be challenging and engrossing. Another aspect of the assessment was a field trip to an exemplary (in terms of sustainable design) industrial site. This trip met the traditional course requirements of exposure to discipline practice and learning to develop process flow diagrams, whilst also reinforcing the relevance of sustainability to their discipline. This type of activity also meets the broader objectives identified in curriculum renewal models that recommend bridging and outreach to local industry and community.

Subject Curriculum Design

In the early years of curriculum reform there were no obvious sustainability aligned curricula embedded into the third and fourth years of the degree program. The required curricula needed to be planned and designed before implementation. Whilst the broad-scale map shown in Table 2 provides a rough idea of the topic area, more specific learning outcomes were required to direct the development of this curriculum. The tool illustrated in Table 3 and particularly Table 4 was used to facilitate the design of new curriculum in a selection of latter year subjects. The appropriate latter year subject and its associated attribute capabilities were identified using the program map in Table 2. Specifically, this was achieved by using existing SLO's and their location in the learning matrix as a starting point for defining the new SLO's. Two techniques were used to develop the new SLO's. The first was incorporate minor and predictable modifications in the terminology used to describe existing SLO's. The second approach was to take an existing SLO from a subject early in the degree program and to use its location within the learning matrix as a basis for deriving new SLO's that extend learning. In this way the SLO terminology remained the same, but the depth and/or type of learning was extended.

Two examples that utilise SLO terminology changes are described. The SLO's from the second year subject (CL2501 SLO2 and CL2501 SLO5), shown again below, were modified and extended to design curricula for a third year subject (EG3000: Engineering project management) and a fourth year subject (CL4040: Process safety & water treatment) respectively. In the third year subject the broad program map in Table 2 is used to identify that the *quantify* and *knowledge* capabilities aligned with *social* sustainability are required. Using capability aligned SLO's from the second year subject (CL2501) as a starting point, the terminology in the knowledge-based learning outcome was modified to include the term "social" instead of "environmental" and in the quantify-based learning outcome the term "social" was used instead of "aggregated CO_{2eq} emissions". These modifications are shown below and two new SLO's were derived for the third year subject:

CL2501 SLO2: To develop a broader *knowledge* of the *environmental* impacts and *environmental* sustainability performance measures of chemical processes.

CL2501 SLO5: To be able to *quantify* the impact of chemical processes in terms of *aggregated $CO_{2\,eq}$ emissions.*

EG3000 SLO1 (new): To develop a broader *knowledge* of the *social* impacts and *social* sustainability performance measures of chemical processes.

EG3000 SLO2 (new): To be able to quantify the impact of chemical processes in terms of *social* measures.

To facilitate curriculum design to meet these new SLO's, they were assumed to be able to be progressed to the same extent in the constructive alignment matrix (i.e. the same depth and type of learning) as the basis SLO's from the second year subject (Table 5). This gives a very specific description of the aims of the new curriculum and helps to facilitate a highly targeted curriculum design process. Similar methods of assessment and pedagogy from the second year subject were considered suitable for SLO development in the third year subject as well. These SLO's formed a

Table 5. Constructive alignment of sustainability learning objectives and subject assessment tasks in a third year subject (EG3000) on engineering project management (A: assignments, E: exams, T: tutorials). Note the identical locations of the basis subject learning outcomes (SLO2 and SLO5) in Table 4

Meta-Cognitive Knowledge					

starting point for sourcing content and lecture materials, designing new assessments, and facilitating professional development. New curricula resources included case studies from Azapagic and Perdan (2011) as well as online documentary videos on the impacts of fly-in/fly-out workforces on social cohesion and videos describing indigenous perspectives surrounding mining proposals and developments. Group based tutorial work was also used to demonstrate students' capabilities.

Another example of the modification of SLO terminology to design new curricula is described. CL2501 SLO5 from the second year subject was targeted for modification and then inclusion in a fourth year subject on process safety & water treatment (CL4040). This was achieved by replacing terms associated with GWP impacts (i.e. $CO_{2\ eq}$) with those associated with other environmental impacts. The choice of aggregated impact category is related to the how relevant the existing content delivered in that subject is to that particular impact category. The IChemE (2013) Sustainability Metrics provide an excellent compilation of impact categories that could be used to develop SLO's of this type. For example, in the process safety & water treatment subject the appropriate impact category might be eutrophication ($PO_4^{3-}{}_{eq}$) and aquatic toxicity (Cu_{eq}).

CL2501 SLO5: To be able to quantify the impact of chemical processes in terms of *aggregated* $CO_{2\ eq}$ *emissions*

CL4040 SLO1 (new): To be able to quantify the impact of chemical processes in terms of aggregated [*eutrophication/toxicity/ozone depletion/resource consumption/.... etc*] emissions

Examples of the use of the constructive alignment matrix to identify new SLO's that extend prior procedural knowledge deeper into the cognitive process domain (i.e. increasing the depth of learning) are now described. Consider for example the SLO's in the second year subject that were aligned with the development of students understanding of systems and LCA (CL2501 SLO3 and CL2501 SLO4 in Table 4). These SLO's can essentially be repeated again (i.e. using the same terminology) in fourth year subjects which are (identified in the overall program map as) important to extending and further developing students understanding and ability to apply systems/LCA techniques. Referring to Table 6, CL2501 SLO3 (To develop knowledge of the life cycle assessment approach to product and process design) could retain the same language but be extended in a latter subject (CL4040 SLO1) from the *remember* and *understand* cognitive domains into the *apply*

Table 6. Constructive alignment matrix illustrating the extension of the depth and type of learning of a second year subjects sustainability learning outcomes (CL2501 SLO3 and SLO4 in italics) into proposed fourth year subject learning outcomes (CL4040 SLO1 and CL4071 SLO1, respectively)

Meta-cognitive knowledge					

and *evaluate* cognitive domains. Assessment of this SLO occurs via a literature review of available product LCA's and an analysis of various sensitivities (boundary, scope, data quality) on the LCA conclusions. Additionally, CL2501 SLO4 (To propose life cycle systems diagrams for products and chemical processes) can retain the same language but can also be extended into the *evaluate* and *create* cognitive domains. This would occur in the fourth year capstone chemical process design subject (CL4071 SLO1) where new innovative process designs are envisaged and evaluated in terms of their LC impacts.

Developing the Applications Capability

Applications is one of the key sustainability attributes identified in group workshops. In an early set of SLO's, a number of "applications" based SLO's were written. An example of a specific application aligned SLO considered in the second year subject (CL2501 Energy balances, LCA & process design) was:

- To be able to understand and quantify engineering *applications* to enhance energy efficiency in chemical processes.

However, after comparing this application driven SLO's and other subject SLO's with Engineers Australia accreditation competencies (see Sheehan et al., 2012) there was insufficient new or distinctive learning to be able to differentiate the applications SLO above from more traditional Engineers Australia learning objectives such as "a student's ability to describe and quantify energy (*efficiency*)". For example, a student who is able to quantify energy (traditional EA competency) and has knowledge of energy efficiency measures (CL2501 SLO2) would be expected to be able to meet the applications-based SLO introduced above. Hence a definitive statement (i.e. SLO) regarding applications is considered redundant. However, we believe that facilitating deep learning in this area requires a student to be exposed to examples of energy efficient processing. However, providing assessment that proves "exposure" to sustainability examples or applications is difficult. This should not in any way discount the value in exposing students to innovative sustainability applications and examples as part of their degree program. At this point we promote the argument that teaching sustainability requires not only exposure to new tools and techniques but the thorough integration of sustainability as a contextual basis during the teaching of traditional engineering concepts.

A selection of examples of sustainability applications/practice and their link to traditional engineering concepts are outlined. In a first year subject (EG1010) biodegradable fibre-reinforced polymers are introduced during a discussion on molecular mass. In the same subject nutrient recovery from urine and non-renewable resource constraints are discussed during lectures describing the phosphate and nitrogen cycles, and are also used as examples for illustrating concepts of chemical equilibrium. Aluminium recycling (i.e. life cycle) is discussed during traditional lecture content on redox reactions and also during lectures on formulating mass balances with recycle. In a second year subject (CL2501), skill development in chart reading and energy balance formulation are developed through use of psychrometric chart data. In the past, cooling towers have been used as the traditional example through which the students practice their skills. The traditional example is altered by including a life cycle comparison (in terms of energy, water, and chemical use) between traditional cooling tower design and air-cooled condenser design. Through this comparison, students develop an understanding of context and competing requirements for the selection of alternative designs. This is reinforced through a field trip later in the course which visits a cooling tower set-up. Another example in the same subject uses an assignment question that requires students to compare energy usage in order to concentrate sugar juice via either single effect or multiple effect evaporation. This example develops fundamental skills in formulating energy balances, understanding fluid thermodynamics, and retrieval of steam table data. It also leads to consideration of energy efficient alternatives and the economic trade off between capital and running costs. Examples in civil engineering include using concrete formulations (fly ash substitution for example) with low carbon footprint, as case studies in traditional materials characterisation learning areas. In thermo-fluid subjects, solar pumps and solar thermal systems can make good examples to present traditional thermodynamic topics.

Exposure to sustainable applications has commonly been seen as essential to making sustainability the context for engineering decisions. It is believed that innovation and technological advances are necessary to creating more sustainable designs and providing solutions to society's wicked problems. This is an area where professional development and alignment of both research and design projects with sustainability can make great inroads. Examples within the JCU program include the capstone full year design project and also the full year thesis research project. Although not explicitly stated as such, sustainability aligned thesis projects now occur across all disciplines but depend greatly on academic staff interest and experience. Examples include projects on solar thermal and energy systems in electrical and mechanical engineering, life cycle analysis of recycled fibre use in cement formulations in civil engineering, by-product use in sugar milling and reactor design for nutrient recovery in chemical engineering. Other projects initiated as part of the curriculum reform process have included multidisciplinary teams of students modelling life cycle energy, water and materials use in tropical housing (included mechanical, electrical, chemical, civil and environmental students). Final year chemical engineering design projects involve local industry assistance in developing realistic and topical resource recovery projects that are based on their existing processes. Industry support is used to source experts in related technological innovation. Examples have included resource (in this case CO_2, N_2 and H_2) recovery from process flue-gas, mine tailings water recycling as well as ethanol and bio-plastics production from sugar mill by-products.

CURRENT CHALLENGES FACING THE ORGANIZATION

To date at least 15 unique engineering subjects at JCU have been updated in order to embed sustainability within the curriculum. The JCU engineering staff numbers are comparatively small, which has led to a highly integrated and interdisciplinary program structure. This has been a significant advantage in helping to expand interdisciplinary curricula and avoiding silo thinking. However, I certainly believe that the use of broad scale non-disciplinary capability key-words is also very useful in avoiding silo thinking. Whilst there has been strong engagement by most staff in the early attribute development workshops, engagement and participation in the actual development and integration of new curricula has been less universal. The uptake amongst a tighter group of more dedicated teaching staff (approximately 12 academics) has been strong, and the most significant embedding and scaffolding of content has been within the chemical engineering program. Embedding within this discipline has developed to such an extent that a new sustainability minor is set to begin in 2015 (available to all engineering programs) enabling other disciplines to learn the new curriculum. Sustainability is strongly supported by chemical engineering experts in both industry and academia and the emerging global imperative to embed sustainability within chemical engineering education provides weight to the argument that curriculum reform in this area is unavoidable. Furthermore, the response of students to the curriculum reform, across a range of student feedback mechanisms, has been universally positive.

There remain pockets of resistance to curriculum reform, particularly amongst established academics and some senior executives. Our experience suggests that resistance arises from a number of different sources. One source of resistance arises from the complex time demands on current academics and the establishment's emphasis on research performance as the traditional pathway to promotion. Strong and supportive leadership from the executive can reduce this barrier by recognising and encouraging curriculum reform as a legitimate and valued academic activity. We have tried to address this barrier at JCU by providing professional development (PD) funds that facilitate the alignment of an academic's research with sustainability. To ensure focus we included requirements that teaching outcomes (curriculum reform) must result from the PD support. There has been good uptake of PD, particularly from academics that are themselves motivated to undertake sustainability-related research and are eager to incorporate their research into their teaching. There has also been good uptake of PD from academics that hold strong personal commitments to sustainability. These academics see great value in the curriculum reform and are motivated by enhancing student learning and improving graduate quality.

Another source of resistance arises out of teaching staff observations that there is limited room for new curriculum in engineering degrees, and that there is a reluctance in letting other curriculum go. However, this constraint is a constant challenge for academics maintaining modern engineering degree programs and avoiding stagnation in curriculum. It is necessary to convince academics that programs change and the needs of industry (i.e. graduate attributes) also change. Engaging industry in curriculum reform is a good way to reinforce the acceptability and desirability of new curriculum. It is widely acknowledged that industry are looking for future engineers who have more developed social/ecological/economic skills and are also more experienced in inter-disciplinary teamwork and projects. Industry is probably more willing to reduce traditional technical curricula to enhance these graduate qualities. The trade-offs involved in developing new curriculum are still being explored at JCU. Closely related to staff reluctance to move away from traditional degree programs (for fear of losing important existing curricula) is the perception of sustainability as a soft science or even a life-style (ethical) choice for which the university has no responsibility. The latter group may have an inherent mistrust of the "environmental activist" associations with sustainability or may simply be less aware of the rigorous and complex methodologies associated with integrating sustainability into engineering design. Strong leadership and professional development such as targeted seminars are important to changing these perceptions. Staff members need to recognise that the drive to embed sustainability is important to both the Institution and also of benefit to the students and their prospective employers. Another common comment by an academic resistant to curriculum reform is to state that "I already include sustainability in my teaching" and thus do not need to change anything. Whether this is driven by the time demands placed on academics or a lack of understanding of the relevance of sustainability within their teaching domain is unclear. Professional development aligned with sustainability and peer example and encouragement are some of the most important drivers for long lasting change to occur. Providing adequate funding for curriculum design is particularly important because traditional teaching resources in sustainability are often unavailable and obtaining suitable learning resources can be more difficult.

CONCLUSION

This chapter provides an overview of the progress in embedding sustainability into engineering and particularly chemical engineering undergraduate programs at James Cook University. Emphasis in the review is placed on identifying the characteristics associated with developing a students' awareness of sustainability. A set of capabilities associated with the awareness of sustainability generic attribute are described because they facilitate curriculum mapping and design and offer increased flexibility in the teaching curricula. A broad-scale map is described which is a helpful template for staging curriculum across the entire program. A finer-scale learning matrix which is populated with specific subject learning outcomes aligned to sustainability capabilities is also described. The learning matrix and subject learning outcomes are shown to be very useful for designing new curriculum which progressively develops a students' awareness of sustainability. A number of curriculum examples are described to help other teachers to embed sustainability within their subjects.

Chapter 41
Managing and Planning Technology Usage and Integration in Teacher Education Programs in an Emergent Nation

Nwachukwu Prince Ololube
Ignatius Ajuru University of Education, Nigeria

ABSTRACT

This chapter explores the impact of the changing context of Information Technologies (ITs) and Information Systems (ISs) on Teacher Education (TE). ITs and ISs have influenced educational philosophy and classroom practices all over the world. Significant technological innovations over the last three decades have altered the environment in which educators operate and profoundly changed the experience of both formal and informal education. The impact and pervasiveness of ITs and ISs have forced traditional Colleges of Education and University Faculties of Education into a period of transition and transformation. Colleges and Faculties of Education have, for example, become sites of branding and rebranding. The policy makers associated with these programs reflexively look to market-based solutions without first giving serious thought to the challenges preventing the effective integration and use of ITs and ISs in TE, particularly in developing economies. Using a theory-based method of analysis, this chapter gathers and analyzes contemporary views and ideas on education and technology. This chapter finds that the impact of ITs and ISs on TE programs in Nigeria has shortchanged these programs. As a result, education consumers and stakeholders are dissatisfied with the slow integration and use of ITs and ISs in government-owned institutions of higher education in general and in TE programs in particular.

INTRODUCTION

The globalization of the education sector and impacts of globalization on the workforce require a different kind of education; one that enhances the ability of learners to access, assess, adopt, and apply knowledge, to think independently, to exercise appropriate judgment, and to collaborate with others to make sense of new circumstances. Much like globalization, emerging technologies have impacted all aspects of national economies and societies. Teacher education has been highly affected by global trends in technology, particularly its economics and business content (Singh & Papa, 2010). Among UNESCO's recent strategic objectives for improving the quality of higher education are the diversification of content and methods, the promotion of experimentation and innovation, and the diffusion and sharing of information, best practices and policy dialogues (UNESCO, 2002, 2003). Many of these objectives relate directly to information technologies (ITs) and information systems (ISs) which have become critical personal and social tools and have had a revolutionary impact on how we see and love in the world (Ololube, Kpolovie, Amaele, Amanchukwu, & Briggs, 2013). In the context of teacher education, ITs and ISs involve the gathering, processing, storing, distributing and use of information in a range of strategy, management and operational activities with the aim of improving the effectiveness and efficiency of teachers.

Information capitalism and globalization have likewise impacted the ways in which teaching and learning are carried out in education programs around the world (Singh & Papa, 2010). Innovations in educational technologies are revolutionizing educational design and methodology (Miniaoui & Kaur, 2014). These trends, however, are not widespread and must be further strengthened if they are to reach a large percentage of the population, especially in the third world. In a complex society like Nigeria, many factors affect the use and integration of technologies in the teaching and learning process. As a result, a proactive, interdisciplinary and integrated approach is required to ensure the successful development of teacher education and, in turn, the successful future development of the national economy (Ololube, 2014).

The global academic landscape includes research, teaching and learning. It includes educational programs and courses, the pedagogy or methodology of teaching, the research process (including dissemination and publication), library information systems and services, and administration and management. The integration of IT and ISs in teacher education programs has been the topic of a great deal of debate throughout this landscape. In Nigeria, the relationship between the development of ITs and ISs for teacher education programs and their diffusion into programs in Colleges of Education and university Faculties of Education is dependent upon governmental policies (Ololube, 2011).

Information technologies and systems are indispensable and have been accepted as part of the contemporary world especially in industrialized societies. In fact, many have already begun considerable adjustments to meet the challenges and opportunities of the knowledge age. The pervasiveness of ITs/ ISs has brought about rapid changes in technology and attendant social, political, and economic transformations (Ololube, 2006a). The field of education has not gone untouched. Without a doubt, ITs and ISs have impacted the quality and quantity of teaching, learning, and research in teacher education programs globally and to some extent in Nigeria. ITs and ISs provides opportunities for student teachers, and academic and non-academic staff to communicate with one another more effectively during formal and informal teaching and learning (Yusuf, 2005). Consequently, student teachers and academic and non-academic staff now require training not just in basic computer literacy, but also in the use of various communication and educational software packages and applications (Ololube, 2006b).

Teachers today must begin to learn at the outset of their teacher training programs about how to effectively integrate ITs/ISs into their classroom activities and school structure. Given that the quality of faculty is known to be a key predictor of student learning (Ololube, 2011), teacher education faculty training in ITs/ISs use is thus critical. Both ITs and ISs can facilitate student teacher training and help student teachers to take full advantage of the potential of technology to enhance quality and student learning in their own future classrooms. ITs/ISs have also introduced a new era in traditional face-to-face (f2f) methods of teaching and learning and in blended learning (BL). It is therefore pertinent that Nigerian education settings open themselves to the benefits that these new trends have offer in terms of building capacity and improving access to information.

The ability to effectively manage and plan for ITS/ISs enhances the proactivity of authorities with respect to information relevant to teaching services, in line with global best practices. When properly approached, ITs/ISs management can provide some of the essential information needed to manage education systems in an efficient and productive manner. This management effort must involve teachers and students as well as administrators and policymakers (Figure 1).

PURPOSE OF THE STUDY

In a complex society like Nigeria, we recognize that a number of prominent factors affect the successful development of teacher education programs. As such, it is quite impossible to consider all such factors at present. The purpose of this study is thus to address, exclusively, ITs and ISs in relation to teacher education and the sustainable development of education in Nigeria. This paper asserts that the effective use of ITs/ISs in teacher education addresses both the problem and solution to technology-based learning. ITs/ISs enable synergistic results that benefit pre-service teachers as they graduate and carry out their duties as teachers. Nonetheless there remains a need to better design teacher education curriculum and programs so that pre-service teachers can better plan for unanticipated and unintended results that confront them in the classroom in terms of ITs/ISs. At the societal level, ITs/ISs help us to better manage complex information flows and to integrate these flows in effective policy formulation and planning towards the maximization of human capital and potential.

It is more important now than ever that teacher education programs recognize these and other positive ramifications of ITs/ISs and ensure their graduates are equipped with effective and integrated tools and training modules to lead the next generation of students in the dynamic and innovative use and further development of these tools. Despite efforts by both the federal and state government, however, to establish effective teacher education programs in Nigeria, an ongoing lack of adequate ITs/ISs infrastructure on university and college campuses has reduced access to ITs/ISs instructional material for both faculty and students. Consequently, most teachers and student teachers rarely, if ever, come into contact with ITs/ISs aided instructional materials (Ololube, Umunadi & Kpolovie, 2014).

The desire to carry out this research arose from the need to examine the effectiveness of teacher education programs in Nigeria in relation to the role and usage of ITs/ISs. Theoretically, this paper aims to ascertain the degree to which ITs/ISs has impacted the development of teacher education. In general, the purpose of this study is to verify the research hypothesis as a basis for encouraging Nigerian institutions of higher education to maintain or improve the quality of their teacher education programs. This paper hopes to provide education administrators, planners and policymakers with the empirical models that will help them to better come to terms with the reality on ground in terms of the effective application of ITs/ISs in teacher education programs.

TEACHER EDUCATION PROGRAMS IN NIGERIA

Nigerian Colleges of Education and Faculties of Education in universities are openly committed to excellence in teacher education programs. Excellence in teacher education can be taken to mean effectively providing teaching and learning experiences that prepare student teachers for the challenges of today's multi-faceted, ever varying, and varied workplace (Ololube, 2006). The guiding philosophy of teacher education is to produce student teachers with sharp intellectual minds capable of further critical intellectual inquiry (Ololube, 2011). Colleges and Faculties of Education are among several institutions in Nigeria that offer teacher education services to students who wish to specialize in subjects including agricultural science, arts, environmental sciences, health education, humanities, information and communication, management and social sciences, and the natural and applied sciences.

Colleges of Education offer post-secondary National Certificate in Education (NCE) training programs. The NCE is the qualification required to teach in junior secondary schools and technical colleges. In addition to training junior secondary school teachers, Colleges of Education now also train primary school teachers. The NCE has become the minimum qualification for primary school teaching as of 1998. Some of the Colleges also offer NCE pre-primary courses to produce qualified teaching personnel for the pre-primary level (Moja, 2000). Universities in Nigeria offer Bachelor of Education degree programs to both senior secondary school graduates and senior secondary school teachers who already have NCE qualifications. They also offer Masters and Doctorate degree programs in education.

Introduction to Computer Science is a fundamental course for student teachers in Nigeria either as part of their program or as a part of a previously completed major. Computer science is ideally taught in a general and applied fashion and produces graduates who are scientifically and technically skilled in information processing, data collection and analyses, and communication. All of this should be set in a problem-solving context where students learn about the planning and management processes involved in using computers. Introduction to Computer Science should also involve teaching and learning about the information needs of computers, the design of information management systems, and the principles and practices of system usage.

The successful completion of an introductory course in computer science is a critical accomplishment for undergraduate students who may one day be at the helm of decision making in their workplace and looking to keep pace with the demands of a globalized economy. This course is equally important for students who are planning to further their studies in the future and who, as graduates, will need to make informed professional development decisions using ITs/ISs. Introduction to computer science courses are challenging classes to teach because the technical complexity of the course material is quite high while student interest in this material can, unfortunately, be quite low. In most cases, take home assignments are given to students with basic instructions and sources for materials on the Internet. In some cases, assignments are submitted to faculty members via e-mail and feedback is provided to students days after the submission also via e-mail.

In Nigeria, the need for well qualified teachers cannot be underemphasized. Teacher education is a means of providing teachers with the skills and knowledge needed to carry out their teaching responsibilities (Osunde & Omoruyi, 2004). Teacher education is concerned with the art of acquiring professional competencies and professional growth. It is designed to produce highly motivated, sensitive, conscientious and successful classroom teachers who will handle students effectively and professionally towards better educational achievement (Ololube, 2005a, b). According to Amedeker (2005), inadequate teacher preparation programs results in teachers' inability to demonstrate adequate knowledge and understanding of the structure, function and development of their disciplines. An effective teacher education program is thus a prerequisite for a reliable and resilient education which leads to confidence among both teachers and students as a result of effectively and professionally coordinated learning (Lawal, 2003; Umunadi and Ololube, 2014).

Teacher education programs in Nigeria are under the supervision and control of governmental organizations. The National Commission for Colleges of Education (NCCE) (2013) has responsibility for teacher education in Nigeria delivered by Colleges of Education. At present there are 74 Colleges of Education, of which 22 are controlled and funded by the Federal Government, 47 are controlled and funded by state governments, and 3 are owned by private agencies. The NCCE was established in 1990 to set minimum standards for all teacher education programs and accredit their certificates and other academic awards after obtaining the prior approval of the Minister. The Commission has also been given responsibility for approving guidelines and establishing criteria for accreditation for Colleges of Education in Nigeria. Nigeria's 129 universities, in contrast, are under the direct supervision of the National Universities Commission (NUC) (2013). Polytechnics, of which 9 run Nigeria Certificate in Education (NCE) programs, fall under the National Board for Vocational Colleges and Technical Education (NBTE) (2013) (Table 1).

Table 1. Status and list of institutions that offer teacher education programs in Nigeria

Institutions	Numbers
Federal Colleges of Education (Regular)	11
Federal Colleges of Education (Technical)	10
Federal Colleges of Education (Special)	1
State Colleges of Education	47
Private Colleges of Education	5
Polytechnics with NCE Programs	9
Universities with Teacher Education Programs	89

The National Teachers Institute (NTI) was established to provide refresher and upgrade courses to teaching personnel, to organize workshops, seminars and conferences, and to formulate policies and initiate programs that will lead to improvement in the quality and content of education in the country. In pursuit of this, the Institute has initiated training and retraining programs to help unqualified primary school teachers receive the qualifications now required. Recently, the Institute also embarked on an NCE program through a Distance Learning System (DLS). Lastly, the Institute provides training for the Pivotal Teachers Training Program (PTTP) also by means of a DLS. The PTTP was introduced in 2002 as a means of producing teachers to fill the gap in teacher supply for the Federal Government's newly introduced Universal Basic Education (UNBE) (Osunde & Omoruyi, 2004).

The requirements for admission to teacher training differ depending on the type of institution. Colleges of Education require prospective candidates to have at least three credits in senior school and two other passes. At the university level, prospective candidates must have five senior school credits that include the chosen major teaching subjects. Prospective College of Education and Polytechnic students are required to sit for and pass the Polytechnic/College of Education Matriculation Examination, while prospective university students are required to pass the Joint Admission and Matriculation Board Examination (Moja, 2000).

ITS/ISS AND TEACHER EDUCATION

Many Nigerian teachers have been unable to find effective ways to use technology in their classrooms or any other aspect of their teaching and learning life. In terms of an explanation, teachers often note that cite their use of technology in the classroom has not been encouraged and that they have not been well trained in the use of ITs/ISs as teaching tools and a means for educational sustainability (Ololube, 2006), notwithstanding the specifications in the National Policy of Education (FRN, 2004). Nigeria as a nation has come late and slow to the use of ITs/ISs in all sectors, particularly education. This is a result of chronic limitations brought about by both economic disadvantages and government policies. These factors have a direct impact on the nation's educational development.

In a 2005-2006 study by Global Information Technology (2005), the Networked Readiness Index (NRI) was used to measure the degree of preparation of 115 economies for participating in and benefitting from ITs/ISs development. Nigeria ranked 90th out of the 115 countries surveyed. The United States of America topped the list, followed by Singapore, Denmark, Iceland, Finland, Canada, Taiwan, Sweden, Switzerland and the United Kingdom. In a similar study of 104 countries in 2004 Nigeria ranked 86th (Global Information Technology, 2004). Thus rather than showing improvement, Nigeria's readiness is declining. Slow or limited access to basic ITs/ISs equipment, low Internet connectivity, inadequate computers, and poor use of audiovisual materials and equipment (films, slides, transparencies, projectors, globes, charts, maps, bulletin boards, programmed materials, information retrieval systems, and instructional television) in teacher education programs are very real barriers to the effective and professional development of teachers in Nigeria (Ololube, 2006). Administrators and instructors must thus make educational technology an integral part of teaching and learning so as to provide a clear demonstration of how the use of instructional technology tools can address the personal and general objectives of teaching and learning in Nigeria.

In recent years the integration of ITs/ISs in university teaching, and particularly in teacher training programs, has been the topic of much discussion (Larose et al., 1999) as ITs/ISs has impacted the quality and quantity of teaching, learning, and research in traditional and distance education institutions around the world. In concrete terms, ITs/ISs literacy has enhanced teaching and learning through its dynamic, interactive, and engaging content, and has provided real opportunities for individualized instruction (Newhouse, 2002a). Information and communication technology has the potential to accelerate, enrich, and deepen skills, motivate and engage students in learning, help to relate school experiences to work practices, help to create economic viability for tomorrow's workers, contribute to radical changes in school, strengthen teaching, and provide opportunities for connection between institutions and the world. ITs/ISs can make education more *efficient and productive* by engendering a variety of tools to enhance and facilitate teachers' professional activities (Yusuf, 2005). To Newhouse (2002b), technology is further developed to solve problems, improve living standards and to increase productivity. It is reasonable to expect educational technology to be developed with similar objectives. That is, if a teacher selects the most appropriate educational technology, student learning can be optimized and an increase in the value of the outcome obtained (Ololube, 2014).

Newhouse (2002a) explains educational productivity as a concept most happily found in economics textbooks where the productivity of a worker or economic unit is defined by dividing the output (revenue) by the input (costs). This is generally more difficult to define for the education industry since the output is not easily measured, particularly in monetary terms, to enable its comparison with costs. Nonetheless, Newhouse offered a helpful definition of output as the quality and quantity of learning demonstrated by students, or learning outcomes.

The concept of teacher ITs/ISs literacy is theoretically unclear and changing in that the precision of the definition depends on whether it occurs at the level of operational abilities or at other levels. Most contemporary authors tend to center the definition of ITs/ISs literacy on a few core competencies or abilities, which might then determine whether teachers know or do not know how to use ITs/ISs instructional material. Ideal definitions go beyond this to include the ability to prepare and use a selection of appropriate and operational ITs/ISs materials, and the ability to identify and efficiently affect specific student purposes in order to build knowledge and develop critical and creative thinking. Teachers committed to improving their competence in ITs/ISs are likely to contribute, directly or indirectly to the growth of student's achievement (Ololube, 2014).

Teacher education and training is a means for professional updating, which deals with all developmental functions, directed at the maintenance and enhancement of one's professional competence and literacy. Teacher education and training must support the idea that ITs/ISs is an important factor in teachers' job effectiveness and professional development. Studies concerning staff training and education clearly demonstrate the need to offer teachers better opportunities to develop their ITs/ISs based knowledge in order to support this effectiveness (Kautto-Koivula, 1993, 1996). Teachers need techniques, tools and assistance that will help them to develop ITs/ISs based projects and activities designed to elevate the level of teaching in required subjects and in turn improve student learning and academic achievement (Aduwa-Ogiegbaen & Iyamu, 2005).

Newhouse (2002b) has classified the educational impacts of the use of ITs/ISs along five dimensions. These are:

- Students Attributes [ITs/ISs Capability, Engagement, Achievement of Learning Outcomes].
- Learning Environments Attributes [Learner-centered, Knowledge-centered, Assessment-centered, Community-centered].
- Teacher Professional ITs/ISs Attributes [Vision and Contribution, Integration and Use, Capabilities and Feelings].

- School ITs/ISs Capacity Attributes [Hardware, Connectivity, Software, Technical Support, Digital Resource Materials].
- School Environment Attributes [Leadership and Planning, Curriculum Organization, Curriculum Support, Community Connections, Accountability].

In contrast to many of the studies citing the benefits of ITs/ISs teacher training, Larose et al., (1999) argue that regardless of the quality of ITs/ISs equipment available to teachers and independent of the quantity of courses they have taken in their undergraduate studies, the transfer of acquired competencies and learning into practice is poor. The major impact of education on the educated, in fact, remains at the level of the "private" use of these technologies and not in their integration into daily teaching practices. In their findings, many of the educated, no matter the level of education, are computer literate but do not use technologies in their teaching because of their fear that the rate of obsolescence of the hardware and/or software will make their task more complex and interminable.

Furthermore, a recent research study (Ololube et al., 2013) which focused on the perceived use, ease of understanding, self-efficacy, facilitating conditions, behavioural intentions, and attitudes and anxieties towards computer use among higher education students and faculty in a developing economy, found that IT/IS constitute an important force in efforts to build an information technology society and to join the international community in meeting the Millennium Development Goals. Higher education institutions are enduring entities that must ensure and create the diffusion of knowledge for national development. Society depends on these institutions for its growth and for the production of new knowledge, its transmission through education and training, and its dissemination through information communication technologies.

DISCUSSION

Theoretical and personal observation evidence suggests that teacher training programs provided by Nigerian institutions of higher education are hindered by their ineffective use and provision of ITs/ISs instructional materials. Although, based on observation, teacher preparation programs have slightly impacted the level of performance of Nigerian teachers this has not been to the extent needed to meet UNESCO's (2005) Millennium Development Goals (MDGs) for education. It might be deduced that there is a considerable relationship between ITs/ISs integration and usage and the poor standard of teacher education programs in general which invariably affect the student and in-service teachers' classroom performance. Yusuf's (2005) study, for example, found that most teachers in Nigeria do not have the needed experience and competence in the use of computers for educational or industrial purposes. Most, in fact, lack competence, skills and knowledge in basic computer and software operations. Yusuf found no significant difference between male and female teachers in their experience in using ITs/ISs materials, their levels of proficiency in computer operations, and their use of common software. Furthermore, the introduction of computer education into Nigerian secondary schools in 1988 has largely been unsuccessful as a result of teacher incompetence. Studies (e.g., Yusuf, 2005) have recognized that teachers' ability and willingness to use ITs/ISs materials and integrate these into their teaching is largely dependent on the quality of professional ITs/ISs development received.

Teachers trained in today's teacher education programs are not technologically equipped to meet the challenges of the 21st century and carry out their duties in line with global transformations in science and technologies. Existing curriculum designed for the training of student teachers in Nigeria does not include the practical usage of ITs/ISs materials such as computers, software, slides, and overhead projectors. In situations where computers are provided, training is based only on theoretical models. Student teachers rarely come into contact with ITs/ISs instructional materials, including those in the department of educational technology proper.

The institutions responsible for the provision of teacher education programs provide programs within the confines of the mandate given to them by federal and state governments through various bodies that coordinate their activities. Their ability to be effective is dependent, for the most part, on the policies set by these bodies and the availability of funds for the purchase and maintenance of much-needed ITs/ISs equipment. According to Osunde and Omoruyi (2004), the greatest problem faced by teacher education programs is inadequate funding coupled with a lack of library facilities and inadequate teaching/learning materials. This may account for much of the limited effectiveness of the teacher training programs. It is possible as well that some of the hardship faced by these institution, and their inability to develop an effective and proficient ITs/ISs literate teaching cadre, is as a result of corrupt practices by both federal and state government officials on the one hand, and the regulatory bodies and officials in teacher education institutions on the other.

CONCLUSION AND RECOMENDATIONS

Technological changes over the past three decades have rendered teacher education and training more important than ever. Teacher education programs around the world, however, are struggling to keep up with the new demands placed on them by the 21st century classroom. They are working, albeit slowly, towards providing their graduates with the knowledge and skills needed in evolving marketplaces and sophisticated learning environments, and to prepare teachers for lifelong learning. In order to meet these challenges, many countries have begun to focus concurrently on expanding access, improving internal efficiency, promoting the quality of teacher teaching and learning, and improving system management (Haddad & Jurich, [n.d]).

Quality education is seen as the main instrument for social, political and economic development of a nation. Thus the strength, security and well-being of Nigeria rest squarely on the quality of education provided for its citizens. Education has enabled a steady supply of human resources for national economies, especially in the west where education is seen and accepted as an effective instrument for success. It is thus essential that we recognize that teachers are indispensable for successful learning about ITs/ISs, and learning and teaching through ITs/ISs s to improve the standard of education in Nigeria.

ITs/ISs is an important instrument in the development of quality teaching and learning in educational systems around the world, as well as a means for fundamentally transforming existing school principles and practices to better prepare students to meet innovations in the global arena. Achievements in ITs/ISs penetration and usage in Nigeria teacher education programs are dependent on the recognition, by federal and state governments and educational authorities, of the importance of ITs/ISs application to education for sustainable development. This recognition must manifest as useful policies and the provision of sufficient funds on the one hand and the implementation of policies by coordinating bodies and the institutions themselves on the other. It is clear that secondary school students in Nigeria are already far behind their peers in developed countries and that the digital divide continues to grow (Aduwa-Ogiegbaen & Iyamu 2005). Federal and state governments, through The National Universities Commission (NUC) and the National Commission for Colleges of Education (NCCE), must thus invest heavily in the institutions that offer teacher education programs. Such an effort will create an enabling environment in which teacher education programs can to strive to produce highly qualified and ITs/ISs literate teachers that will help to make the integration and use of ITs/ISs in schools a success.

Teacher education institutions in Nigeria must assume leadership role in revolutionizing education or be left behind in the wake of rapid technological changes. Accordingly, for Nigerian education to reap the full benefits of ITs/ISs in learning, it is essential that student teachers and in-service teachers are able to effectively use ITs/ISs tools for learning. As noted by Newhouse (2002a, 2002b) and UNESCO's (2002) with emerging technologies, the teaching profession is evolving from emphasis on teacher-centered, lecture-centered instruction to student-centered interactive learning environments. Designing and implementing successful ITs/ISs enabled teacher education program is thus the key to fundamental, wide-ranging educational reforms.

Teacher education institutions and programs must provide leadership in new teacher education models, pedagogies and tools for learning through an effective strategic plan. That is, leadership in teacher education programs should be visionary about conceiving a desired future state, which includes the depiction of where and what the teacher education program should be in the future, without being constrained by such factors as funding and resources. It must then work backward to develop an action plan to bridge the gap between the current and desired state (Ololube, 2014).

This chapter sought to provide an understanding of the impact of ITs/ISs on teacher preparation so as to support the nurturing of a new caliber of teachers whose professional abilities are key to the development of a struggling economy. This is so because the purpose of teacher education is no longer simply to convey a body of knowledge, but to teach how to learn, how to problem-solve and how to blend the old with the new. It is therefore imperative to establish innovative programs and curriculum that will address the challenges of teacher education in a globalized world.

This study proposes that Colleges and Faculties of Education undertake a strategic planning analysis to determine their strengths, weaknesses, opportunities and threats (SWOT). As part of this analysis, they should first determine the intellectual capabilities needed to cope with current complexities in teacher education programs. Second, they will need to set priorities for teacher education programs according to the present and future needs and demands of Nigeria's citizenry. Third, they must be on the lookout for opportunities to improve and guarantee the quality of education. Finally, Colleges and Faculties of Education must be creative and prepare themselves for the challenges of the 21st century in line with the MDGs for both education for sustainable development.

KEY TERMS AND DEFINITIONS

Information Systems (ISs): An integrated set of components that collect, store, and process data for delivering information, knowledge, and digital products. Twenty-first century schools rely on information systems to carry out and manage their teaching and learning processes.

Information Technologies: (**ITs**): The application of computers and telecommunication materials that store, retrieve, transmit and manipulate data in diverse contexts. ITs are commonly referred to as computers and computer networks, which encompass other information distribution technologies such as projectors, the Internet, blended learning tools, televisions, mobile phones, etc.

ITs/ISs Infrastructures: ICT components and resources such as computers, Internet access, power supply, and telecommunication facilities as well as ITs/ISs libraries, personnel, and funds, among others.

ITs/ISs Knowledge: The knowledge, skills, experiences, and abilities needed to stay informed of current technological developments. It is a collective knowledge that is interested in contributing to further ITs/ISs knowledge that will, in turn, lead to individual, national and global development.

Teacher Education: The procedures designed to equip prospective teachers with the skills, attitudes, knowledge and behaviors required to perform tasks effectively in the school setting and community.

Teacher Training: Specialized training organized to promote and produce cutting edge professionals for high quality teaching. It helps teachers to develop subject matter command, skill, and ability combined with exceptional understanding of how to create positive student learning experiences.

Chapter 42
Moving Beyond a Focus on Delivery Modes to Teaching Pedagogy

Judi Simmons Estes
Park University, USA

ABSTRACT

The use of online methodologies to deliver coursework has become institutionalized in higher education. There is an urgent need to move beyond the question of which delivery model is most effective: face-to-face, fully online, or blended, and switch the focus to teaching pedagogy and strategies that effectively engage students in the learning process. This chapter posits that student-learning outcomes are less dependent on delivery mode and instead dependent on a teacher's pedagogical practices; it is the skill of the teacher as facilitator that drives the effective development of the learning community and influences student-learning outcomes. Further, it is suggested that constructivism, as a pedagogy of teaching, be considered, regardless of delivery mode; students construct their own knowledge as the teacher facilitates the process through providing opportunities for active engagement and critical inquiry within a community of learners. Teaching opportunities are adapted in response to the needs of students with technology as a tool to deliver learning outcomes.

INTRODUCTION

There is general agreement that enrollment in online courses, in institutions of higher education, is showing a substantial increase (Means, Toyama, Murphy, Bakia, & Jones, 2009); over 6.1 million students enrolled in at least one online course in the fall of 2010 (Allen & Seaman, 2011). In addition, the availability of online courses has also shown a significant increase in the last eight years (Christensen, Horn, Caldera, & Soares, 2011). The rapid growth of online education has been identified as one of four key trends changing institutions of higher education; increasingly students want to access educational opportunities whenever and wherever they choose (Johnson, Smith, Willis, Levine, & Haywood, 2011). The growth of online delivery of coursework increased 21% in 2009, a substantially higher rate of growth than the 2% growth in overall higher education student

DOI: 10.4018/978-1-4666-8246-7.ch042

enrollment (Allen & Seaman, 2010). Interestingly, 33% of baccalaureate awarding institutions view online courses as critical to their strategic plan (Allen & Seaman, 2008).

BACKGROUND

To be considered an online course 80% or more of the content is delivered via the Internet (Simonson, Smaldino, Abright, & Zvacek, 2009). Students vary in regard to the type of delivery model they prefer; some are drawn to blended (hybrid) courses that meet face-to-face (f-2-f) and have 30-80% of content delivered online (Allen & Seaman, 2007). Blended courses offer institutions, faculty and learners flexibility responsive to the context in which the course is being delivered. The combinations of f-2-f and online delivery of instruction vary and both students and faculty tend to like this combination and enjoying the benefits of each delivery model. When using the blended format, teacher sometimes meet weekly and use the online format to extend time to focus on discussion through online discussion threads. Others teachers may meet predominantly online with some f-2-f contact typically requiring a meeting at the beginning, middle, and end of the course.

According to Freeman (2010), distance learning occurs when time, location, or both separate teacher and the students, and contact can be either synchronous (real-time, teacher-led event in which all students are "in class" at the same time) or asynchronous (interaction between teacher and students occurs intermittently with a time delay). F-2-f, blended and online learning can occur in a variety of models using both synchronous and asynchronous strategies.

Blended learning has been found to offer the best of both online and f-2-f delivery (Vaughan, 2007) and has demonstrated effectiveness in the teaching-learning process (Picciano & Dziuban, 2007). Yet, some researchers have posited that blended learning is not "better" than an online delivery model (Reasons, Valadares & Slavkin, 2005). Rovai and Jordan (2004) concluded that although a blended course allows another means of delivery in education, and one that is rather flexible in nature, it is the skill of the teacher as facilitator that drives the effective development of the learning community and promotes satisfactory learning outcomes for students.

There has been an ongoing debate in the literature as to whether online courses are as effective as traditional courses (Chen & Jones, 2007). However, the results have been inconsistent and lacking empirical data to support any definitive conclusions. Grandzol and Grandzol (2006) posited that in regard to delivering instruction online, it is time to move past researching which mode of delivery is "best," and rather focus on identifying and validating "best practice" for effective instruction regardless of the mode of delivery.

PEDAGOGY OF TEACHING

"Times are changing for higher education….. [From] using technology to expand distance education, to the recognition of the importance of sense of community, we are witnessing a transformation of higher education" (Rovai & Jordan, 2004, p. 1). The practice of offering education online is inviting an examination of the pedagogy of teaching approaches used by institutions of higher education for both face-to-face and online delivery (Giroux, 2001). Pedagogical approaches, how teachers orchestrate classroom learning, do matter, especially today as changes are occurring in traditional methods of teaching in order to meet the needs of students (McKenzie, 2003). If one's teaching pedagogy is clear, then it becomes easier to maintain that integrity as an instructor moves a course from face-to-face model to a blended format or fully online.

Russell (1999) concluded that the amount of learning that occurs in a course is independent of the instructional delivery model or the technology involved and instead depends on the pedagogical practices used by the facilitator; effective teaching can occur in any classroom setting where both students and teachers are invested in the learning process. It is not necessarily the pedagogy of instruction that changes, related to mode of delivery of instruction, but rather the on-going teacher decision-making and reflection that occur while determining the strategies that most effectively deliver instruction while meeting the needs of students. The pedagogy of the teacher is key to the instructional learning process and how instruction is delivered. There is an argument that the most pressing pedagogical issues of the online learning environment include opportunities for interaction, teacher feedback, and course rigor (Compton, Davis, & Correta, 2011).

Teacher as Facilitator

Similar to the f-2-f classroom environment, online instruction is most effective when faculty view themselves as "the guide on the side" of the learning process, rather that the "sage on the stage" (King, 1993). The idea of teacher as facilitator of the learning process is steeped in the theories of Dewey (1859-1952), Vygotsky (1896-1934), Piaget (1896-1980), and Bandura (b. 1925); collectively these theorists laid the foundation for and development of constructivism. Constructivism is a pedagogy of teaching that promotes social interaction and student engagement as well as promoting critical thinking, inquiry, and problem-based learning. A teacher as facilitator plays an integral role in promoting and sustaining critical discourse and constructive social dynamics, managing both learning (e.g., promoting higher level thinking) and the social aspect (e.g., maintaining an appropriate flow of discussion and timely submission of assignments) in an online learning environment. Promoting learning through reflective thought is a role of the facilitator (Land & Zembal-Saul, 2003).

Researchers have stressed the role of teachers in delivering instruction online (Hara & Kling, 1999) as is also true for teaching f-2-f. Teachers must interact with students on a cognitive, emotional, and social level to be most effectives. This is not new information as this is the case for teaching f-2-f. Yet, it may be more important to offer opportunities for social engagement online because the online environment can create a sense of social distance between students. There is a need to overcome those barriers.

Edelstein and Edward (2002) noted that online courses are successful when the students are involved and active participants. Learners must get to know each other and establish relationships based on trust where each member's comments are valued. The sense of shared values and goals gives an online group a sense of community. As the community progresses in development, sharing and reflection should dominate the dialog; when the community matures, teachers as facilitators guide the group into activities involving higher-level thinking. Digenti (1998) mentioned that participation in a learning community involves cognitive skill and social skills. Critical discourse is the primary process by which the learning community members grow, moving from basic knowledge to deeper understanding, restructuring knowledge, an ultimately making the information their own (Ryman, Hardham, Richardson, & Ross, 2009). Shea, Li, and Picket (2006) reported positive relationships between teacher presence and sense of classroom community.

Chickering and Gamson (1987) introduced seven principles for good practice in undergraduate education. Chickering and Ehrman (1996) suggested ways to use technology with each principal to achieve student interaction, collaboration, and active learning as well as teacher use of promoting expectations, feedback, and respect for diversity. The seven practices include 1) encourage contact between students and faculty, 2) develop reciprocity and cooperation among students, 3) encourage active learning, 4) give prompt feedback, 5) emphasize time on task, 6) communicate high expectations, and 7) respect diverse talents and ways of learning. Chickering and Ehrman set the stage for the idea that "new" technology can be used to implement the seven principles for good practice. Given that technology is ever changing and there is no way for educators to predict the technology that may be available in the future, it is likely that there will always be "new" technology to be used. The anchor for good practice is the pedagogy of teaching that underpins the use of technology.

Grant and Thornton (2007) verified the usefulness of the seven practices (Chickering & Gamson, 1987) of undergraduate education, through comparing them with comments on student evaluations; three themes arose that can serve as a bridge between teaching f2f and online: 1) course design, 2) instructional practices, and 3) interactivity/interconnectivity in teaching-student interactions. Whether f-2-f, online, or blended delivery, a common factor in student success is the teacher who views their role as a facilitator of a learning community. Each of these seven principles of good practice is consistent with the tenets of constructivism. Encouraging contact between students and faculty, building cooperation among students, and encouraging active engagement build community and support learning within a social environment. Giving prompt feedback, emphasizing time on task, communicating high expectations, and respecting diverse talents and ways of learning are integral to the role of teacher as facilitator.

Building a Learning Community

There is growing interest in the factors that constitute a learning community online; several online community scales have been developed (Bolliger & Inan, 2012; Lin, 2004; Randolph & Kangas, 2008; Rovai, 2002; Tu, 2002; Young & Bruce, 2011). Rovai's Classroom Community Scale, the first developed, identified two factors of importance in an online community, connectedness and learning. In developing the scale, Rovai challenged the belief that a sense of community is limited to the face-to-face classroom community and proposes that the online classroom can build and maintain a sense of community at comparable levels of those found in face-to-face classrooms. Rovai reviewed literature pertaining to learning communities and applied the literature to the online classroom. Included in Rovai's discussion is elements of design and delivery of an online course supportive to building community among students in an online class environment. While the Rovai Scale is the first developed and the validity of the scale has been challenged (Barnard-Brack & Shiu, 2010), all of the scales that have been developed since 2002 measure combinations of the same two constructs presented by Rovai, connectedness and learning.

Online community has been defined in the literature in many ways, These definitions often identify several common elements and themes, including the ability to build mutual trust; a sense of connection, belonging, support; and an ability to share in the activities of the course as a group (Shea, Swan, & Pickett, 2004). The time together online becomes more than just weekly time together; the learning community in an online course can allow for a collective exploration of ideas and a collaborative approach to academic work. An online community is a cohesive group emerging from shared experiences when students become interdependent and view themselves as a contributing member; an interest in others, as well as self, develops and success of the group becomes a motivating factor for participation (Shaffer & Anundsen, 1993).

Building a learning community is a natural part of a f-2-f classroom environment; building community is just as important in an online or blended course. A community of learners can be experienced when students work together, share experiences, and have a sense of responsibility to one another (Wenger, 1999). Findings in a study conducted by Rovai and Jordan (2004) indicated that the sense of community in a blended course grow as a result of the f-2-f meetings, thus, reducing a sense of isolation that can sometimes occur when a course is being delivered entirely online.

Can the community-building process in online groups be complete without the group meeting face-to-face? Although f-2-f contact at some point in the community-building process can be useful and further facilitate community development, it is not likely to change the group dynamic initially created online. It is possible to build community without f-2-f contact. In a blended class, an initial f-2-f class can be helpful to orient students to the online environment and technology in use. Having periodic f-2-f classes throughout a term in a predominantly online course can be distracting from the online work; what tends to happen is that posting to the discussion will drop off as a face- to- face meeting approaches and then it will take time to build again (Palloff & Pratt, 2007). Formation of online communities without face-to-face contact demands greater attention up front to issues of policy and process. Just as norms would be negotiated in a face-to-face class, the same needs occur online. In fact, in the online environment, collaboratively negotiated norms are more critical.

Building a learning community helps promote skills of collaboration and reflection and support deeper levels of learning (Digenti, 1998; National Research Center for Career and Technical Education, 2010). Creating such a learning community is the result of an intentional effort of the teacher of the f-2-f or online course. Both pedagogical and social factors interplay in an online community (Ryman, Vine, & Richardson, 2009).

The Social Nature of Community

While the social benefits of participating in a community of learners is widely recognized, the research related to online learning communities has only recently been discussed in the literature (Glisan & Trainin, 2006). The term social presence is used in reference to a sense of social connectivity felt by students (Short, Williams, & Christie, 1976); social presence is the degree to which a person is perceived as "real" in communication that is conducted using technology. Social presence has been correlated with learner satisfaction online (Gunawardena & Zittle, 1997), as well as a sense of belonging to a community (Picciano, 2002). Garrison, Anderson, and Archer (2003) posit that in order to form community online, students must have a sense of social connection. Yet, there has been little agreement among researchers on how social connection occurs (Tu & Corry, 2002).

Social presence is something we rarely consider in a face-to-face classroom. When students can see one another within a physical space, we simply assume that presence will occur; students will develop a sense of who their peers are simply by being within physical proximity. However, when instruction is teacher-centered, students can sit in the same classroom and not even learn the names of their peers, much less make a social connection. When active and collaborative learning is part of that face-to-face environment, a sense of social presence is more likely to occur naturally. Simple physical presence may not be enough; the more students feel a part of a group the more they will participate (Picciano, 2002). The more teacher centered the classroom environment, regardless of delivery model, the less opportunity students have to get acquainted with one another.

When a student is taking a course fully online, there may be a greater possibility for a sense of isolation; some students may need more social contact than they are experiencing. Collaborative activities can help alleviate feelings of isolation by purposefully connecting learners with one another through various learning activities and promoting interdependence. Consequently, attention should be paid to the intentional development of social connections. Students in an online class can have a need to feel known by their peers and teacher; both as a learner in the course but also as an individual with a personal life. Teachers experienced in multiple modes of course delivery typically understand that strategies will be adopted in response to the needs of students for the purpose of providing the most effective instruction; the only difference is on-going attention to how technology can best be used as a tool to accomplish learning outcomes.

Wenger (1999) posited that the value of education is in social aspects of learning and that the focus of teaching needs to be on getting to know the individuality of students and supporting each to be a part of the community of learning. Community is a key to creating a sense of belonging for each student; one way to create community and a sense of belonging is through offering collaborative learning opportunities for students.

Collaborative Learning

Although there is a substantial amount of research citing the benefits of collaborative learning in face-to-face learning environments (Johnson & Johnson, 1989, 2004), there is a paucity of research with online environments. Studies have demonstrated that students engaging in collaborative learning are found to have high academic achievement, social connections, and self-efficacy (Johnson, Johnson, & Smith, 1991). The goal of a collaborative learning environment goes beyond knowledge acquisition; students who participate in collaborative learning demonstrate critical thinking (Schultz, 2003). Students often need to experience a sense of connection to other students before being willing to share meaningful responses; contributions can be obligatory when a student does not have a sense of belonging or support for building social connections (Kreijns, Kirschner, & Jochems, 2003).

The most powerful experiences for students are those in which peer interactions and connections occur throughout the group rather than only between student and teacher. It is helpful for students to view a teacher as also being a contributing learner collaborating in the process of critical inquiry. Activities that require students to contribute and interact with one another promote critical thinking within the context of collaboration (Conrad & Donaldson, 2004). In addition, collaboration is a fundamental principal of facilitating the development of an online learning community and in achieving desired learning outcomes for students while promoting both independence and interdependence. Exercising independence in sharing one's point of view contributes to the collaborative process, just as positive group interdependence is an element in both collaboration and community building. Interdependence helps a student develop cooperative skills while profiting from the viewpoints and knowledge of others (Johnson & Johnson, 2005).

It is important to note that students need to be told why collaboration is important and why it is being used in a course (f2f, blended, or online). It is not unusual for students to initially express resistance to participation in collaborative exercises. This resistance is often because of past negative experiences that a student has had; for example, peers did participate in small group collaborations, it was difficult to make contact with peers in the group, or there was general frustration with the process. Teachers can ease resistance by explaining why the collaborative activity is occurring and how it contributes to learning outcomes for the course. There can also be a resistance from students and from faculty to use collaborative learning because it may not seem task-oriented enough to resemble the traditional learning environment associated with a learning environment. The more successful students are at collaborating, the more they seek out opportunities to collaborate (Brookfield & Preskill, 2005).

Student Engagement in Discussions

When students engage in discussions with each other rather than just with the teacher, the possibilities for collaboration increase. Several collaborative strategies are applicable for use in other aspects of student lives; learning to listen respectfully to others, engaging in critical inquiry and analysis, and becoming independent in thinking, are each useful life strategies (Brookfield & Preskill, 2005). It is important for a teacher to facilitate student discussions without suggesting right or wrong answers, allowing for the expression of different viewpoints. Teachers and students can ask higher-level questions that stimulate critical thinking. Next, the responsibility for the facilitation of discussion can be shared between students and teacher. In addition, students should be encouraged to provide constructive feedback to one another on an on-going basis. Initially, this may be a new experience for students. However, if an environment of trust has been established, students quickly learn to welcome input from their peers. Promoting collaborative discussion can assist students in developing an appreciation for other forms of collaborative work. Sharing the responsibility of facilitating discussions is one-way teachers can facilitate discussions keeping them student focused. Rather than being at the center of the discussion, the teacher becomes one member of the discussion, acting only as facilitator. This teaching pedagogy can be new for some teachers and for some students who are use to a teacher-centered environment where the teacher delivers all content with authority. Thus, this constructivist approach can take some adjustment for teachers and students.

The level of interaction of students with one another and the instructor has been shown to be predictor of learning in online and blended courses (Rovai & Barnum, 2003) just as it is in f2f classes. Actively engaging learners in the online learning process and facilitate the meaning-making that is a part of the constructivist approach through which this learning occurs, the content of the course should be embedded in everyday life.

Promoting Critical Inquiry

It is a teacher's responsibility to create a learning environment that guides students to not only work collaboratively but also to engage in critical reflection and inquiry; a process providing a synthesized argument based on evidence to support a position (Alwehaibi, 2012). Critical thinking moves beyond personal opinion. Critical inquiry can be supported within the context of asynchronous and synchronous delivery of instruction. Following are some of the strategies that can be used: a) prompting discussions requiring a higher level of thinking, such as welcoming compare and contrast responses, b) providing a challenge to responses that are opinion-based, asking for sources of information to support the position taken, c) keeping discussion topic focused rather than meandering off on a tangent, and d) offering a counter viewpoint for the purpose of inviting more discussion. Perhaps one of the most effective ways to promote critical inquiry is through questioning.

In an online environment, just as in one that is f2f, the teacher as facilitator asks questions posed to begin discussion that promotes deep exploration of a topic and the development of critical thinking skills. Questions need to be posed so that there is no right or wrong answer; the questions serve only to stimulate thinking and are a means by which to examine a large body of knowledge. As a teacher as provides this type of questioning in an online course, students often begin forming questions that challenge peers to a higher level of thinking. Questions that do promote critical thinking and inquiry are those that provoke high levels of participation and discussion that interject original viewpoints. For example, if a teacher asks questions with a straightforward answer such as, "List three critical factors in using cooperative learning activities as a teaching strategy," the response will be to list three critical factors, typically without discussion or input of personal reflection. On the other hand, if the question is open-ended more original thought is provoked. For example, "Make an argument for or against using cooperative learning activities in exploring a topic with students, defending your answer with research support.

Poor or minimal response to a question indicates that it was not worded in a way that stimulated discussion. A teacher who is closely monitoring a discussion can scaffold the discussion through posing another question when this occurs, continuing to expand upon the original question. It is important to view every question as a beginning point for discussion and monitor, adding prompts as needed to stimulate higher-level thinking.

Collaborative Learning Activities

Another method of promoting collaboration in the online classroom is to offer collaborative learning activities. Hiltz and Turoff (2002) suggest the following ways to provide opportunities for collaborative learning: debates (making an argument for or against), groups projects, case study discussions, role-playing exercises, sharing of solutions for homework problems, and collaborative contributions to essays, stories, research plans, or some content related document (e.g. through use of google docs). The important point is that there are collaborative opportunities to move beyond posts on discussion threads.

Johnson and Johnson (2004) identified five components of effective group collaboration: 1) positive interdependence (group success equals individual success), 2) promotive interaction (providing support for one another), 3) individual accountability (group members identify in advance what they will do for the group), 4) appropriate use of social skills (clear communication and positive conflict resolution), and 5) group processing (reciprocal interactions among group members).

Providing a description about collaboration either within the syllabus, or at the beginning of a course helps to prepare students for group dynamics. For example, a discussion of human tendencies to over function vs. under function or to be more comfortable as a leader or a follower sets the stage for how group members may function. There will also be group members who take charge and want to do the work of others just to get it done. There will be others who always have excuses for non-participation that they explain as life happenings that took them away from the group task.

Prior to forming groups, it is important for a teacher to post guidelines and expectations for the performance and end product. It is also important to encourage the groups to expectations of one another, which can be done within a threaded discussion so that the teacher can monitor. Embedded in guidelines should be expectations that group members evaluate each other's work, participation, and contributions to the collaborative product of the group. A rubric should be made available for the group members to examine prior to group work beginning. Providing members of the group the expectation that they will evaluate themselves and each other, along with a participation evaluation from the teacher, can promote engagement and a successful experience with collaboration. Encouraging students to define tasks to be completed and best ways to be in contact are strategies that can support the collaborative process. It is helpful when a teacher monitors group progress and make individual contact with group members, as needed, to "coach" appropriate behaviors.

Forming small groups can be particularly helpful when there is a large class and breaking into groups provides more of a chance for group member to get to know one another. Whether groups are formed by a teacher or by the students, specific guidelines need to be provided for participation and end product expectations. In a blended course, it is helpful for students to meet f2f toward the beginning of the course. While group formation can be more difficult in the asynchronous online environment (when there is no f2f contact), it is possible and can be an effective way to provide a collaborative opportunity. When students are provided with the invitation to identify ways to connect with one another, they can be creative and identify modes of contact that best meet the needs of the group members.

Shared Structure for Learning

Providing a shared structure for learning is critical to the success of any learning environment, regardless of delivery mode; f2f, online, or a blended format. A shared structure for learning provides clarity of expectations for the learning process. If students are clear about the structure and expectations of a course, experiencing a learning community unfolds rather seamlessly.

Clarity in Expectations

Another important component to building a classroom environment of collaborative learning is the sharing of expectations for the course. A first step is to make expectations clear. This can begin with including expectations for collaboration in the syllabus of the course. If congruence in expectations does not exist, this does not necessarily signify a problem. Instead, it allows the teacher an additional opportunity for explanation. Given learner-focused process is being created and facilitated the teacher must reinforce expectations while responding to the needs of the students. If conflict results from these negotiations, again this is not a problem. The handling and working through of that conflict can move the group closer to congruence in its expectations. The more closely we can achieve congruence in the area of expectations, the more likely it is that a collaborative learning process will be the result. What is being created at this juncture is a contract for learning the process of contracting includes negotiation.

Posting Introductions

Just as it is important in a face-to-face classroom to take time for introductions at the beginning of a course, it is equally important to begin an online or blended course with introductions. To become a true community of learners, community members must take time to form relationships with each other (Ryman, Hardham, Richardson & Ross, 2009). These relationships are especially important when the community members have never held a face-to-face meeting.

Beginning of class warm-up activities can be used in an online class, just as they are in a f2f or blended learning environment; regardless of the delivery mode, ice-breaker activities can be an effective to ease the tension and anxiety that often accompany the start of a class by offering students a social connection. Beginning of course introductions are an example of an activity where the teacher does need to take the lead and respond to the introduction and draw links in experiences between teacher and student as well as students as peers. For example, the teacher can personally connect with a student with whom they have something in common such as serving in the military or living in a particular state. The teacher can connect students with one another in the same way, pointing out commonalities between and among students.

The posting of an introduction is a first step in developing social presence by revealing who one is to the remainder of the group. Because participants feel more comfortable revealing parts of themselves online that they might not reveal elsewhere, it is critical that they feel acknowledged so they can continue to do that safely throughout the duration of the course. This is the first point of connection; the point at which these important relationships begin to develop.

Prompt Feedback

In a meta-analysis of 81 studies that examined teacher immediacy in relation to learning outcomes in traditional, face-to-face classrooms, Witt, Wheeless, and Allen (2004) reported a positive and substantial relationship between overall teacher immediacy and overall student learning; Witt, Wheeless, and Allen posited that the two decades of research on immediacy in face-to-ace classrooms provide a foundation of findings from which to begin investigation of implications in online learning environments.

Chickering and Gamson (1999) identified several strategies for effective instruction as has been previously discussed. It is worth noting that these strategies collectively demonstrate the role of teacher as facilitator. We know that timely and constructive feedback is valued by students who study face-to-face and online (Mancuso-Murphy, 2007). Chickering and Gamson (1987) identified the centrality of feedback to learning and improving performance in face-to-face classroom learning situations. In describing the criterion "gives prompt feedback" (later amended to "incorporates assessment and prompt feedback," Chickering and Gamson (1999) wrote that feedback allows students to assess existing knowledge, reflect on what they have learned and what they still need to learn, and receive suggestions for improvement of future work. Several authors of research studies and best practice have identified the importance of feedback and suggested that feedback be prompt, timely, regular, supportive, constructive, meaningful, non-threatening and help (Grandzol & Grandzol, 2006; Mancuso-Murphy, 2007).

Life Connections

It is important to encourage students to share their talents and ways of learning through incorporating life experiences, interests, and viewpoints into the contributions made through answers and comments. This process of active engagement facilitates the process that students go through while making-meaning of content; this meaning-making process is central to a constructivist approach to teaching. Making-meaning of content involves a process of metacognition, thinking about one's thinking. The more participants can relate life experiences and prior knowledge to the context of the online classroom, the better grasp they will have of course material and the more they will see themselves as community contributors who possess meaningful knowledge; there is a cognitive and social benefit to these types of contributions. A teacher can facilitate this process in many ways including discussion of real-life vignettes, small group exercises to solve a problem, and preparation of a small group project. It is important for a teacher to monitor these discussions and only interject as needed to reinforce the idea that there are no right or wrong answers and that the purpose of the exercise is to bring depth and breadth to the topic discussion.

The more students relate their life experience, viewpoints, prior knowledge and interests to the context of the online classroom, the deeper their understanding will be of what they learn. The process of connecting the learning gained from everyday life to the learning of the course not only creates a deeper sense of meaning for students but it validates who they are as students and learners who possess knowledge and who can apply prior experiences in varied contexts. Encouraging students to share their talents, ways of learning, interests, viewpoints within the discussions of course content is a powerful way to move beyond a focus on the delivery of content and create a learning community sensitive to student needs as recommended by Mandernach (2009).

FUTURE RESEARCH DIRECTIONS

1. There is a paucity of research on the teacher's role in collaborative learning; this is an area for future research.

2. While there is evidence that social connections enhance the experience of the student taking online coursework, there is additional research needed on how these social connections can occur in asynchronous delivery of instruction.
3. Research is needed to determine if receiving professional development training in application of teaching pedagogy, regardless of delivery mode, influences the intentionality of the instruction that is delivered.

CONCLUSION

Institutions of higher education will continue to use technology as a tool for delivering instruction online and in a blended format, in addition to the traditional f2f delivery. This chapter proposes moving beyond which method of instructional delivery is most effective and instead shifting focus to the important role of teaching pedagogy. Research demonstrates that each mode of instructional delivery has successes and that the teacher has a direct influence. In addition, there is some agreement that including a social element in online delivery is important to student engagement and knowledge acquisition. The teaching pedagogy of constructivism offers a model that addresses the social needs of students as well as providing opportunities for critical inquiry; this pedagogy views the teacher as decision-maker in the selection of strategies that best meet the needs of students. It is suggested that the focus of future research relate to the pedagogy of teaching and strategies for engaging students in social interactions in support of critical inquiry and subsequent knowledge acquisition.

KEY TERMS AND DEFINITIONS

Asynchronous: A method of instructional delivery that is time shifted; teacher and students can participate at differing times from the same or different locations; think of email or voice mail and how it is accessed after being sent.

Collaborative Learning: Collaborative learning (or cooperative learning) is an instructional strategy that arranges small groups of students to work together to complete an academic assignment and through sharing and learning from one another accomplish a learning goal.

Community of Learners: When students who are enrolled in a course of study, join with the teacher, to cognitively and socially connect in a common exploration of the course content.

Constructivism: A belief that knowledge is a constructed element resulting from the learning process and that knowledge is unique to the individual who constructs it; also includes a view of teacher as facilitator of instruction promoting student engagement and critical inquiry.

Delivery Mode: Instruction can be delivered in many different delivery modes, including online, blended (hybrid), and face-to-face; the method by which instruction is delivered to students.

F2F: Face-to-face coursework is a delivery model of instruction where the teacher and students meet together in person, typically in a "bricks and mortar" classroom.

Hybrid: Another name for blended delivery of instruction; courses that meet face-to-face with between some portion of content delivered online.

Pedagogy: The actual function of teaching; what teachers do when implementing course content to assist their student's learning.

Synchronous: A method of instructional delivery that occurs at the same time while typically not in the same place.

Teacher as Facilitator: A process by which a teacher facilitates the learning process through promoting community building, cooperative learning, and critical inquiry with students sharing their synthesis and application of course content to add depth and breadth of meaning to knowledge acquisition of the community of learners.

Chapter 43
Prioritization of Design Requirements for Quality Engineering Education

Narayana Rao Kandukuri
G.M.R Polytechnic, India

ABSTRACT

The educational institutions must strive to impart quality education and have to create greater satisfaction in their customer group. Quality Function Deployment (QFD) which is a customer driven tool in implementing Total Quality Management (TQM) helps to accomplish this task. One of the phases in QFD methodology is known as House of Quality (HoQ), which is concerned with translating the voice of customer into design requirements by stakeholders. Design requirements will determine how the customer needs are to be fulfilled. This paper presents an integrated methodology (HoQ-ANP) to translate Voices of Customer (VoC) or customer needs (CNs) into design requirements (DRs) and to determine the importance weights of DRs by considering the complex dependency relationships between and within Customer needs and DRs for total quality in engineering education. In order to deal with the vagueness, uncertainty and diversity in dependency relationships fuzzy set theory and group decision-making technique are used to determine the priority structure of CNs, inner dependence among Customer Needs (CNs), Inner dependence among DRs and inter-relationship between CNs & DRs. Prioritization of design requirements for quality engineering education is determined through a case study by employing HoQ-ANP methodology.

DOI: 10.4018/978-1-4666-8246-7.ch043

1. INTRODUCTION

Engineering education is a process of developing techno human resources, which are to be used later as input to industry which in turn produces goods and services for the societal use. Liberalization, Privatization and Globalization led to increase in the number of ill - equipped engineering educational institutions in India. Therefore, there is a greater need to instill quality in engineering education to produce technically skilled and creative man-power in India.

Education is not only a rigorous study process of obtaining necessary professional qualifications, but it is also the intellectual development of an individual, which will have an enduring impact on one's life. Therefore, quality engineering education means not only adding value to students, but also to the society as a whole. Quality engineering education is the development of intellectual skills and knowledge that will equip graduates to contribute to society through productive and satisfying engineering careers as innovators, decision – makers and leaders in the global economy of the 21st century (Natarajan, 2002).

The education sector that produces the human resource has a pivotal role in the quality movement that demands total quality approach in the education system to live up to the requirements of the industry(Mariappan, 2002).

Quality Engineering Education demands a process of continuous improvement of and dramatic innovation in student, employer and societal satisfaction by systematically and collectively evaluating and refining the system, practices and culture of engineering education institutions (Natarajan, 2000).

The QFD application in higher education is classified into three broad categories, namely, teaching effectiveness, curriculum design, and instructional resources. Benjamin et. al, (1993) designed engineering education and curricula using TQM and QFD principles. Jaraiedi and Ritz (1994) applied QFD to improve advising and teaching processes at West Virginia University. Ermer (1995) showed the design requirements to satisfy each customer by considering faculty, students, and industry as clients.

Hwarng et. al, (2001) applied QFD to translate customers' voices into operations requirements at the National University of Singapore. Clayton (2003) used QFD to provide productive quality learning. The analytic network process (ANP) approach has been used in QFD in product planning to prioritize ECs in order to overcome some shortcomings of the traditional QFD models (Karsak, Sozer, & Alptekin, 2003; Partovi & Corredoira, 2002; Buyukozkan, Ertay, Kahraman, & Ruan, 2004).

Quality Function Deployment (QFD) is one of the quantitative tools and techniques of Total Quality Management that could be used to translate customer requirements and specifications into appropriate technical or service requirements (Baba et al., 2009). QFD process is initiated with capturing the voice of customer and it can be used to measure customer satisfaction (Durga Prasad et al., 2008).

QFD is a planning process that includes four matrices namely; product planning matrix, part planning matrix (part deployment matrix), process planning matrix and production planning matrix respectively, and the first of them is also referred to as House of Quality (HoQ) (Liu, 2009).

The customer portion of HoQ is established by capturing the voice of customer (customer needs) and preparing the priority ratings of the customer needs. The priority ratings reflect the preferences of the customers. A few approaches are also available for the determination of priority ratings of customer needs (Sharma et al., 2007).

The HoQ translates the customer needs obtained from the customer's perception into appropriate design requirements using the designer's perception. The HoQ maps the prioritized list of customer needs to appropriate design requirements and it also gives the priority ratings of the design requirements. Designers have an in-depth knowledge of the functions of the product, and they usually express their information in technical and clear terms (Kazemzadeh et al., 2009). Chandra Shekhar et al (2013), determined weights of the factors that enhance the quality in engineering education institutions (EEIs) using AHP.

More number of engineering educations institutions are established in private sector due to the policy of the government. Unfortunately, higher percentage of student failures in the university examinations, fewer amounts of placement opportunities is the major defects in the engineering educational institutions. To ensure quality in engineering education, the major processes involved in the education system such as curriculum development, teaching, learning and evaluation need to be completely overhauled.

This paper presents a HoQ -ANP methodology to prioritize the design requirements for quality engineering education model. The methodology takes care of vagueness and diversity in decision making by using fuzzy set theory and group decision making technique to enhance the effectiveness and efficiency.

1.1. Research Questions

The goal of the present study is to establish the priority of design requirements for quality engineering education.

The sub-research questions are formulated as follows:

- Identify the inner dependence among Customer Needs (CNs);
- Identify the Inner dependence among DRs;
- Identify the inter-relationship between CNs & DRs.

2. ANALYTIC NETWORK PROCESS (ANP)

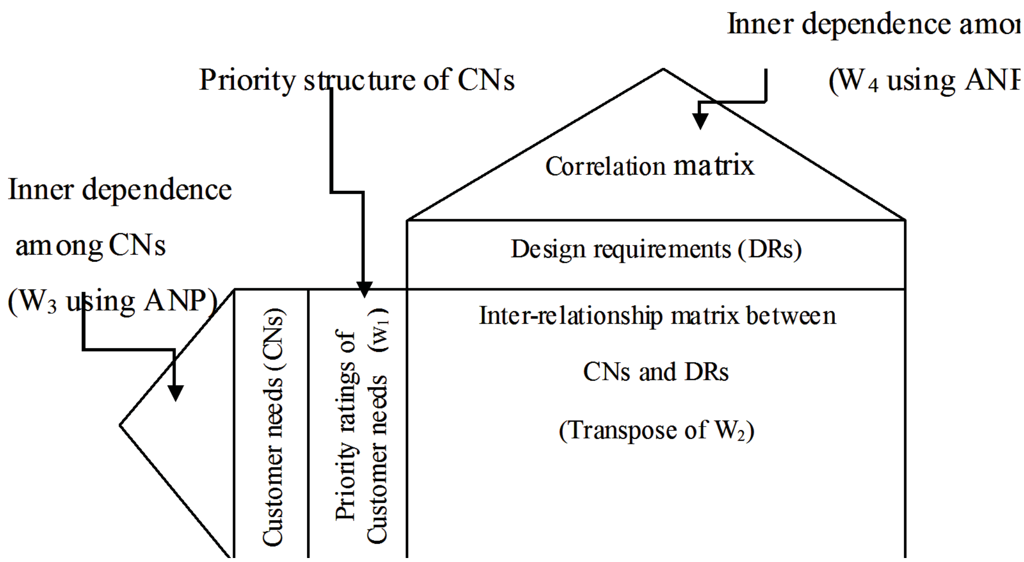
The Analytic Network Process (ANP) is a multi-criteria decision making (MCDM) technique which considers the interdependence among criteria and alternatives and it may transform qualitative judgments into quantitative values. The ANP generalizes the AHP by replacing hierarchies with networks. ANP uses the same fundamental comparison scale (Saaty, 1999) that is used in the AHP. This comparison scale enables the decision-maker to incorporate experience and knowledge intuitively and indicate how many times an element dominates another with respect to the criterion. ANP consists of two stages, namely, construction of the network and calculation of the priorities of the elements (Karsak et al., 2002). ANP enables interrelationships not only among the clusters but also between the elements of a cluster (Andreas et al., 2009).

The degree of relative importance of the design requirements (DRs) with respect to each customer need (CN) is presented in the form of a matrix W_2. The transpose of the matrix W_2 forms the interrelationship matrix of HoQ. The set of priority ratings of customer needs (W_1) are obtained through trapezoidal fuzzy numbers which take care of the vagueness present in the decision maker's judgment. The matrix W_3 represents the inner dependencies of the CNs with respect to each CN. The inner dependence matrix of the DRs with respect to each DR $\left(W_4\right)$ gives the correlation matrix (roof) of HoQ. The HoQ-ANP methodology employed for systematic is shown in Figure 1.

2. DETERMINATION OF WEIGHTS IN FUZZY ENVIRONMENT

Multi-criteria decision making (MCDM) problem deals with the evaluation of a set of alternatives in terms of a set of decision criteria. Abbas

Figure 1. Mapping of CNs and DRs



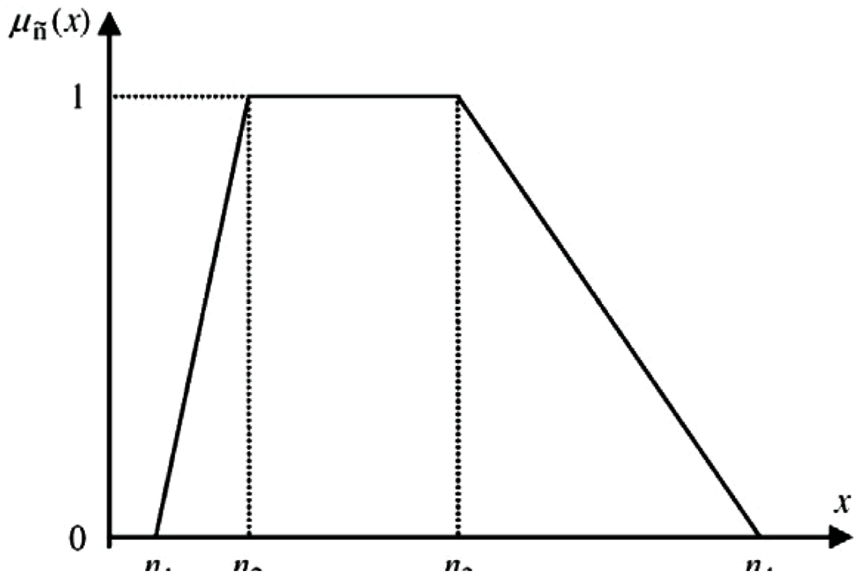
Toloie-Eshlaghy and Mahdi Homayonfar (2011) made a comprehensive survey of methods for eliciting data for MCDM problems and also for processing such data. These methods have attracted much attention from academics and practitioners. Chandra Shekhar et al (2011) adopted Cross Efficiency Approach in Data Envelopment Analysis (DEA) for ranking of Engineering Education Institutions.

In MCDM methods, the ratings and the weights of the criteria are known precisely. However, crisp data are inadequate to model real-life situations, since human judgments including preferences are often vague and one's preference cannot be estimated with an exact numerical value. A more realistic approach may be to use linguistic variables like high, very high, etc. instead of numerical values. A natural way to cope up with such uncertain judgments is to express the comparison ratios as fuzzy sets or fuzzy numbers which incorporate the vagueness of human thinking. When comparing any linguistic variables, the uncertain comparison judgment can be represented by membership functions or the fuzzy number. Here, linguistic values expressed as trapezoidal fuzzy numbers are used to assess the priority of the factors. Venkatasubbaiah et al (2005), evaluated design requirements for quality engineering education using fuzzy outranking technique. Chandra Shekhar et al., (2013), established the overall service quality of engineering education institutions using fuzzy logic approach. In this study, relative weights of the factors influencing the overall service quality of an EEI are determined.

2.1. Trapezoidal Membership Function

Theoretical ranges of the variables are often very wide. The trapezoidal fuzzy numbers are robust characterizations that include minimum and maximum observed values between the wide theoretical ranges. Trapezoidal Membership function membership $\mu_{\tilde{n}}(x)$. A positive trapezoidal number $\tilde{n}$ can be defined as (n1, n2, n3, n4) as shown in Figure 2.

Figure 2. Trapezoidal membership function



The trapezoidal membership function $\mu_{\tilde{n}}(x)$ is expressed as follows:

$$\mu_{x_m}(x) = \begin{cases} 0 & ; \quad x < n_1 \\ \dfrac{x - n_1}{n_2 - n_1} & ; n_1 \leq x \leq n_2 \\ 1 & ; \quad n_2 \leq x \leq n_3 \\ \dfrac{x - n_2}{n_3 - n_4} & ; n_3 \leq x \leq n_4 \\ 0 & ; \quad x \geq n_4 \end{cases}$$

MCDM methods in fuzzy environment like Fuzzy Analytic Hierarchy Process (FAHP) and Fuzzy Outranking Technique (FOT) have the ability to take care of vagueness without aggregating the decision-makers judgments about the importance of the criteria. In this paper, linguistic values expressed as trapezoidal fuzzy numbers by multiple decision-makers are used to assess the weights of the factors. Further, similar to the TOPSIS approach. Fuzzy Positive Ideal Rating (FPIR) and Fuzzy Negative Ideal Rating (FNIR) are used to compute weights of factors.

2.2. Determination of Aggregated Weights

A decision group has K decision makers as k = 1, 2, . . ., K and considers a set of m criteria as c = 1, 2, . . ., m for a selection problem. Then the aggregated fuzzy weights of each criterion W_c can be calculated as: (Chen et al., 2006)

$(W_c) = (w_{c1}, w_{c2}, w_{c3}, w_{c4})$

where:

$$w_{c1} = \min_k \{w_{ck1}\}$$

$$w_{c2} = \frac{1}{K}\sum_{1}^{K} w_{ck2}$$

$$w_{c3} = \frac{1}{K}\sum_{1}^{K} w_{ck3}$$

$$w_{c4} = \max_k \{w_{ck4}\}$$

Table 1. Customer needs

Sl.No.	Customer Needs
1.	Professionalism (P)
2.	Integrated Education (IE)
3.	Educational Facilities (EF)
4.	Responsiveness (R)
5.	Empathy (E)

2.3. Calculation of Closeness Coefficient

The distance between aggregated fuzzy weights (W_c) of each criterion and ideal ratings can be calculated by applying vertex method as given in Box 1, where $\tilde{m} = (m_1, m_2, m_3, m_4)$; and $\tilde{n} = (n_1, n_2, n_3, n_4)$.

The closeness coefficient is determined to calculate the weights of each factor from the following relation:

$$CC_c = \frac{d_c^-}{d_c^* + d_c^-}$$

where d_j^- distance to FNIR is d_j^* is distance to FPIR.

2.4. Determination of Final Weights of the Criteria

By applying normalization to closeness coefficients, final weights of each factor are determined using the following relation:

$$W_c = \frac{CC_c}{\Sigma_{c=1}^{m} CC_c}$$

3. METHODOLOGY

The HoQ maps the customer needs to appropriate design requirements. Fuzzy Positive Ideal Rating (FPIR) and Fuzzy Negative Ideal Rating (FNIR) are used to compute weights of these requirements using survey questionnaire designed to assess the importance of the design requirements to improve the quality of engineering education. The detailed procedure of HoQ-ANP is explained by the following steps:

Step 1. Identification of Customer Needs (CN): Engineering graduate passing out from the college has to fulfill modern and high standard requirements that are needed by industry. All the customer needs are gathered and from the literature and those needs are consolidated into respective categories;

Step 2. Formulation of Design Requirements (DR): This customer needs are to be translated into necessary design requirements. The design requirements may be considered from the literature;

Step 3. Prioritization of Customer Needs (W_1): Assuming that there are no dependence relationships among the CNs, pair-wise comparison matrix within the CNs is constructed with respect to the design goal and the importance weighting vector of CNs is calculated. Priority of customer needs is determined from Fuzzy Positive Ideal Rating (FPIR) and Fuzzy Negative Ideal Rating (FNIR);

Step 4. Determination of inter- relationship matrix (W_2): Inter-relationship matrix is established by assuming that there are no

Box 1.

$$d_v = (\tilde{m}, \tilde{n}) = \sqrt{\frac{1}{4}[(m_1 - n_1)^2 + (m_2 - n_2)^2 + (m_3 - n_3)^2 + (m_4 - n_4)^2]}$$

dependence relationships within DRs. The pair-wise comparison matrix within them is constructed with respect to the inter-dependency relationships between CNs and DRs. These inter-dependency relationships are obtained from Fuzzy Positive Ideal Rating (FPIR) and Fuzzy Negative Ideal Rating (FNIR);

Step 5. Establish the Inner Dependence Matrix of the CNs (W_3): Inner dependence matrix of the CNs is established by constructing the pair-wise comparison matrix within the CNs with respect to the inner- dependency relationships within them. The matrix is obtained from Fuzzy Positive Ideal Rating (FPIR) and Fuzzy Negative Ideal Rating (FNIR);

Step 6. Establish the Inner Dependence Matrix of the DRs (W_4): Inner dependence matrix of the DRs is established by constructing the pair-wise comparison matrix within the DRs with respect to the inner-dependency relationships within them. The inner dependence matrix is determined from Fuzzy Positive Ideal Rating (FPIR) and Fuzzy Negative Ideal Rating (FNIR);

Step 7. Establish the Inter Dependent Priority Matrix of the CNs (W_c): The inter- dependent priority matrix of the CNs is obtained by the following relation:

$$W_c = W_3 * W_1$$

Step 8. Establish the Inter Dependent Priority Matrix of the DRs (Wa): The inter-dependent priority matrix of the DRs is obtained by the following relation:

$$Wa = W_4 * W_2$$

Step 9. Determination of the Overall Priorities of DRs: The overall priorities of the DRs, reflecting the interrelationships within the HOQ are obtained by the following relation:

$$W^{ANP} = W_a * W_c$$

4. CASE STUDY

In order to prioritize the design requirements to improve the quality of engineering education, a case study of Andhra Pradesh state in India is considered. The survey questionnaire is designed to assess the importance of the design requirements for quality engineering education. Sample size of 250 out of 700 engineering education institutions in the state are selected. The distributions of the engineering institutions in Andhra Pradesh are as follows; One hundred institutions in Telangana region, one hundred institutions in Andhra region and fifty institutions in Rayalaseema region. The sample size and the specific institution are chosen considering institute profile, the year of establishment, type of organization, region, and performance. The composition of the persons who have participated in the response of the questionnaire includes: Management, principals, faculty, experts from industry and experts in the field of education. The questionnaires were distributed to the stake holders of engineering education institutions considered in the case study and data is collected.

4.1. Survey Questionnaire

The questionnaire is developed in order to gain vital information that maps the list of customer needs to appropriate design requirements. In general the objectives of conducting the survey is to determine whether performance improvement and measurement is practiced in the education institutions and to assess' attitudes and tendency towards performance improvement. The questionnaire is categorized into four questions.

Question 1 is concerned with finding out importance of the customer needs with respect to the satisfaction of the stakeholders in respect of the goal of achieving Quality engineering Education.

Question 2 is concerned with the impact of the Design Requirements on the Customer Needs.

Question 3 is concerned with knowing of the inner dependence among the customer needs.

Question 4 is concerned with knowing the inner dependence among the design requirements.

The questionnaire is given in the Appendix.

4.2. Data Analysis and Interpretation

The questionnaires were distributed to 600 stake holders out of which 472 were collected which imply 78% were completed by the respondents. The demographic data of the respondents are represented in Figure 3.

Five service quality factors proposed by Shekhar et al., (2010) are considered as customer needs in the study. The authors determined the quality gap of educational services based on differences between students' perceptions and expectations on thirty two items of service quality. Factor Analysis (FA) was carried out to identify the underlying dimensions in the service quality items. Further, the authors validated that these factors significantly influencing the overall service quality of an EEI using ANOVA.

4.3. Customer Needs (CN)

The customer needs are identified from the above study are shown in Table 1

4.4. Design Requirements (DRs)

The customer needs are to be translated into necessary design requirements. Durga Prasad et al. (2007) considered Modern Communication Facilities, Motivated Faculty, Library Modernization, Visual Teaching Aids, Industry-institution Interaction, Better Course Plan and Curriculum, Well Discipline, Opportunity for Knowledge up gradation and capability to attract Companies for Campus interviews as design requirements and prioritized through a case study.

Mahapatra and M.S.Khan (2007) implemented Quality Function Deployment (QFD) method to prioritize design requirements need to be implemented. The design requirements in the priority order are Opportunity for Knowledge up gradation, continuous evaluation system, Technology driven teaching Aids, Industry-institution Interface and management responsibility. In this study, the set of design requirements were generated through literature and the brain storming session held with the eminent faculty, principals, academic deans and placement officers of local engineering colleges. The design requirements are shown in Table 2.

The data collected on customer needs and design requirements by means of questionnaires are analyzed to prepare the fuzzy pair wise comparison matrices using triangular fuzzy numbers. These fuzzy pair wise comparison matrices are useful

Figure 3. Demographic data

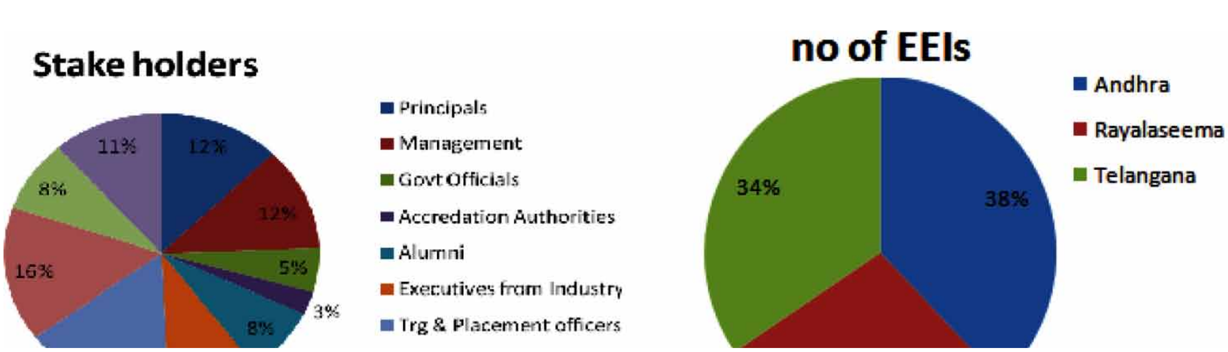


Table 2. Design requirements (DRs)

Sl.No	Design Requirements
1.	Flexible Curriculum Design (FCD)
2.	Teaching Learning Practices(TLP)
3.	Promotion of research and consultancy (PRC)
4.	IT Competency (ITC)
5.	Employability skill Development(ESD)
6	Infrastructure Adequacy (IA)

for analyzing the inner dependency relationships between customer needs, design requirements and the inter dependency between customer needs & design requirements.

5. RESULTS AND DISCUSSION

The HoQ-ANP methodology is employed to determine the overall priority of the design requirements for design of quality engineering education by systematic mapping of CNs and DRs.

5.1. Prioritization of Customer Needs (W_1)

The proposed methodology is illustrated in the following steps. The quality of services provided by the Engineering Education Institutions need to be assessed from the different stakeholder's point of view. Hence in this paper, students, alumni, recruiters and faculty are considered as stakeholders. Five service quality factors viz., professionalism, integrated education, facilities, responsiveness and empathy proposed by Chandra Shekhar et al. (2010) are considered as customer needs in the study.

5.1.1. Specification of Linguistic variables

The following linguistic values of fuzzy variables specified by trapezoidal fuzzy number are considered:

- **Nill:** NL (0,0,0,0);
- **Very Low:** VL (0.0,0.0,0.1,0.2);
- **Low:** L (0.1,0.2,0.3,0.4);
- **Medium Low:** ML (0.3,0.4,0.4,0.5);
- **Medium:** M (0.4,0.5,0.6,0.7);
- **Medium High:** MH(0.6,0.7,0.7,0.8);
- **High:** H (0.7,0.8,0.8,0.9);
- **Very High:** VH (0.8, 0.9, 1.0, 1.0);
- **Full:** F (1,1,1,1).

Relative importance of the factors for quality engineering education is determined by administering the questionnaire shown in the Appendix to the stake holders. The stake holders indicated their response with a Linguistic variable basing on importance of the five factors in respect of Quality engineering Education. The responses are aggregated and shown in Table 3.

The procedure for calculation of aggregate weight is explained by taking professionalism as an example. From Table 3, relative importance of professionalism specified in terms of linguistic values by the stake holders are:

Table 3. Relative importance of factors

H(0.7,0.8,0.8,0.9)

VH(0.8,0.9,1.0,1.0)

H(0.7,0.8,0.8,0.9)

5.1.2. Aggregate Weights

Below are the aggregate weights:

$\tilde{w}$ = (wc1, wc2, wc3, wc4)

where:

$$w_{c1} = \min_{k}\{w_{ck1}\} = 0.7$$

$$w_{c2} = \frac{1}{K}\sum_{1}^{K} w_{ck2} = 0.85$$

$$w_{c3} = \frac{1}{K}\sum_{1}^{K} w_{ck3} = 0.90$$

$$w_{c4} = \max_{k}\{w_{ck4}\} = 1.0$$

c = 1, 2, 3, 4; k = 1, 2, 3, 4; K = 4

Similarly, aggregate fuzzy weights of each customer needs are calculated and shown in Table 4.

5.1.3. Final Weights

A closeness coefficient is determined to calculate the weights of each factor. Final weights of each factor are obtained by applying the normalization to closeness coefficients. The procedure for calculation is explained by taking facilities factor as an example:

d_c^- → Distance from FNIR (very low)

d_c^+ → Distance from FPIR (very high)

Values of linguistic variables 'Very low' and 'Very high' are taken from Figure 2 and are shown below:

NL (0, 0, 0, 0); F (1, 1, 1, 1)

then we arrive at the equations shown in Box 2.

Closeness coefficient:

Box 2.

$$d_c^+ = \sqrt{(0.7-1)^2 + (0.85-1)^2 + (0.9-1)^2 + (1.0-1)^2} = 0.35$$
$$d_c^- = \sqrt{(0.7-0)^2 + (0.85-0)^2 + (0.9-0)^2 + (1-0)^2} = 1.7385$$

Table 4. Aggregate weights of customer needs

Professionalism	Integrated Education	Facilities	Responsiveness	Empathy
(0.7,0.85 0.90, 1)	(0.6,0.825, 0.875, 1)	(0.6,0.825, 0.85, 1.0)	(0.1,0.35, 0.9, 0.4)	(0,0.20,0.275, 0.90)

Box 3.

$$W_j = \frac{CC_c}{\Sigma_{c=1}^{m} CC_c} = \frac{0.8324}{0.8324 + 0.7867 + 0.7826 + 0.4534 + 0.3924} = 0.2561$$

Table 5. Final weights

Factors	d_c^-	d_c^*	Closeness Coefficient	Final Weight
Professionalism	1.7385	0.3500	0.8324	0.2561
Integrated education	1.6752	0.4541	0.7867	0.2421
Facilities	1.6623	0.4617	0.7826	0.2408
Responsiveness	1.0500	1.2659	0.4534	0.1395
Empathy	0.9621	1.4750	0.3948	0.1215

$$CC_j = \frac{d_c^-}{d_c^* + d_c^-} = \frac{1.7385}{0.35 + 1.7385} = 0.8324$$

Similarly the closeness coefficients of the other customer needs are determined to find the final weight.

Final weight of professionalism is shown in Box 3.

The distances, closeness coefficients and final weights of the customer needs are shown in Table 5.

The final weights represent the priority of customer needs and are shown in the matrix W_1:

$$W_1 = \begin{pmatrix} \mathrm{P} \\ IE \\ EF \\ R \\ E \end{pmatrix} = \begin{pmatrix} 0.2561 \\ 0.2421 \\ 0.2408 \\ 0.1395 \\ 0.1215 \end{pmatrix}$$

Highest weight (0.2561) is obtained with professionalism. The professionalism factor includes skill development along with guidance and counseling, good evaluation system, expert lectures and industrial training during study.

The integrated education factor with a weight of 0.2421 is associated with acquisition of multitasking skills, ability to work in any field, entrepreneurial ability, orientation towards design and development of innovative engineering products and ability to solve challenging engineering problems.

Facilities factor has obtained a weight of 0.2408. Facilities include the items related to modern equipment in labs, instructional aids, learning materials. Adequate facilities enhance the overall service quality. The other factors namely, responsiveness and empathy obtained weights of 0.1395 and 0.1215 respectively. Prompt service, personal attention by all teaching and other staff, orderliness, cleanliness, etc. improve responsiveness and empathy. The importance weights of customer needs are graphically shown in Figure 4.

5.2. Inter-Dependency Matrix (W_2)

Inter-dependency relationships between CNs and DRs are also obtained by administering the questionnaire (see Appendix) to the stake holders. The stake holders indicated their response with a Linguistic variable basing on importance of

Figure 4. The importance weights of customer needs

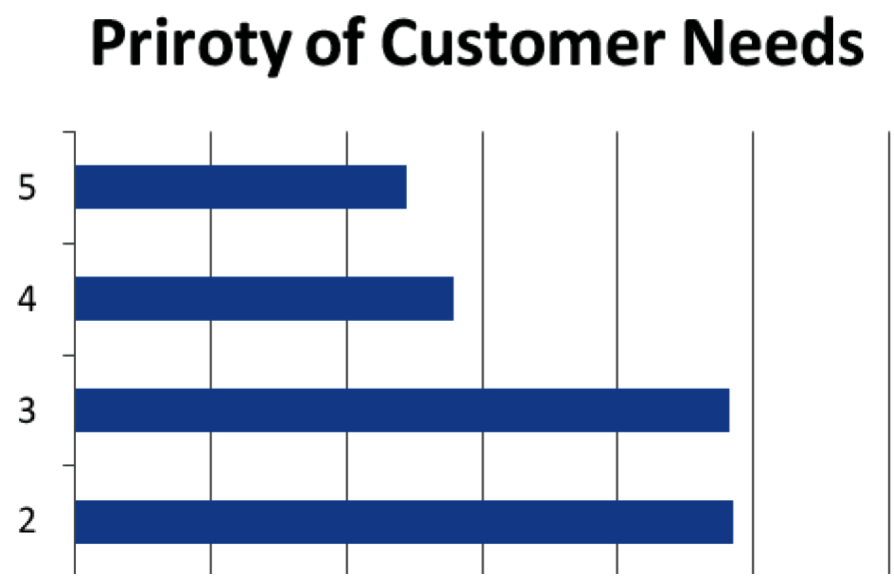

Table 6. Inter-dependency relationships between CNs and DRs

W_2	P	IE	EF	R	E
FCD	0.1128	0.1455	0.1883	0.058	0.0612
TLP	0.1641	0.1659	0.1304	0.1278	0.1851
PRC	0.162	0.1424	0.0678	0.1734	0.1753
ITC	0.2009	0.2296	0.1969	0.2093	0.1883
ESD	0.1998	0.1783	0.207	0.2097	0.2215
IA	0.1807	0.1618	0.2583	0.2355	0.1796

the five factors in respect of Quality engineering Education. The responses are aggregated and shown in Table 11 of the Appendix.

Inter-dependency of DRs and CNs is determined from Fuzzy Positive Ideal Rating (FPIR) and Fuzzy Negative Ideal Rating (FNIR) as discussed in section 4. The Inter-dependency relationships between CNs and DRs are shown in Table 6.

Relative importance of design requirements denotes the impact of the CNs on each of the design requirements. IT capability has an importance degree of 0.2009 on professionalism indicates that Engineering educational institution requires the modern facilities in the field of communication, such as LAN, access to internet, connection of regional libraries by WAN, language labs, E-mail and Fax facilities. These facilities help the students and faculty for solving complex mathematical models and for obtaining latest information on advanced technology.

Flexible curriculum design has an importance degree of 0.3092 on professionalism indicates that there should be interesting modules (content/books), Educational material of high quality, efficient structure of modules, Availability of information on the curriculum structure, variety in elective modules/modules on specialization areas, Laboratories in latest areas should be taken into consideration while designing the curriculum.

Table 7. The inner dependence matrix of the customer needs (W_3)

W_3	PR	IE	EF	R	E
PR	0.2804	0.2686	0.2582	0.2119	0.2052
IE	0.1802	0.3226	0.2072	0.077	0.1677
EF	0.1989	0.177	0.3101	0.188	0.1429
R	0.1898	0.1326	0.0845	0.3298	0.1723
E	0.1507	0.0992	0.14	0.1934	0.312

Teaching learning practices, Employee skill development and Continuous evaluation show little importance on professionalism.

Flexible curriculum design and teaching learning practices with importance weights of 0.3311 and 0.2817 respectively show high importance on integrated education. Continuous evaluation show moderate importance on integrated education. In addition to above factors, Employee skill development, IT capability and infrastructure adequacy influences the acquisition of multitasking skills, ability to work in any field, entrepreneurial ability, orientation towards design and development of innovative engineering products and ability to solve challenging engineering problems.

Facilities include the items related to modern equipment in labs, instructional aids, learning materials and the modern facilities in the field of communication, such as LAN, access to internet, connection of regional libraries by WAN, language labs, E-mail and Fax facilities. These facilities help the students and faculty for solving complex mathematical models and for obtaining latest information on advanced technology. Adequacy of these facilities is important to meet the customer need in respect of education facilities.

Infrastructure adequacy and IT capability with importance weights of 0.5007 and 0.3420 respectively indicate that these requirements ensures improved responsiveness towards student community, Improved access to accurate and timely information. A track of the student's progress is also possible through continuous evaluation which enhances responsiveness.

Importance weights obtained for promotion of research & consultancy, Employee skill development and teaching learning practices indicate their relative importance to ensure empathy.

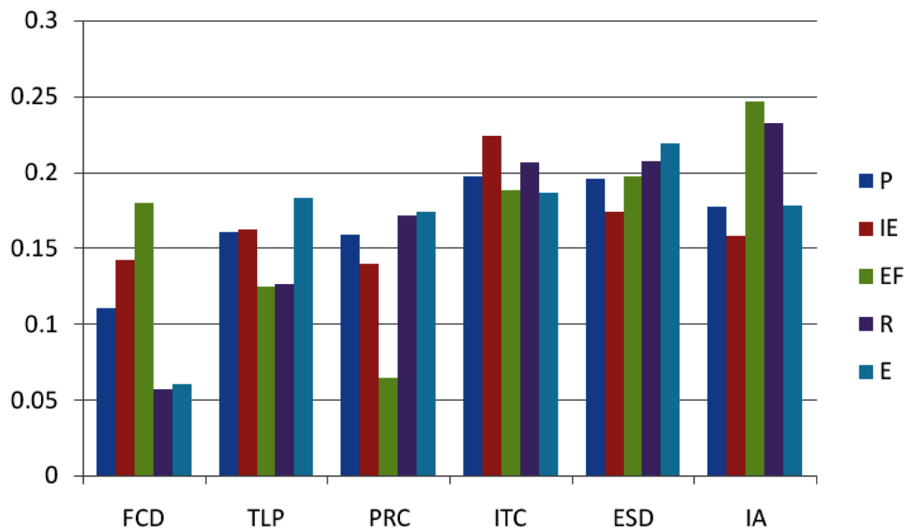
Regular industry institute interaction has importance degree of 0.7656 on industry institute interaction module that improve the employability and exposure of a job seeking candidate of that institution. Hence, it accelerates the conversion rate of prospective aspiring students into successful employees. Inter-dependency of CNs and DRs is graphically shown in Figure 5.

5.3. Inner Dependence Matrix of the CNs (W_3)

Inner-dependency relationships of CNs are also obtained by administering the questionnaire (see Appendix) to the stake holders. The stake holders indicated their response with a Linguistic variable basing on inner dependency among the customer needs in respect of Quality engineering Education. The responses are aggregated and shown in Table 12 of the Appendix.

Inner-dependency among CNs is determined from Fuzzy Positive Ideal Rating (FPIR) and Fuzzy Negative Ideal Rating (FNIR) as discussed in section 4. The Inner-dependency relationships among CNs are shown in Table 7. The values in the table indicate the extent of impact of each customer need on other customer need.

Figure 5. Inter-dependency of CNs and DRs



Normalized values of inner dependency of each customer need on other customer needs are shown graphically in Figure 6.

It is observed that each of the customer needs namely, professionalism, integrated education, Education facilities, responsiveness and empathy depend on the rest of the needs by 71.96%, 67.74%, 68.99%, 67.02% and 68.8% respectively.

It is observed that each of the design requirement namely, flexible curriculum design, teaching learning practices, internal quality assurance, IT capability, employee skill development and infrastructure adequacy depend on the rest of the design requirements by 66.92%, 78.02%, 73.31%, 77.18%,77.3% and 72.65% respectively.

5.4. Inner Dependence Matrix of the DRs (W_4)

Inner-dependency relationships of DRs are obtained by administering the questionnaire (see Appendix) to the stake holders. The stake holders indicated their response with a Linguistic variable basing on inner dependency among the Design requirements in respect of Quality engineering Education. The responses are aggregated and shown in Table 13 of the Appendix. Inner-dependency among CNs is determined from Fuzzy Positive Ideal Rating (FPIR) and Fuzzy Negative Ideal Rating (FNIR) as discussed in section 4. The Inner-dependency relationships among DRs are shown in Table 8 and Figure 7. The values in the table indicate the extent of impact of each design requirement on other requirement.

5.5. Inter-Dependent Priority Matrix of the CNs (W_c)

Using the following relation, the inter-dependent priority matrix of the CNs is obtained and shown in the matrix. The interdependent priority of CNs are shown graphically in Figure 8:

$W_c = W_3 * W_1$

$$w_c = w_3 * w_1 = \begin{pmatrix} P \\ IE \\ EF \\ R \\ E \end{pmatrix} = \begin{pmatrix} 0.2535 \\ 0.2052 \\ 0.2121 \\ 0.168 \\ 0.1612 \end{pmatrix}$$

Figure 6. Inner dependence matrix of the CNs

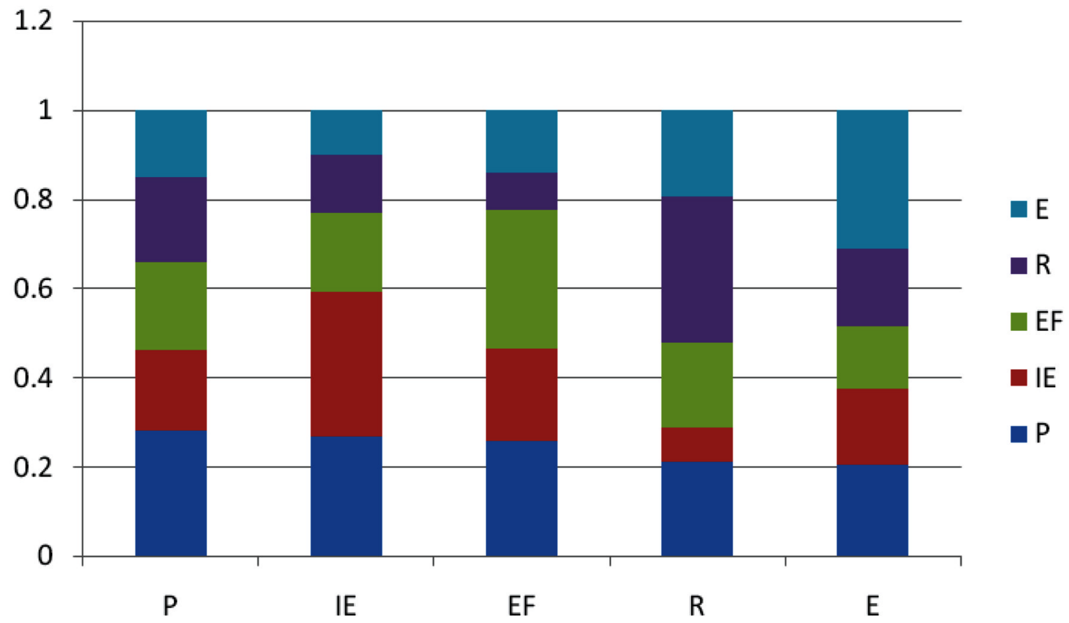


Figure 7. Inner dependence matrix of the DRs

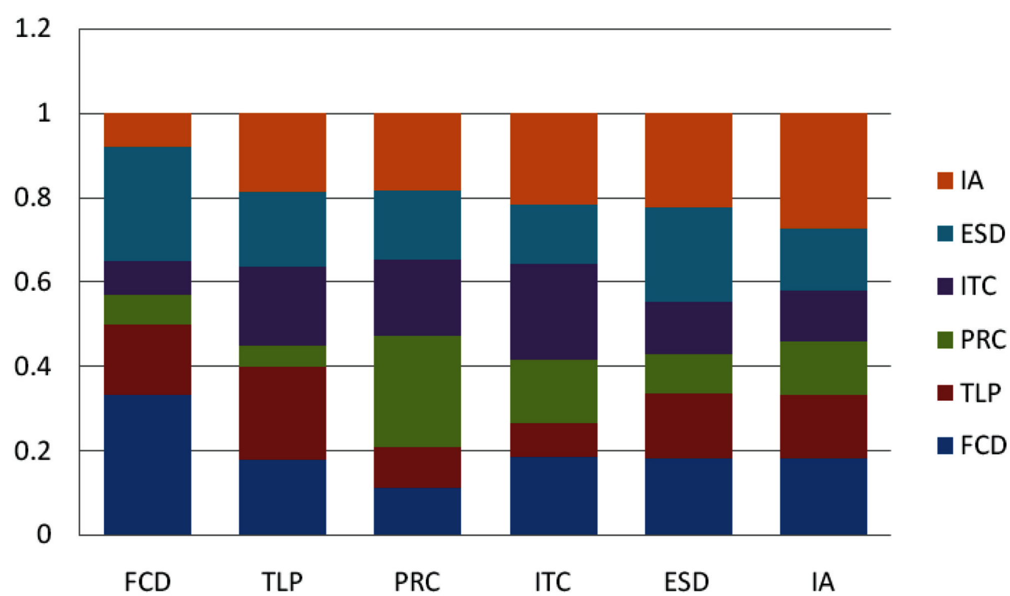

Table 8. The inner dependency matrix of the DRs

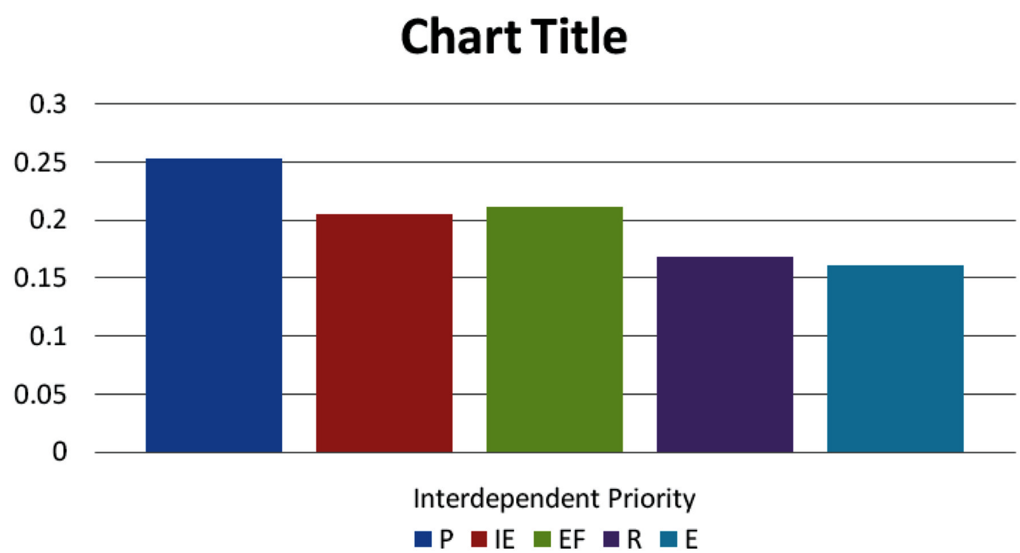
W_4	FCD	TLP	PRC	ITC	ESD	IA
FCD	0.3402	0.1838	0.1134	0.1924	0.1881	0.191
TLP	0.1715	0.2276	0.0966	0.0844	0.1614	0.1592
PRC	0.0742	0.0541	0.2726	0.1543	0.0981	0.1343
ITC	0.081	0.1905	0.1818	0.2382	0.129	0.1261
ESD	0.2783	0.1862	0.1678	0.1466	0.2329	0.156
IA	0.0831	0.1933	0.1892	0.228	0.2347	0.2886

Figure 8. Inter dependent priority matrix of the CNs



The inter dependent values shown in matrix w_c illustrates how individual customer needs always effectively aligned or directed toward a common goal of achieving total quality engineering education and adoption of best practices. From the values shown in the matrix, it is observed that professionalism, integrated education, education facilities, responsiveness and empathy by 25.35%, 20.52%, 21.21%, 16.8% and 16.12% respectively by considering the correlation among the customer needs.

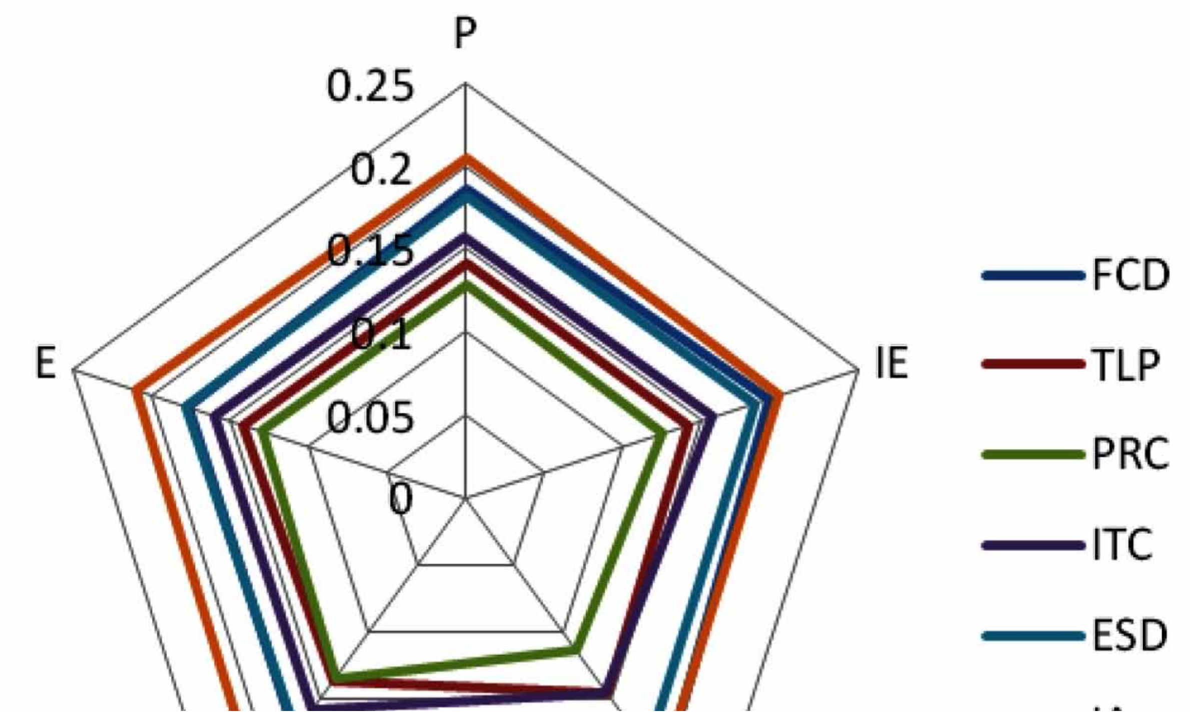
5.6. Inter-Dependent Priority Matrix of the DRs (W_A)

The inter-dependent priority matrix of the DRs is obtained by the following relation and shown in Table 9:

$$W_A = W_4 * W_2$$

The inter dependent values shown in matrix w_A illustrates how the individual design requirements always effectively aligned or directed toward

Figure 9. Inter-dependent priority matrix of the DRs



a common goal by considering the correlation among the design requirements. Inter dependent priority of design requirements and customer needs are graphically shown in Figure 9.

5.7. Overall Priorities of DRs

The overall priorities of the DRs reflecting the interrelationships within the HoQ are obtained by the following relation:

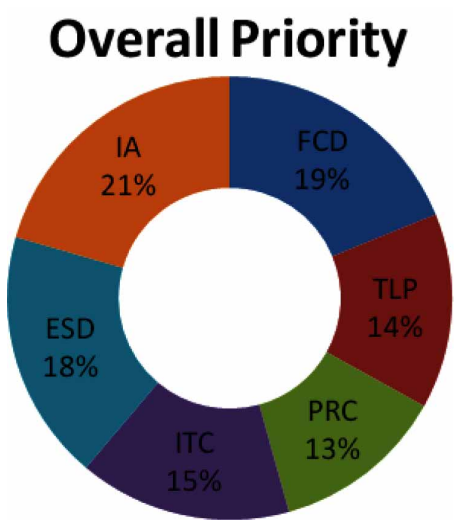
$$W_{ANP} = W_a * W_c$$

$$W^{ANP} = \begin{pmatrix} FCD \\ TLP \\ PRC \\ ITC \\ ESD \\ IA \end{pmatrix} = \begin{pmatrix} 0.2008 \\ 0.1513 \\ 0.1345 \\ 0.1653 \\ 0.1942 \\ 0.2192 \end{pmatrix}$$

Table 9. The inter-dependent priority matrix of the DRs

	P	IE	EF	R	E
FCD	0.1977	0.2048	0.2219	0.1876	0.1869
TLP	0.1503	0.1504	0.1597	0.1448	0.1498
PRC	0.1363	0.1333	0.1249	0.143	0.1372
ITC	0.1663	0.1674	0.1586	0.1671	0.1681
ESD	0.1933	0.1957	0.2054	0.1853	0.1881
IA	0.2166	0.212	0.2217	0.2272	0.2208

Figure 10. Overall priorities of DRs



Normalized values of overall priority of design requirements are shown graphically in Figure 10. The ranking of design requirements basing on the overall priority is shown in Table 10.

In this study, the overall priority of DRs is calculated through QFD-ANP approach. Each of these design requirements has a set of functions either wholly independent or partially dependent on other design requirements. These functions are discussed in brief as follows.

Highest overall priority (0.2192) is obtained with Infrastructure adequacy. Interdependency of IA and CNs is observed during the study. Inner dependency of IA with FCD, TLP, PRC, ITC and are 0.191, 0.1592, 0.1343, 0.1261 and 0.156 respectively. From these values it is observed that the impact of IA on other requirements is considerable. Infrastructure adequacy includes sufficient number of classrooms, laboratories, accommodation, Sports facilities, Medical facilities and availability of infrastructure to host social and cultural events. In case of library services, there should be automating and delivering the entire range of Library functions. Also, availability of textbooks and journals, Easy borrowing process, Friendliness, E-library should be ensured.

Overall priority of 0.2008 is obtained with Flexible curriculum design. Interdependency of FCD and CNs is observed during the study. Inner dependency of FCD with TLP, PRC, ITC, ESD and IA are 0.1715, 0.0742, 0.081, 0.2783 and 0.0831 respectively. From these values it is observed that the there is considerable impact of FCD on TLP and ESD. The curriculum design should create extensive interaction between faculty and students and also among peers. Communication tools in the form of chat, discussion boards shall be provided. Scheduling of the instruction, teacher feedback are also essential to the curriculum planning module. Further, Interesting module content/books, Educational material of high quality, efficient structure of modules, Availability of information on the curriculum structure, Variety in elective modules/ modules on specialization areas, Laboratories in latest areas should be taken into consideration while designing the curriculum.

Employee Skill Development is ranked as third among the design requirements with an overall priority of 0.1942. Interdependency of ESD and CNs is observed during the study. Inner dependency of ESD with FCD, TLP, PRC, ITC and IA are 0.1881, 0.1614, 0.0981, 0.129 and 0.2347 respectively. From these values it is observed that the there is high impact of FCD on IA, moderate impact on FCD, TLP and ITC and less impact on PRC.

Table 10. Ranking of design requirements

DRs	ESD	TLP	IA	PRC	FCD	ITC
Ranking	III	V	I	VI	II	IV

This design requirement should assist in student recruitment and simplifies the same. It should help to improve the employability and exposure of a job candidate from that institution. Hence, it accelerates the conversion rate of prospective aspiring students into successful employees.

In the study, IT capability is emerged as one of the important design requirement with an overall priority of 0.1653. Interdependency of ITC and CNs is observed during the study. Inner dependency of ITC with FCD, TLP, PRC, ESD and IA are 0.1924, 0.0844, 0.1543, 0.1466 and 0.228 respectively. From these values it is observed that the there is high impact of ITC on IA, and moderate impact on FCD, TLP, PRC and ESD.

This design requirement ensures improved responsiveness and empathy towards student community, improved access to accurate and timely information; Enhances workflow, increases efficiency, and reduces reliance on paper; tightens controls and automates e-mail alerts; Provides user-friendly Web-based interfaces; streamlines processes and eases adoption of best teaching learning practices.

Overall priority of 0.1513 is obtained with teaching learning practices in this study. Interdependency of TLP and CNs is observed during the study. Inner dependency of TLP with FCD, PRC, ITC, ESD and IA are 0.1838, 0.0541, 0.1905, 0.1862 and 0.1933 respectively. From these values it is observed that the there is high impact of TLC on IA, ESD, ITC and FCD. There is moderate impact on PRC is observed in the study.

Effective teaching and learning practices include sufficient qualified local teaching staff members are hired for teaching the courses, detailed course materials, sufficient teaching staff with extensive industry experiences, providing students with adequate electronic access to its library, posting of course materials effectively on the institution's webpage. Further, there should be effective staff and student relationships. Students have to receive prompt, individualized attention from the faculty. Faculty has to motivate the students to excel. There should be honest communication among all Staffs and Students.

In the study, PRC is also emerged as one of the important design requirement with an overall priority of 0.1653. Interdependency of PRC and CNs is also observed during the study. Inner dependency of PRC with FCD, TLP, ITC, ESD and IA are 0.1134, 0.0966, 0.1818, 0.1678 and 0.1892 respectively. From these values it is observed that the there is high impact of ITC on IA, ITC, ESD. There is moderate impact on FCD and ESD.

In this study, HoQ-ANP methodology is implemented to prioritize the design requirements of quality engineering education. The design requirements in the priority order are: Infrastructure Adequacy (IA), Flexible Curriculum Design (FCD), Employability skill Development (ESD), IT Competency (ITC), Teaching Learning Practices (TLP) and Promotion of research and consultancy (PRC). These findings are in tune with the earlier studies in the literature (Durga Prasad et al., 2007; Mahapatra & M. S. Khan, 2007).

The ranking of the design requirements obtained through the HoQ-ANP indicates the order in which the institution has to enrich its requirements by setting up and monitoring the above activities to meet the customer expectations. To accomplish the task of establishing total quality engineering education, unconditional commitment and continuous effort by each and every participant of the education system is the primary requirement.

6. CONCLUSION

In this paper, ANP approach is integrated into HoQ to prioritize DRs for total quality engineering education. In addition, the fuzzy theory in determining inner dependence and inter dependence matrices of CNs and DRs are determined from Fuzzy Positive Ideal Rating (FPIR) and Fuzzy Negative Ideal Rating (FNIR). From the study it is observed that the most important design requirement is infrastructure adequacy (IA). The design requirement would help to decide about the design of teaching methodology, students' evaluation methods, students grading pattern and identify the resources needed for teaching learning process. Flexible curriculum design (FCD) is emerged as second important DR closely followed by IA. The curriculum will be designed by considering the inputs such as industry requirements and technological developments. Employee skill development (ESD) is identified as third important design requirement in the study. The design requirement should create perspectives for professional career, opportunities for continuing education and exchange programs with other universities/institutes. IT capability is also necessary to design an integrated architecture framework to incorporate information systems dedicated to the academic environment. Teaching learning practices includes continuous evaluation by regularly updating the students' performance in both scholastic and co-scholastic areas are also necessary to develop quality engineering education model. The educational institutions have to set to up a system to monitor the processes like teaching, learning, curriculum planning etc. to promote research and consultancy.

Ranking of the design requirements obtained in this paper will be the input data to establish performance dimensions and performance enablers of engineering education institutions. These design requirements are subsequently transformed into performance dimensions in turn into performance enablers. Once the network relationship between the design requirements, performance dimensions and enablers is established the analysis and ranking of education institutions may be carried.

The HoQ-ANP methodology furnished the priority ratings of the design requirements in respect of developing quality engineering education is in tune with the stakeholder views. The methodology enables government and managements to make appropriate decisions in selecting design requirements to deploy the customer needs towards quality engineering education.

When the number of engineering characteristics to be compared is not very large, the ANP approach is a more effective approach than other approaches. The future work will focus on the development of priority of design requirements basing on competitiveness and implementation difficulty.

Section 4
Cases and Applications

This section discusses a variety of applications and opportunities available that can be considered by practitioners in developing viable and effective Curriculum Design and Classroom Management programs and processes. This section includes 20 chapters that discuss Curriculum Design and Classroom Management in a variety of settings. Contributions included in this section provide excellent coverage of today's IT community and how research into Curriculum Design and Classroom Management is impacting the social fabric of our present-day global village.

Chapter 44
How Do They Fare?
Learning Achievement and Satisfaction with Blended Learning for Traditional-Age Undergraduates at Moderately Selective Colleges

Janet Kuser Komarnicki
Fisher College, USA

Yufeng Qian
Northeastern University, USA

ABSTRACT

Blended learning is proliferating rapidly in higher education across the United States. However, this learning environment may pose new challenges to learners at moderately selective colleges who are normally found to be low in autonomy. A quasi-experimental study was conducted to examine the learning achievement and course satisfaction of this group of learners in two sections of a course, with one being blended and the other a face-to-face. The results, shown in this chapter, reveal that instructional mode does not have a significant effect on learning achievement and course satisfaction; however, a further examination into the course structure, dialogue, and learner autonomy suggests that low structure and high dialogue can help reduce transactional distance and a synchronous format for the online component in a blended course is highly recommended. In addition, coaching and scaffolding learner autonomy is indispensible for learners at moderately selective colleges and should be considered in the design and implementation of online learning.

INTRODUCTION

Blended learning is proliferating rapidly in higher education across the United States due to its prominent benefits, including flexibility, accessibility, and integration of traditional pedagogical benefits of face-to-face learning and potentially transformative learning enabled by emerging technologies (Kaleta, Skibba, & Joosten, 2007; Vasileiou, 2009). The most recent 2012 Pew

DOI: 10.4018/978-1-4666-8246-7.ch044

Survey on the future of higher education with over 1000 academic experts and stakeholders suggests that 60% are expecting a transition to hybrid classes by 2020 (Quitney, Boyles, & Rainie, 2012). Blended learning, incorporating the best of both worlds, is expected to transform teaching and learning in higher education and is predicted to become the predominant model in course delivery in the near future.

The blended learning environment, with different rhythms and forms of interaction between students and instructor, as well as between students, between students and learning materials, may pose new challenges to traditional-age undergraduate students with moderate academic performance who have been found to be low in academic motivation and self-discipline (Beck, Rorrer-Woody, & Pierce, 1991; Fulk, 2003; Kim & Keller, 2008). In the United States, 800 institutions are considered somewhat selective, accepting between 50% and 75% of their applicants, with an additional 400 less selective institutions that accept over 75% of their applicants (College Board, 2013). Given this backdrop, a large number of students attending colleges in the United States are moderately selective. Is blended learning, which may require relatively higher levels of motivation, engagement and self-directed learning skills (Abulibdeh & Ishtaiwa, 2012; Bliuc, Ellis, Goodyear, & Piggott, 2011; López-Pérez, Pérez-López, & Lázaro, 2011), an appropriate learning environment for this group of learners?

A number of research studies exist on the subject of blended learning in various settings and formats, which reveal mixed results regarding student learning achievement and perceptions of blended learning (Ashby, Sadera, & McNary, 2011; Foulger, Amrein-Beardsley, & Toth, 2011; U.S. Department of Education, 2010). Many existing studies, however, have been conducted at large universities but do not make any reference to level of selectivity of the institution (Hoyt, 2003; Kenney & Newcombe, 2011; López-Pérez, Pérez-López, & Lázaro, 2011; Uzun & Senturk, 2010), others are conducted with graduate students who are dominantly non-traditional adult learners (Falloon, 2011; McLaren, 2010), no specific research has related to blended learning for traditional-age undergraduates at moderately selective institutions. Moore's (2013) theory of transactional distance postulates that the difference in perceptions and understanding between students and instructor (i.e., transactional distance) is a function of three factors: (a) structure (i.e., course design), (b) dialogue (i.e., interaction), and (c) learner autonomy (ability to work independently). In a blended learning environment, where transactional distance may increase due to the quasi-permanent separation of teacher and learners, and between learners in a relatively lower-touch, less relationship-oriented environment, students must possess the ability to function autonomously so as to be successful. As Moore (2013) noted, "a common cause of failure, or at least of courses falling short of expectations, is a failure to design the balance of structure and dialogue that is appropriate for a particular student population and subject field" (p.71).

This chapter is aimed to fill a gap in current distance education research by addressing a prominent subset of the general higher education population. A quasi-experimental study was designed to examine the learning achievement and course satisfaction of undergraduates at a moderately selective college in two sections of the same course, with one implementing a blended learning environment and the other implementing a traditional face-to-face learning environment. Students' course satisfaction in both learning environments will be examined in relation to their perceptions of the course structure and dialogue, and their levels of autonomy, which will be further examined by relating to their satisfaction. The results will help higher education administrators make wise and ethical decisions when adopting blended and online education. Likewise, the results will inform faculty in designing blended courses so as to achieve an optimal balance between course structure, dialogue, and learner autonomy.

BACKGROUND

At one of the moderatly selective institutions, a challenge has been posed by both the potential of blended learning and the concern relative to the ability of the students to succeed in this alternative learning environment. This concern is excerbated by the void in the literature relative to this population of students. The study site is an institution that routinely accepts approximately 85% of undergraduate student applicants and, accordingly, will accept undergraduate students into a bachelor's degree with a GPA as low as 2.1. At this institution, it is not uncommon for students to fail to obtain the required text, routinely fail to complete homework, and have poor attendance despite consistent academic guidelines provided to all students via orientations, standard syllabi elements and faculty policies. The primary concern among faculty and adminstrators alike is that this population of students may not be able to handle the indepenent work required in the online environment, and it could be too risky to implement at a large scale blended or fully online courses and programs in order to aleviate the institution's space constraint issues and students' increasing need for flexibility. What is the effect of a blended learning environment on underachieving students' learning achievment and satisfaction? What would be the optimal balance between course structure and dialogue based upon the autonomy of the individual learner? Exploring these issues from the lens of Moore's (2013) theory of transactional distance, this study was designed to examine the following three research questions:

Question 1: To what extent does learning achievement of traditional-age undergraduates in a moderately selective college differ in a blended learning and a face-to-face mode?

Question 2: To what extent does course satisfaction of traditional-age undergraduates in a moderately selective college differ in a blended learning and a face-to-face mode?

Question 3: To what extent do a course's structure, dialogue, and student autonomy relate to course satisfaction of traditional-age undergraduates in a moderately selective college in a blended learning and in a face-to-face mode?

THEORETICAL FRAMEWORK: TRANSACTIONAL DISTANCE

The theory of transactional distance was first proposed by Moore in 1972 and formally named in 1980 to address distance education (Moore, 2013). Moore was the first to recognize the pedagogical distinctions associated with distance learning and has evolved to support a full range of academic structures relative to the separation of learner and teacher, including the use of current technologies in course delivery, specifically blended and online pedagogy (Moore, 2003; Saba, 1994). The use of the term "transaction" was built from a concept by Dewey and relates to the interplay between teachers and learners in a special learning environment (Moore, 2013). Transactional distance refers to the psychological space and communication gap between student and teacher, and is a pedagogical phenomenon, not geographical, that can occur in any learning environment (Falloon, 2011; Moore, 2003; Saba, 2013; Stirling, 1997).

Course Structure

The first element of the theory of transactional distance can be defined as the "rigidity or flexibility of the course's educational objectives, teaching strategies and evaluation methods" (Moore, 2013 p.70). A course with high structure would have little opportunity for a student to deviate from a prescribed path in the course delivery (Falloon, 2011; Moore, 2013). This theory presumes that online components of the course allow for little deviation and therefore are highly structured, leading to a high level of transactional distance (Moore, 2003). High transactional distance requires a high level of student autonomy. Alternatively, the face-to-face class will be directed by the faculty member and allow for modification and adaptation of the learning activities based on the interaction between the students and teacher.

Dialogue

The second component of transactional distance theory refers to the interpersonal interaction aimed at the communication and construction of knowledge, skills and dispositions between student and teacher (Moore, 2013). The amount of interaction between student and teacher vary across any delivery modality including face-to-face and blended courses. Although Moore limited his concept of dialogue to student-teacher interaction, subsequent theorists have expanded the concept of interaction and dialogue to include student-student interaction as a significant component (Bajt, 2009; Falloon, 2011; Saba, 2013). This construct aligns with Vygotsky's social constructivism that emphasizes the fundamental and critical role of social interaction in learning and development (Vygotsky, 1978), and current online learning theories including the community of inquiry framework which emphasizes social presence, along with teaching and cognitive presences in an online learning environment (Garrison & Vaughan, 2008). The theory of transactional distance presumes that the increase of instructor-student dialogue would decrease transactional distance (Saba & Shearer, 1994).

Autonomy

The third component of the theory of transactional distance refers to the degree of student independence and self-management relative to establishing goals, seeking support when needed, managing time, implementing learning strategies and evaluating outcomes as required for the course (Moore, 2013). The theory proposes that courses will vary in the degree of autonomy required, based on course structure and dialogue. The concept of autonomy is aligned with other theories that relate to student motivation and ability to work independently such as self-determination theory (Deci & Ryan, 2012; Falloon, 2011) and self-directed learning (Garrison, 1997). Various studies have found autonomy to be success factor for blended learning (Abulibdeh & Ishtaiwa, 2012; Hung, Chou, Chen, & Own, 2010; López-Pérez, Pérez-López, & Lázaro, 2011; Owston, York, & Murtha, 2012). In addition, a recent survey of Chief Academic Officers, conducted by The Learning House, reported "the lack of discipline for online students" as the greater barrier to success in online programs (Clinefelter & Magda, 2013, p. 13).

The theory of transactional distance postulates that an inverse relationship exists between structure, dialogue, and autonomy. Transactional distance decreases when instructor-student dialogue increases or when course structure decreases. Transactional distance increases when instructor-student dialogue decreases or when course structure increases (Moore, 2013). The transactional theory provided the foundation for the aforementioned research, as it specifically speaks to the concerns of the faculty and administration at the research site by framing distance education on a continuum and recognizing the need for autonomous learning. What is yet to be known, is whether blended learning, with its unique combination of distance and traditional pedagogies, will demonstrate transactional distance at all and how the course structure, dialogue, and learner's level of autonomy will affect their course satisfaction.

A QUASI-EXPERIMENT AT A MODERATELY SELECTIVE COLLEGE

The research site is a moderately selective private college located in northeastern United States. It has a total undergraduate enrollment of over

2,000 with an acceptance rate of approximately 85%. The study built upon the existing model for blended learning at the research site, which has been utilized over the past five years for non-traditional learners and tested within the past two years with traditional-age undergraduates. The format includes the replacement of one-half of the contact hours with online components and requires weekly discussion forums and the use of various online educational activities. This model was used for the proposed research because of the institutional experience and instructional training available to support this model.

Course Design

The quasi-experiment study was conducted over a traditional 15-week semester using an upper level management class. One instructor taught a section of the course in the traditional face-to-face format and a second section in a blended format. Student participants were all in their junior or senior year of study and self-selected into one of the two sections. There were one experimental group of 18 students (in the blended format) and one comparison group of 19 students (in the face-to-face format). The face-to-face class section met twice per week for 75 minutes each. The blended class section met once per week for 75 minutes and replaced the second 75 minutes of contact hours with instructional activities administered through the learning management system, Blackboard. The course description, learning outcomes, learning materials, and assessment for the two sections were identical, despite the delivery modality. Each week the subject matter was covered, and the learning activities were aligned, but adapted for the specific modality of the class section. The instructor in this quasi-experiment study was highly experienced with teaching in the traditional, online and blended learning environments, with consistently strong student evaluation, as demonstrated by his most recent student rating of 4.71 compared to the overall instructional average at the institution of 4.41.

Data Collection

Data was collected to measure students' learning achievement, and course satisfaction along with the relationship between satisfaction and the constructs of course structure, dialogue, and autonomy. Learning achievement was evaluated using a subject matter test, developed by the faculty member who was an experienced instructor in the course and a subject-matter expert, drawing from test questions provided by the text book publisher. These test bank questions were developed, tested, and peer-evaluated by experts in the field and were sorted and selected by the faculty member to meet the specific learning outcomes of the course. Use of subject matter experts is a common practice for content validity measurement (Gall, Gall, & Borg, 2007). The final exam contained 40 multiple choice, ten short answer questions and one essay question.

The second instrument used was to measure students' satisfaction with the course and their assessment of course structure, dialogue, and self's level of autonomy. The primary foundation for the instrument is the Course Interaction, Structure, and Support (CISS) instrument, developed by Shaik (2002) based on the theory of transactional distance. The CISS was validated for content through a review by experts in the field of education. It was then pilot tested and a factor analysis was completed to ensure construct validity. The instrument was further revised and resulted in a 27 question survey (Shaik, 2002). The Cronbach's alpha reliability test ranged between .76 and .85 for the individual measures. The combined scale had a Cronbach's alpha coefficient of .89, all within the commonly accepted level for internal consistency reliability (Bartkus, Hills, & Naegle, 2009; Muijs, 2011). The instrument was slightly modified to remove three questions relative to an individual construct of departmental support, which was not relevant to the current study. A subscale of the Online Learning Readiness Scale (OLRS) was used to measure learner autonomy

Table 1. Comparison of the face-to-face and blended sections

Class	Enrolled	Withdrew	Completed survey
Group 1: face-to-face	19	0	19
Group 2: blended	22	1	18

(Hung, et al., 2010). This subscale had a composite reliability rating of .871, exceeding the .7 value, which is generally considered acceptable. The final instrument contains four primary sets of variables, each using the same scale within the group. This survey aligned with the researchers' goals of measuring student satisfaction with the course as well as the impact that structure, dialogue and autonomy have on satisfaction.

Quantitative Data Results

The face-to-face class did not experience any attrition and all students completed the survey. The blended section lost one student as a result of withdrawal, and three other students did not complete the survey. Therefore, all analysis related to the three research questions was conducted using n=37 (19 in group 1, 18 in group 2).

The following sections present results of the data analysis for each research question.

Question 1: To what extent does learning achievement of traditional-age undergraduates in a moderately selective college differ in a blended learning and a face-to-face mode?

In this quasi-experiment, students self-selected into the face-to-face or blended section of the course. Given this limitation, a test of normality was required to ensure that each group was similarly aligned and that results would not be impacted by differences that pre-existed within the sample. A review of prior semester cumulative GPA, along with a visual examination of Q-Q plots established a reasonable equivalence of groups. Although the GPA in the blended sections was .22 higher than the face-to-face section (2.99/2.77), the minimum and maximum GPA, along with the range were within .03. In addition, a Shapiro-Wilk test was conducted to ensure normal distribution within each section. The face-to-face section had a p-value of .051, while the blended section had a p-value of .779. In both cases, the benchmark of normality of .05 was satisfied. Once reasonable normality was established an analysis of final exam grades was conducted.

As shown in Table 2, students learning achievement, as measured by final exam grades, was slightly higher for the face-to-face class with a mean of 74.95 compared to the mean score of 73.61 for the blended section. A t-test was conducted with a p-value of .707 indicating that there is no statistically significant difference between these two groups. Despite the lack of statistical significance a Cohen's d measure of effect size was conducted to establish the potential effect that class format had on the variance in final exam grades. This test resulted in a measure of .065, which indicates a minimal practical effect of course format on learning achievement. Of course, a caveat against the no significant difference regarding the learning achievement between the face-to-face and blended groups must be considered, given the relatively small number of sample size (37) involved in this study. A Type 2 error (concluding no significant difference in the sample when one in fact exists in the population) might be possible.

Question 2: To what extent does course satisfaction of traditional-age undergraduates in a moderately selective college differ in a blended learning and a face-to-face mode?

As shown in Table 2, the mean rating of satisfaction in the face-to-face section was slightly higher with a score of 4.68 as compared to the blended section, with a mean score of 4.28. A t-test was conducted to determine statistical significance;

Table 2. Learning achievement and course satisfaction

	Comparison of Means	Sig (2-tailed)	Cohen's d
Learning Achievement	Face-to-face: 74.95 Blended: 73.61	.707	.065
Course Satisfaction	Face-to-face: 4.68 Blended: 4.28	.056	.0625

however, the p-value did not meet the generally accepted threshold of .05 or lower. The actual p-value was .056, which is quite near statistical significance, and therefore presents a cause for consideration. The Cohen's d measure of effect size of .0625 implies a minimal practical effect of course format on overall satisfaction. Similar to the consideration of no significant difference for learning achievement, care must be taken to avoid Type 2 error for course satisfaction, especially when the p value is close to the threshold.

Question 3: To what extent do a course's structure, dialogue, and student autonomy relate to course satisfaction of traditional-age undergraduates in a moderately selective college in a blended learning and in a face-to-face mode?

In order to address question 3, multiple levels of analysis were required. Each construct within the framework of the theory of transactional distance was evaluated in each course format to determine if a blended course delivery demonstrated a higher level of transactional distance than a traditional face-to-face class. By conducting this analysis, not only could the question be answered but the relevance of the theory of transactional distance to blended learning could be assessed. Each construct will be discussed below.

The comparison of mean scores relative to course structure (Table 3), demonstrates a slightly more positive assessment by students in the face-to-face class. The resulting t-test determined that there was not a statistically significant difference in the student assessment of structure by course delivery format. The Cohen's d measure of effect size can be categorized as weak but approaches the benchmark for moderate effect size (.2) which bears some consideration. The Pearson's r coefficient demonstrates a strong correlation between a positive assessment of structure and satisfaction, with the results from the blended section stronger. Based on this analysis, the researchers can support the contention that there is a strong correlation between assessments of course structure and satisfaction for all students regardless of the instructional mode, and there is no statistical significance relative to the variance in assessment of structure for each class section.

The second construct of dialogue was further segmented into an analysis of student/instructor dialogue and student/student dialogue (Table 4). A review of the data provided in the preceding tables demonstrates a recurring observation. In both cases, dialogue was evaluated more positively by the face-to-face class section; however, the p-value indicates no statistical significant difference between the face-to-face and blended

Table 3. Course structure

Structure	Comparison of Means	Sig (2-tailed)	Cohen's d	Pearson's r
Face-to-Face **Blended**	3.58 3.42	.261	.193	.781 .860

Table 4. Dialogue

Student/Instructor	Comparison of Means	T-Test	Cohen's d	Pearson's r
Face-to-Face	3.58	.159	.23	.677
Blended	3.42			.805
Student/Student	Comparison of Means	T-Test	Cohen's d	Pearson's r
Face-to-Face	3.39	.131	.25	.565
Blended	3.17			.812

groups. Yet the Cohen's d measure indicates a moderate effect relative to both components of dialogue and student satisfaction. In addition, there is a very strong correlation between each component of dialogue and satisfaction for the blended section and a moderate correlation with the face-to-face class. Although the students in each section assessed dialogue similarly, there is a modest effect size relative to dialogue and satisfaction and a stronger correlation between dialogue and satisfaction for the blended section.

The third construct of autonomy is a composite variable based on a five-point scale, rather than the four-point scale used in all previous sections. A review of the data above reveals that students in the blended section consider themselves slightly more autonomous than the students in the face-to-face class. This variance however is not statistically significant based on the p-value of .321. The associated Cohen's d measure of effect size, -.165 also indicates a weak effect between the face-to-face and blended groups regarding the student's perception of their autonomy. In addition, the Pearson's r correlation coefficients for each class section are in the moderate range. From this it can be interpreted that student self-assessment of autonomy is not highly correlated with their course satisfaction. However, this analysis is based on student perception of their autonomy and their associated satisfaction. Further analysis is warranted to measure students' actual autonomy and the resulting effect on course satisfaction.

Open Response Results

Each class section was asked one open-ended question that has been summarized for analysis. A simple descriptive coding method was used, which as noted by Saldana (2013), "leads primarily to a categorized inventory, tabular account, summary, or index of the data's contents" (p.89). The small volume of text collected in response to the open ended questions was easily structured and did not warrant any further sub-categorization. A tabular summary of the responses by students in the face-to-face and blended sections to the question regarding their reason for selecting the course format, can be found in the following table:

The overwhelming response to class format selection from the students in the blended class section related to the schedule. However, a reasonable response indicated that students liked the blended format for learning purposes. A follow up

Table 5. Autonomy

Autonomy	Comparison of Means	T-Test	Cohen's d	Pearson's r
Face-to-Face	3.83	.321	.165	.544
Blended	4.0			.688

Table 6. Open-ended question

Face-to-face	Number of References
Tried blended previously	4
Learns better in class **Time management** **Schedule**	9 1 3
Blended	**Number of References**
Less work anticipated	1
Learns better/likes format **Schedule**	8 11

question identified that 14 of the 18 respondents would definitely take a blended class in the future. The following table displays representative comments from students in each class section to provide some insight into the above referenced results.

DISCUSSION

Learning Achievement and Course Satisfaction

In this study, students' academic performance and course satisfaction did not differ significantly in the face-to-face and blended formats. This result supports one common finding from instructional technology research: Delivery mode does not appear to have a significant effect on learning achievement and course satisfaction (Cheng, Lehman, & Armstrong, 1991; Moore et al. 1990; Russell 1999). However, the mean scores do suggest the face-to-face students have performed better in the final exam, despite the fact that students in the blended section began the class with a slightly higher overall GPA. Similarly, student course satisfaction in the face-to-face format was higher than that in the blended format, with its p-value of .056 approaching closely to statistical significance. Regardless of the no-significance conclusion, these results do raise concerns about the blended format for traditional age undergraduates at moderately selective colleges.

As discussed previously, one of the concerns with less achieving students in non-traditional learning environments (i.e., blended, fully-online) is their relatively lower level of autonomy, which has been identified as one of the major factors contributing to withdrawal, or poor performance in an online format. It has been argued that the blended format is more favored over fully online as the former retains the sense of community, and immediacy of feedback and support from the instructor and peers through face-to-face sessions. However, the results from this study reveal that a blended format appears to be inferior to traditional face-to-face classes in assisting and scaffolding less achieving students' learning. This may, of course, be due to the specific design of the blended course, in which

Table 7. Student comments regarding blended class selection

Face-to-face Reasons not to choose blended	Blended Reasons to choose blended
I've tried blended before and it did not work for me I like to have more face-to-face time with my professor I like to go to class and listen to the professor explain things and if I have a question be there to ask them This is the best way to learn I do not think blended courses are the way to get a college education If I were to stay home and have a blended class, where I can manage my own time, I tend to procrastinate	It works with my schedule This allows flexibility to participate online and in person at the next class It is a different commitment and style of coursework, but if you are up for it, it is a good method. Since half the class is on line there is more independent learning but still meets once a week to maintain structure. Fit my schedule great and let me work at my own pace. More freedom and independence. Because I needed to use blackboard for this class, I was always logging in which forced me to keep up with announcements and assignments from other classes.

the online sessions were totally asynchronous, including the delivery of course content, text-based online discussion and group works.

Delayed feedback, a feeling of isolation, and a lack of emotional connection have been perceived as the major challenges to asynchronous online learning (Vonderwell, 2003). The use of synchronous learning in online education in recent years has rapidly increased due to its important advantages over asynchronous learning, such as immediacy, spontaneous feedback, live time interaction and collaboration, and connectedness. A September 2005 eLearning Guild research report indicated that about 90% of respondents had participated in a synchronous e-Learning event (Hyder, Kwinn, Miazga, & Murray, 2007); a 2009 survey of college undergraduate students suggested that almost three-fourths of students prefer online courses that are synchronous with web conferencing capabilities rather than asynchronous online courses (EDUCAUSE, 2009). The use of synchronous e-Learning, if well-designed, holds great potentials for promoting active and deep learning. It may be the case that blended learning is most successful when it is accompanied by the online component in a synchronous format, in which less autonomous students can be fully supported and guided as they are in the face-to-face format.

Structure

Once again, the structure of the course was rated slightly higher by students in the face-to-face class section with a mean of 3.58 compared to a mean of 3.42 for students in the blended section. This however lacked statistical significance and demonstrated a weak effect size; therefore the implication is that students had no significant issues or concerns relative to course structure in either class section. This analysis was furthered with a correlation between assessment of structure and satisfaction to evaluate the relevance of transactional distance. The correlation between satisfaction and structure for the face-to-face section was strong, but was very strong for the blended section. Students in the blended course rated the structure lower, yet it has a stronger relationship for these students for satisfaction. This supports the concept of structure in transactional distance, by demonstrating a difference in assessment of structure and the significance of structure to satisfaction.

Dialogue

The pattern continues as the students in the face-to-face class rated student/instructor dialogue slightly higher with a mean of 3.58 as compared to a mean of 3.42 for the blended section. Although the results lacked statistical significance, there is a modest effect size of .23. To complete the analysis, the correlation was conducted, and established once again that students in face-to-face section demonstrated a strong relationship between student/instructor dialogue and satisfaction, while those in the blended section showed a very strong correlation. This combined with a slightly lower assessment of student/instructor dialogue presents another finding for consideration. For this measure, the interpretation and relevance of transactional distance is complex. On the one hand, the lack of statistical significance raises questions about the applicability of the results to the overall population; however, a modest effect size does imply that students in the blended class section assess student/instructor dialogue slightly less favorably than those in the face-to-face class. In addition, there is a stronger relationship to student assessment of student/instructor dialogue with satisfaction. Therefore, there is a minor finding of reduced student/instructor dialogue, yet this dialogue is more closely correlated to student satisfaction than it is for students in the face-to-face section. These results support the premise that dialogue is reduced in a blended course.

An interesting note regarding student/student dialogue is that it is the item rated lowest by both groups. The face-to-face section had a mean score of 3.39 while the blended class section was 3.17. The effect size was modest and the correlation between student/student dialogue and satisfaction was significantly higher for the students in the blended section with a rating of .812, compared to the correlation of .565 for the face-to-face students. Therefore, students in the blended class had a stronger correlation between student/student dialogue and satisfaction; in other words, the higher they rated student/student dialogue, the higher their rating in satisfaction. They were slightly less satisfied with the dialogue, and it was strongly correlated with their overall satisfaction. For this measure the interpretation and relevance of transactional distance is complex. On the one hand, the lack of statistical significance and effect size imply that blended courses do not suffer from a lower level of student/student dialogue, which supports the premise that transactional distance is not increased in a blended course. However, there is a stronger relationship between assessments of student/student dialogue with satisfaction for students in the blended section. Although the level of dialogue is not statistically validated as being reduced, dialogue is more important to satisfaction for the students in the blended section.

Autonomy

Students who self-selected into the blended course rated themselves slightly higher on a scale of autonomy. This could be interpreted to mean that the students perceived that more autonomy would be required, therefore, selected it because they knew they were capable; or conversely, students who selected into the traditional class, did so in part because of their lack of confidence in their ability to manage the format. This is supported by the open-ended responses from students in the face-to-face section, nine of whom had indicated that they felt they learned better or liked the traditional format better. Some of this is based on experience in a previous section, and some on perception. The variance between means lacks statistical significance and the effect size between the student's assessment of their own perception autonomy and satisfaction is low. For both groups, the correlation between their assessment of autonomy and satisfaction was strong with a coefficient of .544 for face-to-face and .688 for the blended class, slightly stronger for the blended section. In other words, the more autonomous students considered themselves, the more satisfied they were with the course, slightly more so in the blended section. Given these findings the identification of autonomy as a factor in satisfaction for the blended class provides validation that autonomy is more important in a blended class than in a face-to-face setting.

Transactional Distance

According to the theory of transactional distance, distance education is inherently higher in structure; for example, less flexible and adaptable to student needs, and lower in dialogue, which speaks to the interaction between students and student and instructor. For this reason, the theory posits that distance education requires students to be more autonomous learners to be successful (Moore, 2013). The results in this study lend support for the value of the theory of transactional distance for blended learning.

First, each of the constructs that results in transactional distance, structure and dialogue, was perceived less favorably by students in the blended section. Although the results lacked statistical significance, there was a weak to modest effect size in each instance which in conjunction with a slight lower mean supports the notion that students in the blended course were slightly less satisfied with the level of structure and dialogue. This finding is further supported by the stronger correlation between each of these constructs and satisfaction for students in the blended section. This in turn supports the notion that even a blended class increases transactional distance, albeit in a minor way. This development leads to the second major finding or implication.

The second major implication relates to the fact that students in both class sections demonstrated a strong correlation between the constructs and their satisfaction, but the blended section had higher correlation, in some cases very strong. Once again, the constructs were important to all students, but more so for the students in the blended class who simultaneously rated the constructs less favorably. Therefore the construct was more highly correlated with satisfaction and the assessment was lower, demonstrating another finding in support of the existence of transactional distance.

The third key finding concerns autonomy. As mentioned in the theory, a higher level of autonomy is needed when transactional distance is increased. In this study, students in the blended section considered themselves slightly higher in autonomy, yet found the class to be slightly less satisfying and scored slightly lower on the final exam. Although these findings lacked statistical significance they do demonstrate a pattern worthy of consideration. In all cases there is weak to modest effect size that links students' perception of autonomy to their level of satisfaction, and the stronger correlation between autonomy and satisfaction for the blended students further enhances the argument. This is anecdotally supported by the open ended responses of the students in the face-to-face class who indicated they had tried the blended format before and didn't like it; nine students indicated that they "learned better in class," and one specifically mentioned that a lack of time management would not allow them to be successful in blended format.

RECOMMENDATIONS

A fundamental concern relative to the adoption of any new learning environment is to ensure that learning is not compromised and students are not harmed by the implementation. There is a risk with the implementation of any new instructional format, but the risk can be mediated by careful analysis and planning. Based on the findings from this quasi-experimental study, the following section discusses recommendations for introducing and implementing blended learning, particularly at moderately selective institutions.

1. Promote Learner Autonomy in Blended Learning

The results of the study are in line with the decades-long common theme in learning research that learner autonomy is essential to a successful learner regardless of learning environments (Little, 1991), and it is especially seen as indispensable in distance education where transactional distance is presumably high due to the quasi-permanent separation of learner and instructor (Moore, 1993). In addition, recent advances in learning pedagogy suggest that learning in nature is an autonomous, self-directed knowledge construction process, a process that involves both active individual construction of meaning and an individual enculturation into a community (Garrison & Vaughan, 2008). It is, therefore, imperative to support learner autonomy in blended learning environments. Supporting autonomy refers to "an individual in a position of authority (e.g., an instructor), takes the other's (e.g., a student's) perspective, acknowledge the other's feelings, and provides the other with pertinent information and opportunities for choices, while minimizing the use of pressures and demands" (Black & Deci, 2000, p. 742). However, a significant challenge with low achieving learners is that they may feel lost, frustrated or demotivated in a more open learning environment that allows for more choices and autonomy. It is, therefore, important for instructional designers and instructors to design specific instructional strategies to help low achieving students in developing self-directed learning skills, time management skills, and decision-making skills. With sufficient support and scaffolding, these learners can increasingly improve learner autonomy, which will help them assume greater responsibility for their learning.

2. Use a Synchronous Format for the Online Component

Synchronous eLearning can be defined as a real-time, instructor-led online learning event in which all participants are logged on at the same time and communicate directly with each other (Gilbert, 2000). Spontaneous interactions with peers and instructors as well as real time collaborations enabled by the synchronous communication tools are critical elements for enhancing learner experience within online courses. The results of the study support the need for adopting synchronous format for the online part of a blended course. The use of virtual face-to-face real time communication is especially important to less responsible and less autonomous learners who easily tune out and procrastinate in asynchronous online learning. Instructional designers and instructors need to explore how best to take advantage of the abundance and versatility of current synchronous communication tools, such as Blackboard's Collaboration, Google's Hangout, to engage learners and enable "higher order" learning (such as critical thinking, multiple perspectives, socialization, acculturation) that is most likely enabled via purposeful and meaningful social interaction. A caveat to this recommendation however is the impact it would have on increased flexibility provided by the asynchronous format. Offering synchronous meetings decreases the freedom associated with time and place which is a primary advantage of reduced classroom time. A way to mediate this is to offer multiple sessions for the synchronous meetings which increases the flexibility for the student, but is an increased burden on the faculty member (Giesbers, et al., 2014). Given this concern, finding the right balance and usage of this powerful medium is essential.

3. Provide a Low-Structure and High-Dialogue Learning Environment to Reduce Transactional Distance

The results of the study concur with the findings from many other studies in transactional distance. Moore (1993) noted that low structure and high dialogue can reduce transactional distance, which was supported by Wikeley and Muschamp's (2004) study on doctoral students in distance education. While recognizing the critical role of increasing dialogue to online learner success, they further argued "it is better achieved by tightening the structure to allow greater adaptability of content through careful moderation by tutors" (p. 125). It is, therefore, important for instructional designers and instructors at moderately selective colleges to design and develop a highly structured course with clear learning outcomes and expectations, stable routines, and well-structured course materials, learning tasks, and assessment with clear step-by-step instructions. At the same time, instructors need to monitor, assess, and respond to individual learners' challenge and progress by providing customized learning materials and tasks. Just as importantly, instructors need to be highly interactive and responsive during the online sessions in a blended course by providing prompt and explicit feedback and directive step-by-step guidance. In addition to student/instructor dialogue, student/student dialogue also must be addressed. Collaborative learning in both online and blended courses is a proven and significant design element in support of student learning and motivation (Gradel & Edson, 2010; Manning & Emmons, 2010). Specific tactics such as group problem solving and other collaborative activities including peer evaluations have been beneficial to student outcomes in the online learning environment (Jézégou, 2010; Manning & Emmons, 2010). In order to implement these high value practices to reduce the potential transactional distance, faculty training and development in this area are essential.

CONCLUSION

Blended learning will continue to gain prominence at all types of institutions; however, the implications for each unique sub-set of students must continue to be explored. The small size, single location, and single course evaluated in the previously discussed study represent significant limitations. In addition, the lack of statistical significance relative to findings in this study indicates that the results may be coincidental rather than representative of the population of study. Given these conditions, practitioners must use caution in interpreting the findings. However, based on both the theory of transactional distance and the results of this quasi-experiment, several factors should be taken into consideration when developing blended learning programs at moderately selective institutions. The theory of transactional distance can provide insight into best practices to meet the needs of the students. This research provides some validation that the reasonable extension of this format is acceptable.

KEY TERMS AND DEFINITIONS

Academic Achievement: Academic performance as measured by course assessments.

Blended Learning: Also referred to as hybrid learning, is a teaching modality that combines traditional face-to-face instructional practices with online instruction. For the purposes of this study, the mix will be approximately 50/50 of each instructional method.

Dialogue: The level of interaction between students, and between students and their instructor within the learning environment.

Learner Autonomy: Independence and self-management relative to establishing goals, seeking support when needed, managing time, implementing learning strategies and evaluating outcomes.

Learning Outcomes: The knowledge and skills students are expected to achieve through the course.

Moderately Selective College: Admissions standards of 2.1 high school GPA for bachelor degree seeking students.

Structure: Rigidity or flexibility of the course's educational objectives, teaching strategies and evaluation methods.

Student Satisfaction: Attitudes and opinions students have about the overall quality of the course and effectiveness of the instructor.

Support: The level of advice and guidance provided by the instructor.

Traditional-Age Undergraduates: Students who are first time college students in the age group of 18-24.

Chapter 45
Blended for Student Engagement and Retention:
The Case of Cinema and Visual Culture and Healthy Lifestyle Studies

John Doherty
Northern Arizona University, USA

ABSTRACT

Facetiously described as the "third generation" of distance learning, blended learning is now the new kid on the block in the deployment of technology to support teaching and learning. Its versatility as a pedagogical strategy for creating learner-centered instruction lies in the capacity to exploit the potentials of both the traditional face-to-face instruction and online learning modality in order to provide students with multiple pathways of learning. Yet, developing a blended course to take advantage of these duo capabilities is a monumental challenge for faculty. This chapter presents an analysis of approaches and models employed by faculty at Northern Arizona University to develop and deliver two blended courses as part of the institution's strategy of using technology to enhance undergraduate student engagement and retention. The analysis shows that a multimodal approach that infuses technologies and media and a proactive institutional policy in favor of blended learning, coupled with strategic faculty development, provides the best pathway to developing robust blended courses that are truly learner-centered.

DOI: 10.4018/978-1-4666-8246-7.ch045

INTRODUCTION

Blended learning is the new darling of higher education. Blogs, conferences and scholarship on teaching and learning strongly emphasize the (almost) unbelievable benefits blended learning offers. Higher education institutions worldwide are also extolling the virtues of this most recent development of online learning, almost without discretion as to its appropriate pedagogical applications. As is often true with any trend, blended learning in many cases is being implemented 'willy-nilly' with very little rhyme or reason.

Often defined as the intentional and complementary merging of online and face-to-face learning into one harmonious whole, blended learning certainly has much to offer. The potential advantages of well-designed blended courses are significant: students demonstrate better performance in blended courses compared to those in either fully online or face-to-face classes (US Department of Education, 2009). In that they combine the strengths of both online and face-to-face courses, blended courses deliver improved outcomes and increased student satisfaction (Zhao, Lei, Yan, Lai, & Tan, 2005; Dziuban, Hartman, & Moskal, 2010). And blended learning synthesizes several increasingly recognized approaches such as learner-centered teaching, active and collaborative learning, and social constructivist learning. As such, blended learning initially appears to have no faults, no flaws or weaknesses.

However, whereas the empirical literature clearly demonstrates the superior learning experience offered by blended courses, the design of blended courses presents a formidable challenge to faculty who may not be experienced with this format. When executed properly, blended delivery leads to optimal learning. But the challenge lies in proper design and execution of blended courses. Faculty are often ill-equipped to succeed in this modality, and there are other contextual factors which determine whether a blended course will function well to maximize the learning potential in that course.

To delineate these determining factors, we examine what the contemporary studies demonstrate about blended learning; then we analyze exemplary cases of blended learning at Northern Arizona University. We then discuss lessons learned from poorly executed blended courses, drawing conclusions regarding the required contextual factors for effectively designed and delivered blended courses. The analysis illustrates the centrality of a proactive institutional policy in favor of blended learning coupled with strategic faculty development in providing the best pathway to developing robust blended courses that are truly learner-centered.

BLENDED LEARNING THROUGH THE SCHOLARLY LENSES

The recent avalanche of scholarly literature on blended learning is indicative of the centrality that this pedagogical model has attained in the discourse on teaching. It also gives a false impression that this teaching approach has been late in coming. A scrutiny of literature, however, suggests that a "Johnny-come-lately" nomenclature for blended learning is off the mark. It ignores the fact that face-to-face instruction in combination with aspects of a non-classroom technology-mediated delivery system has been in use for the last couple of decades. A sense of recent novelty in pedagogical practices is driven largely by new pedagogical emphasis (from teacher-led to student-centered learning paradigm), new technological innovations (the internet, social media and personal computers including mobile computing devices) and new learning theories (brain-based learning and social constructivism). All these have elicited a reconsideration of traditional approaches to teaching and learning thereby contributing to a paradigm shift in higher education (Buckley, 2002; DeZure, 2000; Barr & Tagg, 1995).

It is now accepted that the platform that has provided the node for the evolution of these new teaching and learning models is the online environment. This environment challenges the traditional approach to teaching and, thus, invites a reconceptualization of pedagogical practices. This is in contrast to earlier technologies such as instructional television that replicated the traditional face-to-face environment (Dzuiban, Hartman, & Moskal, 2004). It is not surprising, therefore, that online-based teaching is now the fastest growing model of providing higher education globally.

The surge in online-based teaching and learning coincides with scientific evidence indicating increased student satisfaction with this mode of instructional delivery (Sampson, Leonard, Ballenger, & Coleman, 2010; Aman, 2009; Drennan, Kennedy, & Pisarski, 2005; Chickering & Ehrmann, 1996). Of the factors contributing to the success, the following are identified as the most overarching: flexibility in program structure thereby permitting more time for students to complete work, cost effectiveness (Vaughn, 2007; Richardson & Swan, 2003); pacing of students' learning in a scaffolding format thus permitting additional time for reflection on the course content (Mathews, 1999; Berge, 1997). In the Sampson, Leonard, Ballenger, & Coleman (2010) study, student satisfaction was highest in the area of instruction but lowest in teamwork. These advantages notwithstanding there have been criticisms voiced on the quality, delivery model in online courses and the cultural consequences of reliance on computers for instruction (see for instance, Goldbert & Riemer, 2006; Manochehri & Young, 2006; Bowers, 2000). However, we shall not delve into details about these censures.

The new kid on the block in online-based instruction is blended learning (BL). From corporate to K-12 institutions, from virtual colleges to brick-and-mortar universities, BL has become the new mantra in delivering education via learning technologies. BL, as the name suggests, is the fusion between two teaching paradigms employing two divergent philosophical assumptions. We begin with a definition which allows us to share a common perspective of an important phenomena. Garrison and Vaughan (2007) define BL as "the thoughtful fusion of face-to-face and online experiences….such that the strengths of each are blended into a unique learning experience…. Blended learning is a fundamental redesign that transforms the structure of, and approach to, teaching and learning" (p. 5). Staker and Horn (2012) of the Clayton Christensen Institute for Disruptive Innovation, on the other hand, define it as "a formal education program in which a student learns at least in part through online delivery of content and instruction with some element of student control over time, place, path and/or pace and at least in part a supervised brick-and-mortar location away from home" (p. 3). The two definitions illustrate the remarkable differences in emphasis. While Garrison and Vaughan focus on the strengths that face-to-face and online delivery bring to an instructional environment, Staker and Horn concentrate on the student control (or lack thereof) of the learning environment, with supervision of student learning being an integral part of the process. In all, both definitions acknowledge, if only incidentally, the transformative nature of the new instructional modality.

Two important considerations are germane to BL. First, what proportion of time should be dedicated to online and in-class activities? This is always a challenging question for BL instructors and course designers and there are no hard and fast rules. A classification scheme adopted by Educause, a nonprofit agency dedicated to the intelligent use of technology in instruction, catalogues blended courses based on the amount of time spend on each modality. Accordingly, blended courses have between 30% and & 79% of activities online, and a fully online course can include up to 20% of face-to-face activities (Allen, Seaman, & Garrett, 2010). Second, what models of BL are in existence? Four models relevant to higher education can be discerned (Friesen, 2012; Staker & Horn, 2012). The *rotation model* involves the combination or embedding of online engagement within a range of face-to-face forms of instruction in a cyclical manner. In the *Flex model*, multiple students are engaged primarily online but under the supervision of a teacher who is physically present. The *Self-blending model* entails students choosing different courses to take independently, but they do so in a setting where a supervising teacher and other students are co-present. Finally, in the *Enriched-virtual model*, online experiences are viewed as enriching only periodically through arrangements of physical co-presence.

Research studies point to student satisfaction and improved learning outcomes in BL courses relative to purely online and face-to-face ones. In a meta-analysis involving 51 studies undertaken by the United States Department of Education, it was established that students enrolled in fully online and blended courses performed better than their face-to-face counterparts with blended learning students performing significantly better (U.S. Department of Education, 2009). Another meta-analysis study by Zhao et al. (2005) identified three types of interactions germane to good course design. These are instructor and students, student and their peers, and student and content. They established that blended courses reported more positive outcomes than wholly asynchronous courses. Dziuban et al. (2010) document the level of satisfaction with blended courses among the three generations of Boomers (57%), Generation X (41%) and Millennials (33%) confirming that older students are more satisfied with this teaching modality than their counterparts.

BL has also the potential to reduce course attrition rates in addition to increasing student learning outcomes in tandem with fully online courses. At the University of Central Florida, in research undertaken between 2001 and 2003, the blended model was comparable or even better than the face-to-face instruction in terms of success rate (students attaining grades A, B, or C). In terms of students withdrawing from classes, blended learning attrition rates were comparable to the face-to-face modality for all ethnic groups (Dziuban et al., 2010).

The combination of online and in-class activities in a course allows students the opportunity to learn in different styles and at different paces. Placing rote knowledge tasks online gives students the freedom to undertake self-directed asynchronous study. Class time can then be dedicated to the elaboration of foundational knowledge acquired online or in textbooks. This combination makes the teaching flexible, approachable, and, most of all, motivating to students (Behnke, 2012). A corollary advantage of this blended learning strategy is the inculcation of lifelong learning skills in students. Since a significant proportion of learning is leased to the students at a relatively early stage, they are likely to develop a desire and the skills to continue learning throughout their lives (Glazer, 2012). They gain skills in acquisition, organization and presentation of information that helps them acquire knowledge about the world. These skills are the linchpin for success in the knowledge-driven economy that we live in today.

Additionally, BL encourages active and collaborative learning by students. Students not only acquire information but also process it to ensure they understand it, can organize it as well as make connections with their existing knowledge. After this, they then have to share it with colleagues either in class or online (Ambrose, Bridges, DiPietro, Lovett, & Norman, 2010; Svinicki, 2004). So the combination of both synchronous and asynchronous learning strategies leads students to greater learning than would otherwise have been feasible. It is also significant that the flexibility of the blended option helps students navigate the multiple demands on their time; blended learning may ameliorate some of the pressure on family, work and commuting time.

Faculty also gain from BL courses. A major relief for faculty is the resuscitation of chronically low-enrollment courses thereby protecting jobs and averting loss of income. Hartwell & Barkley's (2012) use of blended learning strategy in their redesign saw their music class enrollment increase from the perpetual low of 45 students to 1,200 students annually. Not only did this lead to job protection but it also resulted in hiring of additional faculty. Since blended classes also raise student enthusiasm, engagement levels and overall student satisfaction, they play a critical role in cushioning disinterested students from sabotaging the morale of the class. The differentiated instructional structure and scaffolding of the class permit such students to control aspects of the learning process outside the class. This is a major relief for instructors who need not worry about class management issues from such disinterested students.

Finally, faculty enjoy the benefits of increased flexibility in their available time to pursue scholarly or service activities arising from time saved from decreased attendance in class. Because of releasing a portion of the course for independent study by the student coupled by reduced hours of face-to-face instruction time, faculty have additional time for other professional pursuits. Furthermore, with a course using a team teaching structure, it is conceivable for one faculty member to handle the online portion while the other specializes in the face-to-face segment which also contributes to freeing the instructors for other engagements.

In sum, BL represents the third sector in the continuum of distance learning. It blends the strengths of the traditional face-to-face instruction and online asynchronous learning to develop a new learning strategy, both philosophically and structurally. It represents a paradigm shift in both teaching and learning. In keeping with this transformation of pedagogy using the technology medium Osguthorpe & Graham (2003) propose six attributes cardinal to the creation of successful blended courses: (a) pedagogical richness, (b) access to knowledge, (c) social interaction, (d) personal agency, (e) cost effectiveness and (f) ease of revision. Our case analysis of the various BL courses developed at Northern Arizona University (NAU) document the extent to which these design attributes have been articulated in the development of the classes.

BLENDED LEARNING AT NAU

Northern Arizona University has had an official course designation for hybrid learning for at least 10 years. This form of learning has a very flexible definition, including classes that meet once or twice a semester in person and the rest of the time online, or classes that meet in person once a month and the rest of the time is online. There are as many iterations to hybrid learning as there could possibly be. Indeed, the term hybrid learning has begun to be used interchangeably with blended learning, though it is only recently that the University has begun work on a specific definition for blended learning.

The interest in hybrid or blended learning was very informal until just a couple of years ago. Until then the modality of the blend was entirely in the individual faculty member's purview. The only caveat was that the face-to-face meetings had to be listed in the course catalog. Faculty could not require face-to-face meeting times that were not listed. This was also true for fully online courses. The recent Great Recession saw funding to the university severely cut by the State. However, there was no commensurate cut in the State's expectations of the university, especially as it concurrently dealt with an increase in student enrollments. NAU has seen enrollments increase by over 6,000 full time equivalent students since 2005.

On campus enrollment was particularly a concern as the university saw an influx of students without fiscal resources to support them. Also, as the leadership looked ahead demographics suggested that increasing enrollments were here to stay. At one point, the strategic plan called for a potential 35,000 FTE by 2020. Clearly there was a need to accommodate this increase, with less state funding than was available in 2008. Technology was seen as one potential solution, and blended learning in particular as a way to begin to more effectively use the physical and human resources available without sacrificing the high quality, high touch, learner-centered education that the university was credited with offering.

Table 1. First-year student academic experience at NAU, 2010

Courses Rigor	Percent (%)
1. Academic Challenge • High Faculty Expectations • More than 15 hours/week homework • Exams require best performance	 52 33 47
2. Active Learning • Class topics discussed outside • Students work collaboratively inside & outside class • Student applying classroom learning to real life • Student opportunities to tutor each other	 58 49 50 24
3. Student-Faculty Interaction • Faculty members accessible & supportive	 42

Source: (Northern Arizona University (2010)

Also, new thinking on student success as epitomized by rigorous courses and independent learning skills is in consonance with what the students would like to see in their courses. Table 1 summarizes the findings of some key variables of course rigor that first year students ranked as being low. Academic challenge has been perceived as being low with exam performance expectations and homework assignments being rated particularly low. In terms of active learning strategies, the students ranked discussion of classroom topics outside as the highest but this was only slightly above 50%. It is this student concern and the risk of additional student attrition in subsequent years that has been the catalyst for reframing instruction at the undergraduate level with a blended learning approach being the focal point.

Therefore, in 2011 the university instigated the President's Technology Initiative, a program specifically supported by the Office of the President that was designed to encourage high enrollment lower division courses to explore a blended approach to course design and delivery. As of writing, there have been four calls for proposals for this program, out of which 10 course redesigns have been funded. The faculty coordinator receives a stipend to fund the redesign, a budget to bring in resources to enable the redesign, and one or two semesters in which to pilot the redesigned version of the course. Full implementation of the redesign means that the course would be delivered in a blended learning format across all of its sections, except those that were being delivered online. Additionally, departments that support these redesigns are awarded up to $30,000 and they keep any cost savings realized from the redesign.

NAU developed two forms of support for faculty who intended to apply for the grant and for those that were successful and were working on their projects. First, a blended learning workshop was developed and required for anyone interested in submitting a proposal. This workshop, led by instructional designers at the university's e-Learning Center, introduced participants to blended learning designs and modes and also modeled one particular blended learning approach. The focus of the workshop was twofold: developing an integrated and intentional approach to blended learning that was not just an online course with a social hour; and, assisting faculty in completing the application process and in developing a cost savings and program assessment plan. Also, during the pilot and implementation phases the faculty would have priority access to a team of instructional designers, instructional technologists, creative designers, and assessment experts.

The projects highlighted in this chapter were successful applicants for this program. Both have demonstrated the need to build in a pilot phase to any institution-wide blended learning initiative. Also, they clearly called for a peer group of faculty developers and instructional designers to share ideas, challenges, brainstorms, and problems. Consequently, the e-Learning Center and the Faculty Professional Development Program invited participants and other faculty to join a Faculty Learning Community on Blended Learning Course Redesign, the second form of support that was co-facilitated by one of the first course coordinators to avail themselves of the grant, an Instructional Designer, and the director of Faculty Professional Development. This learning community built on the peer aspect of the blended learning workshop with a focus on working through the meaning of and the pedagogy behind blended learning at Northern Arizona University.

Concurrently to these initiatives the Office of the Provost appointed a senior faculty member and returning American Council on Education (ACE) Fellow to bring a stronger focus to blended learning at the university. One of Dr. Denise Helm's first actions was to call together a Blended Learning Leadership Team to begin discussions on what exactly blended learning meant for the campus. The group developed a working definition of blended learning and shared it with the university community for feedback and further refinement. Currently, the definition states:

NAU defines blended learning as an approach that combines the best elements of face-to-face teaching with a variety of technologies, resulting in increased learning effectiveness and improved efficiency. Ideally, a blended course at NAU replaces 50% of the conventional class time with out-of-class activities. However, a course that replaces as little as 25% of the seat time with out-of-class activities can still be considered blended. (see http://www.nau.edu/blendedlearning/).

This group has also opened up the President's Technology Initiative to include a broader focus on courses that are not strictly lower division and high enrollment. As of writing, 27 faculty coordinators representing all colleges are taking the Blended Learning Workshop with a view to submitting a proposal for funding a blended learning course redesign. Also, the Faculty Learning Community on Blended Learning Redesign is in its second iteration, with 12 faculty participating who are also eligible to apply for the grant.

Case 1: CINE 101: Introduction to Cinema and Visual Culture

The Need for a Blended Approach and Pedagogical Orientations

It is not always the case that the world of humanities, cinema studies and critical analysis will find fusion in blended learning. Conventional wisdom dictates that humanities are best experienced through instructor-student interaction in a classroom setting. The cardinal traits of a successful humanities program rest on the ability to provide students with dispositions that enable them to be receptive, critical and constructive. Further, wise rack from yore has consistently held that academic study of movies is best achieved when they are watched and critiqued in a classroom, a deviation reminiscent of today's popcorn-enhanced movie theater entertainment experience. So, the academic study of movies has remained a consistently predictable affair, translating into a boring routine for the instructor and disengaged students. That enrollment numbers in such classes have remained consistently low is not surprising. It is this reality that propelled Astrid Klocke of the humanities program at NAU to redesign CINE 101 Introduction to Cinema and Visual Culture from a face-to-face class to a blended one.

Necessity is the mother of invention. It forces reflection on goals, re-examination of strategies and a consideration of the consequences. The truism of this age old wit could not have been enunciated better in blended learning at NAU than in Cinema 101. A triumvirate of student needs, university interests and instructor necessity provided the impetus for course redesign. Looking at the horizon, the potential reward was a stimulating and engaging curriculum for students, a course that supports the university's freshmen academic programming and a professionally satisfying course for the instructor.

Students' needs were at the apex of the instructor's concern. Nothing is more injurious to a class than disengaged and demotivated students; they are disruptive and indifferent to the content being delivered. Their demeanor, most often, is infectious, rendering havoc to the teaching-learning climate of the whole class. In a class like Cinema 101, students, according to Klocke:

….expected to sit disengaged in class and watch a cinema and then discuss it, meaning pseudo psychologize the meaning and characters and then empathize with them. That is it. What they need is a critical analysis of the film. They need the ability to know the techniques that went into film-making and the tools of the trade of film analysis which includes things such as mise en scene and cinematography. All these tools of analyzing a film, they do not have but they do not think they need them. (Klocke, personal communication, November 15, 2013)

For a long time, that had been the pedagogical approach the class had taken—movie screening in class followed by discussions. Furthermore, since this class fulfills the NAU liberal studies requirements for the freshmen class, most of those who had signed up assumed it would be an easy and "cool" option comprising of watching movies followed by a few discussion points. When students enroll in a course on cinema with its visual, artistic and entertaining attributes but do not attain and develop skills, knowledge and aptitudes in film analysis, then the class becomes an inevitable ritual of movie screening followed by discussions.

The professor's intrinsic motivation to redesign the class was driven by the need to eschew any semblance of a "sage on stage" with its inevitable practice of standing before a class to deliver lectures on cinema. Though the lecture method appears to be the most ubiquitous teaching method in higher education on account of its efficiency, its functional limits in creating an engaging student-centered learning experience are well enough documented not to warrant additional considerations here (see for instance Khan, 2012). Nonetheless for the Cinema 101 instructor, lecturing was no longer intellectually engaging:

….standing there and repeating myself semester after semester doing the same very basic telling them what they needed to do seemed very superfluous, seemed tiring and unnecessary because we have people doing it online, they have short videos….I could even tape myself and put it online…why do I have to deliver the lecture? (Klocke, personal communication, November 15, 2013)

The course redesign was also driven by two institutional imperatives. The first was the First Year Learning Initiative (FYLI) program, "a unique, locally-developed and faculty-driven program for building academic success in the early college career" (Northern Arizona University, 2013). FYLI is based on the premise that students need—and want—high standards in the lower level courses in order to be successful at the undergraduate level. Students want such standards clearly articulated in the first session in the course and, in order to be successful, they need, throughout the course, support, guidance, highly engaging pedagogy and clear, frequent feedback. Courses selected for FYLI designation, as CINE 101 was, must conform to three important principles during the redesign process: socializing students for excellence, maximizing student engagement, and aligning learning outcomes to learning activities and assessments. To incorporate these elements effectively in CINE 101, a blended approach employing a combination of the best practices in humanity pedagogy and modern technology was the most appropriate pathway. This course redesign was facilitated by a generous grant from the NAU President's Technology Initiative, a competitive funding program for 100 and 200 level courses with large enrollment taught by multiple instructors.

Efficiency in the use of lecturer room, as the institutional imperative, required that instructors, if need be, structure their courses for optimal use of such resources. With the healthy growth in undergraduate numbers, current classrooms have become inadequate and efficient use of existing ones is imperative. Where permissible, instructors have been encouraged to use modern instructional technologies to deliver content that may not warrant frequent face-to-face sessions. Lower-level factual activities like watching movies and discussing the plot can best be undertaken outside the class.

The pedagogical underpinnings informing Professor Klocke are borrowed heavily from her background in linguistics. Communicative language teaching, a language teaching approach that focuses on interaction as a means and goal of study, meant that students would acquire skills in the use of language to communicate ideas meaningfully. Equally important is task-based language teaching where students undertake an activity arising from the text they have covered. Students are expected to generate a product from the content rather than merely asking questions of the professor. This is a decentered, facilitative approach that puts emphasis on learning rather than teaching. These pedagogical approaches could best be facilitated by technology in order to move the class from teacher-centered lecture-based instruction to a cognitively-rich student-centered environment.

Course Structure

Like many blended courses in the humanities (see for instance Gau, 2012) Cinema 101 is divided into learning modules consisting of a scaffolding of learning activities both in-class and out-of-class. There are 4 modules that mirror the class text, *The Film Experience: An Introduction (3rd Edition)* by Timothy Corrigan and Patricia While. Each module contains a number of chapters, and consists of: (1) chapter summary that highlights the key points of the pertinent chapter in the course text, (2) chapter quizzes, (3) chapter discussion topics, (4) movies linked to the chapter, and (5) additional readings. The course assessment structure encompasses the following: (1) class attendance, (2) 3 surveys, (3) chapter quizzes which are generated from the test bank provided by the class text publisher, (4) 7 written discussions, (5) group project, (6) midterm exam, and (7) final exam portfolio. These study and assessment activities keep the students engaged throughout the semester.

Rather than two face-to-face class meetings of 75 minutes each week, only one is held. The instructor uses the in-class meetings to provide a forum for critical analysis and discussion of the course text and the movies associated with the particular chapter. The class format calls for students' application of the concepts identified in the readings to movies that they have watched. They are required to demonstrate, with solid evidence from the assigned movies, that they have internalized the cinematography concepts they encountered in the readings. They are also presented with an opportunity to demonstrate why their perspective on the film matters to them. Some of these in-class activities are undertaken in class groups. In-class activities are geared towards what Krathwohl (2002) refers to as medium level conceptual learning skills—where students use factual knowledge to make interpretations and inferences through application, analysis and interpretations of information acquired.

Out-of-class activities include chapter and supplemental readings, online discussions, chapter quizzes, and watching movies. The preference is for the students to watch the movies on the weekend after they have undertaken the readings and the chapter quiz. Doing so provides important background materials with which to critique the movie. After watching the movie, students participate in an online discussion using the topic provided by the instructor. Online discussion is also undertaken in class groups. These semester-long class groups consist of about 8 students constituted by the instructor at the beginning of the semester.

Another out-of-class activity is a mini-internship. Here students can opt to volunteer in the fall Flagstaff Mountain Film Festival or they take part in the various film series on campus. They then write a reflective group paper arising from this mini-internship experience. Online activities provide the student with opportunities to learn at two levels as per Krathwohl's (2002) classification. First is the low level learning skills (literal and factual) where they build essential foundational knowledge through recall, recognition and classification such as watching movies and online discussions. Second is the high level metacognitive knowledge where students begin to evaluate, construct and create as seen in the collaborative group projects and internships.

Course assessment takes place through a variety of activities. Besides class attendance, quizzes, 3 surveys, online written discussions and the group internship project, the course assessment also involves midterm and final exams, an essay paper as well as a comprehensive final exam portfolio. The group internship project forms the basis of the semester-long essay paper in which they are required to not only write a reflective piece but also to undertake a class presentation critically documenting their experience in the internship. The comprehensive final exam portfolio, which each student is required to produce at the close of the semester, includes: a one-page reflective essay, a two-page analysis essay and the final exam. In all, the course assessment is structured as presented in Table 2.

Table 2. Cinema 101 course assessment structure

Assessment Activity	Points
Class Attendance	12
3 Surveys	3
7 Chapter Reading Quizzes	14
7 Written Online Discussions	14
Group Project	10
Midterm Exam	10
Essay Paper • 1st draft (5points) • Peer review (5 points) • Revised draft (10 points)	20
Final Exam Portfolio • 1-page reflective essay (2 points) • 2-page analysis essay (10 points) • Final exam (5 points)	17
Total Points	**100**

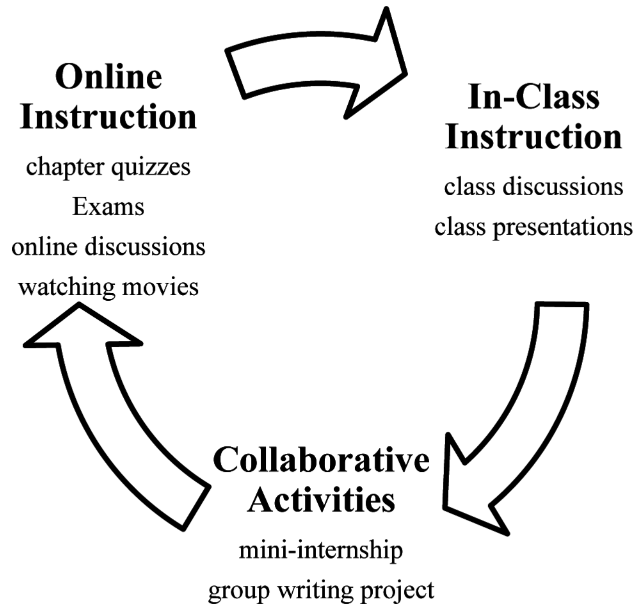
The course taps into a variety of learning styles through visual, audio, interaction and collaboration. The course is recursive in structure with both in-class and out-of-class activities complementing and reinforcing each other as captured in Figure 1. The recursive process employs technology to deliver large scale efficiency, profound engagement opportunities and unlimited learning possibilities.

The Blended Benefits

The rewards arising from blending Cinema 101 are the aspiration of every student, instructor and institution. Pedagogically, students have registered increased satisfaction with the course both in terms of content, organization and delivery. Remarkable evidence of student satisfaction is found in students' written evaluation narratives, in which they comment that the course has changed their entire perspective on watching movies. A substantial number indicate that they now watch films with a critical-entertainment mindset as opposed to only entertainment as was the case previously.

At the departmental level, enrollment in the course has quadrupled from 35 students a semester in one section to around 150 students in 4 sections. As a result, the humanities program has had to hire 4 adjuncts to match the increased enrollment. Though this has entailed an additional supervisory role for Prof. Klocke, the satisfaction of being instrumental in developing and growing a cinema studies minor in the humanities program far outweighs the added responsibilities. In addition, since there is only one in-class session per week in contrast to the two sessions each week that took place prior to blending, classroom utilization in the humanities building has improved. There are now more classrooms available for other classes in the College of Arts and Letters despite the resurgence in student numbers in the last two years in CINE 101.

Figure 1. The recursive structure of cinema 101



Case 2: HS 200: Healthy Lifestyles

Revitalizing a Course through Blended Delivery

Redesigning HS 200: Healthy Lifestyles for blended delivery has caused the course to "come alive," according to Professor Ellen Larson. Faced with apathetic students, limitations in available classroom space and faculty salary, and her own desire to encourage active learning among the primarily freshmen students in this class, Larson applied for and received institutional support in the form of two initiatives underway at NAU. Of primary importance was the necessity of restructuring the use of class time:

I wanted the in class time spent applying knowledge. In order for this to happen, I needed a mechanism for students to learn the basic content knowledge prior to class. Building the content into the course shell, and holding students accountable for learning it (online quizzes, self-assessments, online discussion, etc.) made the difference. (Larson, personal communication, December 13, 2013)

The factor that created the greatest impact on blended HS 200 was Larson's focus on student responsibility for their own learning. Holding students accountable through intentionally designed online activities "made the difference" for this course. Like CINE 101, HS 200 was redeveloped using a blended approach according to the parameters of the First-Year Learning Initiative (FYLI) and the President's Technology Initiative. The result is an engaging, dynamic and successful blended course that showcases the best of what blended learning can be. As described above for CINE 101, FYLI certification requires a course to intentionally support student success through careful monitoring and frequent communication with students regarding their progress. The President's Technology Initiative provides the support to redesign classes for blended delivery to promote efficient use of faculty time and classroom space. Together, these two programs afforded Larson the opportunity to dig in and rebuild HS 200 from the ground up. Having piloted the course for two semesters before delivering it across multiple sections taught by multiple instructors, Larson testifies to the benefits of blending this course:

I am able to use my time well. I don't think 70 students need me to stand in front of them and go over what's in the textbook, the basics.… The thing I like best about the blended class is I get to do what I love best. And that's working with the students, establishing relationships with them, and having a very interactive, experiential type of classroom environment. (Larson, personal communication, November 1, 2013)

Larson claims increased personal job satisfaction as one of the primary benefits of the blended approach. Delivering this content is "so much more rewarding" than it was in a more traditional in-person format. The ability to focus her time and energy on engaging with her students, rather than delivering the same basic knowledge semester after semester, has brought new life to Larson's teaching methodologies and is the most successful element of the redesign.

Blended Course Structure and Redesign Process

HS 200 bears many similarities to CINE 101. Larson delivered the first iteration of blended HS 200 in Fall 2012. In that initial semester, Larson taught two sections of 35 students each. Like CINE 101, prior to redesign HS 200 met twice weekly for 75 minutes per session. So much of in-class meeting time was devoted to content delivery—content that students were to have acquired *before* coming to class—that little time was left over for active and collaborative learning activities, which were Larson's preference. Indeed she often felt frustrated at her students' passive learning experience as she was forced to cover basic knowledge in class. Lecturing to a roomful of disengaged undergraduates was neither a successful strategy for Larson nor for her students.

Redesigning HS 200 has allowed the basic content delivery to be moved online. Students can now benefit much more from interactive and dynamic class meetings. Similarly to CINE 101, HS 200 students now meet once per week in a 75-minute session. The other class content takes place online. Larson meets with one section of the students on Tuesday, the other on Thursday. Students reserve the class meeting time on both days in order to be able to meet as a large group for a guest speaker or exam. This additional flexibility enhances the success of the asynchronous element of the blended format.

In deciding which learning activities were best delivered online vs. in-person, Larson turned to Bloom's Taxonomy. Basic knowledge acquisition, the lower level of the taxonomy, takes place online. Interpretation and application of the content are reserved for class meetings. Students come to class prepared to engage with the content, with each other, and with the instructor. "There is never more than 15 minutes of passive learning in a class period", according to Larson. "The rest of the class time must be interactive" (Larson, personal communication, October 25, 2013).

Fostering Active Learning and Student Responsibility

As part of the FYLI structure, students who are not motivated to do the online work are identified early in the semester while they have time to change their approach. "[Blended delivery] does not work for every student. But it works for many students.… In class, we build community; we build camaraderie" (Larson personal communication, October 25, 2013). Improved connection to the learning community has had a direct impact on student engagement and success in this course.

Larson acknowledges that students' ability to adjust to blended courses vary, but argues that with appropriate instructor support, they can be successful:

Some students quickly grasp the blended concept; some need nudging, some need shepherding all semester. I'm not willing to drag the students through. I'm willing to meet them halfway… to help *them and show them and guide them and support them. I'm into [student] accountability. (Larson, personal communication, November 1, 2013)*

Some of Larson's methods of encouraging students to take responsibility for their own learning include using a gatekeeper syllabus quiz, requiring hard-copy assignments at the beginning of each class meeting, and allowing students two attempts to take online reading quizzes. Students must score 100% on the syllabus quiz before they can access the first module of the online content. They may attempt the quiz as many times as they need to, but until they answer every question perfectly, they can not proceed in the class. Similarly, students who come to class without their hard-copy assignment are unable to participate in that day's learning activities, since class activities have been specifically designed to build on and apply the content from the homework assignment due at the beginning of each class. Both of these strategies keep students accountable for their own learning in the class.

For each online reading quiz, students are permitted up to two attempts. If they are content with their grade on the first attempt, students keep it. If not, students may re-attempt the quiz and will earn the average of both scores. Thus, Larson further encourages students to prepare carefully and take responsibility for their learning experience.

Like in CINE 101, online activities in HS 200 are intentionally designed to support and reinforce in-class activities. Online, students complete a variety of tasks including reading, listening to a mini-lecture, participating in an online discussion, evaluating their own lifestyles using an online self-assessment, and "submitting other materials to help prepare them for engagement as soon as they walk through the door [for the next class meeting]" (Larson, video). The online material is divided into clear tasks with labels such as "Read It," "See It," "Hear It," "Do It," and "Review It." Helping students come to class prepared for active learning has been one of the primary benefits of blending HS 200.

After piloting the blended course in Fall 2012, Larson made minor revisions for Spring 2013. Based on two semesters' experience and student feedback, Larson made further improvements before rolling out HS 200 across seven sections with multiple instructors in Fall 2013. The opportunity to revamp the course several times before "turning it loose" on multiple instructors was "such a gift," according to Larson (personal communication, November 1, 2013). That opportunity resulted directly from NAU's complementary FYLI and President's Technology initiatives.

Teaching in the Blended Format is "So Much More Rewarding"

Students engage more actively with the content of HS 200, and apply it more effectively, as a result of blending the class. Additionally, there is more consistency between sections now that the content is captured in the online class shell. Establishing "continuity across the sections, many of which are taught by adjuncts who may or may not stay on" is yet another advantage of the course redesign.

But the primary improvement for Larson centers around the more effective use of class time and richer learning experience that results:

The course has changed dramatically as a result of going from a traditional face-to-face approach to a [blended] approach. More in-depth learning occurs, I am able to customize the in-class portion based on student need/interest, and I am able to get to know each of my students in a small (35-student) venue instead of a 70-student venue. (Larson, personal communication, December 13, 2013)

In Larson's observation, students are coming to class better prepared because they have been held accountable to complete the online material prior to the next class meeting. And Larson's student-centered, active learning approach to in-class activities benefits both her and her students. "Using class time to do application and see the changes, [observing the] students process info and ask questions that are relevant, [seeing them] engage with the material in a way not seen previously… is so much more rewarding" (Larson, personal communication, November 1, 2013).

Despite her success, Larson is not convinced that blended delivery is for everyone. She encourages faculty to consider whether a blended design would support and enhance "the student achievement of [your] course outcomes" before deciding whether to proceed. "However, I do feel that depending on the course and the outcomes, it can really make a class come alive" (Larson, personal communication, November 1, 2013).

LESSONS LEARNED

These two cases highlight two very successful and, as of writing, mature implementations of blended learning at NAU, as well as three major lessons learned:

- Blended course redesign needs to be accomplished with the student in mind.
- The institution needs to fully support the redesign and faculty need to buy in to it.
- Blended learning redesign needs to start from scratch.

As previously noted, there have been 10 courses funded by this grant program and all have demonstrated similar levels of success: increased student engagement, increased capacity, and increased faculty satisfaction. Introductory courses in Political Science, Chemistry, and Economics demonstrate that student success is positively impacted as well. A lab science course in Biology that was constrained by physical space has doubled its capacity by going to a 50/50 blended model.

Yet there have also been some misfires in informal approaches to blended learning. A prime example was in the NAU first year seminar, where two courses attempted a 50/50 blend, where the class would only meet one day of the week instead of two. These courses were directed at entering first year students; it became clear that the students were ill-prepared for the blended approach. In other words, a successful blended course redesign needs to be accomplished with the student's ability to take control of his or her own learning in mind.

This first lesson can be seen in the implementation of CINE 101 and HS 200. In both instances the courses were intentionally designed to integrate the online and face-to-face components in a fully transparent and obvious way for the students to see the connections and the importance of both. The essential point here is that while blended learning design presents faculty with many challenges, it impacts the students as well. This adds a requirement that faculty design their blended courses to scaffold student learning in this new (to the students) way. Both examples, by adopting the NAU FYLI model, did this from the outset, where there was early and frequent assessment of student learning, and thus the ability to intervene with those students for whom the blended model was not quite working from the outset.

A second lesson learned from NAU's approach to blended learning course redesign is the need for institutional support and faculty buy-in. Many of the courses in the blended learning grant project had issues that faculty and administrators were already well aware of, from lack of student engagement, to DFW rates that were relatively high, to lack of physical space. Also, in most courses there was a high demand for seats from students but not enough resources to fulfill that demand. Thus, these courses would likely have looked for a way to solve these concerns without the grant program.

Yet the grant program put institutional resources firmly behind the faculty as they worked on solutions to their issues. CINE 101 saw increased engagement; HS 200 saw increased student accountability for their own learning. Both of these benefits played well into the goals of the grant program. These courses and others in the grant program also saw faculty fundamentally redesigning their pedagogy. This third lesson is basically that blended learning course redesign needs to start from scratch. In all instances faculty went back to the basics: what are my student learning outcomes and how am I going to assess that students have met these? Only after these questions were answered would the faculty designers then focus on the learning activities, and decide which were best delivered online or face-to-face. For example, in HS 200 Prof. Larson fell back on Bloom's Taxonomy to determine where these activities best belonged. Prof. Klocke, in CINE 101, followed a similar model, ensuring her face-to-face classes were focused on more in-depth student learning.

CONCLUDING REMARKS: THE ROAD TRAVELLED

The recent surge in blended courses in higher education is a testament that institutions and faculty recognize the benefits that advanced technology brings to bear in traditional face-to-face and online classes. It is also a recognition that the hitherto bifurcation between the teaching modalities is slowly, but inevitably, giving way to a new pedagogical approach that is more robust, elevates student engagement and provides the instructor with tremendous opportunities for innovative teaching. This embrace of blended learning cuts across institutions in America; this analysis has documented the experience at Northern Arizona University (NAU), a doctoral-intensive southwest institution.

The success of blended learning courses at NAU is an outcome of the fusion between a facilitative institutional environment, student needs and a committed faculty. The Blended Learning Policy framework, the President's Technology Initiative grant and the First Year Learning Initiative are the high-level institutional policy mechanisms that have catalyzed and facilitated faculty technology-oriented course redesign at undergraduate level in classes that previously eschewed technology. Furthermore, the E-Learning Center at the university has been critical in providing the requisite support for the course redesign. That these classes have registered remarkable success also owes a great deal to students' demand for classes that are more engaging, interactive, and provide independent learning opportunities.

The two blended courses discussed in the chapter, *Cine 101: Introduction to Cinema and Visual Arts* and *HS 200: Healthy Lifestyle*, offer a rich panoply of in-class and out-of-class activities that are superbly integrated by a sophisticated deployment of technology. The mosaic of online discussions, online written assignments, video clips, a broad array of online assessments, face-to-face instruction and presentations along with individual and group projects serve to break the instructor-textbook monotony that characterized the course before redesign. The outcomes have been evident in increased student enrollment, improved satisfaction with the classes as reflected in student evaluation comments, optimal use of university classroom space, and additional time for instructors to engage in their research activities.

KEY TERMS AND DEFINITIONS

Active Learning: Learning through doing and applying, not passively absorbing content through reading or lectures.

Blended Learning: The intentional, complimentary fusion of online and face-to-face teaching and learning into a harmonious whole.

Institutional Support: Mechanisms put in place by the college or university to facilitate course redesign (such as blended courses) including expertise and funding.

Instructional Design: The systematic theory-based development of instructional delivery methods and approaches.

Recursive Course Structure: Cyclic nature of active learning activities in a blended course involving in-class, online and out-of-class collaborative activities complementing and reinforcing each other.

Retention: Student success as evidenced through continuing and increased enrollments.

Scaffolding: The intentional inclusion of early and frequent feedback opportunities including low-stakes learning activities to promote student responsibility and allow for timely intervention with students who may benefit from more support (tutoring, counseling etc.).

Student Engagement: The motivation and active involvement of students in their own learning, non-passive learning.

Chapter 46
The Effects of Problem-Based Learning with Flipped Classroom on Elementary Students' Computing Skills:
A Case Study of the Production of Ebooks

Chia-Wen Tsai
Ming Chuan University, Taiwan

Ming Chuan University, Taiwan

ABSTRACT

This study investigated, via quasi-experiments, the effects of problem-based learning with flipped classroom (FPBL) on the development of students' learning performance. In this study, 144 elementary school students were selected from six grade sections taking a course titled 'Production of Ebook', and were assigned into the following three groups: FPBL group (n = 50), PBL group (n = 48), Control group (n = 46). The authors collected both quantitative and qualitative data, including interviews with students and teacher's journal. Based on the analysis in this study, it is found that the effect of FPBL on improving students' learning performance was significantly higher than other teaching methods investigated. This research provides an innovative design and illustration of PBL for teachers, educators, and schools which pay attention to enhancing students' learning performance.

INTRODUCTION

In this age of digital technology, students have more opportunities for contact with digital electronic products, including personal computers, tablet computers, and smart phones. The functions of these products include rich video and audio effects, various software applications, and Internet connections. With the popularization of Internet access, increase in bandwidth, and applications of cloud technology, there are numerous opportunities for students to use various Internet applications. Recently, it was found that an average student who graduated from a university in the U.S. has spent less than 5000 hours on studying but over 10,000 hours on computer games, email, and social networking sites (Deshpande & Huang, 2011). Moreover, online learning is increasingly common in recent years (King, 2008). Other research indicates that 65% of higher educational institutions offer courses with Internet access for students to study, and as many as 63% offer university-level online learning courses (Allen & Seaman, 2013).

Accordingly, the researchers in this study discussed this topic with some teachers teaching computing courses in elementary schools and found that students are highly interested in the content of the computer courses at school. Yet, after observing how students use computers after school, it was found that most of them simply go online to play games or browse social networking sites. Unfortunately, that type of usage of computers and networks is not for learning or practicing what they have learned in computing courses.

On the positive side, with the development of the Internet technology, there are many applications and more feasible opportunities for online learning. Flipped classroom is one such innovative teaching model. Traditionally, a teacher teaches in a classroom and her/his students go home to do their homework. Teaching in a flipped classroom offers students a video of the course content so that they can study in advance. Then, students perform and join learning activities such as practice and group discussions in the traditional classroom environment (Herreid & Schiller, 2013). The change in time and space of teaching helps to improve teacher-student interactions and discussion in the classroom (Miller, 2012). The idea of flipped classrooms is a popular topic in education reform and innovation. According to the report of a survey regarding flipped classroom by Classroom Window in June 2012, 67% of teachers believed that their students' learning effects were improved with the flipped classroom model, and 80% of teachers indicated that their students' learning attitudes were improved. Furthermore, 99% of the interviewed teachers would continue using the flipped classroom model next year (Francl, 2014). The advantages of flipped classroom include offering students a more diversified learning method, increasing in-class discussions and interactions, and achieving individual learning based on each student's competence (Herreid & Schiller, 2013). Therefore, this study aimed to apply the flipped classroom model in a computer course to explore the beneficial effects of this model on students' computing skills.

One of the authors in this study is a computing teacher in an elementary school. Based on the authors' reflections and teaching experience, it is found that students experience a disconnect with their learning in computing courses. In Taiwan, elementary school students are required to take computing courses; however, after students learn to use computer software, they still cannot apply it in their daily lives. They rarely have experience in solving a real problem with a computer (Lee, Shen, & Tsai, 2008). Problems in real life are much more complex than those in text books. Thus, students' learning must be connected to field experiences and their ability to solve problems should be improved via critical thinking (Chan & Ho, 2014). It is indicated that teachers' adoption of problem-based learning (PBL) and teaching design for students' learning activities is helpful for students' learning through problem-solving and directing of their knowledge (Schwartz, 2013). Therefore, the researchers integrated PBL with flipped classroom, and explored the effects on improving students' learning performance.

LITERATURE REVIEW

Flipped Classroom

In a flipped classroom, students can perform collaborative learning with their classmates and teacher with knowledge learning completed in advance (Bergmann & Sams, 2012). The key of a flipped classroom is not how the teacher creates the before-class preview video, but how teaching interactions will be performed in class (November & Mull, 2012). Watching a teaching video helps students to absorb some basic knowledge. When the class begins, the teacher can offer her/his help to each team or individual based on students' specific needs (Sams & Bergmann, 2013).

In traditional teaching, teachers begin with low-level cognitive teaching goals. Their lecturing is one-way as they teach students concepts to be memorized and comprehended, and integrate some examples and news events in order to raise the cognitive goals to incorporate applications, analyses, evaluations, and creation. Then, students' high-level concepts are self initiated (Herreid & Schiller, 2013). Yet, in a flipped classroom, students watch an easy-to-comprehend video at their own pace and then develop their high-level cognitive goals with assistance from their peers and teacher. This process allows students to actively explore and learn through cooperation, and further develop their cognitive competence (Sams & Bergmann, 2013).

In some universities, flipped classroom has already improved students' learning in courses including biology, mathematics, and physics. In class, students can directly ask questions when they encounter something they do not understand. They are inspired to keep an active attitude toward learning, to discuss with classmates, and have more opportunities to correct their vague concepts (Berrett, 2012). In a flipped classroom, peers' help could improve the process of learning and internalizing knowledge. Students' resulting levels of comprehension and capability to resolve problems are higher than those taught through a traditional teaching method (Dasgupta & Tuttle, 2013; Crouch & Mazur, 2011). Thus, flipped classroom is applied in this study to enhance students' computing skills in producing Ebook.

Problem-Based Learning

PBL is considered as one of the most primitive learning methods of human beings before classrooms and courses (Boud & Feletti, 1998). Because humans are always solving problems, what one has learned from the process of solving a problem is absorbed and internalized. Thus, solving problems is one of the most natural learning methods. PBL stresses adopting a teaching model based on problems and developing learners' abilities to think and to solve problems in real situations in order to internalize important concepts in courses (Tarmizi & Bayat, 2012). This learning model places learners' focus on problems themselves instead of on an individual academic subject. Teachers come up with unstructured vague questions regarding a structured issue to facilitate their students to use resources in more multi-dimensional ways. Then, students can learn to understand problems and to find solutions through discussions and develop the concept of integration (Budé, Imbos, vd Wiel, Broers, & Berger, 2009).

PBL is an approach in which students attempt to find a solution to a problem in a real situation, usually incorporating teamwork (Hatısaru & Küçükturan, 2009). Teachers can arrange a real situation with a problem, and help students to internalize their knowledge (Hmelo & Lin, 2000). In PBL, students resolve real problems from daily life, which generally increases their curiosity and maintains their learning motivation. Through PBL, students can obtain positive learning experiences from the process of solving problems as it also encourages students to study, obtain permanent knowledge, and develop their confidence (Celik, Onder, & Silay, 2011).

It is reported that PBL could result in better learning effects than traditional teaching. In students' understanding of mathematical knowledge under learning of mathematical concepts, self-learning, exploration and resolving problems is better with PBL than traditional teaching (Tarmizi & Bayat, 2010). PBL allows teachers to review their students' tasks at each stage and offer feedback to ensure completion of each learning stage (Pearson, 2006). Students' learning motivation and cognitive capability can be increased through learner group interactions, feedback, and problem solving. When PBL is applied to an online course, learners' critical thinking can be enhanced (Şendağ & Ferhan Odabaşı, 2009). One reason for this is that in order to solve problems, students should adopt effective learning strategies. For example, they may enhance their memory and thinking capability. During the process, their cognitive development can also be improved (Tarmizi & Bayat, 2012). Therefore, PBL is integrated in the implementation of flipped classroom to improve students' learning performance.

METHOD

Participants

The participants in this study were 144 sixth-grade elementary school students. Among them, 61 were male, 83 were female. These students did not have prior experience in editing an Ebook nor using software for editing Ebook. The researchers first checked that that students participating in this study had computers with Internet access at home. The experiment was designed with three groups: The first was the group learning through flipped classroom and PBL (FPBL group, n=50), the second was the group learning through PBL (PBL group, n=48), while the last one was the control group without PBL nor flipped classroom (Control group, n=46).

Course Setting

In this study, the computer course was 20 weeks long. During the first five weeks, the topics included operation of the Internet, computer hard drive, information literacy, paper-book layout introduction combining a reading course provided by the school, and cloud library. During the subsequent 15 weeks, the students learned to use Zmaker, a software package for creating Ebooks, along with Photocap, an image editing software package, and edited and produced their Ebooks.

The teacher introduced the features and interface of the Ebook software, and the students were divided into teams for learning. Each team had to decide their Ebook subject, set a schedule and actually create two Ebooks through collaboration and discussion based on the knowledge and skills they had learned. The teaching goal of this course, in the aspect of cognition, was to help students create Ebooks; in the aspect of affection, it was to inspire the students' creativity through grouping and improve their abilities of communication and coordination; and in the aspect of skills, it was to help the students to learn to use Ebook editing software.

Interventions

The Intervention and Design of Flipped Classroom

In the flipped classroom for FPBL group, the teacher introduced how to use Moodle, a learning platform, in the class, so that the students could use it to share files and have online discussions. The students were asked to watch the teacher-produced teaching videos in advance at home. They were told that they would be grouped in the class to create Ebooks.

The students watched the teaching videos at home and discussed with their classmates through the Moodle platform. They could also ask questions through this course website. Before each class, the teacher recorded a ten-minute teaching video. The video contents became more and more complex as the production contents got more and more complicated and refined. In the class, the teacher played the role of a guide, assigning tasks to the groups, engaging them in discussions, introducing course contents step by step, and interacting with the students. During discussions, the teacher offered guidance to students. This experiment combining flipped classroom and PBL was a one-semester activity, with a 40-minute class every week. Based on the contents of the pre-recorded videos for flipped classroom and group discussions, Ebooks were produced. From the process of collecting materials, editing, using software, and discussions upon discussions, the knowledge of how to create Ebooks was built. Finally, by the end of the semester, the Ebooks produced by teams in FPBL group were presented.

The Intervention and Design of Problem-Based Learning

In the PBL teaching model for FPBL group and PBL group, the students were guided by the teacher to edit and create their Ebooks. In the initial stage, the teacher created an interesting and challenging atmosphere by first introducing the functions of Zmaker, demonstrating how to use the software, then asking the students to practice the basic functions. After the software function practice, the teacher grouped the students and asked them to discuss how to create an Ebook with Zmaker in accordance with the situations the teacher designed. In the class, the teacher played the role of a guide, assigning tasks to the groups and engaging them in discussions, introducing course contents step by step, and interacting with the students. The groups were required to follow the editing process to complete the initial version of their Ebooks. The students were required to create Ebooks according to the guidelines. Through the process of collecting materials, editing, using software, and discussions upon discussions, the knowledge of how to create Ebooks was built. Finally, by the end of the semester, the Ebooks made by teams in PBL group were presented.

Intervention for Control Group

The Control group received traditional lecture instruction with the same hours and tasks as those in FPBL group and PBL group. Although students were also required to create Ebooks, they completed the requirements based on the teacher's lectures, and did not interact through peer discussions, nor did they learn in a flipped classroom.

Measurement

The teacher in this study first checked whether students had any experience in using any Ebook editing software before this course. The students involved in this study expressed that they did not have any related prior experience. Thus, the researchers could rule out the potential factor that students' learning performance resulted from previously learned editing skills.

The teacher in this study evaluated students' designs and Ebooks based on the core components of Ebook design (Jonathan, 2011), which is comprised of text content, presentation, and work setting. The text content scores are based on correctness of word use, creativity, and information use ethics. The presentation scores are based on graphic design and layout and overall aesthetics. The work setting scores are based on animation setting and background setting. This study then attempted to explore the effects of flipped classroom and PBL on improving students' learning performance.

Table 1. Comparison of grades: FPBL group and PBL group

Group	n	Mean	S. D.	F	t-value	df	*p*
FPBL group	50	94.36	3.009	3.082	2.953	89.795	.004**
PBL group	48	92.79	2.202				

**p*<0.05, ** *p*<0.01

RESULTS

Quantitative Analysis

The Effects of Flipped Classroom

The independent sample t-test was used in this study to investigate the effects of FPBL on improving students' learning performance. The results are reported in Table 1. The average score of the FPBL group (94.36) was significantly higher than that of the PBL group (92.79). Therefore, it is believed that flipped classroom could lead to better development of students' computing skills in designing Ebook.

The Effects of Problem Based Learning

As for the effects of PBL on students' enhancing computing skills, based on the data shown in Table 2, there is no significant difference in students' computing skills between PBL group (92.79) and Control group (93.52). That is, the expected effect of PBL is not found in this study.

Qualitative Analysis

As for the combined effects of FP and PBL, based on the interviews conducted, it is found that the students were still unfamiliar with Ebook editing even though they had taken some computer-related basic courses before. In this study, the combination of flipped classroom with PBL could improve students' learning effects, so that students could be more efficient when editing their Ebooks at school and have more time for practice. Some of the interviewed students reflected on their learning and made the following statements:

S1: I watched the recorded video of the Ebook course at home. Then, when I went to school, I could directly start to create (my Ebook), unlike before when I had to follow the examples in the textbooks. Now, I can present my ideas through Ebooks. I found a lot of stories behind idioms and novels as the materials for my Ebooks.

S3: I love this course of Ebook. In this course, I learned different modules and functions. During the process, there were videos as supplementary materials. I searched for images, uploaded my editing, created my Ebooks, and even found someone online to teach me how to modify images using photo-cap so that my Ebooks could be even better.

S6: If there was an exam question that I did not know how to solve, I would try to find the solutions in the teaching videos (in the flipped classroom).

After a semester of learning activities in a PBL environment, the students affirmed this series of problem-solving and learning processes. They believed that PBL could raise their learning motivation and they were able to practically resolve the problems encountered while creating their Ebooks. Finally, they all produced Ebooks on the subjects assigned by their teacher. Some interviewed students expressed their thoughts:

S1: Every time when our teacher asked us a question, we went through all the possibilities and finally we made decisions through discussions.

S5: I enjoyed creating Ebooks with my classmates. I had made a few mistakes; however, we col-

Table 2. Comparison of grades: PBL group and control group

Group	n	Mean	S. D.	F	t-value	df	*p*
PBL group	48	92.79	2.202	9.776	-1.23	92	.222
Control- group	46	93.52	3.443				

$*p<0.05$, $**\ p<0.01$

> lected the ideas of all the team members and came up with solutions. It was a wonderful experience. We worked as a team. Even we had some conflicts, there was nothing too serious.

According to the result of the qualitative analysis, after the students participated in the experiment combining flipped classroom and PBL, they developed some initial concepts regarding Ebook editing. They were also able to create personal pages and the content for the Ebooks of their group. During the PBL process, students had to resolve problems through discussions and work as a team. The effect of PBL was positive and proper such that students could obtain various experiences through individual learning and group discussions and learn the computing skills required for Ebook editing.

DISCUSSION

This study combined flipped classroom with PBL for the purpose of improving students' learning effects. According to the instructional design and the results of this study, contribution was made to e-learning theory in three ways. Firstly, in the flipped classroom applied in this study, the students could receive feedback immediately in class, so that they were able to find solutions to their problems and improve their computing skills. Secondly, this study offered an online teaching environment, a PBL online platform, for the purpose of computer skill learning. Through this, these elementary school students could get used to online learning and self-directed learning earlier than many of their peers. Finally, this study may be one of the early attempts that simultaneously adopted an innovative teaching method of combining flipped classroom and PBL to improve students' learning. The approach and experience of the adoption of new education models can be used as a reference for other teachers in related courses.

This study explored the effects of combining flipped classroom and PBL on improving students' learning performance. The results show that the average computer score of the students receiving flipped classroom (FPBL group, mean = 94.36) intervention was significantly higher than that of the students not receiving flipped classroom (PBL group, mean = 92.79) (p=0.004) intervention. This finding in the present study is similar to that of Bergmann and Sams's (2013) study, which was that flipped classroom could help improve students' learning. Thus, this study suggested that teachers can consider integrating activities combining flipped classroom and PBL in their courses in order to improve their students' learning performance.

Different from the inflexible models of traditional teaching, the combination of flipped classroom and PBL allows students to perform initial learning to discover their own problems, inspire them to have an active learning attitude and create an atmosphere of cooperative learning. Peer assistance can be helpful for facilitating the process of absorbing and internalizing knowledge (Herreid & Schiller, 2013). Furthermore, with the teacher's assistance, the students were encouraged to actively find problems and resolve them. The goal of interactive learning was achieved as the students were guided and assisted by the teacher and discussed with their team members face to face. Through the interview records, it was found that the students from the FPBL group, during their learning process, not only learned the skills to edit Ebooks, but also expanded their learning through using other software. At school, under the framework of PBL, the students had more time to create Ebooks and more opportunities to work on different subjects, so they became more interested in learning. Thus, the intervention of flipped classroom and PBL could result in better development of students' computing skills.

With regard to the effects of PBL on the development of students' computing skills, the data shown in Table 2 indicates the difference of students' computing skills between PBL group (92.79) and Control group (93.52) is not significant statistically ($p = 0.222$). The expected effect of PBL is not found in this research. A potential reason may be that the students have received the traditional spoon-feeding or didactic approach of teaching in previous computer-related courses and thus were not familiar with the PBL method as this was their first experience. Moreover, in the problems-solving processes, possibly students could not put themselves into the situations of the problems due to the time pressure, which may have further resulted in the insignificant difference of students' computing skills between PBL group and Control group. It may also be true that the creation of an Ebook is inherently a problem-based activity, thus making it difficult to distinguish between the effects of PBL and Control group approaches.

CONCLUSION

In this research, it is found that the adoption of flipped classroom could result in better development of students' computing skills in producing Ebooks and improved the quality of students' assignments. As the students learned through the online course at home, during the class they were more efficient in problem solving and discussions. The class time could be more meaningful, as well as allow for discussion of higher-level problems, and the teacher could offer timely assistance. Thus, the effect of FPBL on students' learning was positive and significant. The researchers in this study expect that the design and integration of FPBL, and the lack of significant effect found in the implementation of PBL alone can provide references for teachers who plan to provide flipped classroom or implement PBL in their courses.

Limitations

This study adopted the experimental method of two experimental groups and one control group. The results may have been influenced by other potential factors. For example, the teacher may have spent more time and efforts on the students in the experimental groups, who may have known that they were under experiment so that their performances were influenced. In addition, the Hawthorne effect or the John Henry effect may be at play as the students from the control group were not to be outdone, causing bias in this study. Teachers and researchers who may adopt the flipped classroom and PBL in this study should be aware of these factors that may influence the effects claimed in this study.

Chapter 47
Barriers to Blended Teaching and Learning in Sub-Saharan Africa:
Challenges for the Next Decade and Beyond

ABSTRACT

This chapter explains the need to better design blended teaching and learning curricula, the need to address infrastructural problems, and the need to organise programmes so that faculty and students can better plan for unanticipated and unintended situations that confront them in the teaching and learning processes. Improving the quality of education through the diversification of content and methods and promoting experimentation, innovation, the diffusion and sharing of information, and best practices are among UNESCO's recent strategic objectives in education. Discussions in this chapter centre on (1) the contexts of blended teaching and learning, (2) the barriers to blended learning usage, integration, and diffusion, and (3) the need to consider policy outcomes when evaluating blended teaching and learning resources. This study uses a qualitative research method, as both document materials and observation were an essential part of this chapter. This study concludes that the great enthusiasm around blended teaching and learning in sub-Saharan Africa has been dampened by inadequacies in essential services and infrastructures, such as electricity and telecommunication services, and institutional, socio-cultural, and economic barriers. Nonetheless, the development of blended teaching and learning resources continues.

INTRODUCTION

Amid the advent of the blended learning revolution (Graham, 2005), the world is witnessing an expansion of blended teaching and learning. This revolution enabled academic institutions to provide flexible and more open teaching and learning environments for faculty and students. The convergence and availability of new blended learning technologies such as computers, satellites, WebCT, PowerPoint, and other learning and fibre optic technologies is making it easier for institutions to implement and achieve their educational objectives (Nel, 2005; Akhahowa & Osubor, 2006). Blended teaching and learning methods have become the foremost tools in some learning institutions and have had a remarkable impact on how educational development is viewed around the world. Blended Learning involves a combination of face-to-face and technology-based learning, distinct from other learning strategies that is highly conducive to faculty teaching and increased students learning (Ololube, 2011). This revolution, however, is not a universal one and needs to be reinforced to reach a larger percentage of the student population worldwide (Nel, 2005; Mac-Ikemenjima, 2005; Olalekan, 2012; Mpofu, Chimhenga, & Mafa, 2013).

The effective use of blended learning as a method in the teaching and learning processes addresses many of the problems associated with technology-based learning, seeking synergistic results that benefit faculty and students as they move beyond their studies and execute their responsibilities as professionals. In order to demonstrate the previous assertion, this paper will embark on a discussion of blended learning and the factors that hinder its effective use in educational institutions as means of achieving educational objectives in sub-Saharan Africa. Blended teaching and learning are central to enabling us to better manage contemporary complex information flows and integrating these flows into effective teaching and learning aimed at the maximisation of human capital. To this end, we must develop integrated methods and training modules that enable blended teaching and learning application.

Stakeholders, parents, governments, faculty and students rely on universities to educate those enrolled through certification and accreditation in approved programmes. Still, despite efforts by sub-Saharan African governments to establish these programmes to help in the preparation of an effective workforce (Nel, 2005; Yusuf, 2005a, 2005b, 2006; Ololube, 2011; Ololube, Amaele, Kpolovie, & Egbezor, 2013), a number of fundamental problems have incapacitated their full development. These same problems have hindered the successful implementation of blended teaching and learning in institutions of higher education. More than half of the students and lecturers in sub-Saharan Africa, for example, lack e-knowledge and most students have limited (or no) experience in the use of WebCT's interactive features (such as discussion forums and assignment submission) (Nel, 2005). Likewise, Yusuf's (2005a) study, which investigated teachers' self-efficacy in implementing computer education in Nigerian schools, found that most teachers in Nigeria lack competence in using computers and computer software for educational purposes. Another recent study (Mpofu, Chimhenga, & Mafa, 2013) found that most of the professionals employed in Zimbabwe Open University (ZOU) Regional Centres are not effectively trained in the design and use of e-learning materials. As a result, where computers have been secured e-learning as a form of blended learning is not used to interact with the student on a regular basis.

The popularity of blended teaching and learning methods has brought swift changes in educational technology and has caused a global educational and economic transformation, particularly in developed countries. To be effective in the innovations relevant to blended teaching and learning, faculty need training not only in computer literacy but also in the application of various kinds of educational software; they need to learn how to integrate blended teaching learning into their academic activities (Ololube, 2006a, 2006b).

The quality of faculty in higher education institutions is widely accepted as a main predictor of the quality of student learning (Ololube, 2011). Faculty training is thus crucial in the adoption of blended teaching and learning methods. Higher education in this paradigm refers to the post-secondary section of the national education system delivered in Universities, Polytechnics and Colleges of Technologies including courses provided by Colleges of Education and such institutions as may be allied to them (Ololube, Ubogu, & Egbezor, 2007). Information Technology (IT) and Information Systems (IS) are tools that can both facilitate faculty training and help faculty to take full advantage of the potential of technology to enhance student learning through effective integration of blended learning programmes. IT and IS have ushered in a new era in teaching methods and offer new educational experiences to both faculty and students (Ololube et al., 2013). In a complex society like Nigeria, however, there are still many factors that affect the usage and integration blended learning methods.

BACKGROUND

The higher education landscape in sub-Saharan Africa includes the teaching and learning process, educational programmes and courses, the pedagogy or methodology of teaching, the research process, including publication and the dissemination of knowledge, libraries and information services, on-line education options, etc. Despite these many dimensions, the majority of the higher education institutions in the region are not accomplishing their stated objectives and are in no particular hurry to redesign their programmes to ensure that faculty are thoroughly prepared for their role in improving curriculum, instruction and student academic achievement through blended learning (Ololube, 2011; Fry et al., 2006).

Sub-Saharan African countries (See Figure 1) have fared poorly on the various indices used to assess a country's readiness to participate in the information age, despite their abundant resources (Ifinedo & Ololube, 2007; Ifinedo, 2005b, Ifinedo & Uwadia, 2005). This lack of readiness has largely been attributed to corrupt practices. Sub-Saharan Africa has enormous economic potential. It has a vibrant private sector, highly motivated entrepreneurs, and a large domestic market. It represents the world's largest reservoir of natural resources, including petroleum, natural gas, tin, coal, limestone, zinc, columbite and lead. In spite of these resources, however, its progress towards meeting the Millennium Development Goals (MDGs) has been very slow. According to the International Monetary Fund (IMF) (2012), increased public spending on education alone is not the answer; the quality and equity of spending are equally important.

According to the 2006 World Bank Report, countries in Africa remain the world's largest development challenge. More than 314 million

Canada	North America	34.3 m (July 2012)	99% (2003)	81.48 (July 2012)	US 41.500 (July 2012)	26.96 million (2009)	580.6 billion (2010)

Source: CIA: The World Factbook (last updated January 2013)

Africans—nearly twice as many as in 1981—live on less than $1 a day. Thirty-four of the world's 48 poorest countries, and 24 of 32 countries ranked lowest on the United Nations Development Programme's Human Development Index, are in Africa. Most African countries are heavily indebted, often to the IMF and World Bank. In order to reduce this burden, the Joint IMF-World Bank comprehensive approach to debt reduction has been designed to ensure that no poor country faces a debt burden it cannot manage. To date, debt reduction packages under the HIPC Initiative have been approved for 36 countries, 30 of them in Africa, providing US$76 billion in debt-service relief over time (IMF, 2013). Table 1 displays several comparative socio-economic indicators, perhaps collectively indicative of e-readiness, for select sub-Sahara African, Western European and North America countries.

GLOBALISATION AND TECHNOLOGY EDUCATION

National economies, and even national cultures, are globalising. Everything, including relations among family and friends, are rapidly being organised around a much more compressed view of space and time (Carnoy, 2005). Globalisation means that national borders do not limit a nation's investment, production, and innovation, and that competition for local businesses is no longer limited to a physical city or region.

According to Tabb, Queens College and the Grad Centre (n.d), we are often told today that education can only be rendered more efficient by adopting a market model and moving away from the notion of education as a publicly provided and monitored social good. This manifestation of neoliberalism—the belief that today's problems are best addressed by the market and that government regulation and the public sector should remain as marginal as possible—is not unique to debates about education: it dominates economics, politics and social policy across most of the world.

Globalisation can be described as the emergence of altered global structures driven by a skill revolution, an organisational explosion, and a continuous flow of ideas, money, goods, and people that is rendering long-standing territorial boundaries increasingly obsolete and fostering an extensive decentralisation of authority (Pulkkinen, 2004). It is the concentrated increase in cross-border economic, social, and technological exchange and a process that leads to greater interdependence and mutual awareness (reflexivity) among economic, political and social units worldwide. One might be tempted to think of globalisation as only a matter of industry and business separate from national governance and systems of education. If we understand education as part of the future business climate of a country or as an important part of a country's service sector, then education can be seen to be at the core of the globalisation process. Some governments, for example, are trying to enhance their global competitiveness by reformulating the objectives of education policy to ensure the production of the "human capital" most appealing to global "buyers" (Webster in Pulkkinen, 2004). Post-secondary educators would do well to include their own future prospects as they consider the impact of globalisation in the coming years. The university will be a very different place in another decade or two, and what it will look like depends to a large degree on what version of globalisation is triumphant.

According to Stromquist (2005), globalisation today is a concept that everyone uses and, consequently, has acquired multiple meanings. Despite this multiplicity, two very different understandings are emerging: one in which the technological aspects are emphasised and another in which the economic and political aspects dominate. In both versions, education is posited as central. It is, for some, the major tool for incorporation into both the "knowledge society" and an increasingly technological economy. These are, arguably, exaggerated expectations. While education is being democratised, as more and more people achieve higher levels of schooling, education is only one factor among many in economic growth, and the societal rewards of education are quite finite, being felt mostly by those with the highest levels of education.

BLENDED LEARNING AND SUB-SAHARA AFRICA EDUCATION

Sub-Saharan African countries came late and slowly to the use of collaborative learning in all sectors, especially in education. This is as a result of the unceasing limitations brought about by economic disadvantages and government policies (Ololube, 2006b) that have direct consequences on educational development. The negative impacts are many and a large number of sub-Saharan higher education institutions are still unable to find effective ways to use technology assisted methods of teaching (blended learning) in their classrooms or any other aspect of their teaching and learning (Nel, 2005). The most common justification for this lack of success is that the use of technology in the classroom has not been encouraged and faculty members are not well trained in the use of computer aided instruction as a means for educational sustainability (Ololube, 2011).

A recent study conducted by Global Information Technology (2012), used the Networked Readiness Index (NRI), covering a total of 142 economies in 2011-2012, to measure the degree of preparation of a nation or community to participate in and benefit from ICT development. South Africa ranked 72nd out of the 142 countries surveyed, followed by Cape Verde 81st, Rwanda 82nd, Botswana 89th, Kenya 93rd, Ghana 97th, Senegal 100th, and.Nigeria 112th. Sweden topped the list, followed by Singapore, Finland, Denmark,

Table 2. The 2012 networked readiness index

Rank	Country/Economy	Score
1	Sweden	5.94
2	Singapore	5.86
3	Finland	5.81
4	Denmark	5.70
5	Switzerland	5.61
6	Netherlands	5.60
7	Norway	5.59
8	United States	5.56
9	Canada	5.51
10	United Kingdom	5.50
72	South Africa	3.87
81	Cape Verde	3.71
82	Rwanda	3.70
89	Botswana	3.58
93	Kenya	3.51
97	Ghana	3.44
100	Senegal	3.42
101	Gambia	3.41
105	Namibia	3.35
109	Zambia	3.26
112	Nigeria	3.22

Switzerland, Netherlands, Norway, United States, Canada, and the United Kingdom (See Table 2).

Given the results of the 2012 Networked Readiness Index, administrators and trainers must work to make educational technology an integral part of teaching and learning so as to provide a clear demonstration of how instructional technology tools can address the personal and general concerns of teaching and learning in sub-Saharan Africa.

In recent times, the integration of blended teaching and learning methods in higher education teaching has been the topic of much debate. Blended learning has impacted the quality and quantity of teaching, learning, and research in education institutions around the world. In concrete terms, blended learning methods and literacy in its methods has enhanced teaching and learning through its dynamic, interactive, and engaging content and has provided real opportunities for individualised instruction (Newhouse, 2002a). Educational systems around the world are thus under increased pressure to use new Information and Communication Technologies (ICTs) to impart to students the knowledge and skills required in the 21st century (Larose et al., 1999). Institutions that train teachers in turn are faced with the challenges of preparing a generation of teachers to effectively use the new learning tools in their teaching practices (UNESCO, 2002).

To Newhouse (2002b) technology has been developed to solve problems, improve living standards and to increase productivity. It is reasonable that we expect educational technology to have been developed with similar objectives. Ideally, educational technology should influence both educational outcomes and costs: if faculty members select the most appropriate educational technology and student learning is optimised, this means an increase in the value of the outcomes.

It has been argued (Creemers, 1994a) that faculty members who are focused on improving their competence are likely to contribute directly or indirectly to the growth of students' academic achievements. Similarly, studies concerning faculty training and education demonstrate the need to offer faculty better educational and development opportunities in order to increase job effectiveness (Kautto-Koivula, 1996). To this end, faculty need contemporary techniques, tools and assistance to help them develop blended learning based projects and activities designed to raise the level of teaching and improve student learning and academic achievement (Aduwa-Ogiegbaen & Iyamu, 2005). Realistically, the inclusion of blended learning materials in higher education is of little value if faculty members are not adept in their applications.

BARRIERS TO BLENDED LEARNING IN SUB-SAHARAN AFRICA

The zeal of institutions of higher learning to establish quality education programmes is not in contention in this paper. These institutions however are confronted with enormous challenges that often impede proper execution. The greatest of these is poor IT penetration and usage among education practitioners. This is compounded and driven by the fact that basic IT/IS infrastructures are inadequate in almost all African countries due to a lack of electricity to power IT materials, poor telecommunication facilities, and insufficient funds with spending on education generally reaching just 12% of national budgets.

Technological (ICT) Barriers

An on-going problem in the sub-Saharan African educational systems is the lack of attention paid to emerging innovations in education. The success of education depends upon its ability to identify and respond to technological changes in order to advance teaching and learning processes (Ololube, 2009). Over the years, a number of technological changes have taken place and involve the incorporation of modern tools into teaching and learning. These advances have created a rich global resource and collaborative environment for the dissemination of literacy materials, interactive discussions, research information, and the international exchange of ideas, all of which are critical for advancing meaningful educational initiatives, training highly skilled labour forces, and understanding emerging issues related to economic development.

As educational systems around the world are encouraged to use these new blended learning technologies to teach students the knowledge and skills they need to thrive in the 21st century, individual institutions face the challenging task of ensuring the financial and human resources needed to acquire and deploy these technologies in a teaching environment. African nations came late to the technological table and have progressed slowly in their use of ICT. Delayed access to basic ICT equipment, low Internet connectivity, a lack of computers, and inadequate use of audio-visual materials and equipment including films, slides, transparencies, projectors, globes, charts, maps, and bulletin boards, as well as programmed materials such as information retrieval systems and instructional television, remain barriers to the effective and professional development of students in the region.

Institutional Barriers

The basic barrier to the implementation of blended learning in educational programmes in sub-Saharan Africa is the issue of educational technology. One of the goals of educational technology is to provide as complete an education as possible to students. IT and IS knowledge and skills are essential today. Thus, educational technology allows students to stay up-to-date with computer and telecommunications technology. This is highly challenging if not impossible in sub-Saharan Africa where only limited efforts support the integration of technology in education. There are few to no blended teaching and learning methods that students can use to expand their perception and understanding of IT and IS. As a result, students often lack the language to access the contemporary terminology used in describing and deploying educational technology (Ololube, 2006a, b). It is also evident that policy makers, administrators and faculty members in developing countries lack the necessary expertise to manage new innovations, including the implementation and delivery of IT-enabled education (Mac-Ikemenjima, 2005, Nel, 2005).

Socio-Cultural Barriers

Socio-cultural barriers to blended teaching and learning include people's attitudes, behaviour patterns, gender, and demography. All of these factors have influenced the way education has developed in sub-Saharan Africa. In general, given these culture and social attitude/anxiety constraints, sub-Saharan African countries have not developed a mechanistic view of the world (Ifinedo, 2005a, 2005b; Ifinedo & Ololube, 2007).

Available evidence suggests that the digital divide is closing rapidly. Over the last decade, millions of people each year, especially in advanced countries, have gained access to computers. Never in human history have there been so many people with access to computers, digital networks, and electronic communication technologies (Tuomi, 2000). A research study (Ololube, 2009) in sub-Saharan Africa, however, found that post-secondary students' attitudes towards computers relate to prior experiences, particularly those of their early years of education. The study suggests a correlation between the unpleasantness of early experiences and current anxiety toward computer mediated learning. This in turn has led to the slow rate of use and integration of Computer Communication (CC) and ICTs amongst higher education students. Students with positive early access to CC/ICTs have far fewer computer phobias. Studies by Parasuraman and Igbaria (1990), Agnetha-Broos (2005), and Igbaria and Chakrbarti (1990) found similar results.

A 2011 population estimate for sub-Saharan African countries stands at 874,841,049 million. This population boom has meant that some rural campuses struggle to maintain enrolments, and most urban campuses are overcrowded, thereby making teaching and learning difficult.

Infrastructural Barriers

On a range of ICT indicators, African countries score lower than the global average; in other words, the digital gaps between African and other developed countries and emerging economies persist; indeed, they have intensified over the last decade (Gillwald, 2005). The term digital divide is used to refer to imbalances such as these between countries poised to reap the benefits of the information age and those unable to do so (Ifinedo, 2005a). The growing digital divide includes ICT products and outputs (Internet access, e-mail, fax, television, radio, cell phones, etc.) and inputs (knowledge, programmers, engineers, scientists, etc.) (Gillwald & Esselaar, 2005) and could make other development gaps impossible to bridge.

In a recent survey in sub-Saharan Africa (2009), Nigeria had an estimated 43.989 million Internet users, followed by South Africa at 4.42 million, and Ghana at 1.297 million. Camerron trails far behind with only 748, 600 thousand users. Not surprisingly, sub-Saharan African countries tend not to have the same ICT infrastructural facilities and support as the developed West, prerequisites for this new era in education (Ifinedo, 2005b). According to Yusuf (2006), education today is not complete without use and knowledge of communication and technological tools (e-mail, fax, Internet, television, radio, etc.). Several cities and rural areas in Africa are yet to secure electricity or endure fluctuations in its supply, and most Africans students (69%) cannot access technology-aided learning tools and other telecommunication facilities. Even telephone lines in urban centres are inadequate when it comes to meeting the needs of the expanding population. Despite the recent introduction of Global System for Mobile communications (GSM) in sub-Saharan Africa, access is still limited, services are yet to be perfect, and service charges make GSM unattractive for most learners (Ololube, 2006b).

Economic Barriers

The Gross Domestic Product (GDP) and the Gross National Product (GNP) form an important economic indicator in the measurement of development. The economic circumstances of a nation determine the level and purchasing capabilities of its citizens. Currently, over 80% of the sub-Saharan Africa population live below poverty line. This is compared to 15.1% in developed countries.

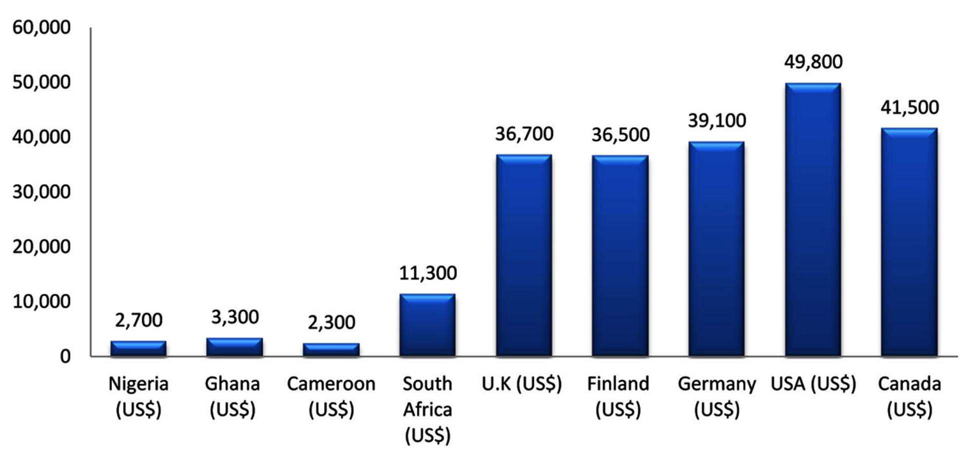
An average middle-income earner in a sub-Saharan African country cannot afford even basic technological and communication devices. The same is true of most higher education students and institutions. The cost of these devices in the region is generally three times the monthly wage of an average worker, and so they remain luxuries at home, school and the office. The cost of subscribing to a telephone or Internet service is beyond the reach of the average sub-Saharan citizen. This has made the integration of necessary on-line resources (e-mail, newsgroups, e-libraries, the world-wide-Web, etc.) into higher education institutions difficult at best. Most African countries spend less than 12% of their annual budget on education in general and far less on IT and IS in the classroom. All of this is compounded by high levels of illiteracy, which is endemic, in these countries. Approximately 25-33% of the population in the region are still unable to read and write (CIA: The World Factbook, 2013). Figure 2 outlines the income levels of selected countries relative to countries in sub-Saharan Africa.

Competency Barriers

The level of technology illiteracy in sub-Saharan Africa is alarming (Langmia, 2005). Sub-Saharan African countries lack qualified information communication technology professionals; this is so because higher education institutions do not graduate enough skilled ICT professionals to match current blended learning needs (Ifinedo, 2005a; Ifinedo & Ololube, 2007). The enthronement of mediocrity in all spheres of life in sub-Saharan Africa is, in turn, a by-product of educational ineffectiveness. That is, the education systems in many Third World countries, particularly sub-Saharan African countries, have failed to prepare youth for successful and industrious living and involvement in national development (Ololube, 2006b).

The quality and quantity of ICT materials in sub-Saharan higher education institutions are poor and faculty trained through these programmes are not technologically equipped to carry out their duties effectively in terms of the global transformation in science and technology. Consequently, the existing curriculum, designed for the training of students in sub-Saharan Africa, does not include the practical usage of ICT materials such as computers, computer software, slides, overhead projectors, etc. When it is included, it tends to be theory-based alone. Students rarely come into contact with ICT instructional materials, including those in the department of computer science and educational technology (Ololube, 2006b).

Figure 2. Per capita income of selected countries
Source: CIA: The World Factbook (2013)



The institutions responsible for the provision of education programmes provide programmes within the confines of the mandate given to them by the federal and state governments through various bodies such as the National Commission for Colleges of Education (NCCE), National Universities Commission (NUC), and the National Board for Vocational Colleges and Technical Education (NABTECH). Ultimately, however, their ability to be effective is dependent on the availability of funds to purchase the needed ICT equipment.

Education Facilities/Material Resources Barriers

Well-designed and functional education programmes, with a wide array of technology-aided teaching enable the effective delivery of a school's curriculum and are positively related to students' academic achievement (Ololube, 2011). Adequate and modern education facilities and/or material resources are vital to this sought after achievement. Educational facilities are those things which enable a skilful faculty to achieve a level of instructional effectiveness that far exceeds what is possible when they are not provided. These "things of education" or educational facilities are therefore numerous and include any materials or services that help to facilitate teaching and learning. This can include teaching aids, computers, Internet connections, projectors, fix-line connectivity, and e-libraries. In most higher education institutions in sub-Saharan Africa, there are not enough facilities to adequately aid teaching and learning.

Problems supplying instructional technology aided materials in education systems often stem, in part, from an inadequate availability of materials either in the finished or raw form and their high cost. According to Adeniyi (2001), there is constant competition and demand for financial resources by all sectors of the economy. The education sub-sector (within the social services sector) is no exception. Almost all sub-Saharan African countries are poor and indebted. The dire economic situation in these countries exacerbates an existing inability to make use of ICT products, especially those related to educational technology (Ololube, 2006b).

FUTURE TRENDS

Rapid growth in blended teaching and learning around the world has acted as a catalyst for educational transformation in recent years. Sub-Saharan African countries and indeed African countries in general are attempting to take advantage of this technological revolution in order to make strides in education. Blended learning offers tremendous possibilities in terms of meeting present day educational challenges around access and quality higher education (Boitshwarelo, 2009; Halverson et al., 2012).

African higher education is confronted with numerous challenges in its external and internal environments. Higher education institutions are forced to respond to these challenges, such as continual developments in ICT, in order to graduate capable and prepared students. At the same time, a rapid decline in educational standards is evident due to crumbling infrastructure, an unpredictable academic calendar, flight of researchers and professionals abroad, and declining respect for its graduates across the globe. Providing access to quality education for every student in higher education institutions is a significant task. African Colleges of Education, Polytechnics and Universities must follow the prevailing trend in most parts of the world by applying new technological advancements to overhaul and enhance their educational materials and resources in pursuit of effective educational achievement.

Higher education in sub-Saharan Africa must find a way to foster educational environments that are responsive to technological change as one way to provide access to quality education is through electronic learning. This form of learning helps to provide faculty and students with the opportunity to access the very best experts, resources and up- to-date information (Akhahowa & Osubor, 2006). To this end, blended learning is fast becoming an accepted and indispensable part of mainstream educational systems around the world, especially in the more developed West (Ifinedo & Ololube, 2007).

CONCLUSION

This chapter has focused on barriers to blended teaching and learning in sub-Saharan African institutions of higher education. The practical implications of blended learning in relation to higher education include the need for faculty and students to use different methods and approaches to teaching and studying. These new methods and approaches are likely to be dependent on social, economic, institutional and infrastructural support. It is hoped that this chapter has made some contributions to the understanding of the impact of blended learning on professional competencies and the training of a new calibre of faculty whose professional abilities are essential in the teaching and learning processes.

Social, economic, institutional, infrastructural and technological changes in the past decades in the West are making education and training more crucial than ever. Higher education systems worldwide, however, are struggling to different degrees to afford educational opportunities to all, and to provide their graduates with the ICT knowledge and skills needed to meet emerging trends in the marketplaces and in our increasingly sophisticated living environments. In this context, countries must now focus concurrently on expanding access, improving internal efficiency, promoting the quality of teaching and learning through blended learning, and improving higher education management.

The strength, security and well-being of sub-Saharan Africa rests directly on the quality of education provided to its citizens. Quality education has been and remains a great asset on an individual, community and national level as well as a source of qualified and prepared employees for the national economy, especially in the West where education is accepted as an effective instrument for national progress and success.

Despite considerable hurdles and setbacks, technology aided learning is beginning to play a major role in the future of education agendas in sub-Saharan Africa. Emerging blended learning technologies show that teaching and learning are shifting from teacher-centered and lecture-centered instruction to student-centered interactive learning environments (Newhouse, 2002a). According to Newhouse (2002b), a good balance between discovery learning and personal exploration on one hand, and systematic instruction and guidance on the other characterises a powerful technological sensitive learning environment. Designing and implementing successful blended learning programmes is thus in many ways the key to fundamental and necessary wide-ranging educational reforms. Higher education institutions must either assume a leadership role in this transformation of education or be left behind (Ololube, 2011).

In order for higher education to reap the full benefits of technology assisted learning, faculty and students must be able to effectively use blended learning tools in the teaching and learning processes. It is essential that sub-Saharan African countries recognise that faculty members are crucial to successful teaching and learning using blended learning methods and strategies on the path to improved standards of education. Higher education institutions thus must provide proactive leadership and new models, pedagogies and tools for teaching through effective strategic engagements and plans. That is, leadership in higher education must be visionary about conceiving a desired future state which includes the picturing of where and what the education programme should be in the future, without being constrained by such factors as economic, social, funding and human resources (Ololube, 2006b).

Such successful and effective strategic plans, however, depend on the extent to which proper implementation and monitoring are carried out. This in turn is heavily dependent on the government, which must ensure that all parts of the country, including rural regions and communities, receive telecommunication services. Universal access must be a priority. Consequently, the sub-Saharan African telecommunications sector needs increased investment. Ongoing activities and efforts in this area will help to improve the teledensity rates for sub-Saharan African. There is also an urgent need to increase the number of computers available to the population and so Sub-Saharan African governments may have to waive certain import duties and tariffs for goods and equipment imported for education services. Shortages in infrastructural facilities, for example power generation, need to be addressed. The electricity (KW) productions of all sub-Saharan African countries are dismal. Governments' commitment to improve power generation must be unequivocal. Lastly, nearly all Africa countries are deficient in IT/IS professionals. Sub-Saharan Africa needs more highly trained and skilled people to help the rest of the population reap the benefits of using ICT in education (Ifinedo & Ololube, 2007).

KEY TERMS AND DEFINITIONS

Barriers: Are things that block or impede the development of blended teaching and learning in sub-Saharan Africa.

Blended Learning Infrastructures: This includes blended learning components and resources such as computers, satellites, WebCT, PowerPoint, and other learning and fibre optic technologies.

Blended Learning Knowledge: Are the knowledge, skills, and experiences needed to stay informed of current blended learning developments, which is a collective knowledge that effectively contributes to further blended learning knowledge that will, in turn, lead to individual, national and global development.

Blended Teaching and Learning: Is a combination of face-to-face and technology-based learning, distinct from other learning strategies that is highly conducive to faculty teaching and increased students learning.

Challenges: A fight to overcome obstacles, accomplish things and able to learn how to work together effectively.

Learning: Is regarded as the central most powerful, engaging, rewarding and enjoyable aspect of learners personal and collective experiences.

Sub-Saharan Africa: Is the area of the continent of Africa that lies south of the Sahara, which consists of all African countries that are completely or in part located south of the Sahara.

Teaching: Is a framework that guides learners and help keep them in focus and develop their understanding.

Chapter 48
Introducing a Teaching Innovation to Enhance Students' Analytical and Research Skills:
A Blended Learning Initiative

Hela Miniaoui
University of Wollongong in Dubai, UAE

Avneet Kaur
University of Wollongong in Dubai, UAE

ABSTRACT

The term "blended learning" has gained considerable interest in recent years as a description of particular forms of teaching combined with technology. This chapter reports in some detail the experience of a small group of undergraduate learners as they progress through their Bachelor course at University of Wollongong in Dubai (UOWD) in the United Arab Emirates. In particular, this study looks at discussion forum approach as a blended learning initiative and what that entails to the learners in terms of making the subject more interactive and enhancing students' analytical and research skills. From the findings, a conclusion has been drawn regarding the role of the Blackboard tool in learning by helping students to obtain a deep sense of understanding of how to operate in a virtual team despite the challenges.

INTRODUCTION

In psychology and education, a common definition of learning is a process that brings together cognitive, emotional, and environmental influences and experiences for acquiring, enhancing, or making changes in one's knowledge, skills, values, and world views (Illeris, 2000; Ormorod, 1995).

Many other theories consider that the Human learning is a social process. In fact, learning is not an isolated activity (Hung & Nichani, 2001) and interaction and collaboration between learners is a major enabler of the knowledge construction paradigm (Duffy & Jonassen, 1992).

A combination of traditional learning within the classroom and Web-based learning is called blended learning. It is the mix of face-to-face

DOI: 10.4018/978-1-4666-8246-7.ch048

instructions and online interactions between the students and teacher to optimize the learning outcome. It is considered more effective than only face-to-face learning or fully online learning as it makes the teaching learning process more interactive and allows regular feedback.

This case study examines how undergraduate students pursuing Bachelor of Business Administration and Bachelor of Commerce, majors Finance and Accountancy, enrolled in International Trade Theory and Policy subject, worked collaboratively in small work groups on assignments over a period of thirteen weeks. Particular focus in this chatper is given on how to make the subject more interactive and inculcate analytical and research skills in students by using discussion forum approach of blended learning.

The rest of the chapter is organized as follows: Section 1 reviews relevant research on blended learning and its impact on students' learning. Section 2 describes the application of discussion forum as a tool to optimize students' learning. Within this section, the outcomes, rationale, assessment and the findings of the study are discussed. Section 3 suggests certain future research directions. The final section concludes the chapter.

BACKGROUND

Blended learning is facilitated by the effective combination of different modes of delivery, models of teaching and styles of learning, and founded on transparent communication amongst all parties involved with a course (Heinze & Procter, 2004).

According to Hisham *et al.* (2006), the definition of Blended learning is varied and contrasting. Some studies (Whitelock and Jefts, 2003; Alavi and Gallupe, 2003; Arbaugh, 2005; Peterson, 2003) referred to Blended learning as the integrated combination of traditional learning with Web-based online approaches. Singh (2003) defined Blended learning as models that combine various delivery modes.

Blended learning is being used as a combination of face-to-face learning including hard copy study materials and online learning with a variety of online resources (Bawaneh, 2011).

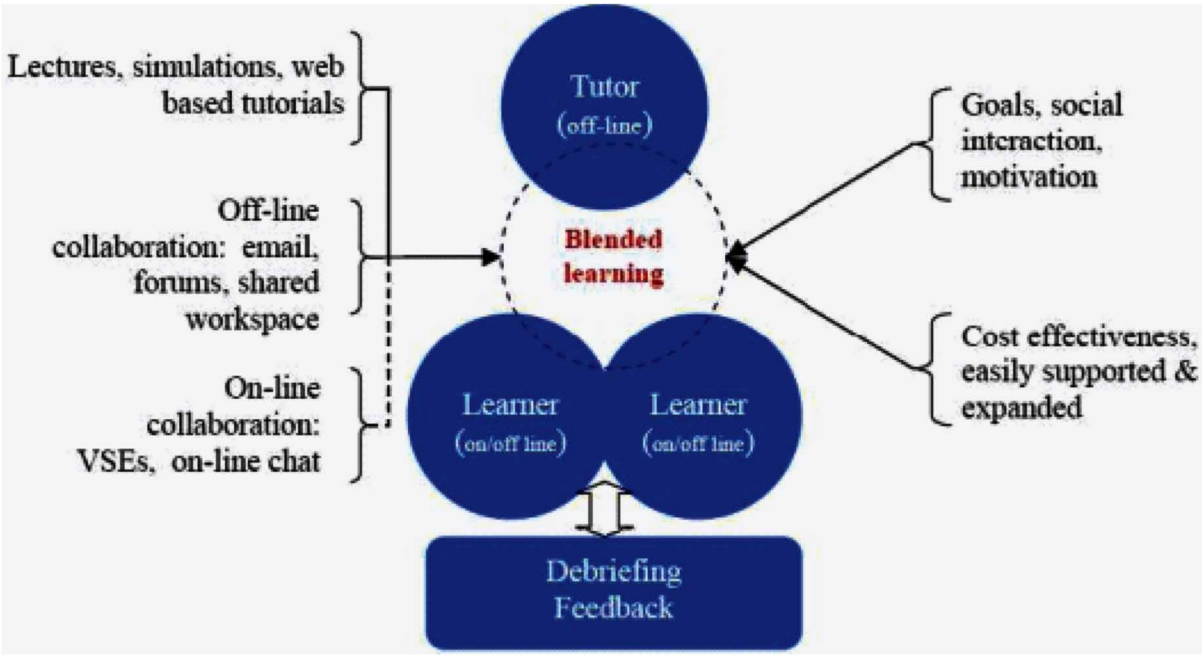
Many works have focused on the definition of the main functions of blended learning systems and we choose here to mention the classification of (Siemens, 2004):

- Different levels of permissions for users (students, teachers, tutors, administrator, visitor).
- Search functions (simple search and advanced search).
- Multimedia application for digital material.
- Collaborative workspace.
- Knowledge share and reuse.

Blended learning can combine the positive aspects of the two learning environments; classroom based learning and e-learning (Bonk & Graham, 2006). According to Rastegarpour (2010), blending learning provides various benefits over using any single learning delivery medium alone. Learners not only learn more, their interaction and satisfaction improves. Moreover, several linked options for learners; in addition to classroom training increases learning. According to Citera (1988), shy students are more likely to participate in an online discussion because it is less intimidating than speaking up in class.

According to Doiron (2006), blended learning approach was successful in encouraging individual participation. Statistically significant high correlations were found between performance and posting frequency. For Karayan and Crowe (1997), and Smith and Hardaker (2000), the advantage of a discussion forum, as opposed to the traditional face-to-face class discussion session lies in its asynchronous nature, which allows for wider student participation and offers them more time to process their thoughts.

Figure 1. The blended learning model



According to Oliver (2002), through technology-facilitated approaches, contemporary learning settings now encourage students to take responsibility for their own learning.

Blended learning approach can be summarized in Figure 1.

DISCUSSION FORUM AS A BLENDED LEARNING INITIATIVE

Blackboard Learning System or Web Course Tools (WebCT) is an online virtual learning environment system that is available to all faculty members at UOWD, from University of Wollongong in Australia via Staff Intranet for e-learning.

Initiated by Dr. Payyazhi Jayashree, Head of Centre for Academic Staff Professional Development (CASPD), this program was launched in Spring 2011 where many faculty members volunteered to use the Blackboard and help understand the benefits and problems of using the new system as opposed to "MyUOWD" account which is a student's account based on Dubai campus. Every student of the university has a "MyUOWD" account where they can find a range of online services and access the lecture materials, tutorials, notices, time tables, policies, etc.

CASPD was instrumental in organizing three training sessions to introduce the Blackboard system to self-nominated volunteers. These training sessions were specifically focused on the functionality of the learning interface. The participants were then advised to think about an effective use of pedagogy, with the sole objective of achieving an improvement in teaching and learning.

The target was to develop skills in the usage of the E-learning platform (Blackboard/WebCT) to enhance the teaching and learning experiences of students. At a later stage, after having experimented with the use of Blackboard for a semester, the volunteers were asked to follow a cascading process and mentor other faculty members to embed the usage of Blackboard at an institutional level.

In Autumn 2011, we experimented with implementing the system with second-year student cohort to understand how a range of Blackboard functionalities can be incorporated as part of assessments and as a learning enhancement tool, to improve teaching and learning.

The Outcomes

At the start of this experiment we broadly listed out the main outcomes that we would like to achieve.

On completion of this project, we will have:

- Designed and implemented an online assessment tool (Discussion forum) in the International Trade Theory and Policy (ECON216) subject.
- Evaluated the impact of this assessment tool on students' learning and engagement.

With the help of this tool it is expected that students will be able to:

- Have a strong hold on the concepts being taught in the subject.
- Develop their reading, writing and communication skills.
- Develop research and analytical skills.
- Learn how various variables of the economy are interrelated and impact each other.

Rationale

The major objectives behind adoption of Blackboard were first to increase students' involvement with the subject by engaging students in discussion forums and hence make the subject as interactive and dynamic as possible, which would further help students to develop their communication skills. The second objective for using Blackboard, was to cover most of the program objectives and to catch-up with the significant learning outcomes of the subject. Thirdly to enable collaborative learning among the students by involving them in various discussions on the topics posted on the discussion forum. Finally, to extend students learning experience beyond the classroom and the textbook reading.

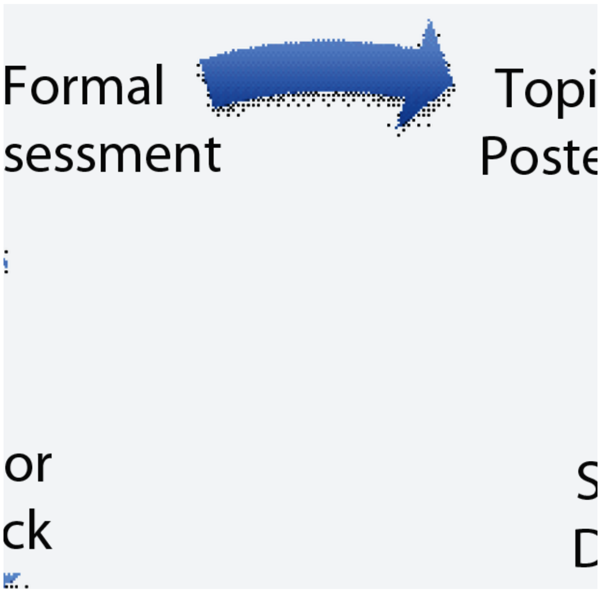
Description of the Assessment

The discussion forum assessment was worth 10% of the total marks of the subject. In the beginning of the semester, the whole class was divided into groups with a maximum size of 5 students per group. Students were asked to discuss the topics posted on Blackboard within their respective groups using the student forum (also hosted on Blackboard) before posting their final answers on the discussion forum. These postings were then evaluated to provide regular feedbacks to the students. Few interesting postings were also brought to the classroom to motivate students to be active participants on the discussion forum.

The topics and case studies posted, motivated the students to participate in the initiative during the 13 week-semester. In fact, the topics were guided by couple of questions that the students could refer to before starting their research on the given topics.

During the 4th week of the semester, the first topic, with case studies was posted on Blackboard for one week. Basically, this topic, among the 5 topics posted, was to give the students a basic idea of how to adopt this tool, how to use it and to increase their confidence. This topic was informally assessed and feedback was given to the students regarding what was expected from them for the rest of topics. The remaining four topics were posted for discussion on the forum at equal intervals during the rest of the semester. Regular feedbacks were provided on the discussion forum for the postings made by the students after getting responses for each of the topic. The postings made by the students were then formally assessed. The five topics that were discussed through the WebCT/Blackboard system are Trade Restrictions, Political Economy of Protectionism, Economic Integration, The Foreign Exchange Market and

Figure 2. Strategy of use of "discussion forum" to assess students



Exchange Rates and Macroeconomic Policy Coordination. The topics accompanied with guiding questions were framed in a manner such that they provided students with an opportunity to carry out research and apply the concepts learnt in the classroom to the real world situation.

Once introducing and explaining to students the use of Blackboard system, different phases were adopted to implement Discussion forum as a blended learning tool to assess the students. Figure 2 describes the strategy of students' assessment through a "Discussion forum" tool.

Methodology of Implementation of the Approach

Seventy-four students, pursuing Bachelor of Business Administration and Bachelor of Commerce during the Autumn 2011 semester were administered for this case study. These undergraduate students with different background and different nationalities were enrolled for the core subject International Trade Theory and Policy (ECON216).

A blended learning experience that combines traditional practices and e-learning was implemented to discuss key concepts, clear up misconceptions and factual errors related to the topics. The major purpose to adopt Blackboard tool was to cover the four following significant learning outcomes of the subject:

- Understand the microeconomic underpinnings of trade theory and explain the basis of trade and the gains and losses from free trade.
- Understand the working of the foreign exchange market and how it facilitates or impedes international trade.
- Explain the different forms of economic integration and the reasons for closer economic ties particularly with reference to the Gulf Cooperation Council countries.
- Evaluate open-economy macroeconomic policies and performance under the various international monetary systems.

A further aim was to help students acquire the intellectual skills necessary for this subject by means of interactive discussions via online forums. In addition, we encouraged the students to be active respondents to the postings for the discussion forum by uploading the subject outline, lecture slides, tutorials including multiple choice questions and problem solving problems on Blackboard itself. This was done to make students familiar with the system as most of the students were using Blackboard for the first time. Apart from this, all the announcements during the semester were made through Blackboard in the form of notices.

RESULTS AND DISCUSSION

This kind of assessment motivated the students to engage in discussions related to economic concepts, interpretation of international economic situations, and to interact among themselves on their point of view.

Indeed, topics covered important concepts and different economic situations and their impact on international trade that were also part of the midterm and final examinations. The discussion forum provided students an opportunity to analyse the economic situations and express their viewpoints about these situations by applying the concepts learned within the classroom in real world situation.

Throughout the semester the students posted a total of 250 messages on the 5 topics. The discussions made by the students were well supported with evidences. The postings included statistical data's, tables, graphs etc. to support their view points, the explanations were also supported with several figures showing relationship between various economic variables. The students were encouraged to participate in the discussions by providing regular feedbacks for their postings; apart from this the most appropriate postings were included in the discussions done in the classroom while reviewing the same topics during the tutorial sessions. Another motivation for students to participate in discussions was the assessment marks worth 10% of the total marks for the subject.

Most of the students were quite regular and posted their discussions for all the topics. While, there were a few students who did not make any post to the discussions at all. When this issue was discussed with the students during the tutorials, they revealed that they were comfortable using "MyUOWD" system, which was being used for the rest of the subjects, and found it difficult to change. This indicates a resistance to change from the traditional "MyUOWD" system.

At the completion of the semester when the results were finalized, it was noticed that students' performance improved, as evident from their grades in comparison to previous semesters. Improvement was also seen in the answers' scripts of the final exam papers in terms of the quality of explanations as they were supported with relevant examples based on real situations. In fact, 82.43% passed the subject. The top performers' achievements with HD (High Distinction, 85% to 100%) and D (Distinction 75% to 84%) as 22% demonstrated motivation in using this new tool and the quality of their postings was good. This was also reflected in the final examination answers to the topics covered in the Blackboard that helped these students getting good grades. On the other hand, the middle range performers with C (Credit 65% to 74%) and P (Pass 50% to 64%) stood at 60% that seems to reflect improvement in students' Performance. Only 1.35% stood at PC (Pass conceded 45% to 49%). The overall result reflected the achievement of significant learning outcomes of the subject. Eight students out of twelve who failed to post their discussions on the topics also failed the subject (66.66%).

This Discussion forum offered opportunity for appreciation of students' work, hence reinforcing their positive learning experience.

Blackboard was a useful resource for discussion and analysis. In fact, we enjoyed the opportunity to respond to the students' remarks, queries and reflections and it was a fruitful experience for students as it enhanced their independent learning at their own pace and in their own time.

In order to get a feedback from students about their experience with Blackboard, a questionnaire (see appendix) with four sections was used. First section had questions based on students' attitudes towards technology (questions 1 and 2), following this was the section about students' attitudes towards using WebCT/Blackboard as a tool of blended learning (questions 3 to 7). Section 3 had questions related to students' attitudes towards learning through WebCT/Blackboard system (questions 8 to 15). The final section (questions 16 and 17) was asking students suggestions about how this platform might be improved in order to help their learning process.

On the basis of the survey distributed to the whole class it can be said that the student valued the experience indicating that this new tool has strengthened the class discussion and came up with other ideas and it has answered any question that was not asked in the class. Moreover, the survey indicated that students have coped with this platform but there are still some technical challenges that demotivate them from using the system. Seventy-three out of seventy-four students have responded to the questionnaires. 41% stated that they were quite regular and using the Blackboard few times a week. Moreover, the use of this system is more convenient and encompasses the teaching-learning process beyond the boundaries of classrooms as 74% of the total students were using the system from home.

On the basis on the survey, it was found that most of the students enhance their learning because of the Blackboard. Around 60% of the students felt more connected to the subject.

The average of the class considered that Blackboard improved their communication not only with the instructor but also with other students. Around 70% of the students agreed that this platform gave them more access to resources and learning materials that also helped the students in their examinations. Moreover, around 70% agreed that updates given by the instructor were regular and frequent which also made their learning easier.

Below are some selected comments made by the students via the survey.

Question 16: Do you have any suggestions about how the WebCT /BlackBoard is used in this class and how it might be improved to help your learning process?

I suggest the WebCT to be used frequently in class that will help the students learning process, in addition greater success will be attained.

It has improved the communication between the students & instructors.

It's used very well where we can post discussion & answer without any paper or hard copy.

In my opinion if the assignments are for more than 20% it will be better.

I prefer to have more assessments on WebCT.

Question 17: Additional comments on WebCT/ BlackBoard and how you would feel about using in other classes in the future:

Yes I would strongly recommend using the WebCT because it enhances the students learning and it's very crucial to use it in other classes.

Web CT/Blackboard is a good tool and I recommend that each class should utilize it, as it will strengthen the class discussion and come up with other ideas and it will always answer any questions that was not asked in the class. This will always make the student efficient to think and perform well in his education."

It is good & should be used in other subjects as well.

Very helpful, easy to use understand.

Yes, please use it other classes also.

Yes i would strongly recommend using the WebCT because it enhances the students learning & it's very crucial to use it in other classes.

During this project, some barriers and challenges that learners had encountered were noticed. In fact, based on the survey administered on students, most of the students were comfortable using Blackboard but some of them resisted this change. In fact, 18 students representing 24.32% did not make discussion on any of the topics and got zero out of this 10% assignment. This can be because students were busy with other subjects and they were not excited to do it and they did not have the motivation as well.

Some technical challenges were faced. The biggest challenge was how to familiarize students with the new system. In fact, students kept comparing WebCT to "MyUOWD." According to some students "MyUOWD" is more than enough and it is accessible from almost anywhere including Blackberry. For them, it is very confusing to have so many systems and technically challenging to access materials through these different systems. Moreover, some students have suggested a separate login bar at the main Website instead of going through Student online services (SOLS). Few of them reported that it takes too long to open and download the files posted on Blackboard.

Below are some selected comments made by the students via the survey.

Change the color of the background.

It should be used for more subjects but it should not replace MyUOWD.

Sometimes I have a problem of connection.

I would prefer sticking to the conviction in simplicity of MyUOWD.

Our uowddubai Website is much better & easy to use & it's very useful.

FUTURE RESEARCH DIRECTIONS

Blended learning approach is considered as a bridge between sole classrooms based learning and fully online learning. It acts as a platform wherein these two mediums of teaching can be combined to enhance the teaching-learning process. Discussion forum as a tool of Blended learning is used to provide an opportunity for students to discuss and debate academic ideas through which they can improve on their writing and communication skills. Apart from this, they also improve on their research and analytical skills.

The need for blended learning will continue for academic institutions to support teaching and learning. In fact, in order to implement blended learning process successfully, attention has to focus on innovating new ways of teaching and learning and also designing different educational Web-technologies (for instance, mobile blended learning, wed-blogs, online Labs…).

The advancement in technology will create exciting opportunities for blended learning as a tool of teaching and encourage students' responsibility for learning. Indeed, online environment will enable learners to have their voices heard and will foster independent learning. On the other hand, instructors will be able to comprehend the practical implications of the topics covered on the class.

In future research, discussion forum can be used for testing larger groups and can also be implemented in courses that are based on different pedagogical models with varied students' attitudes and proficiency levels.

Continued research on blended learning, as a tool of teaching and learning is required to design advanced pedagogical and visual models that encourage students' learning and make teaching learning process more efficient.

CONCLUSION

By using Blackboard, students accept more responsibility for their learning, within a clearly structured framework. As students reflect on their learning, they become aware of what they know and where their weaknesses lie. Moreover, students develop the capacity to evaluate their own work. Apart from this, discussion forum also helped the students who are shy and resist making contributions to the classroom discussions and gave them the opportunity to express their viewpoints on the topics posted on discussion forum. The use of Blackboard in the subject also helped students to learn the application of the subject concepts in real world situations and hence developed their research and analytical skills.

Overall, this experience was very interesting for us, lecturer and tutor, as it helped us to strengthen our teaching. Indeed, because of this tool of learning, the coordination between the lecturer and the tutor has improved as we were meeting more often to monitor the discussions as compared to the previous time, (during Spring 2010), where we together taught the same subject but without using Blackboard.

At the end, most of the students have expressed an appreciation for having had the opportunity of using a discussion forum as it enhanced their learning experience. What was most rewarding is the fact that they have obtained a deep sense of understanding of how to operate in a virtual team despite the challenges. We would definitely encourage this blended learning tool to be continued when we get the chance to teach the subject again and use it in other subjects as well.

Based on the survey conducted, more than half of the students were ready to move to the new system believing that this process enhanced their learning and took them outside the boundaries of the classroom. However, they suggested that if all grades are also posted on Blackboard then the system might be used more often. While, there were a few students who did not post their discussions at all this is an evidence of resistance to change from the traditional system.

Based on the final results of the students, it was identified that the performance of the students who were regular and committed to making posts on the discussion forum on Blackboard was far better than those who failed to discuss the topic on the forum.

As improving teaching could be achieved by paying attention to voice, gestures and physical movements during lectures, we reckon that incorporating many of Blackboard's tools into subjects, will make students' learning experience more interactive and will invariably enhance students' learning process and encourage students to be more engaged with the lecturer and the tutor and the subject as well. In fact, our teaching philosophy joins theory 3 of Ramsden (2003) "Teaching as making learning possible," insofar as it includes blended methods to help students learning. Moreover, we are improving learning during discussions as theories of learning of Race and Brown (1998) stating that by allowing our students to interact through discussion forums to analyze and evaluate different economic situations, we enabled students' learning as per the concepts of 'learning by doing' and 'learning through feedback'.

In addition, our learning approach joins the theory of experiential learning of Stewart (2004). Indeed, student's experience is important in the role of education since no two individuals share the same past experience. Indeed, students have shared their experiences especially through case studies discussed on the forums.

Finally, as volunteers using Blackboard, we think that this experience contributed to improve our teaching approach and it allowed us (the lecturer and the tutor) to make contact and interact with all the students especially through discussion forums. Interactions between the lecturer and the tutor also improved drastically.

KEY TERMS AND DEFINITIONS

Blended Learning: A mix of the effectiveness of classroom instructions with independence of expression via computer mediated activities with the objective to optimize learning.

Discussion Forum: An online system wherein students can hold conversations and share knowledge, and also can obtain feedbacks from their instructors and peers.

eLearning: Learning through technology.

Improving Learning: Innovating new methods to enhance student learning.

Information and Communication Technology (ICT): Technology that helps in communication and distribution of information.

Interactive Resources: Interaction between teacher/instructor and students and between students and their peers/learners.

Online Learning: Learning carried out via a platform hosted on the Web, providing anytime and anywhere access.

Web-Based Instruction/Tool: Instruction assisted by Internet/Web-supported courses.

This work was previously published in Advancing Technology and Educational Development through Blended Learning in Emerging Economies edited by Nwachukwu Prince Ololube, pages 21-35, copyright year 2014 by Information Science Reference (an imprint of IGI Global).

APPENDIX

UOWD WebCT/BlackBoard Questionnaire

Dear Student,

This short survey is intended to measure your satisfaction with the WebCT/Blackboard component of this class. Your responses are confidential and will be used solely for the purpose of improving our development of this system at UOWD. Thank you for your responses.

1. How often do you use WebCT/ BlackBoard? (Choose one)
   - Daily
   - A few times a week
   - Once a week
   - Once or twice per month
   - Never (have not yet used the system)
2. From where do you access WebCT? (Choose as many as apply)
   - Home
   - Workplace
   - UOWD Library
   - UOWD computer labs
   - My own laptop while at UOWD
   - Internet cafe
   - Mobile device
   - Other (specify) ____

Table 1.

Getting Started		Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
3.	I am comfortable with using computers					
4.	It is convenient for me to use the system (for example, at home, work, or at UOWD)					
5.	There was enough introduction to the system by the instructor in the classroom					
6.	It was easy to get started on the WebCT/Black Board system					

7. Is there anything that could have been done differently to make it easier for you to start using the WebCT/Black Board system? For example, instructor guidance, printed materials, instructions, etc.

Table 2.

WebCT/BlackBoard and Learning		Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
8.	Using WebCT/Black Board improves my communication with the instructor					
9.	Using WebCT /BlackBoard improves my communication with other students					
10.	Using WebCT /BlackBoard gives me more access to resources and learning materials					
11.	Using WebCT /BlackBoard makes me feel more connected to the subject					
12.	The instructor makes enough references in class to the system and the expectations for use by the students					
13.	Using WebCT /BlackBoard makes it easier for me to learn					
14.	There is enough material on the system from this class to make it worthwhile					
15.	Updates by the instructor are frequent enough to maximize the experience					

16. Do you have any suggestions about how the WebCT /BlackBoard is used in this class and how it might be improved to help your learning process?
17. Additional comments on WebCT /BlackBoard and how you would feel about using in other classes in the future:

Chapter 49
Blended Learning Methods in Introduction to Teaching and Sociology of Education Courses at a University of Education

Nwachukwu Prince Ololube
University of Education, Nigeria

ABSTRACT

In recent years, the use of the Blended Learning (BL) methods has experienced worldwide uptake and is responsible for enormous changes, not only in developed country education, but in developing country education, particularly sub-Saharan Africa. Given the role that blended learning can play in educational development, educational institutions, students, employers, and governments are increasingly urged to examine the economic, demographic, and technological environments of the present so as to ensure comprehensive preparedness for the future. This study employs a questionnaire for data gathering and results are analysed quantitatively. The findings reveal a significant improvement in the use of blended learning methods to achieve effective academic performance in students. The impact of blended learning in the educational sector is thus evidenced in the changing instructional pedagogies that lead to more interactive learning processes.

INTRODUCTION

Educational systems around the world are effective to the extent that they make use of available resources to achieve stated aims and objectives. The main objective of an educational system, irrespective of the level of education, is to offer high quality education to learners. The resources needed to provide high quality education include financial as well as human and material resources (Carrim & Shalem, 1999; Ololube, 2009). The success of any educational system also undoubtedly depends on methodological competence in the use of blended learning (BL) methods (Ololube, 2011).

Given the dramatic increase in educational methods rendered possible by technological advances, a more open and flexible approach to teaching and learning, particularly in higher

DOI: 10.4018/978-1-4666-8246-7.ch049

education institutions where various forms of online/e-learning are taking shape, has been advocated across the globe (Fisher, 2003, Ifinedo, 2005; Ololube & Egbezor, 2009; Ebrahimi, 2012). The most frequently used blended learning format combines the face-to-face (f2f) and online delivery methods (Graham, 2006; Osguthorpe & Graham, 2003; Jackson, 2005; Nel, 2005, Ololube, 2011), with the objective of providing a resourceful and effective instructional experience. More broadly, blended learning has been invoked to explain approaches that combine several different learning delivery methods. It is also used to describe learning that mixes event-based activities, such as face-to-face classroom learning, e-learning, and self-paced learning (Graham, 2006). Blended learning has resulted in more proactive and higher quality teaching methods. Its most recent manifestation, the incorporation of Information Communication Technology (ICT) in educational settings and curriculum has significantly altered the tools, content, dynamics and expectations of teaching and learning (Ololube, 2011).

The degree to which blended learning takes place, however, and the way it is integrated into the curriculum, can vary across institutions of higher learning. Blended learning in college and university based instruction is often employed to accommodate students' diverse learning styles and to enable them to participate fully in academic activities in ways not possible with traditional f2f classroom instruction. Blended learning has the potential to improve educational productivity by accelerating the rate of learning, taking advantage of learning time and hours more effectively, reducing the time cost-benefit scenario, and making better use of instructional materials (Heller, 2010; U.S Department of Education, 2012).

Blended learning is essential in enabling access to mainstream contemporary education. As such, it remains an important tool in Nigeria's educational development (Ololube, 2011). Nigeria must thus be diligent in integrating ICT into its education sectors, especially tertiary education, as this level of education is at the forefront of national and regional development, charged with the production of equipped and adept human capital. Nigerian higher education institutions are preparing, albeit slowly, for these new challenges and have been sluggish in responding to calls for the expansion of blended learning services (Ifinedo, 2005; Iloanusi & Osuagwu, 2009). Globally, there is an increasing demand for more and better ICT competencies among students and faculty given rapid advances in technology and global education (UNESCO, 2008). The effectiveness or success of teachers today thus depends on how well they are prepared for their roles within a changing and challenging system (Hennessy, Harrison & Wamakote, 2010).

The teaching methods employed by educators guide and subsequently evaluate the progress of students (Ololube & Egbezor, 2009). This progress, then, depends on the instructional strategies employed. Faculty are expected to have specialized training and knowledge in the application of several different instructional delivery methods and that their methodological application is appropriate to day-to-day pedagogical encounters with students (Ololube, 2011). According to Husu (2006) and Haßler, Hennessy and Lubasi, (2011), teacher competence, specialized training and knowledge in the application of instructional delivery methods, goes beyond skills to include the attitudes and stamina needed to carry out actions in even the most difficult situations.

A number of barrier to blended learning use in Nigerian universities have been identified. These include inadequate funding, limited computer availability, intermittent Internet access, poor infrastructure, power supply shortages and often complete black outs, lack of trained faculty and personnel, and poverty, among others (Ifinedo & Ololube, 2007; Ololube, 2011). These factors make it difficult a total shift to blended learning assisted classrooms in public universities difficult at best (Mulford; 2003; Aladejana, 2008). Nonetheless, it is imperative that colleges and universities continue to endeavour to use blended learning tools and resources in a variety of ways to support teaching and learning.

Purpose of the Study

The primary objective of this study is to codify and understand students' opinion and beliefs concerning blended learning tools and services. Despite studies confirming the importance of blended learning to student academic performance (Graham, 2006; Aladejana, 2008; Iloanusi & Osuagwu, 2009; Ololube, 2011), there remains the perception among academic and non-academic staff in Nigeria that the ability to learn effectively and with enthusiasm may not be tied to the use of blended leaning tools. Instead, they see student academic performance to be tied to intelligence, interest, and other personal traits.

Research on blended learning has become a major industry in the west, not only in the United Kingdom but also in Australia, Canada, and the United States of America. Although more than a decade in the making, this body of research has had a major impact on educational policy. As such, this study seeks to learn from the research on blended learning and to apply its lessons to policy aimed at improving higher education in Nigeria. This study also aims to identify best practices around the use of blended leaning management and planning strategies in higher education administration, particularly in this time of scarcity when educational systems the world over are doing more with less. This atmosphere of inadequate resources is one of the strongest influences on education in Nigeria today.

There are limited research publications in Nigeria on this topic and those that exist tend to be quite narrow in that they fail to address the full range of possible features that might improve the use of blended learning teaching methods. This study looks to offer new insights into the diverse factors that support the use of blended learning tools and methods. One of the central purposes of this study is to address the intellectual gap in understanding faculty competences around, and student readiness to, accept blended learning as a process meant to enhance college and university productivity. In doing so, this study enters into the global debate on the use of blended learning in educational improvement and students' academic achievement from the viewpoint of a developing country.

In its efforts to codify and understand faculty and student opinions and beliefs concerning blended learning tools and services, the under listed hypotheses were developed:

- Performance expectancy is not significantly related to the perceived impact of blended learning.
- Effort expectancy is not significantly related to the perceived impact of blended learning.
- Facilitating conditions are not significantly related to the perceived impact of blended learning.
- Attitude towards computer systems is not significantly related to the perceived impact of blended learning.
- Behavioural intentions are not significantly related to the perceived impact of blended learning.
- Computer systems use is not significantly related to the perceived impact of blended learning.
- Respondents' personal information is not significantly related to their opinion on the perceived impact of blended learning.

BACKGROUND

The Ignatius Ajuru University of Education is one of two universities of education located in Port Harcourt, the South-South geo political zone of Nigeria. The university is dedicated to excellence in teacher preparation and confers the degrees of

Bachelor of Science Education (B.Sc. Ed.) and Mater of Education (M.Ed.). Excellence, in an educational context, refers to effectively providing learning experiences that prepare students for the challenges of multifaceted, ever varying, and diverse workplaces in society (Ololube, 2011). The university is composed of six faculties: Natural and Applied Sciences, Business Studies, Humanities, Industrial Education, Social Sciences, and Education. The Faculty of Education is home to several departments, including the Department of Educational Foundations and Management.

At present, this department has a staff of thirty one (31) lecturers ranging from Professors to Assistance Lecturers. The department services six (6) B.Sc. (Ed.) courses for several other departments in the university, which, with the exception of one, are all compulsory. As the name implies, the department is comprised of lecturers in the core foundation courses as well as in management, planning and supervision. The vision of the department is to produce teachers that will be continuously relevant at present and into the future in the Humanities, Social Sciences, Arts, Pure and Applied Sciences, and Science and Technology, as well as in research through the provision of sound foundational and management courses in education.

The objectives of the department are:

- To make Educational Foundations and Management the reference point for other faculties in the University of Education and faculties of Education in other universities, within and outside Nigeria.
- To discourage and or even eliminate forms of social ills, such as examination malpractices, cultism, immorality, sorting, sexual harassment, etc., that are fast becoming part of the school system.
- To encourage hard-work, creativity, and scholarship among teachers and students so as to meet up the present and future demands of the country.
- To produce great thinkers (philosophers) sociologists, historians, management personnel and others in the field of education that can compete favourably with their contemporaries within and outside Nigeria.

Introduction to the Teaching Profession and Sociology of Education are compulsory courses in the department. Introduction to the Teaching Profession or EDU 111 is comprised of the general and philosophical contents of teaching, teaching as an occupation, career and a profession, teaching and its professional ethics, modern day teachers and their challenges, the teacher and the learner, the subject matter and the school environment, lesson preparation and presentation, teaching skills, methodology and techniques, teaching resources, evaluation outcomes, school records, and discipline. Sociology of Education or EDU 222 is comprised of the meaning, nature and scope of sociology, sociological theories, social organization, characteristics of organizations, education and social change, education and culture, school as a component part of larger society, socialization and education, types and agencies of socialization, social stratification and its implication for education, education and social mobility, deviant behaviours in school, common offences in Nigerian schools, the family, types of families and their characteristics and influence on education performances, changing structures of the family over time, and education and the law.

The successful completion of Introduction to Teaching and Sociology of Education is a critical step in the teacher education of undergraduate students. These courses are important for all who are planning to further their teaching careers and who, as graduates, will need to make informed teaching decisions as part of their professional competences. Consequently, both courses are requirement of all undergraduate programmes in the university. EDU 111 and EDU 222 courses are challenging classes to teach because the technical complexity of the course requirements are quite high while student interest in these required courses can, unfortunately, be quite low.

Throughout both courses, take home assignments are given to students with basic instructions and sources for materials on the Internet. Assignments are submitted to faculty via e-mail and feedback is provided to students two days after the deadline for submission. Students are advised to print the feedback for presentation and discussion in class. The use of Power Point presentations is encouraged throughout both courses. Students complete f2f contact sessions throughout the semester with two online delivery components. During each cycle of lectures, students are required to participate in at least 75% of classroom activities, as per university regulations, to qualify for examination.

CONCEPTS AND USES OF BLENDED LEARNING

The global evolution of Information Communication Technologies (ICTs) has modernized teaching methods. Blended learning is one such modernization (Graham, 2006; Lee, 2008; Garrison & Vaughan, 2008). The blending of different learning experiences has, however, naturally occurred both inside and outside of the classroom for hundreds of years and the precise origin of the term "blended learning" is uncertain (Friesen, 2011).

According to Friesen (2012), blended learning has been interpreted from a number of diverse perspectives and can mean:

- To combine or mix modes of Web-based technology (e.g., live virtual classroom, self-paced instruction, collaborative learning, streaming video, audio, and text) to accomplish an educational goal.
- To combine various pedagogical approaches (e.g., constructivism, behaviorism, and cognitivism) to produce an optimal learning outcome with or without instructional technology.
- To combine any form of instructional technology (e.g., videotape, CD-ROM, Web-based training, and film) with face-to-face instructor-led training. To mix or combine instructional technology with actual job tasks in order to create a harmonious effect of learning and working (p. 2).

Within the context of this chapter, blended learning is defined as the combination of f2f and online learning (Mortera-Gutiérrez, 2006; Naaj, Nachouki & Ankit, 2012). For Iloanusi and Osuagwu (2009), blended learning is a flexible form of learning that represents a suitable incorporation of the components of technological enabled learning and f2f teaching and interaction. At its best, it involves models that enhance the delivery of e-learning and classroom learning for the students and faculty involved in the teaching and learning processes. Well blended e-learning, for example, easily adapts to the needs of students and reduces forced student adaptation to tools and methods that are more problematic than suitable (Ololube, 2011).

Blended learning in this paradigm emphasizes active learning and a reduction in classroom time and is based on the concept of hybridization: the bringing together of two dissimilar parts to produce a third result. When successfully achieved, the result is an educational environment that is highly conducive to faculty teaching and student learning (Vaughan, 2007): a good balance between discovery learning and personal exploration on one hand, and systematic instruction and guidance on the other (Newhouse, 2002a).

In higher education, blended learning is often referred to as a hybrid model. The goal of hybrid courses is to join the best features of in-class teaching with the best features of online learning to promote active and self-directed learning opportunities for students with the added advantage of flexibility. Students have long indicated that blended learning model provide them with the ability to better schedule their own time and improved learning outcomes. Nonetheless, students may initially encounter issues around time management, taking greater responsibility for their own learning, and using sophisticated technologies (Vaughan, 2007). In terms of the concrete success of this delivery model, improved performance has been found in those taught with blended strategies compared to those taught with a single method. In Bonk, Kim and Zeng (2005), the majority of faculty who were experienced applying Web technologies to their teaching indicated that BL has significantly improved student academic achievement. Despite these very positive outcomes, the use of blended learning is still new or meek for most students and faculty in Nigeria.

Early assessments of the application of blended learning in higher education reinforce the need to:

- Integrate blended learning principles in Nigerian schools so as to create an enabling environment where teaching and learning can be advanced.
- Thoroughly articulate the professional competencies essential to the implementation of blended learning designs.
- Present illustrative scenarios of blended learning designs that contain practical guidelines for further blended learning design.
- Adequately describe the tools and techniques that actively engage students in the blended learning process (Garrison & Vaughan, 2008).

Unfortunately, as children grow their passion for learning often fades. Consequently, faculty find that a large number of students, while physically present in the classroom are mentally absent, and many more fail to invest themselves in the experience of learning at all (Ololube, 2009; 2011). The main purpose of education is to improve the reasoning process as it is applied to solving problems. As such, students need to know why they are learning something. Students also need to be encouraged towards self-directed learning as they better progress when they take control of how they learn. Students often prefer a problem solving approach to learning in that they learn best when the knowledge is presented in a real-life setting. For students to be motivated to learn, new knowledge must help them solve problems they perceive as important (Miller, 2005). They find satisfaction in learning based on the understanding that the goals are useful to them and less commonly based on the pure enjoyment of exploring new things (Austin, Dwyer & Freebody, 2003).

Most often, a student's readiness to embrace blended learning strategies comes with time, and faculty must support this development (Ololube, 2011). Faculty must encourage students to fully participate in the teaching and learning processes. Assigning homework that helps faculty to determine learning objectives and activities is a step in the right direction in terms of bringing out students' inner selves who are ready to learn. None of these methods, however, will create continual inspiration unless the goals are realistic for the learner. Effective faculty are thus those who enlist students in goal setting (Ebrahimi, 2012). Some students may bring with them unrealistic notions about what they can accomplish. Perhaps they do not understand the precision with which a skill must be carried out or have the deepness of understanding needed to master certain instructional material. To identify realistic goals in any case is an essential part of the profession and so faculty must be skilled in assessing student readiness or improvement in the direction of the stated objectives using better blended learning strategies (Ololube, 2011; Ololube, Eke, Uzorka, Ekpenyong, & Nte, 2009).

The teaching of EDU 111 and EDU 222 is a challenging task for most faculty and blended learning methods sound vague to many. Likewise, Internet-based environments or instructional materials can be daunting for non-computer literate faculty. Overcoming these insufficiencies in a blended learning environment is necessary to enhance learning. Not surprisingly, Zhongjun and Lijuan (2009) argue that adopting improved blended leaning methods will strengthen teaching effects on a large scale, especially teacher-student communication.

Competence in the use of blended learning methods means getting most students to engage in higher level cognitive processes that more academic students use spontaneously. It means getting students to engage in learning-related activity that helps them attain the particular objectives set for the unit or course, such as theorizing, generating new ideas, reflecting, applying and problem-solving (Ololube, 2011; Ololube, Amaele, Kpolovie, & Egbezor, 2013). Other important faculty competencies include inspiring students to compete against themselves, to take on tasks that seem to exceed their abilities, and to discover and develop their potential as thinkers. In order to affect these ends, faculty need to be curious, imaginative, empathetic, interesting, friendly, and hardworking, thereby creating an environment that enhances and strengthens the learning disposition of students.

METHOD

Design

This study falls within the action research paradigm, and employs quantitative assessment aimed at improving the best available practices, processes and performances of blended learning in higher education. These practices and processes are increasingly central to the creation and development of excellence and the discovery of new ideas. In this model, action research involves inquiring into one's own experiences throughout recurring processes, in other words, observing and reflecting on the progress of the teaching and learning process.

This study assesses the use of blended learning methods in the teaching of Introduction to Teaching and Sociology of Education in a University of Education. It looks at the role of faculty in employing blended learning as a method of teaching and learning. It also sought to determine blended learning successes and their effects on student academic achievements/performances. It is hoped that this research will offer useful insights to education planners and administrators and in the policy development process.

This study used a combination of observation and text-based materials (valuable records about educational research) to enrich the study. In terms of the observational component, the researcher is a full time faculty member and has been involved in teaching B.Ed. EDU 111 and EDU 222 as well as 100 and 200 level B.Ed. part-time and regular students of Accounting Education, Marketing Education, Management Education, and Secretarial Studies Education at the University of Education, Port Harcourt, Nigeria. Observations were made of student competences when using computer applications and software to solve EDU 111 and EDU 222 problems and the quality and skill of students in completing their assignments on time and participating in the classroom.

Prior to the commencement of lectures, it was noted that the majority of the students did not have email accounts intended to facilitate the submission of assignments and communication with faculty. Consequently, students were asked to open an email account of their choice. The sampling for this study was purposive, which means that every student who registered for the courses participated in the teaching and learning processes and the submission of assignments online for assessment and grading. The electronic grading process provided continuous prompt and detailed feedback to students on their performance.

Data Collection and Instrument

Data for this study was gathered during the 2011-2012 academic year. Data was collected from multiple sources including a comprehensive review of contemporary literature, faculty observations, and student questionnaires reflecting assignment exercises and analyses.

The student questionnaire, a six-point Likert type scale of (1) Totally Disagree [TD]; (2) Partly Disagree [PD]; (3) Disagree [D], (4) Partly Agree [PA]; (5) Agree [A]; and (6) Totally Agree [TA], was administered to both regular and part-time students. The questionnaire was divided into two sections. Section A was comprised of questions about respondents' personal data (gender, age, department of study, year of study, programme of study). Section B sought to elicit information on the variables that may or not be responsible for the perceived impact of blended learning (BL) and student performance (see Table 1).

Instrument Validity and Reliability

The questionnaire was guided by the characteristics of a good questionnaire as developed by Dillman, Smyth and Christian (2008), Fink (2008), Fowler (2008), and Bowen (2009). Assistance from professional colleagues validated and made the development of such a questionnaire for this study possible. Feedback from colleagues helped ensure that the measures reflected the content of the concept in the questions. Consequently, the face validity was determined to be intact.

The questionnaire was as simple as possible to accommodate different categories of students. The questionnaire was designed to gather information on both the overall performance of the blended learning system as well as its specific components. Since the questionnaire also includes demographic questions, it was used to correlate performance and satisfaction with the blended learning study methods among students. A Cronbach Alpha reliability estimate of .841 was used to judge the reliability of the instrument. The questionnaires provided, among others, feedback on students' expectations of blended learning, reflections on experiences with collaborative assignments, and suggestions on ways in which online collaborative learning could be enhanced.

Data Analysis

In analysing the data gathered from respondents, the Statistical Package of the Social Sciences (SPSS) Version 18 was used. A simple percentage (cross tabulation) method of data analysis was adopted for personal data. Multiple inferential statistical analyses, T-test (t) and One Way Analysis of Variance (ANOVA) were used to analyse the hypotheses at the .05 level of significance (two tailed).

Mean was used to determine the strength of some variables relative to the weakness of others and cross tabulation was used because it is one of the simplest and most common ways of demonstrating the presence or absence of a relationship (Bryman & Cramer, 2011; Norusis, 2012). T-test (t) analysis was used to determine the relationship and (or) differences between the variables in Section B of the questionnaire, while ANOVA was used to determine if significant relationships existed between respondents' personal information and the perceived impact of blended learning.

RESULTS

The statistical analysis for this study revealed the extent of the perceived impact of blended learning and student performance in the teaching of Introduction to Teaching and Sociology of Education. The majority of respondents agreed that the use of blended learning is effective and has a positive impact on student academic performance. An overwhelming number of respondents (students) felt that Introduction to Teaching and Sociology of Education courses are highly beneficial to students, especially students pursuing a professional degree in management-education, accounting-education, marketing-education and secretarial studies-education because of its ability to render students more competent in their chosen profession.

Table 1. Perceived impact of blended learning and student performance

	PERFORMANCE EXPECTANCY/BL	SD	D	PD	PA	A	SA
1.	I find computer systems useful in my studies	1	2	3	4	5	6

Respondents (regular students N-166 and part-time students N-60) to this study completed a questionnaire that employed a six-point Likert-type scale. Results revealed that 99(42.5%) of respondents were male while 130(57.5%) were female. In terms of age, 35(15.5%) were younger than 21, 148(65.5%) were 21-30 years of age, 35(15.5%) were 31-40, 8(3.5%) were older than 40. See Table 2 for further details of respondents' demographic data.

Hypothesis 1: Performance Expectancy is Not Significantly Related to the Perceived Impact of Blended Learning

Table 2. Respondents demographic data

Variables		Freq.	%
Gender	Male	96	42.5
	Female	130	57.5
Age	Less than 21years	35	15.5
	21-30 years	148	65.5
	31-40 years	35	15.5
	More than 40 years	8	3.5
Department	Accounting/Education	18	8.0
	Management/Education	103	45.6

	Secretarial Studies/Education	11	4.9
Level/Year of study	100 level	60	26.5
	200 level	166	73.5
Type of Programme	Full time students (Regular)	166	73.5
	Sandwich	60	26.5

The results in Tables 3 and 4 were tallied along agree and disagree. Based on the data as shown in the tables, 87.4% find computer systems useful in their studies during the use of blended learning methods. Table 4 shows a significant result in the t-test analysis at ($t = 43.328$, $P < .000$) such that 72% are of the view that using computer systems during blended learning classes enables them to accomplish assignments more quickly ($t = 34.506$, $P < .009$). Similarly, 81.6% of respondents were of the opinion that using computer systems during blended learning classes increases their learning ability. The t-test analysis here shows a significant relationship at ($t = 24.930$, $P < .001$).Almost all respondents, 90.2%, agree that the use of computer systems increases their chances of getting a good job at ($t = 26.758$, $P < .000$). Finally, 85.1% agree that using computer systems during BL classes is significantly related to their academic growth at ($t = 31.224$, $P < .000$). On the whole, the results show that performance expectancy is significantly related to the perceived impact of blended learning. Hypothesis 1 is therefore rejected.

Hypothesis 2: Effort Expectancy is Not Significantly Related to the Perceived Impact of Blended Learning

The second analysis conducted was a two-tailed t-test (t) and cross tabulation analysis to determine whether relationships exist between effort expectancy and the perceived impact of BL (see Tables 5 and 6). The study found that effort expectancy is significantly related to BL. The data revealed that 89.2% of respondents felt that interactions with computer systems during BL classes is clear and understandable ($t = 27.556$, $P < .000$). Similarly, 84% are of the view that it is easy for them to become more skilful at using computer systems as a result of the BL classes ($t = 26.597$, $P < .000$). The majority of respondents (73.6%) found computer systems easy to use as a result of BL classes ($t = 25.234$, $P < .000$) and 77.6% of respondents believed that learning to operate computer systems was easy ($t = 26.356$, $P < .000$). Evidence of the impact of BL on students' academic performance in the literature is immense (Ololube, 2011). Thus, Hypothesis 2 is rejected.

Table 3. Cross tabulation analysis of performance expectancy and blended learning

s/n	Variables	Disagree (D)	Agree (A)
1	I find computer systems useful in my studies	12.6%	87.4%
2	Using computer systems enables me to accomplish assignments more quickly	28%	72%
3	Using computer systems increases my learning ability	18.4%	81.6%
4	If I use computer systems, I will increase my chances of getting a good job	9.8%	90.2%
5	Using computer systems is good for my academic growth	14.9%	85.1%

Hypothesis 3: Facilitating Conditions are Not Significantly Related to the Perceived Impact of Blended Learning

Data from the cross tabulation (Table 7) and t-test analysis (Table 8) reveal that facilitating conditions are significantly related to the perceived impact of blended learning. These results show that 84.3% of respondents agree that university administrators believe that the use of computer systems provides significant benefits to BL teaching and learning ($t = 41.291$, $P < .000$). Somewhat lower, 69.9% feel that they receive the necessary assistance from their lecturer in the use of computer systems during BL classes ($t = 25.742$, $P < .000$). Almost three-quarters, 72.5%, agree that they have access to resources that enable them to use computer systems at school ($t = 26.438$, $P < .000$). Just over three-quarters, 77.7%, agree that persons are available to assist them with difficulties arising from computer systems use during BL classes ($t = 27.282$, $P < .000$). As a result of the above analysis, Hypothesis 3 is rejected.

Hypothesis 4: Attitude towards Computer Systems is Not Significantly Related to the Perceived Impact of Blended Learning

Cross tabulation (Table 9) and a t-test analysis (Table 10) were conducted to determine if a significant relationship exists between attitude towards computer and perceived impact on BL. Results showed that 86.2% agree that the using computer systems during BL classes is a good idea at ($t = 49.411$, $P < .000$). Respondents also agree (68.5%) that computer systems make learning more interesting ($t = 25.722$, $P < .000$). Likewise, 88.8% felt that using computer systems to learn and to do assignments is fun ($t = 50.245$, $P < .000$). Results thus revealed that attitude towards computer systems is significantly related to the perceived impact of blended learning and so Hypothesis 4 is rejected.

Table 4. T-test analysis of performance expectancy and the perceived impact on blended learning

Table 9. Cross tabulation analysis showing whether attitude towards computer systems impacts on blended learning

s/n	Variables	Disagree (D)	Agree (A)
14.	Using computer systems during BL classes is a good idea	13.8%	86.2%
15.	Computer systems make learning more interesting	31.5%	68.5%
16.	Using computer systems to learn is fun	11.2%	88.8%

Table 10. T-test analysis of attitudes towards computer systems and the perceived impact on blended learning

ATTITUDES TOWARDS COMPUTER SYSTEMS/BL		t	df	Sig. 2-Tailed	Result
14.	Using computer systems during BL classes is a good idea	49.411	225	.000	Impact
15.	Computer systems make learning more interesting	25.722	225	.000	Impact
16.	Using computer systems to learn is fun	50.245	225	.000	Impact
N: 226 **Df:** N-1. **Sig. level:** 0.05					

Table 11. Cross tabulation analysis showing whether behavioural intention impacts on blended learning

s/n	Variables	Disagree (D)	Agree (A)
17.	I intend to use computer systems in my assignments and learning	22.1%	77.9%
18.	I predict I would use computer systems in the coming months	32.8%	67.2%
19.	I plan to use my computer systems whenever I have a need	23.6%	76.4%
20.	I am certain I'll use computer systems effectively in the coming months	18.8%	81.2%

Hypothesis 5: Behavioural Intention is Not Significantly Related to the Perceived Impact of Blended Learning

Data from the cross tabulation and t-test analysis reveal that behavioural intention is significantly related to the perceived impact of blended learning (see Tables 11 and 12). From the data, 77.9% intend to use computer systems in their assignments and learning ($t = 27.989$, $P < .000$). In addition, 67.2% predict the effective use computer systems in the coming months as a result of their exposure to BL classes ($t = 22.659$, $P < .000$). More than three-quarters, 76.4%, plan to use computer systems whenever they have the need ($t = 26.642$, $P < .000$), while 81.2% are certain they will use computer systems effectively in the coming months ($t = 33.086$, $P < .000$). Based on the above results hypothesis 5 is rejected.

Hypothesis 6: Computer Systems use is Not Significantly Related to the Perceived Impact of Blended Learning

In tests to determine if a significant relationship exists between computer systems use and the perceived impact of blended learning (see Tables

Table 12. T-test analysis of behavioural intention and the perceived impact on blended learning

BEHAVIORAL INTENTIONS/BL		t	df	Sig. 2-Tailed	Result
17.	I intend to use computer systems in my assignments and learning	27.989	225	.000	Impact
18.	I predict I would use computer systems in the coming months	22.659	225	.000	Impact
19.	I plan to use my computer systems whenever I have a need	26.642	225	.000	Impact
20.	I am certain I'll use computer systems in the coming months	33.086	225	.000	Impact
N: 226 **Df:** N-1. **Sig. level:** 0.05					

Table 13. Cross tabulation analysis showing whether computer systems use impacts on blended learning

s/n	Variables	Disagree (D)	Agree (A)
21.	I frequently use computer systems to understand a problem	20.1%	79.9%
22.	I often use computer systems in my university	28.9%	71.1%
23.	I frequently use computer systems to find answers to a problem	30.2%	69.8%
24.	I very often use computer systems in my learning	17.8%	82.2%

13 and 14), 79.9% frequently used computer systems to understand problems during blended learning classes and assignments *(t = 48.418, P < .000)*. Nearly as many, 71.1%, agree that the frequent use computer systems in university is significantly related to the perceived impact of blended learning *(t = 43.706, P < .000)*. In addition, most respondents (69.8%) felt that the frequent use computer systems helps them to find answers to problem and that this is significantly related to the perceived impact of blended learning *(t = 49.584, P < .000)*. Finally, 82.2% very often use computer systems in EDU 111 and EDU 222, which is significantly related to their academic performance *(t = 46.145, P < .000)*. The overall results reveal that computer systems use impacts on blended learning and so Hypothesis 6 is rejected.

Hypothesis 7: Respondents' Personal Information is Not Significantly Related to Their Opinion on the Perceived Impact of Blended Learning

In Table 15, the Analysis of Variance (ANOVA) shows that respondent's opinions, based on their personal information, are significantly related to the variables tested. The analysis reveals that respondents, irrespective of department *(F = 4.943, p > .000)*, gender *(F = 4.694, p > .000)*, age *(F =* 2.322, *p > .044)*, year/level of study *(F = 6.808, p > .000)*, type of programme *(F = 6.808, p > .000)*, show a significant relationship in their overall perception of all of the variables tested. Hypothesis 7 was thus rejected.

DISCUSSION AND CONCLUSION

Research suggests that blended learning methods create enhanced opportunities for teacher-student interaction, increased student engagement in learning, added flexibility in the teaching and learning environment, and opportunities for continuous improvement (Vaughan, 2007). The successful

Table 14. T-test analysis of computer system use and the perceived impact on blended learning

COMPUTER SYSTEMS USE/BL		t	df	Sig. 2-Tailed	Result
21.	I frequently use computer systems to understand a problem	48.418	225	.000	Impact
22.	I often use computer systems in my university	43.706	225	.000	Impact
23.	I frequently use computer systems to find answers to a problem	49.584	225	.000	Impact
24.	I very often use computer systems in my learning	46.145	225	.000	Impact

integration of BL results is an educational environment that contributes significantly to faculty teaching and student learning. Such an environment can be characterized by the balance between innovation in learning and personal exploration on one hand, and systematic instruction and guidance on the other (Newhouse, 2002a, 2002b).

In line with the findings of Bonk, Kim, and Zeng (2005), this study posited that BL has significantly improved student academic achievement. In spite of this very positive outcome, the use of BL is still new and its impact is yet to be widely felt by most students and faculty in Nigerian higher education.

Nigerian universities must provide access to quality education for every student as a means of helping them achieve their full potential. Consequently, universities must follow prevailing global trends by integrating BL strategies into their teaching and learning resources. While universities are indeed struggling to meet the demands of student population growth, in that they often

lack the ability to expand educational resources to accommodate new students, effective BL policies are required to foster conducive educational environments that are responsive to valuable teaching and learning and workforce challenges. Electronic learning is one such way to foster these responsive educational environments (Osguthorpe & Graham, 2003). BL provides faculty and students with the opportunity to access the best resources and up-to-date information concerning teaching, learning and curriculum. It is thus not surprising that BL is fast becoming an accepted and indispensable part of mainstream higher education systems especially in the developed world (Akhahowa & Osubor, 2006).

This chapter is a realistic resource for the practical application of BL in higher education, as many colleges and universities across the globe are now investing in more e-learning and BL methods (Graham, 2006; Shivetts, 2011). The BL approach has been proven to both enhance and expand the effectiveness and efficiency of teaching and learning in higher education (Wan, Wang & Haggerty, 2008). This study makes obvious the ways in which BL techniques integrate the benefits of both traditional f2f teaching and e-learning approaches in the teaching of Introduction to Teaching Profession and Sociology of Education. It offers an inclusive view of the benefits and troubles of the applicability of BL in the teaching and learning process.

This study suggests several propositions for future research and practice. These inferences pertain most directly to students, researchers, faculty and higher education institutions. At a management level in higher education, this study calls for policies to ensure balanced investments in, and increased funding for, higher education that will allow for the effective use, integration and diffusion of BL services and methods in the teaching and learning processes (Yang, 2010). Given the somewhat small sample of this study, the researcher recommends larger studies based on a more broadly administered questionnaire. Limitations, such as the small sample size, need to be accounted for when evaluating the result of this study as they raise the likelihood that some dissimilarity in judgment may be more of a function of research design and contextual factors than any real differences in BL studies. As with other studies, the findings should not be regarded as definitive but as offering students, faculty, educators, researchers, planners and administrators a view of the author's reality on the use of BL in a developing economy.

KEY TERMS AND DEFINITIONS

Blended Learning Methods: Blended learning methods mean the range of possibilities presented by combining Internet and digital media with established f2f classroom instructional processes that require the physical presence of faulty and students.

Computer Systems: These include the computer along with its software and other devices that are necessary to make a computer function.

Faculty: The range of persons adjudged to have the processional skills and knowledge involved in the teaching and learning process.

Introduction to Teaching Profession: Introducing pre-service teachers to the rudiments, techniques, abilities, skill, and knowledge of the job of teaching.

Sociology of Education: A science that introduces pre-service teachers to the traits of the influences of the society on education and education on society.

Technology-Assisted Learning: The application of technology devices in the teaching and learning purposes. It involves the usage, knowledge, skill and competence in the use technology in solving problem or performing specific function during and after academic activities.

Chapter 50
Blended Learning Implementation in Accounting Discipline:
A Study in a Malaysian Public University

Universiti Teknologi MARA, Malaysia

Salina Salleh
Universiti Teknologi MARA, Malaysia

ABSTRACT

This chapter examines the successful implementation of blended learning in an intermediate financial reporting course in a public university. The results of this study show that there is a significant difference between students completing the course through conventional learning and those completing the course via blended learning, with the later showing unfavourable results. The results in this study provide indication that for the students to perform well there is the need for them to be independent learners when studying using blended learning. However, the students believe that they could complete the course successfully regardless of whether they study the course through conventional learning or blended learning. Finally, the results show that academics are of the opinion that students should change their attitude to succeed. The academics further opined that the course and facilities need to be reviewed and upgraded to assist students in completing the course. The findings in this study provide some understanding of the implementation of blended learning in an intermediate financial reporting course.

DOI: 10.4018/978-1-4666-8246-7.ch050

1. INTRODUCTION

Accounting relates to the process of communicating financial information of a business entity to its users such as the shareholders. The communication of accounting process often in the form of financial statements communicated in monetary value which is prepared based on information selected that is relevant and reliable to the users. Accounting practitioners are expected to be skilful in the preparation of financial statements and well-versed in the understanding of accounting principles in order to ensure that the process of communicating the business entity's performance to the users is smooth, relevant and reliable. Accounting practitioners often get their exposure of this skill during their higher education study where they are taught on the accounting principles and the techniques in preparing financial statements (Davis et al., 2008)

For more than 50 years, the Faculty of Accountancy in a public university have provided effort for teaching to educate generations of accountants. The public university is one of the public universities in Malaysia. It is formed to ensure its graduates are employable in the market of either in the top list of big reputable accounting firms and multinational companies. The faculty aims to equip the students with good academic qualification coupled with other strength comprising of excellent interpersonal skills, possessing professional qualification recognised worldwide, acquiring both soft and hard skills relevant to the field and by being seen of having good attributes and qualities such as being ethical.

With the evolution of Information Communication Technology (ICT) in the higher educational setting, the curriculum and content has significantly altered the methodology of learning from the conventional white board face to face learning to a more sophisticated learning incorporating ICT such blended learning. Blending learning which forms a combination of online and face to face learning is seen as a tool that could assist the university to accommodate the increasing population of accounting students without sacrificing the quality of knowledge. The arguments that proactive and quality methods of educating students is believed to contribute to such belief.

Due to this, one of the institutes of a public university that takes charge of distance learning have started to implement blended learning for its undergraduate students in stages starting from subjects taught in the first semester. The implementation of blended learning for accounting courses began in 2011 and over a year period, academics have provided various comments and feedbacks on the implementation on blended learning on accounting subjects. Particularly, the comments and feedbacks are related to the effectiveness of blended learning on accounting students' performance. Such comments and feedbacks were raised mainly because accounting discipline is unique in nature due to the involvement of transmitting both theoretical and technical knowledge. Due to its unique nature, academics believe that students need to have a large amount of contact hours such as face to face learning in order to get in depth understanding on accounting principles and therefore, it is unlikely that blending learning with number of hours being reduced by more than seventy five percent could be an effective mode of teaching to accounting students (Ghani et al., 2012).

This study examines the success implementation of blended learning in the accounting discipline. Specifically, this study examines the effect of blended learning on students' performance, the accounting students' perception on blended learning and the issues and challenges in blended learning. The results of this study would shed some light on the implementation of blended learning. The remainder of this paper is structured as follows. Section 2 provides a literature review on the blended learning. Section 3 outlines the research method. The results are presented in section 4. Summary and conclusion are provided in the last section.

2. BACKGROUND OF STUDY

2.1. Students' Performance

Many empirical studies in the education literature have researched on factors that could influence students' performance within the accounting discipline. Most of these studies support the hypotheses that students' performance could be affected by sitting location in the class (Topping, 1994), gender (Deboer, 1994; Horne, 2000), attendance (Devadoss & Foltz, 1995; Durden & Ellis, 1995) learning styles between the students and instructors (Borg & Shapiro, 1996) and their previous results (Nordstrom, 1990). Other studies have examined self efficacy (Christensen, Fogarthy & Wallace, 2002, Tho, 2007); motivation (Yamamura, Martin, Campbell, Campbell & Frakes, 2000; Chen, Maksy & Zheng, 2006), study style (Chen et al., 2006), class length (Ewer, Greer, Bridges and Lewis, 2002) and pre-requisite of another subject (Campbell & Glezen, 1989) and teaching and learning method (Sugahara & Boland, 2006; Amare, 2008 Ghani et al., 2012).

There are many teaching and learning method and the effectiveness of the teaching and learning method often falls on the preferences of the students (Bartsch & Cobern, 2003; Blalock & Montgomery, 2005, Sugahara & Boland, 2006). Students may prefer teaching and learning method that could provide them easy understanding on the topic being taught, easy access to content and a method that allow students to have guidance and feedback (Wan Ahmad et al., 2008). The learning theory suggests that students' performance could be further improved when the students are actively involved in the learning, when students are encouraged to do lots of critical thinking and when students are provided with real-life case assignments (Watkins, 2005; Smart & Cappel, 2006). To achieve this, studies have suggested the use of blended learning.

2.2. Blended Learning

Blended learning is a form of teaching and learning method often described as a hybrid learning combining several teaching and delivery methods (Ward & LaBranche, 2003; Smart & Cappel, 2006; Wan Ahmad et al., 2008). Blended learning is said to offer incremental value in learning and encourage appreciation of the concept of the course undertaking by students (Koohang & Durante, 2003; Osguthorpe & Graham, 2003). Often, blended learning is being used in on-campus courses which include hard copy study materials, face-to-face contact and a variety of online resources (Bawaneh, 2011). These include involvement of the use of online interaction in complement to the face to face interactions between the academics and the students (Kerres & Witt, 2003). There have been suggestions that the use of online interaction would allow students to be more prepared and participated more actively in the learning process compared to when they are sitting in the classroom providing passive participation (Johnston et al., 2005).

Within the education literature, numerous studies have examined the link between blended learning and students' performance (such as Johnston et al., 2005 and Iverson et al. 2005). These studies examined a range of issue and the results from these studies are mixed. Some studies found that blended learning could provide better environments that encourage students to be engaged with the material and learn by doing (Pallof & Pratt, 2003; Johnston et al., 2005; Stacy & Gerbich, 2007; Bawaneh, 2011). Other group of studies concluded that using some form of blended learning became least effective as compared to the traditional classroom setting (Terry et al., 2001; Iverson et al., 2005). Other studies do not where these studies found that students who were given in-class opportunities to practice and apply what they have learned, or are encouraged to immediately transfer their learning upon returning to their jobs and tasks performed better (Bryant

& Hunton, 2000; Gagne & Sherperd, 2001; Lim & Johnson, 2002; Love & Fry, 2006). However, most of these studies examined did not examine the effect of blended learning on students' performance in terms of integrating traditional classroom setting and online interaction.

Studies that have examined issues relating to blended learning and students' performance were conducted in various disciplines and in various countries. A large number of these studies were conducted in the business and management discipline (Smart & Cappel, 2006; Arbaugh et al., 2009), sciences (Sancho et al., 2006; Woltering et al., 2009) and mathematics (Javed & Vale, 2007; Wan Ahmad et al., 2008). Other studies were conducted in the accounting discipline (Chen & Jones, 2007; Bawaneh, 2011) and linguistic (Neumann and Hood, 2009; Shih, 2010). These studies were conducted in various countries including Spain (Lopez-Perez et al., 2011), Jordan (Bawaneh, 2011), Turkey (Akkoyunlu & Sonlu, 2008) and Australia (Javed and Vale, 2007; Shih, 2010) although most of these studies were conducted using US context (Smart & Cappel, 2006; Chen & Jones, 2007; Lim & Morris, 2009),

Wang (2003) noted that researchers often provide little interest in addressing students' perception of blended learning. Following this, a group of studies in the education literature have examined the students' perception on blended learning (Smart & Cappel, 2006; Wan Ahmad et al, 2008). The results of these studies are mixed. Few studies conclude that students using face to face and online interaction method provide better performance compared to students who use solely classroom setting (Smart & Cappel, 2005; Lopez-Perez et al., 2011; Wan Ahmad et al., 2008). These studies were mostly conducted in a non-accounting discipline and if they do, the subjects chosen in undertaking their study did not focus on a financial reporting nature.

In summary, studies that have examined various issues relating to the link between blended learning and students' performance. This study aims to extend the education literature to support the effect of blending learning on students' performance and if the results prove otherwise, this study aims to identify the issues and challenges faced by the students and academics in applying blended learning.

3. RESEARCH DESIGN

This study examines the success implementation of blended learning in the accounting discipline related to financial reporting. Specifically, this study examines:

1. The effect of blended learning on students' performance.
2. The accounting students' perception on blended learning.
3. The issues and challenges in blended learning.

The objectives are met by way of questionnaire survey and content analysis.

3.1. Sample

The sample consists of students that have undertaken subject related to financial reporting principles in 2011 and 2012. The students comprise of first year students that have enrolled in full time and blended learning to complete the financial reporting subject. Such selection allows this study to do comparison of students' performance to determine whether students who studied based on blended learning that consists of online and face to face learning does in fact improved compared to the conventional white board face to face.

To achieve the second objective of this study, accounting students who have enrolled in the financial reporting subject via blended learning were approached and requested to complete a questionnaire. The questionnaire consists of questions related to the students' perception on blended learning. Ninety-five students responded and completed the questionnaire. In addition, three academics who have taught the subject of financial reporting are chosen as the sample to provide comments and feedbacks on the issues and challenges of implementation of blended learning in the accounting discipline.

3.2. Research Instrument

The objectives of this study are met by way of primary and secondary data. The primary data involved questionnaire survey. The questionnaire consists of two sections. Section A consists of questions that related to the respondents' perception on blended learning in teaching and learning financial reporting. The questions are adapted from Wan Ahmad et al. (2008) with modification. The questions include requesting the respondents to perceive whether teaching and learning via blended learning makes it easy to learn the topic, learn the topic better using blended learning as opposed to the conventional method, easy to visualise the important concepts, able to analyse better, appreciate the learning process and find the subject interesting among others. The respondents were asked to complete the questionnaire using a 7-point scale ranging from '1' being extremely strongly disagree to '7' being extremely strongly agree.

Section B consists of demographic profile of the respondents which include age, gender, work experience and whether the students who enrolled via blended learning are currently in the accounting department and whether they are currently servicing in the public sector. The respondents were requested to complete the questionnaire and return the questionnaire to the researchers using the self addressed envelope provided.

Interviews were also conducted with three academics that have experienced teaching the subject via blended learning. The academics were approached by the researchers via telephone or email requesting their participation in the study. The academics agreed and meeting time and date were set. The academics were approached using structured interviews and the meeting was held for about an hour. Their response were then analysed by coding according to two themes, namely, students and facilities.

The secondary data is in the form of the students' result for the subject undertaken. The results were obtained from the academics who have taught the students in the intermediate financial reporting course. The results of the analysis determine whether this study support the academics' prediction that blended learning does or does not in fact improves students' performance.

3.3. Course Conduct

The course chosen in this study is a course on intermediate financial reporting. This course consists of 13 topics that are covered in seven seminars of two hours each over a semester. The lecturers meet the students via face to face interaction over the period where the students are expected to be prepared beforehand and to ask questions in class. The students could also communicate among them and with their lecturers via an online blog known as i-class. This blog is accessible only by the academics and the students undertaking the course. In this blog, all materials such as the lesson plan, notes and past year questions pertaining to the course are uploaded by the academics and accessible by the students at any time and place.

3.4. Data Collection

Data collection was conducted between the months of September 2011 to November 2012. The data collection involved three phases. The first phase involved obtaining the students' results for financial reporting subject. The results of the students were obtained from the academics that have taught the subject of financial reporting in the year 2011 and 2012. Where the results could not be provided by the academics, the researchers requested the faculty to obtain the students' results. In total, 207 students' results were taken and analysed.

The second phase involved sending out questionnaires to the students who were enrolled in the financial reporting subject via blended learning. The students were approached and given a set of questionnaire by their teaching academic. The questionnaire was distributed with a formal letter identifying the purpose of such study and requesting the students to complete and return the questionnaire to their teaching academic. One hundred and twelve questionnaires were distributed and returned.

The final phase involved the researchers interviewing the teaching academics. Three teaching academics were approached via telephone or email to set a date for appointment. The researchers then met the teaching academics and interviews were conducted. The interview session lasted about an hour.

4. RESULTS

The primary focus of this study is to examine the success implementation of blended learning in the accounting discipline related to financial reporting. The results of the content analysis and interviews conducted by the study are analysed based on the two specific objectives discussed in the previous section.

4.1. Blended Learning and Students' Performance

This section presents the results of the first objective of this study. The first objective of this study is to examine the effect of blended learning on students' performance. The examination results of the students on financial reporting were keyed-in into *SPSS* version 20 and were analysed.

4.1.1. Demographic Profile

This section presents the demographic profile of the respondents consisting of accounting students who have completed their financial reporting course. The main demographic attributes of respondents are comprised of their years of working experience, whether they are in the accounting department and whether they are a government staff. These have been examined using categorical scales and are presented in Table 1.

Table 1 is divided into 2 panels. Panel A of Table 1 shows that there are 207 students' results of financial reporting subject. Out of the 207, 167 belong to female students while the remaining 40

Table 1. Respondents' demographic attributes

Panel A: Gender		
Gender	**Number of Subjects**	**Percent**
Male	40	19.3
Female	167	80.7
Total	207	100.0
Panel B: Mode of Study		
Study Mode	**Number of Subjects**	**Percent**
Non-blended learning	95	45.8
Blended learning	112	54.2
Total	207	100.0

Table 2. Blended learning and students' performance

Panel A: Descriptive Statistics			
Study Mode	**N**	**Mean**	**Std. Deviation**
Non-blended learning	95	57.73	8.14031
Blended learning	112	44.75	28.81957
Panel B: Levene's Test			
Dependent Variable: Results	F.	Sig	
Equal Variances Assumed	5.981	0.15	
Panel C: Independent Sample T-Test			
Results	Mean Difference	Std Error Difference	Sig (2-Tailed)
Equal variances assumed	12.97632	3.05621	0.000

belong to the male students. Ninety five of the students (45.8 percent) were enrolled in a face to face only mode while 112 students (54.2 percent) enrolled in the financial reporting subject via blended learning as shown in panel B of Table 1.

4.1.2. Effect of Blended Learning on Students' Performance

Table 2 presents the results of Independent Sample T-Test. Panel A of Table 2 shows that the mean score for the students who did their financial reporting subject via non-blended learning is 57.73. On the other hand, those students who did their financial reporting subject via blended learning scored a mean score of 44.75. The results indicate that students enrolled under the conventional classroom mode scored better performance compared to those students who enrolled through blended learning. A t-test shows significant difference (p=0.000) with equal variances based on Levene's test (p=0.15) between these two groups.

4.2. Students' Perception on Blended Learning

This section presents the results for meeting objective two. Objective two examines the accounting students' perception on blended learning in intermediate financial reporting course. The examination results of the students on financial reporting were keyed-in into *SPSS* version 20 and were analysed.

4.2.1. Demographic Profile

This section presents the demographic profile of the respondents consisting of accounting students who have completed their financial reporting course based on blended learning. The main demographic attributes of respondents are comprised of gender, age, years of working experience, whether they are in the accounting department and whether they are a government staff. These have been examined using categorical scales and are presented in Table 3.

Table 3 is divided into 5 panels. Panel A of Table 3 shows that most respondents are female students (86.6 percent) and the remaining 13.4 percent are male students. This is not surprising since it is quite common in Malaysia that female students tend to enrol for accounting courses compared to male students. Most of the respondents are aged between 20 to 30 years old (91.1 percent) whereas only 8.9 percent are above 30 years old as shown in panel B of Table 3. Such results indicate indicating the trend of young adults improving their career development.

Table 3. Demographic profile of blended learners

Panel A: Gender		
Status	**Number of Subjects**	**Percent**
Male	15	13.4
Female	97	86.6
Total	112	100.0
Panel B: Age		
Age	**Number of Subjects**	**Percent**
20 to 24 years old	45	40.2
25 to 30 years old	57	50.9
31 to 35 years old	9	8.0
Above 35 years old	1	0.9
Total	112	100.0
Panel C: Work Experience		
Experience	**Number of Subjects**	**Percent**
Less than 5 years	77	68.8
5 to 10 years	32	28.6
11 to 15 years	3	2.7
16 to 20 years	0	0
Above 20 years	0	0
Total	112	100.0
Panel D: Employment Status		
Status	**Number of Subjects**	**Percent**
Government	49	43.8
Non-governent	63	56.3
Total	112	100.0
Panel E: Job Attachment		
Attachment	**Number of Subjects**	**Percent**
Accounting	82	73.2
Non-accounting	30	26.8
Total	112	100.0

The results in panel C of Table 3 shows that 109 respondents have less than 5 years working experience (97.3 percent). Slightly more than half of the respondents (56.3 percent) are working in the private sector compared to the remaining 43.8 percent working in the public sector (refer panel D of Table 3). As expected, 82 respondents are working in the accounting department representing 73.2 percent. In contrast, 30 respondents are working in a non-accounting department. This is unexpected since often students enrolled in a course related to their working environment. Further analysis shows that these students are either in their own business or other firms such as law firm and engineering firm. There are also students who set up their own business and take

Table 4. Effect of students' perception on blended learning

	Mean	Std. Deviation
I find it easy to learn the topics via blended learning	3.9821	1.31507
I learn the topics better via blended learning compared to conventional learning	4.3750	1.37628
I find it easy to visualise the important concepts of the topics via blended learning	3.9911	1.27693
I analyse better the important concepts of the topics via blended learning	4.0536	1.29336
I appreciate the learning integration of blended learning using face to face interaction and online learning	4.8571	1.21446
I put lots of efforts using online learning	4.7321	1.25907
I still prefer conventional learning compared to blended learning	5.6964	1.08087
I believe the lecturer needs to provide more effort in helping students to learn the topics via blended learning	5.5536	1.39393
I believe I need to put more effort in learning the topics via blended learning	5.8393	1.11947
I believe I could pass this course regardless whether I am using blended learning or conventional learning	5.0536	1.46944

charge of their own business financial accounting records.

4.2.2. Effect of Students' Perception on Blended Learning

This section presents the mean score of the respondents' perception on completing the financial reporting course via blended learning. The respondents were asked to complete the questionnaire using a 7-point scale ranging from '1' being extremely strongly disagree to '7' being extremely strongly agree.

The results in Table 4 show that the respondents provide the highest mean score for statement number 9 that "I believe I need to put more effort in learning the topics via blended learning." Such score provides indication that the students understand and aware that they need to be more independent in learning the topics of the intermediate financial reporting course if they are to complete the course via blended learning. Such results are consistent to the respondents' mean score for statement number 7 that "I still prefer conventional learning compared to blended learning." The results in Table 4 show that despite the effort of the university in introducing blended learning to the students, most of the respondents opined that they prefer the conventional learning compared to blended learning. These respondents provide the second highest mean score of 5.6964 indicating highly agreeable on the preference of using conventional learning as opposed to blended learning.

The respondents however, also opined that the academics teaching the course should provide more effort in helping the students to learn the topics via blended learning. The results showing a mean score of 5.5536 indicating the respondents expect that apart from their side of needing to be independent learners, they also expect the academics to put lots of effort in helping them in the course. Such results are consistent to the respondents' mean score for statement number 9 as discussed earlier. However, the respondents in general agreed that regardless whether they are using blended learning or conventional learning in completing the financial reporting course, they would be able to succeed the course successfully (mean score 5.0536). Such results indicate that the mode of study is not an important determinant to succeeding a course.

Table 4 also provides the results showing whether the students find it easy to learn the topics via blended learning. The results show a mean score of 3.9821 indicating that most of the respondents did not find it easy to learn the topics via blended learning. The respondents also find difficulty in visualising the important concepts of the topics when using blended learning (mean score of 3.9911) despite having putting lots of efforts in completing the course via blended learning (mean score of 4.7321). The respondents however, in general do agree with a mean score of 4.8571 that they appreciate the learning integration of blended learning using face to face interaction and online learning. Finally, the respondents are somewhat in between of agree and disagree (mean score of 4.0536) on whether they find it better in analysing the important concepts of the topics when using blended learning.

4.3. Issues and Challenges in Blended Learning

This section presents the results of interviews conducted in this study. The interviews were conducted in order to meet objective three. Objective three aims to identify the issues and challenges in implementing blended learning. Interviews were conducted with three academics that have experienced teaching the intermediate accounting course via blended learning as well as conventional learning. The academics were approached using structured interviews and the meeting was held for about an hour. Their response were then analysed and were segregated according to two themes, namely, students' attitude and course/facilities.

4.3.1. Students' Attitudes

The course was conducted in the form of blended learning. Blending learning format requires students to be independent where they are supposed to read, understand and attempt exercises before coming to class. The role of the academic assigned to handle the class acts as a facilitator to attend students' doubts based on their reading and attempting questions. However, such scenario did not exist for the past few semesters. The students often came unprepared, often quiet when being asked and did not attempt the exercises. The students expected the facilitator to teach from the beginning and to show them the techniques from the beginning in detail of which in the end, the facilitator has no choice but to meet the students' expectations. In order to make blended learning implementation successfull, the university needs to provide more awareness to the students on the concept of blended learning and its expectations.

Another issue that was raised is the the gap of one meeting to another (about two weeks gap) could also contributes to the high failure rate since students were likely to forget what has been taught and covered before coming to the next class. What is more important, students seem to have lack of understanding and knowledge on pre-requisite financial accounting courses such as introductory accounting that contributed to the high failure rate for the current course. Since each topic in this course links from one topic to another, having strong foundations in accounting is a must.

4.3.2. Course/Facilities

The total topics for the course has to be completed in 14 hours per semester which are considered overwhelming. Students are expected to learn 13 Financial Reporting Standards of which two topics (Topic 12 and 13) represent 50 marks in the final exam. To be able to attempt these two topics, namely publish account and statement of cash flow, students need to understand the concept of the earlier financial reporting standards before they could attempt these two topics successfully.

Although the facilitator could cover the whole syllabus within the semester, the students' level of understanding on these standards is questionable. Further, the learning process has to be done in a fast pace to ensure the syllabus to be fully covered within a limited number of meeting hours.

One of the academics noted that the i-Class facility provided by the university was not fully utilised by the students. Most of the feedbacks and comments received from the students were only "noted" and "thank you" To make it worse, some students do not even know what i-Class is.upon receiving materials or announcement from the facilitator. This is surprising since i-Class briefing was given to the students on registration day and announcement was also made on the Website and students' portal. Obviously, such terms do not provide any meanings to the learning process. Surprisingly, despite the effort provided by the university, there are students who did not have i-Class account. The university needs to provide more awareness to the students on the facilities provided so students could be more aware of the benefits provided to them.

5. CONCLUSION

This study examines the success implementation of blended learning in the accounting discipline related to intermediate financial reporting course. Specifically, this study examines the effect of blended learning on students' performance, the accounting students' perception on blended learning and the issues and challenges in blended learning. The results of the study show that there is significant difference between students completing the course via conventional learning and those completing the course via blended learning. The results also show that the students are aware that they need to become more independent when studying via blended learning and regardless the mode of learning, they believe they could complete the course successfully.

Finally, the results show that the academics opined that students' attitude need to be changed in order to succeed the course and that the course and facilities need to be reviewed and upgraded in order to assist the students in completing the course. The findings of this study implicate that all related parties namely, the university, the academics and the students need to understand their role in the implementation of blended learning in order to make this mode of teaching a success. Such implication is important since the education industry is going towards ICT environment and therefore, serious efforts need to be taken in order to make this mode of learning a success. The findings in this study provide some understanding on the implementation of blended learning in an intermediate financial reporting course.

This study is not without its limitation. First, this study focuses only on intermediate financial reporting course. The results of this study may be different if other financial accounting courses are included. Future research could be done to include other financial accounting courses such as on advanced financial reporting course. This would allow generalisability of the results. Second, the sample taken in this study comprises of students who have enrolled for the course over a four semester period. Students' attitude may be different which could provide a different result if similar study is undertaken. Future research may include a larger sample size.

KEY TERMS AND DEFINITIONS

Accounting Students: Students that have enrolled in an accounting course.

Blended Learning: A formal education program comprising a combination of online delivery of content and instruction with some element of student control.

Financial Reporting: A formal record of financial activities of a business.

Perception: An organisation, identification, and interpretation of information to represent and understand the environment.

Chapter 51

21st Century Distance Learning in Sub-Saharan Africa:
Distance and Blended Learning in Ghana

Alex Kumi-Yeboah

William Young
University of South Florida, USA

Kankam Boadu
University of Cape Coast, Ghana

ABSTRACT

Distance education in Ghana is rapidly gaining recognition as a result of the increasing demand for higher education by qualified applicants, most of whom are denied admission due to the limited space and resources. Distance education promotes cross-national, multi-disciplinary perspectives in educational practice and equips students, faculty, and administrators with resources to compete in the academic world of the 21st century. Universities in Ghana have opted for distance learning as an alternative measure to reduce congestion and help remedy student admissions to the few universities available (Dzisah, 2006). However, little is known about the trend of distance and blended learning education in Ghana. This chapter addresses the trend of distance learning and university education; distance and blended learning in Ghana; information on African Virtual University and distance education, benefits, challenges, recommended strategies of distance and blended learning programs in Ghana; and a conclusion.

INTRODUCTION

In the 21st century, distance learning has become a major medium of instruction between instructors and students especially in the developed countries. However, in the developing countries, most applicants are denied admission due to the limited space and resources. The demand for higher education in sub-Saharan Africa is higher than the few institutions can accommodate. The United Nations Organization (UNO) estimates that 3.8 million teachers will need to be recruited

DOI: 10.4018/978-1-4666-8246-7.ch051

and trained by 2015 to achieve universal primary educational goals (United Nations, 2009). The number of student enrollments in sub-Saharan Africa between 1991 and 2006 increased by 16%, however, the various governments expenditure on high education rose to only 6% (World Bank, 2010). This leads one to conclude that Sub-Saharan African countries will not be able to meet the demands of increasing trend of student population in providing resources such as educational technology, staff, and training facilities (World Bank, 2010). Thus, various governments need to provide equitable access to higher education while considering other options of distance learning. An effective combination of different approaches of distance learning can lead to increased accessibility of students into tertiary institutions in Africa.

Ghana (formerly Gold Coast) is a country situated on the West Coast of Africa in the Gulf of Guinea. It occupies a total land area of 238,539 square kilometres (92,099 square miles). Ghana is a multilingual country with diverse local languages, predominantly Akan, Dagomba, Ewe, and Ga. English is the official and commercial language, and is taught in all schools. The rural population forms about 66% of Ghana's 25 million people. Ghana gained independence in 1957 from Britain, becoming the first country in sub-Saharan Africa to free itself from colonial power. It shares borders with Cote d'lvoire to the west, Togo to the east, and Burkina Faso to the north. Major cities in Ghana are Accra- the National capital, Kumasi, Tema, Sekondi-Takoradi, and Tamale. It has a tropical climate, with an annual mean temperature of 26^0 C and 29^0 C. The majority of the people are employed in agriculture; however, there exists inadequate developed resources such as roads, schools, electricity, and health care (Millennium Development Goals Report, 2011). The country is divided into ten (10) administrative regions and 170 decentralized districts. The government is a presidential democracy with an elected parliament and independent judiciary.

Ghana became the second country in Sub-Saharan Africa to have full Internet connectivity. However, the Internet sector's expansion has been slowed by shortages of functional dial-up phone lines (CIA fact book, 2011; Lundkvist et al., 2004). Internet service is connected to the world's first submarine fibre-optic cable system, SAT-3/WASC/SAFE, linking Africa to Europe and Asia (Research-Africa.net, 2010). In 2002, the National Communication Authority (NCA) licensed 52 Internet service providers (ISPs); however, few of them are currently operating (Lundkvist et al., 2004). In 2005, Ghana was ranked 61st in the World Economic Forum's Global Information Technology Report (World Economic Forum, 2006).

In 2003, there were more than 750 Internet cafes in Ghana, mostly using dial-up connections. About 70% of them are located in Accra, and others in cities such as Kumasi, Tema, and Takoradi (Lundkvist et al., 2004; Opoku, 2004). Most countries in sub-Saharan Africa have taken the advantage of the technological advancement in distance learning to make strides in the advancement of education. These technologies offer tremendous hope towards providing its citizens with access to a higher education (Selinger, 2002; Isaacs et al., 2004; Shrestha, 2000).

The rapid growth of student population and limited space in the universities had called for urgent measures to widen university admission. For example, in 1996, only 6,088 students were admitted to the universities out of 22,477 qualified applicants 27%. Consequently, Universities opted for distance learning programs with blended learning focus as the best alternative (Nichol & Watson, 2003). Considering the high demand for access to tertiary education and decreasing budgetary allocation for educational provisions in Ghana, there has been a growing interest in distance education and open learning (Development of Education in Africa, 2002) as an alternative to efficient means of providing quality education to people. This chapter highlights the trend of distance learning and university education, background knowledge of higher education, distance and blended learning in Ghana, the role African Virtual University and distance education, benefits, challenges, recommended strategies of distance and blended learning programs in Ghana, and conclusion.

BACKGROUND

Higher Education in Ghana

One major function of higher education in Ghana was to train leaders and resource personnel therefore, university education was restricted to carefully selected elites who were become future leaders (Effah, 2001). Higher education in Ghana is composed of eight universities, ten polytechnic institutions and several professional institutes (Manuh, Gariba & Budu, 2007). Enrollments in the public tertiary institutions have increased more than 50% from 13,415 to about 87,929 students in the period of 1990 to 2004 (Manuh, Gariba & Budu, 2007). Since 2000s, a significant number of private universities and institutions have been established mainly by missionary authorities to augment the lack of access to university education by majority of the applicants who have been denied admission to the public universities. Private universities account for only 5 percent of total tertiary enrollments and their establishments have helped to reduce the problems of admission to tertiary institutions in Ghana (Manuh, 2007). As of 2012, Ghana is reported to have had more than 45 private universities accredited by the National Accreditation Board (Ghana National Accreditation Board Website, 2010). Despite the growth experienced in Ghana's tertiary education, the total enrollment ratio for the 18-22 year old age cohort in tertiary education stands at only five percent (UNESCO Institute for Statistics, 2006).

Access to university education in Ghana is limited and categorized by the socio-economic status, region of origin, types and locations of secondary school of the applicant (Manuh, Gariba & Budu, 2007). Less than 35% of the students who apply are admitted due to growing numbers of qualified secondary school leavers and university space and staffing limitations. The majority of students come from a limited number of secondary schools and the more advantaged regions. As a result of these problems, the various universities in Ghana have devised strategies to make university education accessible to all.

Distance and Blended Learning Solutions

According to Roblyer and Edwards (2000), distance learning is defined as "the acquisition of knowledge and skills through mediated information and instruction, encompassing all technologies and other forms of learning at a distance (p. 192)." It is an educational process in which, a significant portion of the teaching, is conducted by someone removed in space and or time from the learners (UNESCO, 2002). Further, Distance learning is an organized instructional program in which teacher and learners are physically separated (Newby, Stepich, Lehman & Russell, 2000). The Association for the Development of Education in Africa (ADEA), 2002 defines distance education as "the process whereby the learner is separated from the instructional base or teacher, either in space or time, for a significant portion of their learning." According to the Association for the Development of Education in Africa (2002), distance education has the following characteristics: (a) institutional accreditation, where learning is accredited or certified by some institution or agency; (b) use of a variety of media, including print, radio and television broad casts, video and audio cassettes, computer-based learning and telecommunications; (c) provision of two-way communication, which allows for tutor-learner interaction; and (d) possibility of face-to-face meetings for tutorials, learner-learner interaction, library study and laboratory or practice sessions.

It is a 20th century invention based on organizational structures and technologies produced by the industrial revolution (Frempong, 2004).

According to Osguthorpe and Graham (2003), blended learning combines face-to-face instruction with distance education delivery systems. Blended learning combine technology based learning with face-to-face learning (Kerres & De Witt, 2002, p.101). Similarly, Driscoll (2002) defines blended learning as mix modes of Web-based technology (for example, live virtual classroom, self-paced instruction, collaborative learning, streaming video, audio, and text) to accomplish an educational goal.

Kerres and De Witt (2003) and Hoffman (2001) identify the following as most used elements in blended learning situations:

1. Traditional classroom or lab settings (face-to-face instruction).
2. Reading assignments (print-based workbooks).
3. CD-ROM (self-paced content).
4. Performance support tools (collaboration software, threaded discussions, online testing.
5. Tele-training such as videoconferencing.
6. Asynchronous Web-based training (email-based communication, e-learning platforms, discussion boards).
7. Synchronous Web-based training (chat rooms, computer conferencing).

Further, McArthur (2001) argues that technology is not the main medium in blended learning but rather much consideration should be focused on blended learning strategy. In support of this plan, Franks (2002) designed blended learning models to include (a) initial mode that provides administrative information on a course; (b) through a communication element; (c) leading to materials delivery; and (d) use of technology to meet learning needs. In the context of distance learning and higher education in Ghana, Fox's (2002) definition of blended learning fits most appropriate as "… the ability to combine elements of classroom training, live and self-paced e-learning, and advanced supportive learning services in a manner that provides a tailored learning…" (p.26). According to Rovai and Jordan (2004), blended learning has the following major types:

- **The Use of Multimedia and Virtual Internet Resources in the Classroom:** Examples include the use of videos, virtual field trips, and interactive Websites.
- **The Use of Classroom Websites in the Classroom.**
- **The Use of Course Management Systems:** Examples include the use of Moodle, WebCT and Blackboard.
- **The Use of Synchronous and Asychronous Discussions in the Classroom:** Examples of resources available include Yahoo Groups, TappedIn, Blogs, and Elluminate (Rovai & Jordan, 2004).

Schmidt (2002) states that blended learning should incorporates the following components:

- **Administration:** Which involves the organization of the syllabus, increase teacher productivity/efficiency, distributing/collecting material, and scheduling duties.
- **Assessment:** Which involves the ability to providing feedback, tracking student progress, and testing opportunities.
- **Content Delivery:** That comprises communicating content through different learning styles, using multimedia, incorporating learning activities, using the Internet for the acquisition of knowledge.
- **Community Component:** That involves building the classroom community through synchronous/threaded chats, providing office/help hours to communicate online.

Provost (2011) asserts that the population of sub-Saharan Africa is expected to grow to by more than 34% over the next 20 years. Therefore, it is incumbent upon the region to institute measures to respond the increasing demand of potentially 77 million new students. Student enrollment in higher education has grown faster than financing capabilities, reaching a critical stage where the lack of resources has led to a severe decline in the quality of instruction and in the capacity to reorient focus and to innovate (World Bank, 2010).

Roberts and Associates (1998), further explains that currently more than 140 public and private institutions provide tertiary distance education services within sub-Saharan Africa and methods of delivery are mainly print media, supplemented by written assignments, and face-to-face tutoring by instructors (Murphy & Zhiri 1992). Most distance learning programs are in the area of teacher education preparation with the sole purpose of providing the upgrading of required skills for teachers and as well as for professional development. Other offered programs include: business management or information technology, science, social sciences, mathematics and peace studies. A recent survey of 143 tertiary distance education programs in Africa found that 52% of anglophone programs and 67% of francophone programs targeted teachers and school administrators (Roberts & Associates 1998). According to Opoku (2004), the development of Information, Communication and Technology (ICT) will provide significant opportunities for developing countries such as Ghana. There is high demand for open and distance learning in Ghana's public and private universities (Opoku, 2004). Universities in Ghana have opted for distance learning as an alternative measure to reduce congestion and help remedy student admissions to the few universities available (Dzisah, 2006). Thus, blended learning that mixes various event-based activities such as face-to-face classrooms, live e-learning, and self-paced learning with the development of new technology systems is highly recommended as the best efficient way to enhance the delivery of quality education to increasing students population in Ghana with the power of ICTs (Unwin, 2005; Valiathan, 2002). There is a need for comprehensive analysis of the instructional design and use of distance and blended learning programs in Ghana.

Distance and Blended Learning in Ghana

The Ministry of Education under the direction of the government developed a comprehensive plan using distance learning to meet the demands for higher education and also to relieve the over population of students on campuses of the public universities (Addah, Kpedu, & Frimpong Kwapong, 2012). The mission of the distance education program in Ghana is to make quality education at all levels accessible and relevant to meet the growing academic needs of Ghanaians with the sole purpose of enhancing their academic performance and improve the quality of their lives (Frimpong Kwapong, 2012, World Bank, 2010). The government of Ghana has issued a statement that identifies major reasons for implementing distance learning. Distance learning will provide Ghanaians with opportunities to manage technological advancements and enhance contributions to national building; as well as provide opportunities for further education. Further goals are to provide an equitable and efficient access to education for all and improve the capacity of Ghanaians to manage technological advancement and the knowledge society and be able to enhance their contribution to nation building (Addah, Kpedu, & Frimpong Kwapong, 2012).

The main public universities in Ghana namely the University of Ghana (UG), Kwame Nkrumah University of Science and Technology (KNUST), the University of Cape Coast (UCC), the University of Education, Winneba (UEW), and the University for Development Studies (UDS) (Oppong-Mensah, 2009) have established open and distance learning centers to train and offer degree programs to the increasingly student population. Due to inadequate infrastructural resources, lack of personnel, and finance, blended learning in Ghana is contextual depending on the program of study and location. However, blended learning programs are focused more on face-t-face instruction with less use of technology. Thus, the mode of delivery is dual mode component of distance learning (80% face-to-face and 20% use of technology- the use of print-based (modules). It was started by UEW in 1996, followed by UCC in 2001, then KNUST in 2004 and in 2007 by the UG. As stated earlier, distance learning has been the best alternative measure to provide access to university to most people in Ghana (Addah, Kpedu, & Frimpong Kwapong, 2012).

The Center for Continuing Education at the University of Cape Coast (CCEUCC) runs two dual distance-learning programs in Diploma and Post Diploma in Basic Education Degrees, for the training and retraining of basic teachers in Ghana. The mode of delivery is blended learning with about 90% face-to-face meeting on campus and 10% off campus through correspondence and minimal use of technology. The Centre for Continuing Education (UCC) has more than 23 study centers for the Basic Education Programs across the country with a regional coordinators responsible for students' and course tutors' affairs, face-to-face sessions, examinations and quizzes, as well as supervise students' project work and off-campus teaching practice, arrange for students to get guidance and counseling services (Addah, Kpedu, & Frimpong Kwapong, 2012). The mode of delivery is highly centered on the use of print-based (modules) infused with traditional face-to-face instruction at the various learning centers. Students and tutors meet monthly on a face-to-face instruction in all the 26 study centers across the country. Regional coordinators from the main campus at UCC and the center representatives visit the study centers every week to monitor the face-to-face sessions, offer counseling to students, and organize assessments. In 2012, about 33,000 students with close to 20,000 offering education and the rest business programs are pursuing higher education through distance learning at the University of Cape Coast (UCC). UCC has the largest distance learning programs with dual mode component in Ghana. It currently has about 13 education and eight business programs with about 2,000 qualified course tutors using blended form of learning wit 80% face-to-face instruction and the use of print-based (modules) (Oppong-Mensah, 2008).

At the University of Ghana, the Institute of Distance and Continuing Education (IDCE) is tasked to design and manage bachelor and post graduate programs to many people who otherwise would not have been able to access higher education. Distance learning program at the university of Ghana entails courses in the social sciences such as Sociology, English, Religious, and Political Science at the bachelor degree level. Further, the Institute of Distance and Continuing Education (IDCE) has centers in all 10 regions. Method of delivery is blended learning with print-media and traditional face-to-face instruction and some form of Internet use. There is collaboration between the University of Ghana and the Indira Gandhi National Open University in various academic programs offered by the Indira Gandhi National Open University via the tele-education mode under the Pan-African e-Network Project that started in 2011 (Addah, Kpedu, & Frimpong Kwapong, 2012).

The Institute of Education Development and Extension (IEDE) is in charge of a distance education program at the University of Education, Winneba (UEW). The IEDE offers certificates, diploma, post-diploma and degree programs for teachers and non-teachers. The IEDEI has centers at all the ten regions in Ghana in addition to the two major branch campuses of the university. Each center has a regional coordinator whose responsibility is student affairs, affairs as well as proctors end of semester examinations. Student population has grown from 7,954 in 2007 to 12,665 in 2008 and 17,169 in 2009 to over 20,000 in 2012. The method of delivery is blended learning with more than 80% in a "Sandwich Program" (a distance learning program where students meet face-to-face with instructors mostly on summer) and 20% use of print-based materials (Oppong-Mensah, 2008).

In 2009, the IEDE lunched a master's degree program in mathematics, music, technology, social studies, and science education through its "Sandwich Program" distance learning and plan on starting a collaborative Doctor of Philosophy PH.D program with the same disciplines using distance learning (Oppong-Mensah, 2008). To increase the percentage of technology use in its distance and blended learning programs, the IEDEI initiated the use of video-conferencing in all 23 centres that host the university's distance programs as a way to introduce an electronic component in the distance education program. To make effective use of technology, the IEDEI started converting print course modules into electronic books (e-books) and the content converted into interactive online learning materials for students on a pilot basis.

The Institute of Distance Learning (IDL) was established at the Kwame Nkrumah University of Science and Technology to increase access to motivated and qualified students using multimedia. The Institute of Distance Learning at the KNUST introduced three top-up undergraduate programs in Computer Science, Electrical and Electronic Engineering and Telecommunications Engineering during the 2009/2010 academic year using blended learning medium. In 2010/2011, KNUST introduced a new distance learning program in Doctor of Optometry. The program uses a wide range of technologies (60%) such as, print, multimedia, TV, and radio broadcast, video conferencing and Web-based technology and (40%) face-to-face instruction of campus or designated learning centres. In 2011/2012, the Institute of Distance Learning (IDL) of KNUST offered two programs namely, Master of Science (M.Sc.) in Information Technology and Master of Philosophy (M.Phil) in Health Informatics. The Institute offers eleven (11) undergraduate, and five (5) post-graduate programs concurrently in eight Regions of the country using blended learning modules.

Additionally, the Institute of Distance learning offers MSc in Information Technology, ICT professional courses and MBA in Finance through ICT usage for the Ghanaian public through e-learning and distance education. The Institute of Distance learning at KNUST has a center in Accra that offers in both undergraduate and graduate programs. Examples of these programs are BSc. Building Technology and BSc. Actuarial Science for undergraduates as well as MSc. Environmental Science and MSc. Industrial Mathematics. Lectures for these programs are facilitated in Accra. Most of the classes are offered on weekends and nights with the use of print-based (modules) and face-to-face instruction (Asabere & Enguah, 2012).

African Virtual University

African Virtual University (AVU) began in 1997 as a pilot study in Africa by the World Bank with its headquarters in Nairobi, Kenya. Its mission is to increase access to educational resources throughout sub-Saharan Africa, and promote quality higher education in the most critical area of economic development. It started with 57 learning centers in 27 African countries working to support economic development and offers many programs leading to certificates, diplomas, and degrees in business administration, biology, chemistry, distance and e-Learning professional development, physics, mathematics, teacher education professional courses, renewable energy, food security, ICT integration in education, ICT basic skills, and computer science (African Virtual University, 2012).

The AVU was established with the following objectives: (a) increase access to tertiary and continuing education in Africa by reaching large numbers of students and professionals in multiple sites simultaneously; (b) increase access to higher quality Open, Distance and e-Learning (ODeL) resources that are relevant to Africa; (c) enhance the capacity of African tertiary educational institutions; (d) enhance and sustain a network of Partner Institutions; (e) build and sustain partnerships with institutions that can support the African Virtual University Mission; (f) carry out research and evaluation activities on the African Continent; (g) build and sustain a committed and effective African Virtual University organization; and (h) develop and implement a fund raising strategy in support of all of the above objectives with focus on African Governments, the Private Sector and International Organizations (AVU, 2012; 2013).

AVU has developed significant experience in the following areas since 1997: (a) delivering programs though information and communication Technologies (Degree Programs, Certificate and Diploma Programs); (b) building and managing large consortia of African Educational Institutions; (c) designing and implementing Multinational e-Learning Projects; (d) developing African-based residential and e-Learning materials for Partner Institutions; (e) establishment of state of art e-learning centers in Partner Institutions; (f) training of Partner Institutions staff in e-Learning methodologies; (g) developing and implementing Open Education Resources (OER) strategy; and (h) managing a digital library (AVU, 2011; 2011b).

In 2003, the AVU introduced the teacher education program as a component of the AVU multinational support project. The aim of the project was to address the challenges of quantity and quality that teacher education profession faces in sub-Saharan Africa. The AVU teacher education program has the benefits of (a) improving the quality of teaching and learning in mathematics and science education through the use of ICTs; (b) increase the number of mathematics, sciences, and basic computer science teachers by expanding access to training through the use of ODeL methodologies; (c) develop and promote research in teacher education in order to encourage evidence-based decision-making in all aspects of teacher development; and (d) promote regional integration and strengthen relevant partnerships with other teacher education initiatives in Africa and globally (AVU, 2009; 2012).

The AVU, through partner institutions, has trained more than 43,000 students since its establishment in 1997. The method of teaching delivery includes asynchronous, synchronous satellite video, videotaped classes, and video conferencing where students have the opportunity interact and ask questions via using telecommunication, email, or fax. Email-interaction between students and instructors is often used and live lectures in a one-way video, two-way audio, and digital satellite broadcast is often used as a teaching method (AVU, 2003; 2004). The AVU has established more than ten (10) e-learning centers, one in each of ten beneficiary countries, between 2007 and 2012. AVU centers act as physical hubs for the creation, organization, and sharing of knowledge as well as the development of local, distance, and e-learning programs. In Ghana, the University of Ghana (UG), University of Cape Coast (UCC), Kwame Nkrumah University of Science and Technology (KNUST), and the Ghana Institute of Management and Public Administration (GIMPA) have AVU centers that offers distance learning in computer science, and business administration for both undergraduate and graduate programs. This has helped many students to gain admission to the above institutions who could have been denied admission due to lack of infrastructures, shortage of faculty, and resources. Overall, the establishment of the AVU has helped to increase access to university education to majority of students in sub-Saharan Africa as a result of mode of delivery through the use of ICT and multimedia considered as the first of its kind in Africa (AVU, 2005).

Benefits and Constraints of Distance Learning in Ghana

To address the challenges of education in Ghana and increase the ratio of teacher-student, the government has reformed the educational systems in the late 1980s, which reduced the duration from 17 years to 12 for basic and secondary education and increased university education from three to four years. The main aim of these educational reforms was to increase student access and enrollment as well as to make vocational and technical education a greater part of the educational system in Ghana (Dzisah, 2006). The Ministry of Education (2002) designed a new program to address the problem of teacher shortages and high attrition rates associated with teacher migration to other sectors of the economy (Oppong-Mensah, 2008).

Benefits of Distance and Blended Learning in Ghana

Distance learning has the potential of equipping teachers with adequate knowledge and skills for lifelong learning. In Ghana, distance learning with blended focus provides the opportunity for professionals especially teachers to have access to university education. Distance learning can be used to provide in-service training of untrained teachers and professional upgrading in basic and secondary education (Perraton, 1993, 2000; Perraton et al., 2002; Robinson & Latchem, 2002; Saint, 1999).

Distance learning will open up new frontiers to learning by enhancing collaborative research opportunities among African universities. It will promote cross-national, multi-disciplinary perspectives in educational practice and equip students, faculty, and administrators with resources to compete in the academic world of the 21st century (Darkwa & Mazibuko, 2000). According to Saint (1999), distance education in sub-Saharan Africa can effectively reach people who have been denied access to university education. For instance, women who are unable to attend traditional educational programs because of household responsibilities or cultural constraints, and teachers in the rural areas who want to receive university degree or update their teaching skills have opportunities to complete their education and become professionals. The establishment of the AVU has enhanced the use of new information technologies to support classroom teaching. For example, lectures can access the latest scientific information, reference resources, effective learning exercises and creative teaching aids through the Internet. Students and lectures can communicate and research with the use of e-mail and Internet facilities that turn to local research activities (AVU, 2012).

Distance learning in the form of e-learning has the potential of reducing cost considering the elimination of costs associated with instructor's salaries, student travel, lodging, and meals are directly quantifiable. The reduction of time spent away from the job by employees may be the most positive offshoot (Asabere & Enguah, 2012). Students have the opportunity to receive consistent delivery of content with asynchronous, self-paced e-Learning. As a result of the modular approach distance learning adopts, course materials can be updated or modified to suit particular types of students without the need to reproduce them in their entirety leading to cost-efficiency (Saint, 1999). Distance and blended learning have created flexibility and opportunity for students to take significant advantage of tertiary education in the 21st century. It confronts the challenges of serving an increasingly diverse pool of students with an expanding range of learning requirements (Saints, 1999).

Additionally, distance and blended learning provides the opportunity for students to work and study simultaneously. It does not require the additional costs of campus residence, and offers an alternative pathway to tertiary training for students with limited financial means. This is contributes to the narrowing of the education gap among different ethnic groups, making a meaningful educational contribution to the country's long-term political stability (Saint, 1999; Darkwa, 2007).

Distance learning promotes cross-national, multi-disciplinary research in education, making students, faculty, and administrators have the requisite resources to engage in meaningful and scholarly work on the 21st century (Darkwa & Mazibuko, 2000). Since 2010, the AVU has been offering joint certificates programs in teacher education, designing, developing and offering e-Learning training, providing consultancy services and the provision of academic services for income generation. This includes content design and development, consultancies in e-Learning, e-conferences, Webinars, as well as organizing fundraising activities (AVU, 2012). According to Oppong-Mensah (2008), distance education promotes quality through the development and provision of learning resources that can be utilized by teachers and learners, regardless of their location. Distance learning has the potential to enhance and promotes access to lifelong learning such as professional development to individuals who have obtained formal qualifications (Oppong-Mensah, 2008). The use of blended learning in higher education in Ghana has opened numerous opportunities for college students to have access to tertiary education. It has also increased growth of student population in the universities thereby generating income for the universities. For example, the university of education, Winneba (UEW) and the University of Cape Coast (UCC) generates more income from distance learning program.

The implementation of distance learning has extended tertiary education opportunities to students in the rural areas, small towns especially teachers in the rural areas of the country who do not have convenient access to tertiary institutions. It saves them travel time, travel expense, and the continuation of work income while studying (Frempong, 2004; Opoku, 2004).

Challenges/Constraints of Distance and Blended Learning in Ghana

Distance learning programs generally require better management skills than traditional tertiary programs (Asabere & Enguah, 2012). The problem of logistics has been a major challenge to distance learning in Ghana as a developing nation. The use of technology is critical to the success of distance-learning programs in Africa (Saint, 1999). In Ghana, there is a technical problem of reliable power supply to institutions that runs distance learning. This hampers the adoption of information and communication technology (ICT) into the distance learning making Internet unreliable for students and faculty. There is a problem of bandwidth capacity in the universities that offer distance education. Most universities pays 50 times more for their bandwidth than their educational counterparts in the rest of the world, and fails to monitor, let alone manage, the existing bandwidth. This hinders useful research and distance education (Steiner, Tirivayi, Jensen & Gakio, 2005).

Few of the tertiary institutions in Ghana are equipped with up to date Internet and wireless broadband, telephone links to rural areas are poor, despite advances in wireless technology. For example, students in the distance learning program have no choice than to use private Internet Cyber Cafes run by private small businesses within and outside campus for additional cost (Opoku, 2004; Dzisah, 2006). Access to information technology and connectivity is generally limited in these institutions and staffs are not trained on how to use ICT facilities, thus hindering the growth of distance learning. The libraries in these universities possess few stand-alone computers equipped with dial-up e-mail (and perhaps a CD-ROM player).

According to Isaacs et al. (2004), there is wide spread low Internet bandwidths, limited telephone connections, and negligible computer ownership as a common problems in Ghana. Thus, posing major challenges to students in the distance learning programs in Ghana. Sagna (2005) further explain that information communication and technology infrastructure is limited to capital cities and major centers. Thus, Internet accessibility is unavailable to the great majority of rural and remote area dwellers, leading to uneven access. Another challenge to distance learning is that of financial constraints. The government of Ghana provides little financial support to universities in the field of distance learning. This makes it difficult for the universities to institute efficient distance learning programs (Asabere & Enguah, 2012). In Ghana, there is a degree of cost-sharing on tuition for tertiary distance education programs between students and government is becoming an established precedent (Saint, 1999). This practice derives from an assumption that distance education students are employed has put financial burden on students who opt for distance learning. Lastly, there is a high degree of brain drain of human resource personnel with skills in ICT. This has resulted in the lack of competent faculty and ICT experts who will undertake implementation of distance and blended learning projects (Intsiful, 2003).

Recommended Strategies

Distance learning with blended focus is changing rapidly in sub-Saharan Africa with no exception to Ghana. The total number of students in distance learning is more than 45,000 students in universities in Ghana. Distance learning has created the possibility of an increased access to tertiary education at more cost- effective levels for students and other adult learners (Saints, 1999).

Universities could revise, and develop a clearly defined strategic policies and plans with specific objectives on the implementation strategies to be outlined for blended learning in the future. The plan and strategies must identify how distance learning could address the needs of students' access to higher education. Universities could increase their effort of expanding distance education programs to include online and blended learning for students in the teacher education program.

More over, funding could be made available to distance learning in the universities to help transform instructional technology to meet the rapid growth of technology in higher education in the 21st century. Equal access to tertiary education could be made available to all students regardless of their location and socio-economic status through distance learning. Thus, universities could mobilize more funding to build distance learning centers to promote equal access to tertiary education for all using blended learning. The government could provide funding financial and logistics support to distance learning programs that will make it possible to ease campus congestion due to increased number of students outpacing facilities. Funding should be available to purchase modern resources such as computers, books, transportation, printing materials, and other technological logistics to support distance and blended learning education. Universities could provide professional development training to faculty, and staff on the best practices of teaching and computer literacy using blended learning modules in their distance learning programs. Human resources are critical to distance education program, thus, effective training will provide steady stream of experienced personnel who will guide future activities on distance learning policies (Saint, 1999).

Finally, universities and polytechnics could collaborate with other universities to establish networks that have the potential to identify the challenges and the implementation of appropriate strategies to help reduce it (Opoku, 2004). To support e-learning implementation in higher education, universities could partner with private Internet service providers or corporate investors to provide Internet and technology support to students off campus. This could enhance reliable power supply, Internet service and efficient bandwidth management for a successful distance learning in Ghana. It is important for the university administrators initiate efficient training programs for faculty, technical staff and students. Effective training will ensure consistent progress of the educated and experienced personnel capable of implementing and guiding future distance education programs.

FUTURE RESEARCH DIRECTIONS

Distance learning has been considered an alternative educational strategy to decongest university campuses and provide an opportunity for equal access to tertiary education. It is a form of education that helps to solve the growing demand for higher education and bridge the gap between those living in the rural areas and in the cities. However, distance learning faces challenges such as financial constraints, inadequate infrastructural facilities, shortage of skilled personnel, and government low level of commitment that stifles efficient distance learning programs to meet the growing demand for student willing to receive higher education.

This chapter contributes to the trend of distance learning and university education in Ghana. This Chapter shows that distance learning has provided opportunities for many people to have access to university education and bridging the gap of human resource development. Additionally, more women have been admitted to the universities in Ghana, as a result of the distance learning programs, for it allows students to work and study with options of class time and convenience (Frimpong Kwapong, 2012). The educational implication of this chapter is that it shares information about the benefits and challenges facing distance learning in Ghana as well as strategies that can be used to solve the problems. This chapter highlights the trend of distance learning in Ghana and how it is delivered to students and the instructional pedagogy involved. The chapter provides information about various distance learning programs undertaken by the various universities and online education, models of instruction, benefits, challenges and future directions of research. Future investigation could be conducted on the possibilities of blended and online learning in the universities and the challenges involved. Additional research could be investigated on effective professional development curriculum for faculty and staff on distance education. Furthermore, future research could investigate the perception of students and students on distance and online learning.

CONCLUSION

It is important for policy makers and the government to recognize the significance of distance and blended learning in the promotion and quality of higher educational opportunities in Ghana. Distance and blended learning will be the best alternative to increase higher education opportunities for people willing to acquire education but who cannot get access because of a variety of inadequacies, infrastructure and space (Ayeh, 2008). Distance and blended learning programs has led to academic and professional competence of majority of people in higher education especially teachers and other professionals. This study will contribute as a secondary source for researchers in the field of distance learning to know the existing trend of distance learning in sub-Saharan Africa with special reference to Ghana. The trend of distance learning with blended focus is encouraging despite numerous challenges. For example, distance learning is now highly utilized in the emerging financial, educational and agricultural sectors in Ghana (Effah, 2001; Oppong-Mensah, 2009). Distance learning with blended elements programs have crossed a new threshold and culturally accepted by the people. The trend seems to be promising with infusion of ICT into all sectors of the economy with education being the first priority.

KEY TERMS AND DEFINITIONS

African Virtual University (AVU): Established in 1997 as the first online university in sub-Saharan Africa by the World Bank with its headquarters in Nairobi, Kenya.

Asynchronous: Means students can learn the same content (pre-recorded lecture, notes posted online, Web-based simulation) at different times. It could be an existing or occurring at the same time.

Blended Learning: Combines forms of instructional technology (e.g., videotape, CD-ROM, Web-based training, film) with face-to-face instructor-led instruction depending on availability and resources in the context of location.

Distance Learning: It is an educational process in which, a large portion of the teaching, is conducted by someone not in the classroom or in space and or time from the learners. In distance learning the instructor is either most of the time out of class or minimal presence in the classroom or place of instruction.

E-Learning: Comprise all forms of electronically supported learning and teaching.

Ghana: (Formerly Gold Coast) is a country situated on the West Coast of Africa in the Gulf of Guinea.

Higher Education: Education beyond secondary education that is provided by college or university in Ghana.

Open and Distance Learning: Way of providing learning opportunities that is characterized by the separation of teacher and learner in time or place, or both time and place; learning that is certified in some way by an institution or agency; the use of a variety of media, including print and electronic; two-way communications that allow learners and tutors to interact; the possibility of occasional face-to-face meetings; and a specialized division of labour in the production and delivery of courses (Common Wealth of Learning).

Synchronous: Means events that happen at the same time for everyone, but can be online using Web conferencing or IM chats or offline. Not going at the same rate or exactly together with something else.

Chapter 52
Adoption of Blended Learning Technologies in Selected Secondary Schools in Cameroon and Nigeria:
Challenges in Disability Inclusion

Julius T. Nganji
University of Hull, UK

Shawulu H. Nggada
Polytechnic of Namibia, Namibia

ABSTRACT

Blended learning could be seen as the solution to learning resource accessibility, especially when the indicators of measure are limited to distance and time. Distance and time could be said to be the generic indicators for the measure of blended learning. However, these do not solve the problem for everyone in society. For Inclusive Blended Learning (IBL), different types of users in society should be considered in its design. This is exactly what has provoked the focus of this chapter, to investigate the position of blended learning with respect to people with disabilities. The chapter's investigation is centered on selected secondary schools in Cameroon and Nigeria.

INTRODUCTION

Due to increasing development and employment of Information and Communication Technologies (ICTs) in various sectors of society, this age could be described as that of an information revolution. This age has facilitated teaching and learning, and with the development of e-learning means students can access learning materials from anywhere and at anytime when they have access to the required technologies. This, by design should improve the learning ability of students since accessibility of learning resources is high. In its much wider implementation, access to such resources could

DOI: 10.4018/978-1-4666-8246-7.ch052

also be made available on mobile devices. This does not necessarily have to come in the form of a mobile app (application) which may be restricted to a particular device but in the form of mobile Web pages since most popular mobile devices have browsers.

Also, the perpetual development and integration of ICT in various facets of society has meant individuals and organizations are forced to continually adjust to newer approaches of teaching and learning. It is expected that such newer approaches will also be found in institutions of learning. Africa, and in particular Sub-Saharan Africa, has been found to be among the least digital (Heeks, 2009) due to the effects of the digital divide (ITU, 2005). This implies less use of such technologies even in the educational sector. In such societies, the rural areas tend to be most disadvantaged.

However, Africa was identified as one of the fastest growing continents in terms of adoption and use of mobile phones (ITU, 2004). There is great potential therefore to utilize such technologies in education. In fact, it has been reported that farmers and those in the healthcare sector are positively using these technologies for their benefits (Mutume, 2009). Such use of technology could be emulated in the education sector to improve teaching and learning. However, the increasing uptake of technology by sub-Saharan African countries, and their eventual utilization in education (Nganji, Kwemain & Taku, 2010), has been discriminatory in that students with disabilities are often excluded (Nganji, 2008). This might be due to the fact that such technology has not been designed for accessibility (Brophy & Craven, 2007; Sheldon, 2001). Also, in most sub-Saharan African societies, there is the tendency to neglect the needs of people with disabilities. This includes education as the society has not adapted to including the needs of disabled students within mainstream education. This calls for measures to improve accessibility to blended learning technology for disabled students.

Aims and Objectives of Chapter

This chapter will investigate the integration and level of blended learning in some selected secondary schools in Cameroon and Nigeria particularly focusing on how blended learning is employed for the benefit of students with disabilities. A brief review of the adoption of blended learning technologies in Africa will be discussed, including the effects of the digital divide.

Thus, this chapter will assess the level of disability inclusion in the adoption of blended learning technology (mainly computers and associated technologies) in the selected secondary schools. The results of a survey in these schools will be presented, analyzed and discussed, and some recommendations will be made on improving access to blended learning technologies for everyone, particularly those with disabilities who are often neglected in the society. The chapter will also present the challenges of adopting blended learning technologies in Cameroon and Nigeria.

By examining these issues, this chapter will be going a step further to address an issue that is not normally the focus of researchers in the region. Addressing such issue will help stimulate thought and discussion on inclusion of disabled students in the use of blended learning technology in resource poor areas.

BLENDED LEARNING

According to Cohere (2011), blended learning (BL) has emerged in response to the increasing need and demand to respond to diverse students' needs, to provide engaging and meaningful learning experiences, and to optimize increasingly scarce resources. Hence it appeared that BL's scope of implementation is user inclusive. Blended learning simply refers to the combination of the traditional face-to-face approach and the use of technology in learning (Graham et al, 2012). The traditional face-to-face aspect of learning is the

Table 1. Continuum of blended learning models

Model 1	Model 2	Model 3	Model 4	Model 5
Fully online curriculum with options for face-to-face instruction.	Mostly or fully online curriculum with some time required in either the classroom or computer lab.	Mostly online curriculum with students meeting daily in the classroom or computer lab.	Classroom instruction with substantial required online components that extend beyond the classroom.	Classroom instruction that includes online resources, with limited or no requirements for students to be online.

type which most societies are familiar with as it has been around for a long time. However, the mode of delivery of this type of learning is constantly being modified to improve student understanding relative to learning outcomes. According to Sider (nd), public schools in the United States have embraced the teacher-manager model or the traditional face-to-face learning model of education for at least 200 years; where the teacher in a given classroom acts as the primary manager of conduct, assessment and instruction. These responsibilities are demanding and often limit instructional time and the ability of teachers to provide differentiated instruction for diverse groups of students. With blended learning where technology is included, a teacher could be relieved from such demanding task and therefore have the required time to focus on other pressing needs among students (e.g. students with special needs) and also to providing quality instruction.

However, the technology aspect of blended learning is fairly new and its implementation varies greatly from country to country and from school to school. This chapter is concerned with the level of technology used in teaching in selected secondary schools. At the elementary level of BL, implementation technology consists of basic computing devices (such as PCs, laptops, etc.) for the purpose of lesson delivery or teaching. At its advanced level, BL is implemented to support access to learning resources at any time and from anywhere provided the user has the required technology for accessibility.

As mentioned earlier, BL comes in different implementations and the models for this variation are shown in Table 1. Table 1 provides a summary of the continuum of models used in schools throughout the United States, giving educators a working picture of the many ways in which online learning blends with and supports traditional instruction (Blackboard, 2009).

Model 1 and 5 are both extremes. Model 1 is a full implementation of BL while Model 5 is a minor implementation. Our survey data is provided to classify selected secondary schools in Cameroon and Nigeria within these models. However a full BL system may not necessarily be accessible and usable for certain user groups in society. This infers that BL should be inclusive.

Inclusive ICT

Inclusive ICT, whether in the form of hardware (e.g., keyboards, mouse, etc), software (e.g., word processors, virtual learning environment, etc) or management, (e.g., ICT policies) is one which incorporates the needs of various identified user groups. Such user groups include people with disability, people without disability, various generations of learners, etc. When inclusive ICT is used only within a given context (user group), then its meaning is confined within that context. Inclusive ICT in education refers to the accessibility and usability of ICT infrastructures within a given educational setup.

In the context of secondary/high schools, the quest for inclusive ICT is a quest for the following.

- Existence of students with disability.
- Existence of staffs with disability.

- Availability of ICT facilities (or infrastructures).
- Use of ICT in teaching.
- Accessibility to ICT facilities.
- Usability of the ICT facilities.

To successfully implement inclusive ICT in schools, teachers specialized in disability will need to be trained and recruited. Teacher training curriculum needs to include specialized training in disability support in an academic role such that specific qualified teachers could specialize in inclusive education and act as support to students, providing guidance through the learning process. Once these specialized teachers graduate and take up their role, it is also important for institutions to consider having a support unit for students and teachers with disability. By doing this, disabled students will be equipped to compete in the job market when they graduate.

The existence of people with disability will reveal whether existing systems are accessible and usable to them. One factor which could affect inclusive ICT is the digital divide. For instance the needs of people with disabilities may not be considered if the ICT skills or awareness of decision makers (management) is low, or there is very limited number of infrastructures. Disability and the digital divide in Africa are related directly to this chapter and will thus be considered.

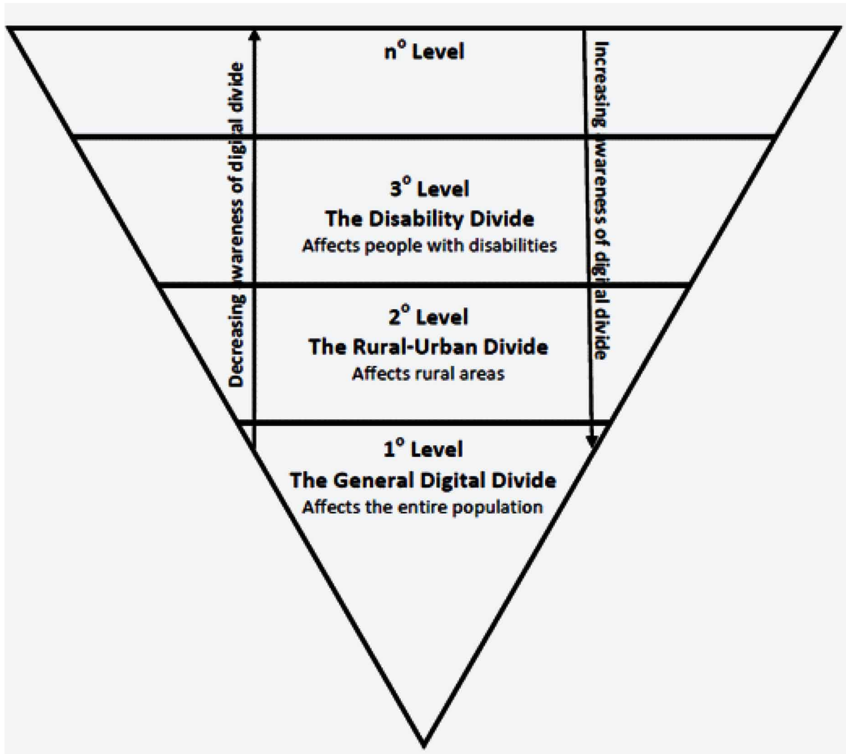
The Digital Divide in Sub-Saharan Africa

The term digital divide has several variants of definition and metamorphoses relative to contemporary technology. Initial definitions concentrated on the possession of computers, and later the inclusion of access to Internet which also categorizes whether the access is broadband or not. Mehra, Merkel & Bishop (2004) in their own terms defined digital divide as the troubling gap between those who use computers and the Internet and those who do not. In our context we define digital divide as the gap existing between people or groups with effective use and access to ICT and those with ineffective use, limited access or no access at all. The term 'groups' refer to organizations, governments, schools, etc, while the term 'effective use' means that having the state of the art infrastructure is not sufficient, but maximizing the use through appropriate skills is necessary. The term 'access,' refers to the reach, affordability or possession of the appropriate infrastructure. Access to ICT will also include various sub groups of users including people with disabilities.

In a specific country, the digital divide could have different levels (1st…nth level), beginning with the "general digital divide" which affects the entire population as shown in Figure 1. This is the case where in a particular country for instance there could be a general low access to ICT. At a secondary level, this divide then extends to a divide between the urban and rural areas known as the "rural-urban divide." When a country has moved from the general digital divide and has closed the gap through improved accessibility of ICT, the secondary level could become more evident in the case where urban areas are prioritized. This is a common case in many sub-Saharan African countries where schools in urban areas have more access to ICT equipment than those in rural areas due to poor or no access to electricity Aduwa-Ogiegbaen and Iyamu (2005). The tertiary level of the digital divide involves the "disability divide" where people with disabilities have less access to ICT than those without disabilities. This is particularly evident in circumstances where people with disabilities have been given ICT but without any assistive technologies to help compensate for their inability to use the equipment due to specific impairments. People with visual impairments for instance might need to use screen readers to access Websites, without which they might be excluded from accessing the information on the Web.

As could be seen from Figure 1, the divide widens with decreasing awareness of such divide by the population and vice versa. At the primary

Figure 1. Various levels of the digital divide



level for instance, more people are aware of the lack of technology as it affects everyone and hence action is taken to procure the appropriate technology, thus reducing the gap. However, at the tertiary level which affects mostly people with disabilities, the digital divide is wider given the fewer number of people with disabilities in the society, leading to a neglect of their needs to use technology given that it does not affect the majority of the population. The figure allows for the inclusion of other levels of digital divide, which of course gets wider.

With today's technological advancement, many services are increasingly being offered online and it is becoming more difficult for people to carry out daily activities without interfacing with computing devices and the Internet. Such is the case with blended learning. The World Wide Web (WWW) segment of the Internet is a huge repository of educational resources that can enhance learning. According to Aduwa-Ogiegbaen and Iyamu (2005), modern life is dominated by technology and there is universal recognition of the need to use ICT in education as we enter the era of globalization where the free flow of information via satellite and the Internet hold sway in global information dissemination of knowledge. Advertisement for jobs and products, purchases, meetings, learning, etc are some of the numerous activities dominating the Internet. This simply means that an individual or group will find it hard to compete against others without effective access and use of the Internet. Our definition is thus an embodiment of the components contributing to the digital divide. Mehra, Merkel and Bishop (2004) identified four major components contributing to the digital divide: socioeconomic status, income, educational level and race. From our definition, the term digital divide is context specific, and two targets referred to as individuals and groups are identified. The components contributing to the digital divide are dependent on the context being referenced.

Individuals form the nucleus of any given society and when empowered, the society benefits from it through efficient delivery of services. Digital empowerment will result in high productivity and hence economic growth as the Internet is expected to have a positive impact in this area, and its adoption rate will determine the extent of this impact (Huang, Keser, Leland & Shachat, 2003). Closing the individual gap will empower people to admit and embrace new blended learning technologies without fear and thus the confidence to network with peers worldwide. Dijk and Hacker (2003) identified four general barriers: lack of elementary digital experience, no possession of computers and network connections, lack of digital skills, and lack of significant usage opportunities. We also identify with these barriers, especially the first three which fall in the context of individuals. Elementary digital experience is the expected minimal experience in ICT that will jump-start an individual into embracing ICT as a tool. Some of the barriers to obtaining such experience include lack of interest to embracing ICT, unattractiveness of technology and lack of personal computers.

Groups play an important role in promoting the economy of a nation and the world at large. Groups may likely interact with each other and where there is gap in digital divide, transactions become difficult, and in the same manner an individual to group transaction also suffers. Some of the barriers of the digital divide as it relates to a group are:

- **Lack of Policy that Enforces Effective Use of ICT in Schools:** Policy will force educational institutions to adopt inclusive blended learning technologies.
- **Lack of ICT Training:** Training imparts the knowledge required to developing skills for the effective use of ICT.
- **Non Sustainability of Training through Refresher Courses:** It is necessary to constantly update skills.
- **Poor Individual ICT Skills:** It is likely that individual ICT skills in an educational institution will differ as a result of individual difference, educational level, or both. This creates a gap within and among groups.

Disability and the Digital Divide in Sub-Saharan Africa

For several years now, sub-Saharan Africa has been the continent with the smallest percentage of access to ICT. Although this gap is closing, it will still take an ample amount of time to significantly close the gap. A number of advances in closing the digital gap include the following. In rural Togo, a farmer can now obtain real-time market prices from the capital Lomé through cellular phone, while in Accra, Ghana, an entrepreneur who experienced no dial tone on his landline in the past, now has connection to the Internet (Mutume, 2009). In Rwanda, there is wireless Internet access service throughout the country (Mwangi, 2006), and Africa has the highest rate of mobile phone subscription (Momo, 2005). These are few scenarios in Africa that suggest the gap has the potential of closing at a reasonable rate. One of Africa's problems in reducing the gap is the erratic supply of electricity. This also makes ICT access and ownership cost relatively expensive as one has to rely on petrol/diesel power generators.

Despite these hindrances, Africans seem to be putting much effort into gradually closing the digital gap. Unfortunately, as the gap appears to gradually reduce, certain members of the African society are given little or no consideration on access to ICT. This class of people are those who have some form of disability or impairment. Disability is defined as the physical or mental impairment which has a substantial and long-term effect on a person's ability to carry out normal day-to-day activities (Equality Commission for Northern Ireland, 2007). The mental aspect of disability is what is mostly referred to as "learning disability." Different models of disability exist, including mental and social. Disability as a social problem needs to be eradicated by societal change (Goodley, 2001). The societal attitude and treatment of disabled people need to take a positive course. In the United Kingdom for instance, there is legislation in place that protects disabled people and prevents disability discrimination; the Equality Act 2010 (DirectGov, 2010). Where such legislation is lacking, disabled people are left without protection.

It is evident in most countries in sub-Saharan Africa that emphasis is not laid on the needs of people with disabilities. From the inaccessible architectural structures to the lack of disability legislation, it could be seen that disabled people are being left behind in a competitive society where each one fights for survival. As most of these countries are poor, the focus of most governments has been towards poverty alleviation, but this has often been hampered by corruption. However, technology could be a powerful tool in fighting poverty and promoting inclusion. Education is also a good tool in fighting corruption and discrimination and blended learning technologies will facilitate such education.

Within the educational setting, knowledge on disability inclusion needs to be inculcated and the virtual learning environment is a good platform for such knowledge to be transmitted. However, Tompsett (2008) reveals that research still needs to be done to include people with disabilities in education as the current learning environments are sometimes incompatible with assistive technologies. Identifying the reasons why disabled people in Africa are left out of access to ICT is a step towards addressing inclusive ICT access in education for people with disabilities in Africa. These reasons are briefly discussed below.

Absence of Legislation: The absence of legislation in place to promote the civil rights for disabled people and to protect them from discrimination is a major reason why they have little or no place in African society. On a positive note, a number of countries in Africa have started passing disability legislation to promote inclusion of disabled people. Whilst in South Africa, the Promotion of Equality and Prevention of Unfair Discrimination Act (PEPUDA) was promulgated in 2000, Ghana only passed its disability bill to discourage discrimination and promote inclusion of disabled or physically challenged people in 2006. Recently, Nigeria's Senate passed the Discrimination Against Persons with Disabilities Bill (Ogala, 2009). Nevertheless, whilst some countries in Africa have considered this legislation, many more countries have not yet done this. Therefore, the concern of discrimination against people with disabilities will continue.

Superstitious Belief: Disability could result from accident, disease, or from birth. The ideology that nothing happens naturally still exists among some Africans and this is a set-back in the acceptance of disabled people. For instance, disability from birth may be viewed by some as a repercussion of iniquity that existed somewhere within the family lineage. Without societal acceptance of disabled people, there will be reluctance in providing them access to ICT. The societal change in attitude towards people with disability is vital in the sense that disabled people in Africa will begin to see themselves not as a burden but productive members of the society.

Ability Perception: There is a common belief in Africa that disabled people may not be able to perform well in workplaces, hence the notion of "no ability in disability." In Cameroon for instance, a ministerial decree prohibited some disabled people from applying for a place in a teacher training college (Opio, 2008). Thus, the government that should pass legislation and encourage the society to accept disabled people, appear to be directly and publicly discriminating against them. If Africans begin to see that there is ability in disability, then the provision of tools and accessible technologies necessary for them to carry-out functions at work will begin to be a reality and a stepping stone to disabled people reaching their full potential.

State of Blended Learning in Sub-Saharan Africa

Although blended learning is rapidly being adopted in Sub-Saharan Africa, many implementations or studies are not being documented. Much of the literature that exists online is for blended learning in South Africa. This study will thus contribute to literature on blended learning in West Africa by looking at Cameroon and Nigeria. A study on blended learning in Nigerian secondary schools has shown the benefits of blended learning over traditional approaches. Aladejana (2008) found a significant difference in learner performance when blended learning was used, compared to traditional learning. In Cameroon, the incorporation of computers and the Internet in learning in some secondary schools has been a significant factor in encouraging enrolment in secondary schools (Nganji, Kwemain & Taku, 2010). The government of Cameroon and some non-governmental organizations are involved in promoting the use of ICTs in secondary schools although the projects have not yet progressed to the adoption of virtual learning environments where courses could be uploaded for students to study in their own time.

Similar projects are widespread in sub-Saharan Africa where students are introduced to computers in a school environment and have gone a long way to help reduce the digital gap. This could be considered the building blocks for implementing blended learning as the basic infrastructures are being provided. What remains therefore is to drive this vision forward through a full implementation of blended learning with an online environment customized for each school and including the needs of students with various disabilities.

Blended learning at the undergraduate level in most South African higher education institutions involves online learning with common Learning Management Systems (LMS) such as Blackboard and Moodle (Nel, 2010). The benefits of blended learning in sub-Saharan Africa is not only limited to classrooms but could be utilized by other non-educational institutions. In educational institutions however, blended learning does not only benefit students but teachers as well. For instance, blended learning has been employed for the professional development of teachers in Botswana (Boitshwarelo, 2009).

Although there is some progress made in adopting and implementing blended learning in Africa, it is sad to say that blended learning in this part of the world has bypassed students with disabilities and focused on students and teachers without disability. The lack of adequate financial resources, the struggle to bridge the digital divide and general negligent attitude of the population towards people with disabilities amongst other factors could account for this setback.

It is worth mentioning that the case of implementing ICTs in schools in Cameroon has shown that enrolment increases in schools adopting ICTs. The main reason is that most students want to acquire technological skills while at school so that upon graduation, they will be employable as most employers will certainly need employees with technological skills rather than spending much money on training them to acquire these skills after they have been employed. Also, ICT implementation in schools would cost the students less money in acquiring the necessary skills compared to enrolling in a computer training institute after graduation. Whilst this is economically viable, the advantage in implementing ICTs and blended learning in secondary schools is also that it enables students to reach their full potential. Computers could serve as assistive technologies for some students with disabilities. The use of Word processing applications for formatting text and correcting spelling is a great assistive tool which could also help students in their spellings. When blended learning makes use of additional assistive technologies such as screen magnifiers, screen readers, etc, it gets even better as it facilitates learning and helps not only students, but teachers reach their full potential. Disability is not only restricted to students, so, staff with disabilities will also need to be considered when thinking of implementing blended learning.

BLENDED LEARNING IN CAMEROON AND NIGERIA

The study of BL in Cameroon and Nigeria was carried out through the use of an online survey questionnaire. A survey on disability awareness with focus on ICT accessibility and the availability and accessibility of learning resources was made available to secondary/high schools in Cameroon and Nigeria from 2010 to 2012. The principals of different secondary/high schools were solicited by email, for participation of their staff and students in the survey while volunteers at the target countries assisted in the campaign for participation. The survey questionnaire targeted two types of groups each with a separate questionnaire. These groups were *students* and *staff*. In total, students and staff from 12 schools located in urban (8) and rural (4) cities participated in the survey.

The perception of disability and blended learning may depend on its definition or description. Therefore in our survey, we simplified the description of disability and blended learning to the participants as follows.

"Disability refers to some physical or mental impairment to an individual which prevents them from carrying out their normal activities. Examples include blindness or partial sight, deafness or difficulties in hearing, mobility difficulties (e.g., 'lameness'), epilepsy, dyslexia (known by some as 'slow learners'), speech impairments (e.g., dumbness, stuttering, etc), mental health difficulties, etc."

"Blended learning is a form of learning where a teacher would physically be in the presence of students teaching and that necessary resources for the class is made available and accessible at anytime to students in electronic form. The resources could be audiovisual format of the teaching, notes, forums, etc."

Results and Discussions

The results are presented in two categories. First, students' responses are presented, followed by an analysis of the results. Second, staff responses are presented also followed by an analysis of the results.

Student Response

Among a total of 433 students who responded, 34.3% were in schools located in urban cities, while 65.7% are in rural cities. However, it would be premature to say that location is indicative of the results which follow in Table 2 since this is out of the scope of this chapter. Infrastructure could be independent of location. Most of the responses require a closed form of response which was restricted to "yes" and "no."

The results in Table 2 suggest most secondary/high schools have a computer laboratory, however, only a few use it in teaching. A vast majority of students acknowledge the existence of students with disability among them. Although the data indicates students with disabilities are able to use computers; they use it without assistive technologies and other accessibility facilities. This may suggest that they struggle in the use of computers. The vast majority of students believe that assistive technologies and accessibility facilities will improve the performance of students with disabilities. The data also reveals most of the selected schools do not have Internet access, and of those that do, many of them have a Website. However, none have learning resources available on their respective Websites and very few schools have

Table 2. Students' response

Indicator	Responses	
	Yes	No
Existence of a computer laboratory.	416	17
School has students with disability.	332	101
Use of computer in teaching.	119	314
School has Internet access.	55	378
School has a Website.	149	284
Teaching resources available in electronic form.	43	390
Teaching resources available on school's Website.	0	433
Do teaching resources in electronic form target people with disabilities.	0	433
Disabled students able to use computer.	310	123
Availability of ICT assistive technologies and accessibility facilities disabled students.	59	374
Disability facilities can improve the performance of students with disability.	416	17
School has disability officer (staff) who is in charge of disabled students.	54	379
School management strives to meet the needs of disabled students.	92	341

learning resources in electronic form. There is no virtual learning environment dedicated for teaching and learning, thus full adoption of blended learning is still a dream. The learning resources if available in electronic form exclude the needs of people with disability as they are not accessible. Additionally, most of the schools involved in the survey do not have a disability officer (a staff member who is in charge of disability issues) and the school is not striving to improve the standards of students with disability. The presence of a disability officer and a unit to cater for the needs of disabled students in most schools is a necessity if schools would help disabled students reach their full potential as earlier discussed.

Staff Response

Among a total of 28 staff members who responded, 37.0% of them are from schools that are located in urban cities while 63.0% are in rural cities. The categories of staffs with their respective participation in the survey are shown in Table 3. The majority of the participants were teachers.

Staff were also asked to report on the number of students with disabilities in their institution. The percentage numbers in series-intervals of students with disability was reported by staff members. The interval groups set for the survey ranged from 1-10, 11-20 .. 90-100, >100. However the highest range obtained in the entire survey was 51-60, specifically in staff response. This range limit is therefore adopted for both responses (staff and students). The survey revealed that the vast majority of schools have minimum range of about 1 – 10 students with disability. An evaluation of the statistical mean *m* for the survey's source data of the survey using equation 1 gives $m = 11.28767123$. This implies that for each of the schools which participated in the survey there are approximately 11 students with disability. Most staff reported that there are 1 to 10 students with disability in their schools while the least reported that 21 – 30 students have disability. Therefore the use of the *mean* gives an indication of the number of students with disability in each of the schools.

$$m = \frac{\sum_{i=1}^{n}\left(\left(\frac{L_i + U_i}{2}\right) * f_i\right)}{\sum_{i=1}^{n} f_i} \quad (1)$$

where: m is the mean

n is the number of ranges (or intervals)

f_i is the frequency of the *i-th* range

L_i is the lower limit of the *i-th* range

U_i is the upper limit of the *i-th* range

Table 3. Staff categories with number of participants

Staff Category	Number of Staff
Principal	1
Vice principal	1
Bursar	1
Discipline master	2
P.T.A. staff	2
Teacher	21

The survey also revealed that there is considerable numbers of staffs who are with disability and only 51% are without disability. The statistical mean *m* from the survey's source data of the number of staff without disability and using equation 1 gives $m = 2.951388889$. This means that in every school there are approximately 3 staffs with disability.

Table 4 shows other responses obtained from the staff members. As in the case of students' response, the results in Table 4 suggest that most of the schools involved in the survey do not have a disability officer and have no ICT assistive technologies and other accessibility facilities for individuals (staff and students) with disabilities. It also suggests only few schools use computers in teaching and that where learning resources exist in electronic form it does not target students with disability. Interestingly, most staff are aware that anyone can become disabled at any given time. The vast majority of staff involved in the survey believe that ICT assistive technologies and other accessibility facilities will improve the performance of students and staff with disabilities.

Both results from staff and students point to the fact that educational institutions have staff and students with disabilities and hence these institutions need to act towards including them in teaching and learning through the adoption and implementation of inclusive technology. The adoption of assistive technology in BL will not only benefit students but will also be beneficial to teachers with disabilities. If secondary schools expect an increase in performance through BL and hence a greater chance of attracting more students, they must then focus on including everyone. Inclusion is a step towards helping each staff and student to reach their full potential in education.

Table 4. Other responses from staff

Indicator	Staff Response

Use of computer in teaching.	11	17

Challenges

Given the results of Table 2 and Table 4, it is observable that none of the secondary/high schools considered matches any of the continuums of BL models. Hence challenges to BL in the schools considered are Internet access and the inclusion of online resources. In addition to these are student personalization of online materials and hardware assistive technologies. When users have personalized profile then this would mean that when they log into the system, the system will load the specific configuration that matches or addresses their disability needs.

Most secondary schools also face the challenges of procuring the technology needed for inclusive BL as the economies in most of these areas are resource poor and institutions are not financially equipped to get the state of the art technologies for higher quality education. The lack of disability experts in schools also means the needs of disabled people such as assistive technology, wheel chairs, assistive furniture, etc are not considered.

Government policy in most of the countries is not favorable towards inclusion as other things are prioritized. If the Ministry of Education could emphasize the need for inclusion in all aspects of education, including laying down appropriate measures for its implementation, then the situation would change drastically in a positive direction.

Recommendations for Adopting Inclusive Blended Learning

In order for institutions of learning to successfully implement BL, this should be inclusive of all learners regardless of their disabilities. To accomplish this, institutions of learning could do the following:

- Appoint a disability officer to oversee the assessment of the students in order to determine the type and degree of disability and match them to required assistive technology or support needs.
- Create a fully staffed student support service providing support to students with disabilities and assessing the assistive technology needs of students.
- Provide support to students in using assistive technology in blended learning and continuously assess their needs as students' needs could change over time.
- Consult with disabled students on their inherent technological needs.
- Source adequate funding for inclusive BL prior to commencing its implementation.
- Review how existing blended learning meets the needs of disabled students and staff and made appropriate and timely adjustments as required.

FUTURE RESEARCH DIRECTIONS

This chapter has only considered two countries in Sub-Saharan Africa. Therefore as an extension study in the future it would be helpful to consider other Sub-Saharan African countries. It will also be useful to investigate the statistics of students who have access to computers at home, access to mobile devices and access to Internet. This will inform the potential of blended learning implementation and target platforms. Additionally it will also be useful to carry out the study with respect to specific disabilities so that specific problems are addressed.

CONCLUSION

Although BL is increasingly being adopted in Sub-Saharan Africa, much of the implementation has not been targeted towards students with disabilities as could be seen in the type of technology being employed in schools. Most secondary schools are not equipped with assistive or adaptive technologies to accommodate the needs of students with disabilities. There is great need therefore to incorporate assistive technologies into BL to include students with various impairments. Although this could be expensive, mainly because of the needed hardware, software, amendments to buildings to allow for accessibility, furniture, etc, institutions could implement inclusive blended learning by gradually including the cost in their budget. Also, normally there should be a disability officer whose job is to cater and represent people with disability. It is important that there is someone whom people with disability can share their problems or complaints, and knowing that their voices will be heard at management meetings. This gives the student with disability a sense of belonging and boosts to their confidence. Most secondary schools in both Cameroon and Nigeria lack a disability officer who would cater for the needs of disabled students. Hence students with disability find it difficult to voice out their problems. Although the digital divide is a factor in blended learning, the significant extent to which mobile technology has been embraced in Sub-Saharan Africa could be utilized to also implement blended learning on such platforms. However, the implementation should consider using an inclusive approach. That inclusion means not leaving people with disabilities behind.

ACKNOWLEDGMENT

We thank Ms. Kfukfu Nsangong and Ms. Sandra Ozah who were the volunteers in Cameroon and Nigeria, respectively, and assisted in the campaign for survey participation.

KEY TERMS AND DEFINITIONS

Assistive Technology: Any hardware or software product or service that helps compensate for a loss in function for individuals with disability, enabling them to function independently.

Blended Learning (BL): The combination in use of technology, usually online learning and traditional methods of teaching to deliver educational programs.

Digital Divide: This is the inequality that exists between groups regarding the access to and use of Information and Communication Technology (ICT).

Disability: A physical or mental condition that affects an individual's ability to perform certain functions and hence affects equal participation in the society. Lower limbs mobility difficulty for instance affects the way an individual could move and hence may require a wheelchair for mobility.

Dyslexia: This is a specific language-based learning difficulty that manifests in difficulty in spelling, writing, and pronouncing words.

Inclusive Blended Learning (IBL): This is blended learning that includes the needs of all learners including those with disabilities and older learners with varying needs.

Information and Communication Technology (ICT): Refers to all technology that could be used for such purpose such as telecommunication devices, computers, and all electronic devices that are used for storing and manipulating information.

Learning Management System: This is a software system for administering e-learning.

Screen Reader: A software application that enables people with visual impairments to read information on an electronic device.

Chapter 53
A Comparative Study of Business and Engineering Students' Attitude to Mobile Technologies in Distance Learning

Andreas Ahrens
Hochschule Wismar, Germany

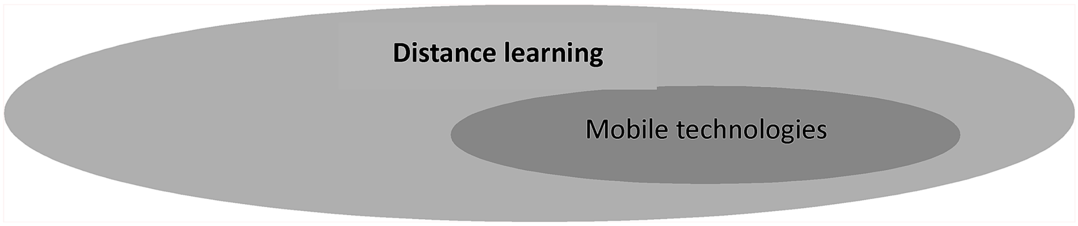
Jeļena Zaščerinska
Centre for Education and Innovation Research, Latvia

ABSTRACT

Mobile technologies are widely employed in distance learning in higher education to provide students with an opportunity to learn regardless of time and place in order to obtain a higher education degree. However, little attention has been paid to a comparative study of business and engineering students' attitudes toward mobile technologies. The aim of the chapter is to compare business and engineering students' attitudes toward mobile technologies in distance learning, underpinning elaboration of a hypothesis. The meanings of the key concepts of distance learning, blended learning, and attitude are studied. Moreover, the study demonstrates how the key concepts are related to the idea of mobile technologies and shows how the steps of the process are related: students' attitudes toward mobile technologies in distance learning→ empirical study within multicultural environments → conclusions. The results of the present research show that both business and engineering students' attitudes toward mobile technologies are positive.

DOI: 10.4018/978-1-4666-8246-7.ch053

Figure 1. The relationship between distance learning and mobile technologies



INTRODUCTION

Many universities throughout the world have already adopted or are planning to adopt mobile technologies in many of their courses as a better way to connect students with the subjects they are studying (Ferreira, Klein, Freitas & Schlemmer, 2013). Particularly, mobile technologies in distance learning of higher education have already become an indispensable tool in both university staff and students' daily life. Mobile technologies are widely employed in distance learning of higher education to provide students with an opportunity to learn regardless of time and place in order to obtain a higher education degree. In distance learning, mobile technologies allow students to access content anywhere/anytime to immerse himself/herself into that content (alone or interacting with educators or colleagues via web communication forms) and to interact with that content in ways that were not previously possible (via touch and voice recognition technologies, for instance) (Ferreira et al., 2013). Therein, mobile technologies and distance learning are closely inter-related as depicted in Figure 1.

Evaluation of the educator/student acceptance and adoption of mobile technologies has been carried out (Ferreira et al., 2013). Against this background, students' attitude to mobile technologies in distance learning plays a two-fold role within the institutionalized blended educational process of higher education as shown in Figure 2.

- On the one hand, students' attitude to mobile technologies influences students' distance learning, and,
- On the other hand, students' attitude to distance learning shapes students' application of mobile technologies.

Thus, application of mobile technologies in distance learning is driven by students' attitude to mobile technologies in distance learning.

Figure 2. The relationship between students' attitude, mobile technologies and distance learning

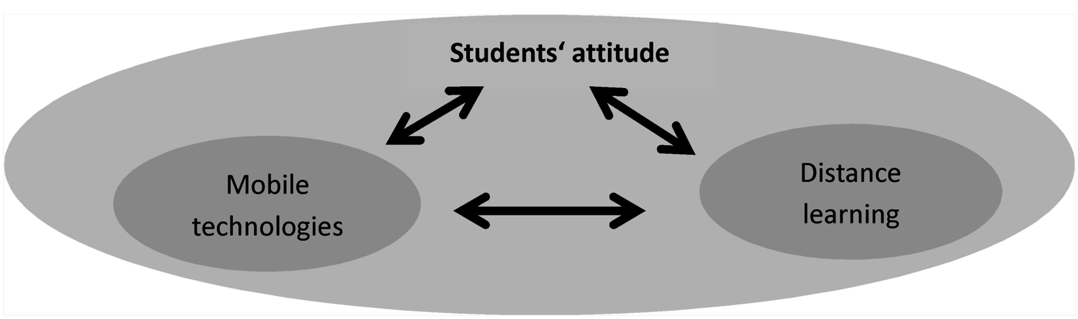


Figure 3. The relationship between lifelong education, higher education and distance learning

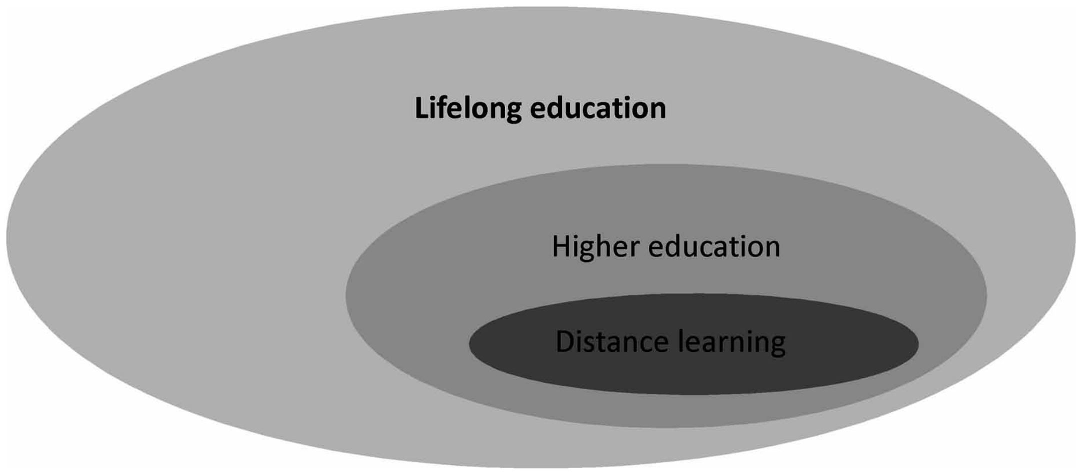

However, little attention has been paid to a comparative study of business and engineering students' attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education.

The aim of the paper is to compare business and engineering students' attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education underpinning elaboration of a hypothesis. The meaning of the key concepts of *distance learning, blended learning* and *attitude* is studied. Moreover, the study demonstrates how the key concepts are related to the idea of *mobile technologies* and shows how the steps of the process are related: students' attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education → empirical study within multicultural environments → conclusions.

In the present contribution, distance learning is considered as part of higher education, and higher education as part of lifelong education as demonstrated in Figure 3.

Efforts of modern research on lifelong education reveal that higher education in general and distance learning in particular is currently generated by the transition from opportunity to choose towards qualities and purposes in the context of higher education globalization and internationalization (Bassus & Zaščerinska, 2012). This shift changes the nature of higher education as well as distance learning. For the advancement of higher education as well as distance learning, social nature of change has become dominant (Bassus & Zaščerinska, 2012). Social nature of change in higher education as well as distance learning is mediated via the System-Constructivist Theory. The System-Constructivist Theory is introduced as the New or Social Constructivism Pedagogical Theory. The System-Constructivist Theory serves as the basis of the methodological background of the present contribution. The System-Constructivist Theory is formed by:

- Parsons's System Theory (Parsons, 1976) on any activity as a system,
- Luhmann's Theory (Luhmann, 1988) on communication as a system,
- The Theory of Symbolic Interactionalism (Mead, 1973),
- The Theory of Subjectivism (Groeben, 1986).

The System-Constructivist Theory implies the dialectical principle of the unity of opposites that contributes to the understanding of the relationship between external (social, social interaction, teaching, etc) and internal (individual, cognitive activity, learning, etc) perspectives as the synthesis of external and internal perspectives (Bassus & Zaščerinska, 2012). In comparison, the Constructivism Theory focuses on learning and, consequently, the internal perspective, the Social Constructivist theory – on teaching and, consequently, external perspective as well as on the balance between teaching and learning and, consequently, the balance between the external and internal perspectives (Bassus & Zaščerinska, 2012).

The System-Constructivist Theory and, consequently, the System-Constructivist Approach to learning introduced by Reich (Reich, 2005) emphasizes that human being's point of view depends on the subjective aspect:

- Everyone has his/her own system of external and internal perspectives (Ahrens & Zaščerinska, 2010) that is a complex open system (Rudzinska, 2008), and
- Experience plays the central role in the knowledge construction process (Maslo, 2007).

Therein, the subjective aspect of human being's point of view is applicable to the present research on this comparative study of business and engineering students' attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education.

The methodological background of the present contribution, namely the System-Constructivist Theory, contributes to the application of such a methodological approach of the present research as the outcome based approach. The outcome-based approach is opposed to input-based approach. The outcome-based approach is result-oriented. In comparison, input-based approach is focused on the process. Application of the methodological approach, namely the outcome based approach, to the present research determines students' attitude as an outcome of application of mobile technologies in distance learning within the institutionalized blended educational process of higher education.

The novel contribution of this paper is the definition of attitude and attitude's indicators and constructs newly identified by the contributions' authors as well as the educational model of application of mobile technologies in distance learning within the institutionalized blended educational process of higher education. The educational model of application of mobile technologies in distance learning within the institutionalized blended educational process of higher education represents the inter-connections between distance learning as part of blended learning and mobile technologies as a means of distance learning.

Our target population to generalize the educational model of students' attitude to mobile technologies in distance learning within the blended educational process of higher education is students in formal higher education.

The remaining part of this paper is organized as follows: the next section introduces theoretical framework on students' attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education. The associated results of an empirical study will be presented in the following section. Finally, some concluding remarks are provided followed by a short outlook on interesting topics for further work.

THEORETICAL FRAMEWORK

The present part of the contribution demonstrates the definitions of:

- Attitude,
- Mobile technologies,
- Distance learning, and

Figure 4. The relationship between outcome and learning outcome

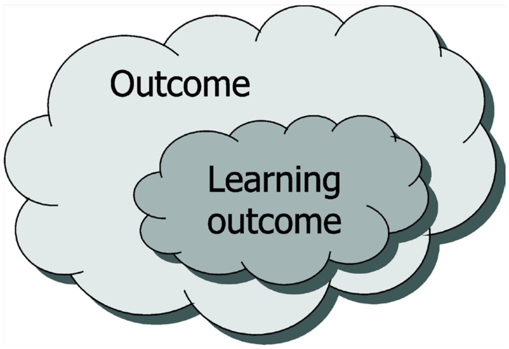

Figure 5. The relationship between outcome, result and output

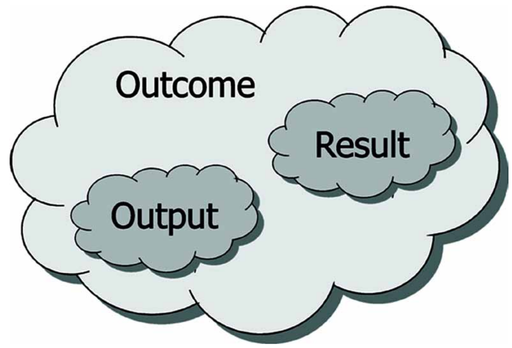

- The institutionalized blended educational process of higher education.

As the outcome based approach is used as the methodological approach in the present contribution, the present research is result-oriented. Therein, the present research identifies *outcome* on the pedagogical discourse as the direct results of the instructional programme, planned in terms of student/learner growth in all areas (Vlãsceanu, Grünberg & Pârlea, 2004). Outcome includes learning outcome as demonstarted in Figure 4.

Furthermore, in many publications the terms *outcome*, *result* and *output* are used synonymously as shown in Figure 5.

The synonymous use of the terms *outcome, result* and *output* determines three criteria of learning results (Huber, 2004) as depicted in Figure 6.

Learning outcome is defined as direct results of learning, planned in terms of student growth in all areas. Criteria of learning outcome are determined as students' learning achievements, social competence and individual development.

The present contribution focuses on students' social competence as a criterion of students' learning outcome. It should be noted that the notion of social competence has been constantly changed and accompanied by a change in the originally used terms such as social competencies, communicative competence, etc (Zaščerinska, 2013). Despite the changes in the notion of social competence and its terms, social competence remains the overall concept as shown in Figure 7.

Thus, in the further text of the present contribution, the term *competence* is used. Students' attitude is part of competence as competence includes knowledge, skills and attitudes (European Commission, 2004) as shown in Figure 8.

The elements of competence, namely knowledge, skills and attitude, are inter-related. Students' negative attitude fails to promote the increase in the level of students' knowledge and skills as well as competence, in general. In contrast, students' positive attitude ensures the enrichment of the level of students' knowledge and skills as well as competence, in general.

As students' attitude is an outcome of application of mobile technologies in distance learning within the institutionalized blended educational process of higher education, application of mobile technologies in distance learning within the institutionalized blended educational process in higher education is able to enrich students' digital competence. Students' digital competence is of great importance as it serves as

- One of eight key competences outlined by the European Commission for lifelong learning (European Commission, 2004), and

Figure 6. Three criteria of learning results

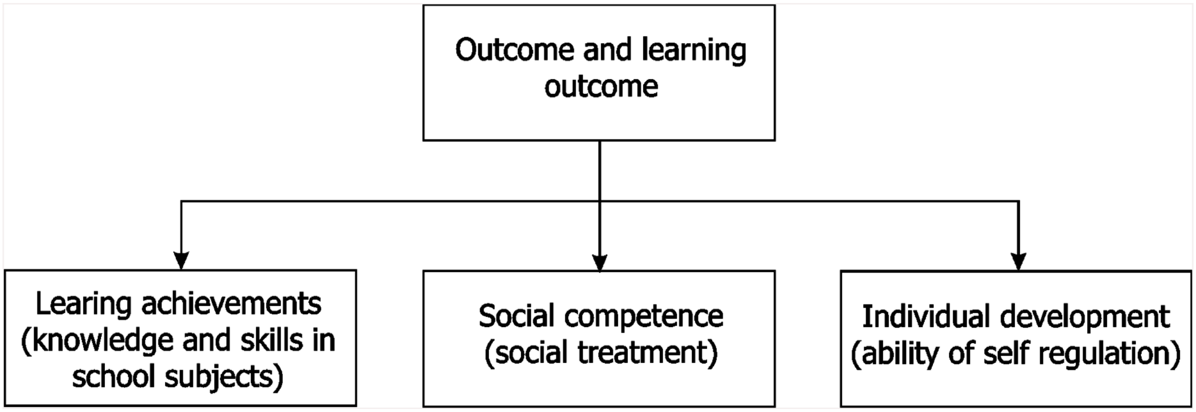

Figure 7. Inter-relationships between terms of social competence

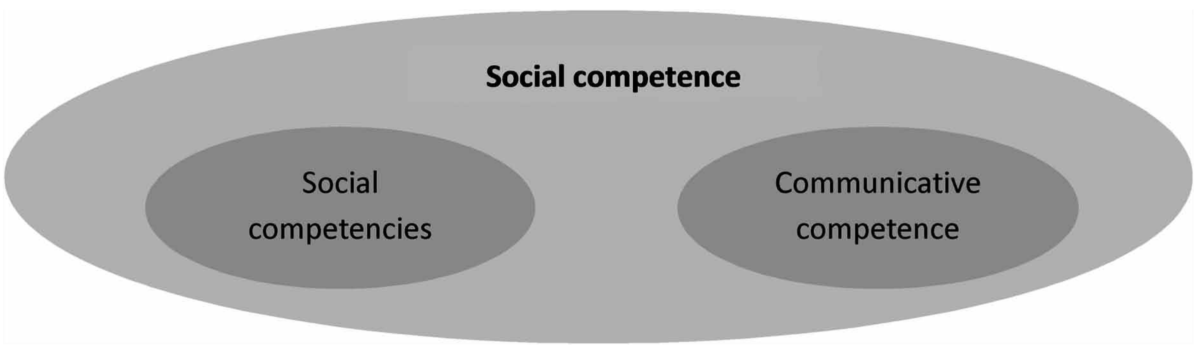

Figure 8. Elements of competence

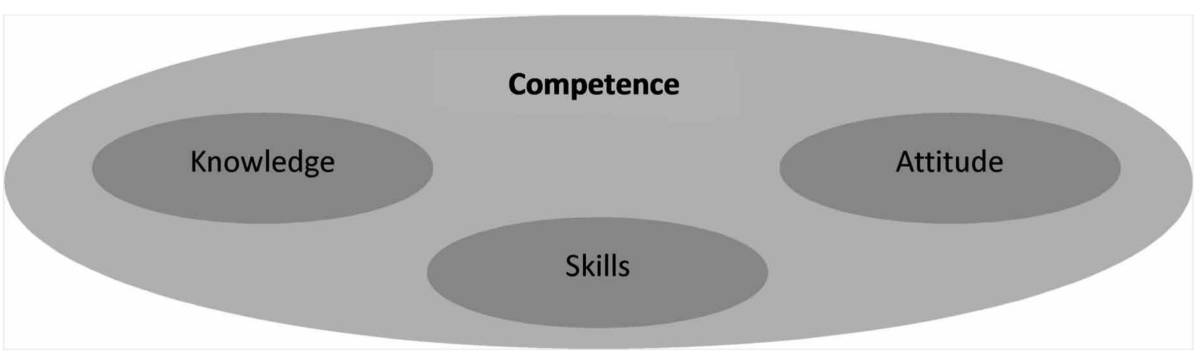

- A condition, factor and evaluation criterion of application of mobile technologies in distance learning (Surikova, 2007).

Hence, students' attitude serves not only as an outcome but also as a criterion of application of mobile technologies in distance learning within the institutionalized blended educational process of higher education. It should be noted that criteria serve to structure, assess and evaluate while indicators determine developmental dynamics (Lasmanis, 2003; Špona & Čehlova, 2004), and constructs differentiate a variable which is not directly observable. Criteria, indicators and constructs are identified via analysis of (Špona & Čehlova, 2004).

- Definition of the research object,
- Structure of the research object, and
- Factors.

Attitude has been defined by a number of researchers. Palmer and Holt define attitude as an individual's positive or negative feelings about performing the target behavior (Palmer & Holt, 2009). This implies that learners' positive or negative feelings about their use of mobile technologies in distance learning would directly influence their behavior to use mobile technologies in distance learning. Consequently, attitude comprises positive as well as negative feelings as shown in Figure 9.

Another definition of attitude that is of the interest of the contribution's authors is attitude identified as a combination of evaluative judgements about a phenomenon (Crites, Fabrigar & Petty, 1994).

Analysis of these definitions of attitude by the contribution's authors and complementing the attitude definition formulated by Crites, Fabrigar and Petty (Crites et al., 1994) with the word *individual* leads to such a newly determined definition of student's attitude as an individual combination of evaluative judgements about a phenomenon. As well as, in comparison to attitude's positive or negative feelings determined by Palmer and Holt (Palmer & Holt, 2009), the contribution's authors differentiate attitude into positive, neutral or negative as illustrated in Figure 10.

Understanding students' attitudes towards mobile technologies in distance learning can help to determine the extent to which students utilize mobile technologies in distance learning (Ong & Lai, 2006).

Attitude differentiation is considered as levels of attitude shown in Table 1.

A positive attitude is associated with the evidence of motivated behaviour, while a negative change is linked to a less motivated behavior (Berg, 2005; Movahedzadeh, 2011).

Figure 9. Feelings of attitude

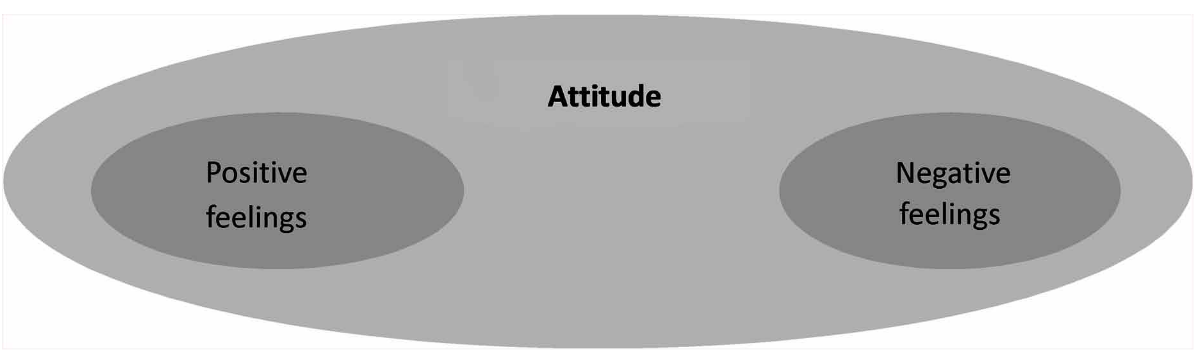

Figure 10. Differentiation of attitude

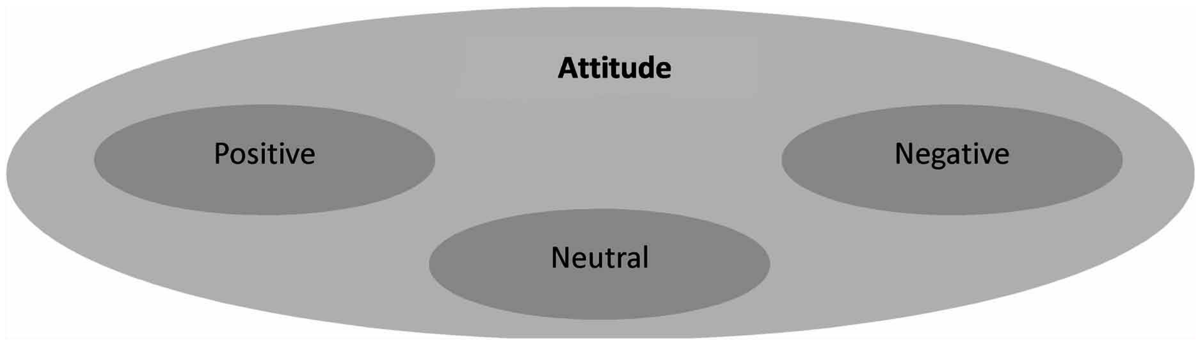

Table 1. Attitude as a criterion of application of mobile technologies in distance learning and levels of attitude

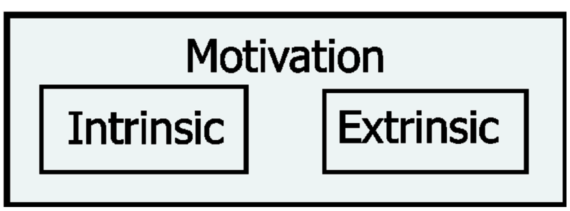
Criterion	Levels		
	Level 1	Level 2	Level 3
	Low	Optimal	High
	1	2	3
Students' attitude to mobile technologies in distance learning	Negative	Neutral	Positive

Figure 11. Components of motivation



It should be noted that motivation comprises (Harmer, 2001) as shown in Figure 11:

- Extrinsic motivation caused by a number of outside factors, and
- Intrinsic motivation that comes from the individual and is especially important for encouraging.

Intrinsic motivation is formed by internal factors of three groups (Pintrich, 1994) as demonstrated in Figure 12.

Expectancy components include (Pintrich, 1994):

- Control beliefs,
- Attributions,
- Learned helplessness, and
- Self-efficacy.

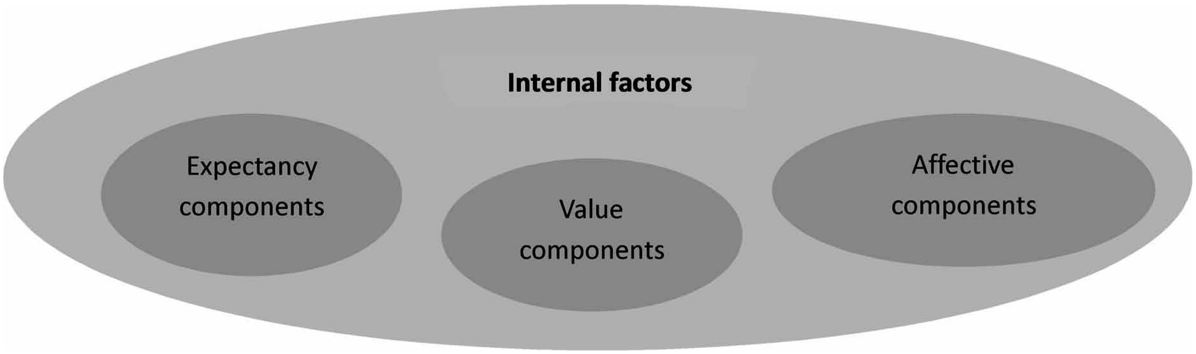
Value components comprise (Pintrich, 1994):

- Intrinsic/extrinsic goals,
- Task value, and
- Personal interest.

Affective components involve (Pintrich, 1994):

- Test anxiety,
- Self-worth, and
- Other emotions (pride, shame).

Figure 12. Components of internal factors that form intrinsic motivation



For the attitude change from negative to positive, such methods are proposed to motivate students extrinsically as:

- Educators' adapting teaching styles (Movahedzadeh, 2011) to the students' needs,
- Showing students the relevance of the learning topics to their everyday lives (Movahedzadeh, 2011),
- Creation of learning environment that helps motivate students not only to participate in distance learning but also wish to learn and enjoy learning (Movahedzadeh, 2011),
- Asking students to consider the preconceptions about subject-related topics that they bring to distance learning (Etkina & Mestre, 2004).

For the measurement of students' attitude, three domains are identified (Al-Musawi, Al-Bustan & Al-Mezel, 2013) as shown in Figure 13.

For the determination of indicators and constructs of students' attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education, the contribution's authors propose to analyse the nature of attitude. The nature of attitude is rooted in emotions. Thus, emotions and attitude are interrelated as depicted in Figure 14.

Figure 13. Domains of attitude

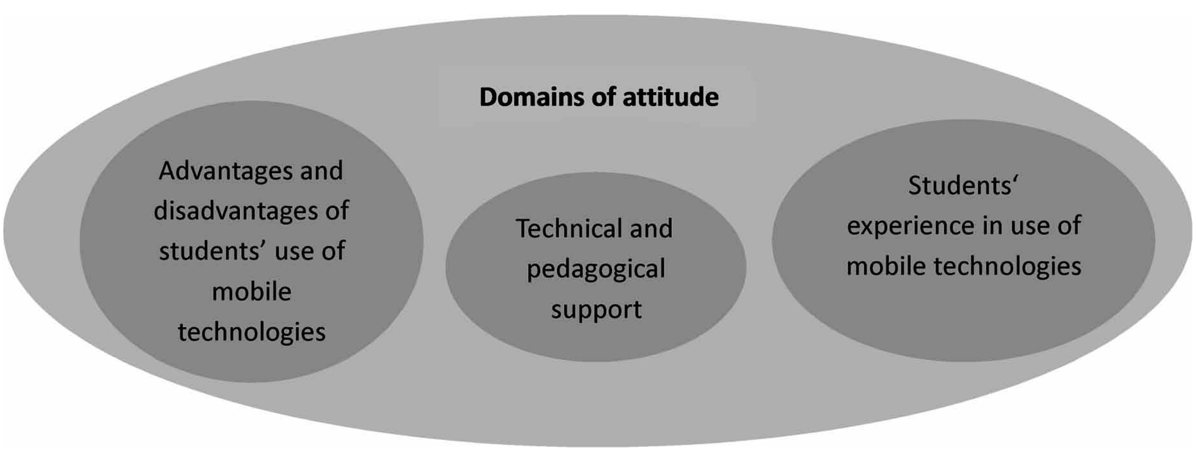


Figure 14. The relationship between attitude and emotions

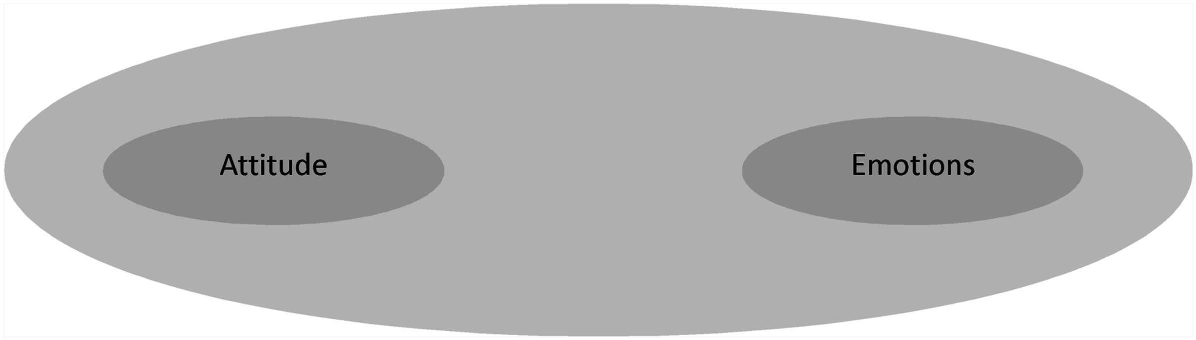
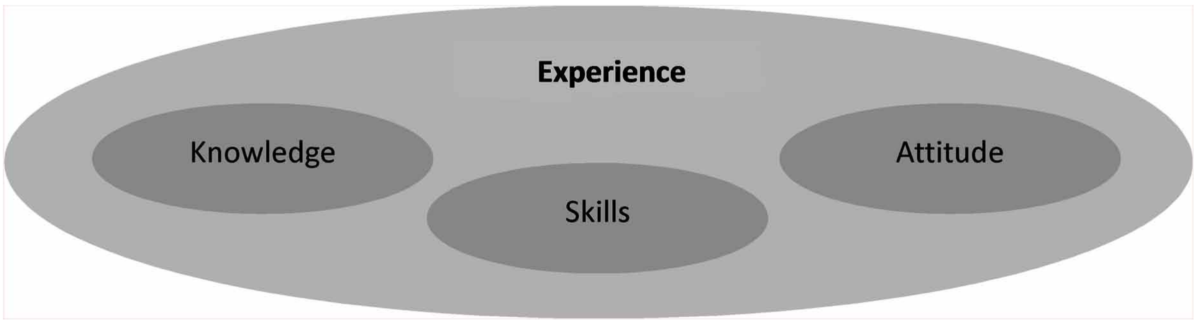


However, emotions refer to psychology, and attitude – to pedagogy. Therein, psychological processes provide the basis for pedagogical developments.

Emotions defined as nerve impulses ensure this faster reaction to a problem situation as emotions encourage for acting by use of an immediate plan of action (Kriumane, 2013). The main thing is that emotional processes and states have their own special positive development in man (Leont'ev, 1978). Therein, it is widely believed that men and women differ in their emotional responding (McRae, Ochsner, Mauss, Gabrieli & Gross, 2008). The positive development of emotional processes and states must be especially emphasized in as much as the classical conceptions of human emotions as "rudiments" coming from Darwin, consider their transformation in man as their involution, which generates a false ideal of education, leading to the requirement to "subordinate feelings to cold reason" (Leont'ev, 1978). Consequently, the relationship between human emotions and age has to be further analysed. Emotions are not only feelings, but also other elements, such as expressions in the face or the voice, physiological changes, and changes in action tendencies or action readiness (De Vierville, 2002). Emotions fulfill the functions of internal signals, internal in the sense that they do not appear directly as psychic reflection of objective activity itself (Leont'ev, 1978). The special feature of emotions identified by Leont'ev (Leont'ev, 1978) is that they reflect relationships between motives (needs) and success, or the possibility of success, of realizing the action of the subject that responds to particular motives. Therein, emotions do not reflect those relationships but reveal a direct sensory reflection of emotions, about experiencing (Leont'ev, 1978). In pedagogy, experience includes knowledge, skills and attitude (Zaščerinska, 2013) as shown in Figure 15.

Consequently, the terms *experience* and *competence* are used synonymously in pedagogy in general and in the present contribution in particular. Further on, emotions are relevant to the social activity and not to individual actions or operations that realize it (Leont'ev, 1978). As a result emotions are not subordinated to activity but appear to be its result and the "mechanism" of its movement (Leont'ev, 1978). For the cultural dimension of the process of application of mobile technologies in distance learning within the institutionalized blended educational process in higher education, it is important that the experience and expression of emotions is dependent on learned convictions or rules and, to the extent that cultures differ in the way they talk about and conceptualize emotions, how they are experienced and expressed will differ in different cultures as well (Cornelius, 1996). Consequently, taking into consideration the discipline culture, as emotional practitioners, students can make the process of application of

Figure 15. Elements of experience in pedagogy



mobile technologies in distance learning within the institutionalized blended educational process in higher education exciting or dull (Hargreaves, 2000). Moreover, students' interactions can be crucial in developing students' academic self-concept and enhancing their motivation and achievement (Komarraju, Musulkin & Bhattacharya, 2010). Thereby, on the one hand, emotion reflects the culture trait of a person (Harré, 1986), and, on the other hand, the emotions are social constructions (Averill, 1980).

Analysis of the inter-relationship between attitude and emotions contributes to the identification of attitude's indicators and constructs presented in Table 2.

Such constructs of verbal expression as a word or sentence may express a positive or negative meaning. For example, "excellent" is considered as a construct that demonstrates a positive attitude, "moderate" – neutral, and "bad" - negative.

Regarding non-verbal expression, smiling face means positive attitude, a neutral voice tone – neutral attitude, crossing one's arms – negative attitude.

Such constructs of cultural expression as applauding demonstrates positive attitude, listening without a comment – neutral, and turning one's back to a colleague – negative.

In distance learning within the institutionalized blended educational process of higher education, students' attitude is mediated via application of mobile technologies. By mobile technologies, smart phones, laptops, tablet personal computers, ultra compact computers, hybrid devices, etc. are meant as shown in Figure 16.

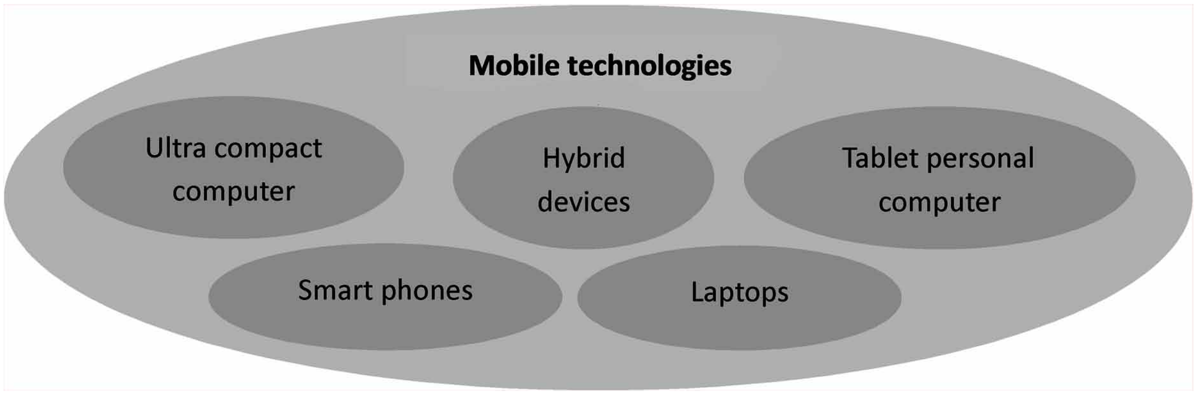
Mobile technologies are connected to the Internet via wireless access that ensures mobility in distance learning.

A couple of educational models of distance learning described by the Association to Advance Collegiate Schools of Business (AACSB) (AACSB International, 2007) exist in higher education such as:

Table 2. Attitude's indicators and constructs

Criterion	Indicators	Constructs
Students' evaluative judgements on mobile technologies in distance learning	Verbal expression	A word, sentence, etc
	Non-verbal expression	Face expression, body language, mimicry, etc
	Cultural expression	Cultural habits

Figure 16. Elements of mobile technologies



- Distance learning means any learning system where teaching behaviors are separated from learning behaviors. The learner works alone, guided by study material arranged by the instructor in a location apart from students. Students have the opportunity to communicate with an instructor with the aid of a range of media (such as text, telephone, audio, video, computing and Internet technology, etc).
- Distance learning may be combined with various forms of face-to-face meetings.
- Remote access to learning materials, databases and libraries, electronic communication, computer-connected workgroups, archived lectures, and other features of distance learning increasingly are used in campus-based instruction.

Analysis of these educational models of distance learning reveals that despite that fact that all the students' focus is put on distance learning, distance learning is not activated till teaching is provided. Thereby, distance learning is part of the institutionalized educational process in higher education as demonstrated in Figure 17.

Further on, analysis of these educational models of distance learning allows concluding that distance learning is inter-connected with teaching as well as blended teaching (archived lectures, databases, libraries, etc.). Moreover, the relationship between teaching and distance learning, in other words, the educational process of higher education have been transformed into the institutionalized blended educational process (Zaščerinska & Ahrens, 2013) that demands on the re-design of educational models of distance learning in higher education.

In the present research, educational process, training, instruction and educational act are employed synonymously. Consequently, educational process, training, instruction and educational act in formal higher education are considered as the institutionalized processes. Therein, by formal higher education, an organized higher education model (university, institution, college, academy, summer school, etc), systematic, structured and administered according to a given set of laws and norms is meant. Thereby, the institutionalized educational process has to be relevant to the university's (institution, college, academy, summer school, etc) requirements such as lecture or seminar framework. Thus, the institutionalized educational process is organized, systematized, structured and administered within formal higher education according to a given set of laws and norms. The institutionalized blended educational process includes blended teaching, blended peer-learning and blended learning as depicted in Figure 18.

Figure 17. The relationship between higher education, institutionalized educational process and distance learning

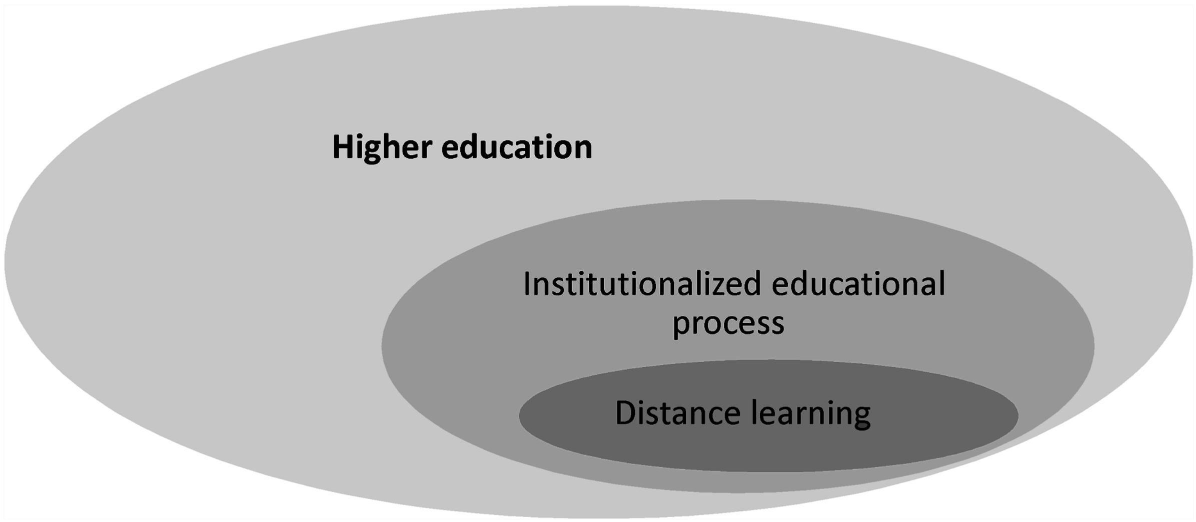


Figure 18. Elements of the institutionalized blended educational process

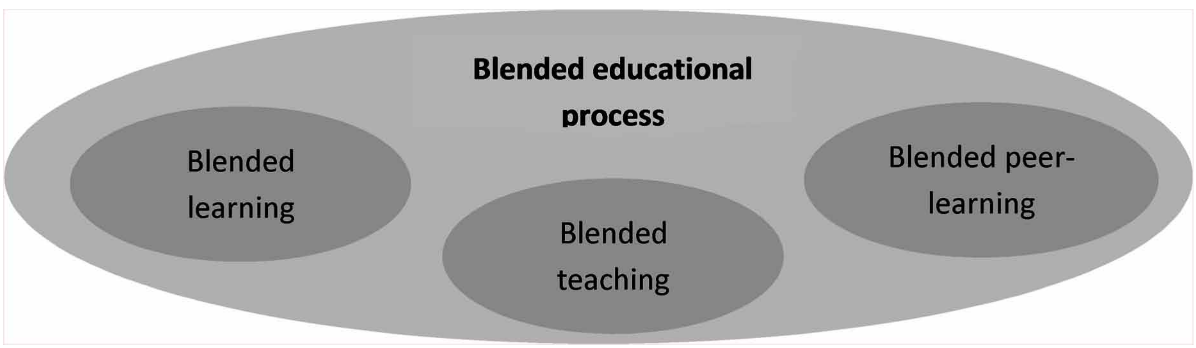
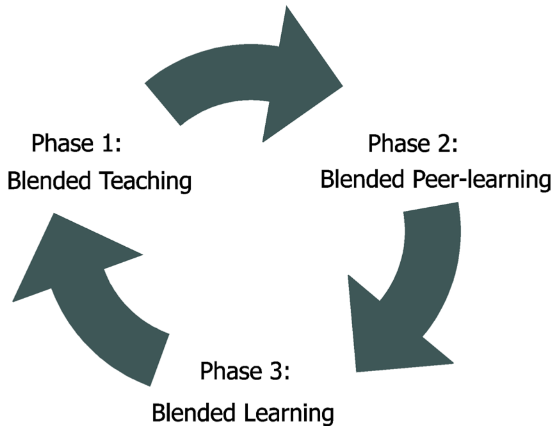


The institutionalized blended educational process proceeds as demonstrated in Figure 19.

- From blended teaching in Phase 1.
- Through blended peer-learning in Phase 2.
- To blended learning in Phase 3.

Blended teaching means a purposefully organized joint process of educator's sharing experience (knowledge, skills and attitudes) with students (Ahrens, Zaščerinska & Andreeva, 2013) via use of mobile technologies. Blended peer-learning is the sub-phase between blended teaching and blended learning in the institutionalized blended educational process. Blended peer-learning is aimed at students' interacting with each other via mobile technologies to learn something new. Therein, the blended teaching phase of the implementation of the institutionalized blended educational process is aimed at promoting students' motivation and their readiness to implement joint process. The blended peer-learning and blended learning phases of the implementation of the institutionalized blended educational process increase the level of difficulty in contents, students' autonomy, type of the institutionalized blended educational process, etc.

Figure 19. The phases of the institutionalized blended educational process



Further on, each phase of the implementation of the institutionalized blended educational process is differentiated into two sub-levels as illustrated in Table 3, thereby providing opportunities for the development of students' competence (Maslo, 2006).

These phases and sub-phases of the implementation of the institutionalized blended educational process and corresponding six levels of students' competence determine the essence and sequence of the implementation of the institutionalized blended educational process. The implementation of the institutionalized blended educational process is described as following:

Phase 1 *Blended Teaching* is aimed at a safe environment for all the students. In order to provide a safe environment, the essence of constructive social interaction and its organizational regulations are considered by both the educator and students. The present phase of the institutionalized blended educational process is organized in a frontal way involving the students to participate. Blended teaching process is under educator's guidance.

- Educator makes previous experience rational. The institutionalized blended teaching process includes choice of forms and use of resources that motivates the students.
- Peers do not participate in guidance of the institutionalized blended educational process. This phase of the institutionalized blended educational process is carried out

Table 3. Levels of implementation of the institutionalized blended educational process

Phase of the Institutionalized Blended Educational Process	Sub-Phase of the Institutionalized Blended Educational Process	Level of Student's Competence
Phase 1 Blended Teaching	Sub-Phase 1 - Beginning of Phase 1	Level 1 - very low
	Sub-Phase 2 - End of Phase 1	Level 2 - low
Phase 2 Blended Peer-Learning	Sub-Phase 1 - Beginning of Phase 2	Level 3 - critical
	Sub-Phase 2 - End of Phase 2	Level 4 - average
Phase 3 Blended Learning	Sub-Phase 1 - Beginning of Phase 3	Level 5 - optimal
	Sub-Phase 2 - End of Phase 3	Level 6 - high

qualitatively only with the help of the educator. Dependence on the educator is observed. The students study alongside but not together.
- Students create the system of the aim and objectives, search for a variety of information source and obtain techniques of information compiling. Students fulfil the present phase of the institutionalized blended educational process qualitatively only with the educator's help. Dependence on the educator is observed, not dependent on peers.

Phase 2 *Blended Peer-learning* is designed for the students' analysis of an open academic problem situation and their search for a solution. The same educational materials can be prepared for all of the group students. But these educational materials are different whereas learning styles and opportunities are different. This phase of the institutionalized blended educational process involves the students to act in peers.

- Educator functions as a resource and moderator. Educator delegates his/her duties to the students.
- Peers regulate each other: it is typical for students to regulate each other. The students study together, study from others and teach others. The present phase of the institutionalized blended educational process is under peer's guidance. Forms and methods of the institutionalized blended educational process are exchanged.
- The students fullfil the present phase of the institutionalized blended educational process qualitatively with the peers' help. Partial independence is observed. The relevant process is performed jointly with other students and with shared responsibility. It is typical for students to regulate each other.

Phase 3 *Blended Learning* emphasizes the students' self-regulation with use of assessment of the process and self-evaluation of the results.

- Educator functions as a consultant and an assistant. Educator delegates his/her duties to the students.
- Peers have consultative and advisory functions.
- Students' self-regulation is typical. The students learn independently. The students fulfil the present phase of the institutionalized blended educational process qualitatively on their own, and their independence is observed. The participants' self-regulation on the basis of the process assessment and the result of self-evaluation is used. The relevant activity is performed with a high sense of responsibility. Self-regulation is typical, and a student does not depend on peers.

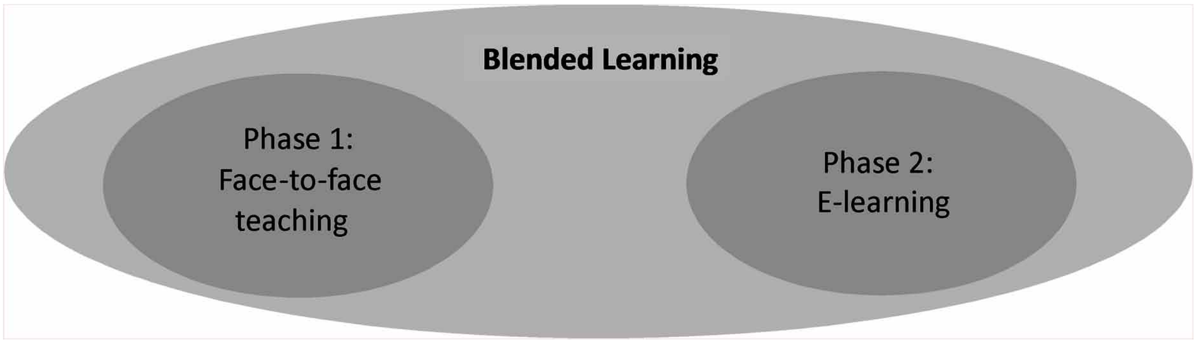
The advantages of the blended educational process and, consequently, the institutionalized blended educational process are identified as follows:

- Widening opportunities for each student in order to construct the experience in social interaction and cognitive activity, and
- Promoting opportunities for self-realization.

Many researchers define blended learning as a combination of face-to-face (traditional classroom) and online instruction (Grgurovic, 2011; Qiu & Chen, 2011). Some authors suggest that blended learning proceeds in the educational act of two main phases (Porumb, Orza, Vlaicu, Porumb & Hoza, 2011) as shown in Figure 20:

- Regular teaching in Phase 1 and
- Internet-based learning in Phase 2.

Figure 20. The educational act of blended learning



However, learning is learning, and instruction (teaching, training) is instruction. Hence, learning is neither teaching or instruction, or training. This differentiation between blended instruction and blended learning is highly significant as blended instruction (teaching, training) does not provide positive results in the improvement of students' individual experience and, consequently, competence (knowledge, skills and attitudes) till blended learning is engaged (Ahrens et al, 2013). Blended (hybrid) learning is one of the approaches that is utilized to help students for meaningful learning via information and communication technologies (Gecer & Dag, 2012). In the present research, the process of blended learning proceeds as a cycle. The cycle of the process of blended learning of three phases is proposed, namely preparation in Phase 1, implementation in Phase 2 and analysis in Phase 3 as demonstrated in Figure 21.

Phase 1 *Preparation* is aimed at planning the implementation of blended learning, choosing forms of information compilation and using resources for the implementation of blended learning. Phase 2 *Implementation* is focused on analysis of an open problem situation and search for a solution. Phase 3 *Analysis* includes evaluation of the blended learning results and elaboration of further perspectives.

Blended learning is differentiated into learning and distance learning as depicted in Figure 22.

Moreover, the terms "distance learning" and "e-learning' are used synonymously in the present contribution. Distance learning is defined as a purposefully organized or spontaneous process of students' improvement of his/her individual experience and, consequently, competence (knowledge, skills and attitudes) based on cognition via use of mobile technologies. Hence, distance learning differs from learning by use of mobile technologies in the process of cognition. As higher education is centred on research, and research is a kind learning, distance learning in higher education via use of mobile technologies as demonstrated in Figure 23 focuses on use of:

- University e-Libraries,
- Patent databases such as European Patent Office (EPO), US Patent and Trademark Office (PTO),
- Bibliographic databases such as SciVerse Scopus (SCOPUS), Thomson Reuters, Education Resources Information Center (ERIC),
- Research communities' networks such as www.researchgate.com, www.ResearcherID.com, etc.

University e-Libraries provide access to eResources such as electronic resources, i.e., online journals, indexes, databases, and books that is restricted by licenses with vendors to university's

Figure 21. The cycle of the process of blended learning

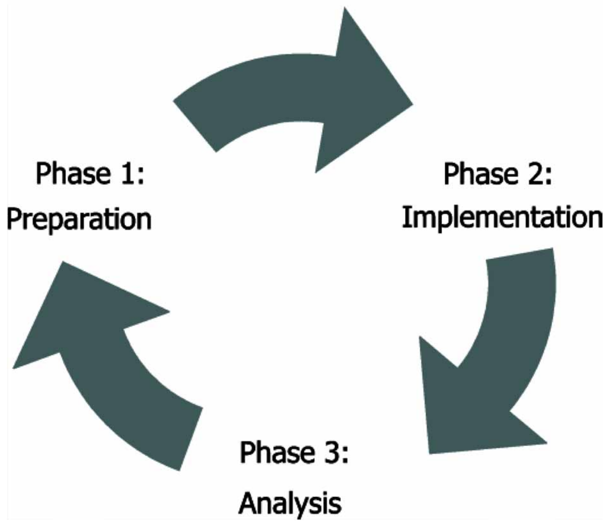


Figure 22. The relationship between blended learning, learning and distance learning

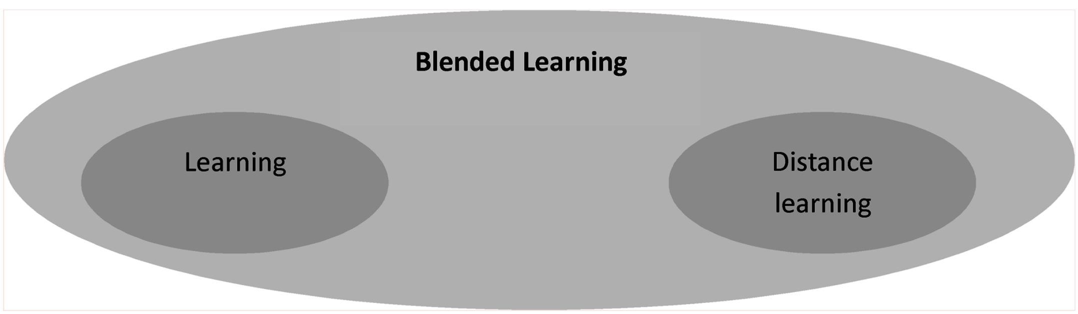

Figure 23. Distance learning via mobile technologies within the institutionalized blended educational process in higher education

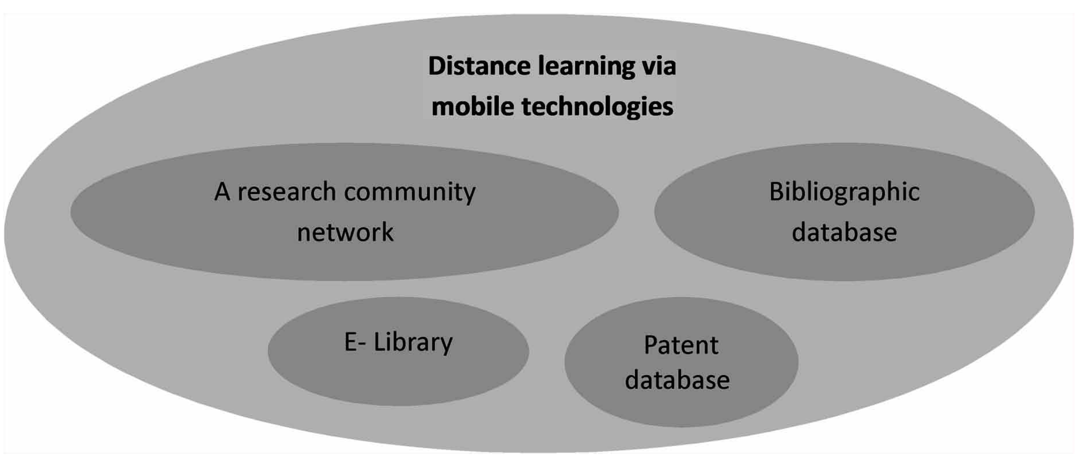


students, faculty, and staff. A particular university's students, faculty, and staff have off-campus access that is only ensured to these licensed eResources.

Patent database enables users to search the full text of multiple international patent collections. Users can search published applications, granted patents and utility models mostly from 1985 to the present time. The data available includes full text patents, English machine translations and full document images. These collections are periodically updated to include additional years of coverage.

A bibliographic database is a database of bibliographic records, an organized digital collection of references to published literature, including journal and newspaper articles, conference proceedings, reports, government and legal publications, patents, books, etc. In contrast to library catalogue entries, a large proportion of the bibliographic records in bibliographic databases describe articles, conference papers, etc., rather than complete monographs, and they generally contain very rich subject descriptions in the form of keywords, subject classification terms, or abstracts (Feather & Sturges, 2003). A bibliographic database may be general in scope or cover a specific academic discipline. A significant number of bibliographic databases are still proprietary, available by licensing agreement from vendors, or directly from the indexing and abstracting services that create them (Reitz, 2004). Many bibliographic databases evolve into digital libraries, providing the full-text of the indexed contents. Others converge with non-bibliographic scholarly databases to create more complete disciplinary search engine systems, such as Chemical Abstracts or Entrez.

Research community networks in the present contribution mean use of web-based tools to discover and use research and scholarly information about people and resources (Clinical and Translational Science Award, 2012). Research community networking tools serve as knowledge management systems for the research enterprise. Research community networking tools connect institution-level/enterprise systems, national research networks, publicly available research data (e.g., grants and publications), and restricted/proprietary data by harvesting information from disparate sources into compiled expertise profiles for faculty, investigators, scholars, clinicians, community partners, and facilities. Research community networks are designed for such target groups as (Barnett & Jardines, 2012):

- Investigators
  - To discover potential collaborators,
  - More rapidly and competitively to form teams,
  - To identify targeted grant opportunities and
  - To create digital vitae,
- Administrators
  - To work with better data for institutional business intelligence,
  - To better assess performance for annual reviews,
  - To recruit new faculty and attract students,
- Researchers
  - To study networks of science teams to improve research effectiveness.

Research community networks (Barnett & Jardines, 2012) include four technology components such as:

- A controlled vocabulary (eg., the VIVO Ontology) for data interoperability,
- An architecture for data integration and sharing (Linked Open Data),
- Applications for collaboration, funding, business intelligence, or administration, and
- Rich faculty profile data of publications, grants, classes, affiliations, interests, etc.

Further on, repositories of profile data need to talk to institutional systems like faculty directories (Barnett & Jardines, 2012).

Research community networks' tools facilitate the development of new collaborations and team science to address new or existing research challenges through the rapid discovery and recommendation of researchers, expertise, and resources (Carey, 2011; Fazel-Zarandi, Devlin, Huang & Contractor, 2011).

Research community networks' tools differ from search engines such as Google in that they access information in databases and other data not limited to web pages. They also differ from social networking systems such as LinkedIn or Facebook in that they represent a compendium of data ingested from authoritative and verifiable sources rather than predominantly individually asserted information, making research community networks' tools more reliable (Gewin, 2010). Yet, research community networks' tools have sufficient flexibility to allow for profile editing. Research community networks' tools also provide resources to bolster human connector systems: they can make non-intuitive matches, they do not depend on serendipity, and they do not have a propensity to return only to previously identified collaborations/collaborators (Contractor & Monge, 2002). Research community networks' tools also generally have associated analytical capabilities that enable evaluation of collaboration and cross-disciplinary research/scholarly activity, especially over time.

Importantly, data harvested into robust research community networks' tools is accessible for broad repurposing, especially if available as linked open data (RDF triples). Thus, research community networks' tools enhance research support activities by providing:

- Data for customized,
- Up-to-date web pages,
- CV/biosketch generation, and
- Data tables for grant proposals.

A short description of a research community network such as *ResearchGate* gives a short overview of functions of a research community network: ResearchGate is a social networking site for scientists and researchers to share papers, ask and answer questions, and find collaborators (Lin, 2012). The site has been described as a mashup of "Facebook, Twitter and LinkedIn" that includes "profile pages, comments, groups, job listings, and 'like' and 'follow' buttons" (Lin, 2012). Members are encouraged to share raw data and failed experiment results as well as successes, in order to avoid repeating their peers' scientific research mistakes (Dolan, 2012). Microsoft co-founder Bill Gates is among the company's investors (Levy, 2013). ResearchGate announced in 2013 that the site had two million members.

Research community networks demonstrate such opportunities as (Barnett & Jardines, 2012):

- Support to innovative team building approaches,
- Provision of richer data for comparative institutional studies, and
- Potential for national networks of collaborative research.

Research community networks reveal the existence of such threats as (Barnett & Jardines, 2012):

- Some desired data are private (eg., award amounts) or restricted (eg., FERPA),
- Negotiation between research and administrative efforts is required, and
- Efforts threaten established networks of research influence.

For the success of research community networks, such issues are to be considered as (Barnett & Jardines, 2012):

- Leveraging existing institutional efforts for research networking and annual faculty review,

- Understanding institutional culture and policy for faculty information sharing,
- Making the technology investments to develop the required new capabilities, and
- Identifying sources of available high quality profile data (institutional, corporate, federal, Linked Open Data cloud),
- Use of existing research or administrative initiatives and workflows that manage profile data,
- Overcome of institutional cultures that may not prevent data use for research networking, and
- Bringing together (typically) multiple initiatives that manage faculty profile data in a sustainable institutional strategy.

EMPIRICAL STUDY

The present part of the contribution demonstrates:

- The design of the empirical research,
- Survey results, and
- Findings of the comparative study.

The design of the present empirical research comprised the purpose and question, sample and methodology of the present empirical study as demonstrated in Figure 24.

The question of the empirical study was as follows: are there any similarities and differences between business and engineering students' attitude to mobile technologies in distance learning?

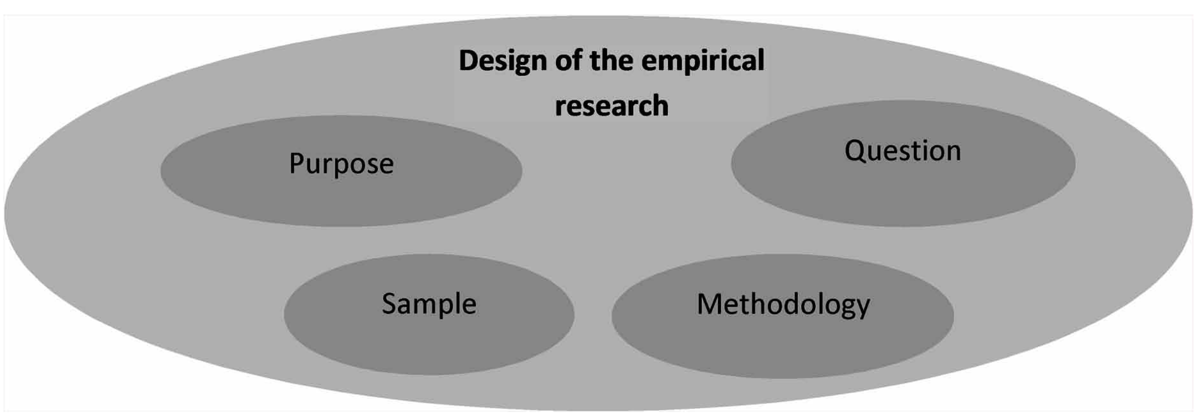
The purpose of the empirical study was to compare business and engineering students' attitude to mobile technologies in distance learning underpinning elaboration of a hypothesis.

The present empirical study involved:

- 13 second-year bachelor part-time students of the *Business Management* programme of the Northern Business School, Neumuenster, Germany, in January 2014, and
- 23 engineering students of Baltic Summer School *Technical Informatics and Information Technology* held at Vilnius Gediminas Technical University, Vilnius, Lithuania, July 20 - August 4, 2013.

It should be noted that the *Business Management* part-time programme of the Northern Business School, Neumuenster, Germany, as well as Baltic Summer School *Technical Informatics and Information Technology* held at Vilnius Gediminas Technical University, Vilnius, Lithuania, are organised as formal higher education institutions, thereby they are based on the institutionalized blended educational process of higher education.

Figure 24. Elements of the design of the present empirical research



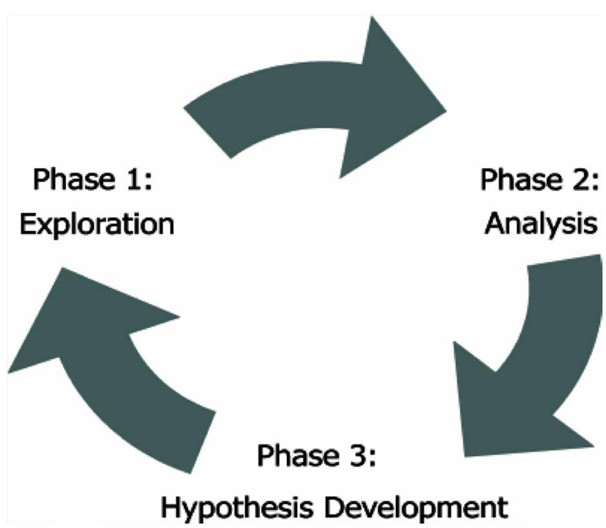
The respondents of 13 second-year bachelor part-time students of the *Business Management* programme of the Northern Business School, Neumuenster, Germany, in January 2014 included seven male and six female students. The age of students ranged between 20 and 50. All the students obtained working experience in different fields of business. Although the students studied in the same group, they represented different cultures, namely, German, Polish and Russian.

The respondents of 23 engineering students of Baltic Summer School *Technical Informatics and Information Technology* held at Vilnius Gediminas Technical University, Vilnius, Lithuania, July 20 - August 4, 2013 involved four female and 19 males. The age of the respondents differentiated from 22 to 35. All 23 students had got Bachelor Degree in different fields of engineering and computing. Working experience of the students was different, too. The students represented the cultures of Lithuania, Russia, Poland, Pakistan, France, Estonia, Serbia, Czech Republic, Finland, Ireland, Germany, Mexico, Georgia and Ethiopia.

Therefore, the sample is multicultural as the respondents with different cultural backgrounds and diverse educational approaches were chosen. Students' different cultural and educational experience emphasized the significance of each student's contribution to the analysis of their attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education. Thus, the groups' socio-cultural context (age, cultural and educational experience, mother tongue, etc.) is heterogeneous.

The interpretive paradigm was used in the empirical study. The interpretive paradigm aims to understand other cultures, from the inside through the use of ethnographic methods such as informal interviewing and participant observation, etc (Taylor & Medina, 2013). Interpretive research paradigm corresponds to the nature of humanistic pedagogy (Luka, 2008). The interpretive paradigm creates an environment for the development of any individual and helps them to develop their potential (Luka, 2008). The core of this paradigm is human experience, people's mutual everyday interaction that tends to understand the subjectivity of human experience (Luka, 2008). The paradigm is aimed at understanding people's activity, how a certain activity is exposed in a certain environment, time,

Figure 25. Methodology of the explorative research



conditions, i.e., how it is exposed in a certain socio-cultural context (Luka, 2008). Thus, the interpretive paradigm is oriented towards one's conscious activity, and it is future-oriented (Luka, 2008). Interpretive paradigm is characterized by the researcher's practical interest in the research question (Cohen, Manion & Morrison, 2003). Researcher is the interpreter.

Explorative research was used in the empirical study (Mayring, 2007). Explorative research is aimed at developing hypotheses, which can be tested for generality in following empirical studies (Mayring, 2007). The explorative methodology proceeds as demonstrated in Figure 25 (Ahrens, Bassus & Zaščerinska, 2013):

- From exploration in Phase 1.
- Through analysis in Phase 2.
- To hypothesis development in Phase 3.

Phase 1 *Exploration* is aimed at data collection. Phase 2 *Analysis* focuses on data processing, analysis and data interpretation. Phase 3 *Hypothesis Development* ensures analysis of results of the empirical study and elaboration of conclusions and hypotheses for further research.

In order to analyse the students' feedback regarding their attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education, the informal structured interviews were based on the following question: Do you use mobile technologies in distance learning? Only verbal expression of business and engineering students' attitude to mobile technologies in distance learning was taken into consideration. The evaluation scale of five levels for the question was given, namely, strongly disagree "1", disagree "2", neither disagree nor agree „3", agree "4", and strongly agree "5". The evaluation scale was transformed into the level system as illustrated in Table 4.

The business students' results of the question (students' attitude to mobile technologies in distance learning) used in the informal structured interviews are demonstrated in Figure 26 where:

- The vertical numbers show five levels to measure students' attitude to mobile technologies in distance learning, and
- The horizontal numbers present the code number of the business student who participated in the survey.

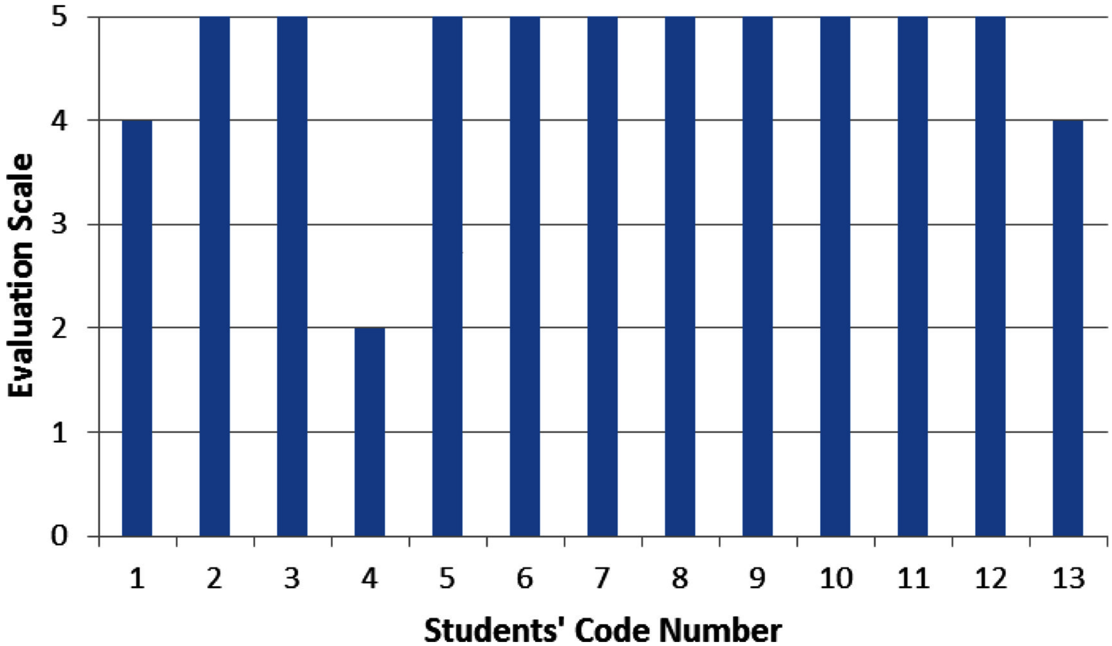
The business students' results of the question (students' attitude to mobile technologies in distance learning) reveal that:

- One business student's evaluation of his/her attitude to mobile technologies in distance learning refers to the low level,
- Two business students' evaluation of their attitude to mobile technologies in distance learning refers to the optimal level,
- 10 business students' evaluation of their attitude to mobile technologies in distance learning refers to the high level.

Table 4. Indicator and levels of students' attitude to mobile technologies in distance learning

Indicator	Levels				
	Level 1	Level 2	Level 3	Level 4	Level 5
	Very Low	Low	Average	Optimal	High
	1	2	3	4	5
Verbal expression	Strongly disagree Very negative	Disagree Negative	Neither disagree nor agree Neither negative nor positive	Agree Positive	Strongly agree Very positive

Figure 26. The business students' results of the question (students' attitude to mobile technologies in distance learning)



In comparison, the engineering students' results of the question (students' attitude to mobile technologies in distance learning) in the informal structured interviews are shown in Figure 27.

The engineering students' results of the question (students' attitude to mobile technologies in distance learning) reveal that:

- One engineering student's evaluation of his/her attitude to mobile technologies in distance learning refers to the low level,
- Three engineering students' evaluation of their attitude to mobile technologies in distance learning refers to the average level,
- Three engineering students' evaluation of their attitude to mobile technologies in distance learning refers to the optimal level,
- 16 engineering students' evaluation of their attitude to mobile technologies in distance learning refers to the high level.

The comparison of the results of the question (students' attitude to mobile technologies in distance learning) shows that the majority of both business and engineering students' evaluate their attitude to mobile technologies in distance learning to be of the high level.

The data were processed applying *Excel* software.

Frequencies of the business and engineering students' answers were determined in order to reveal students' attitude to mobile technologies in distance learning as shown in Table 5.

The comparison of the frequencies of business and engineering students' answers to the question (students' attitude to mobile technologies in distance learning) shows that the majority of both business and engineering students evaluate their attitude to mobile technologies in distance evaluates learning to be of the high level (77% and 70% respectively).

Further on, the mean results determine the high level of both business and engineering students'

Figure 27. The engineering students' results of the question (students' attitude to mobile technologies in distance learning)

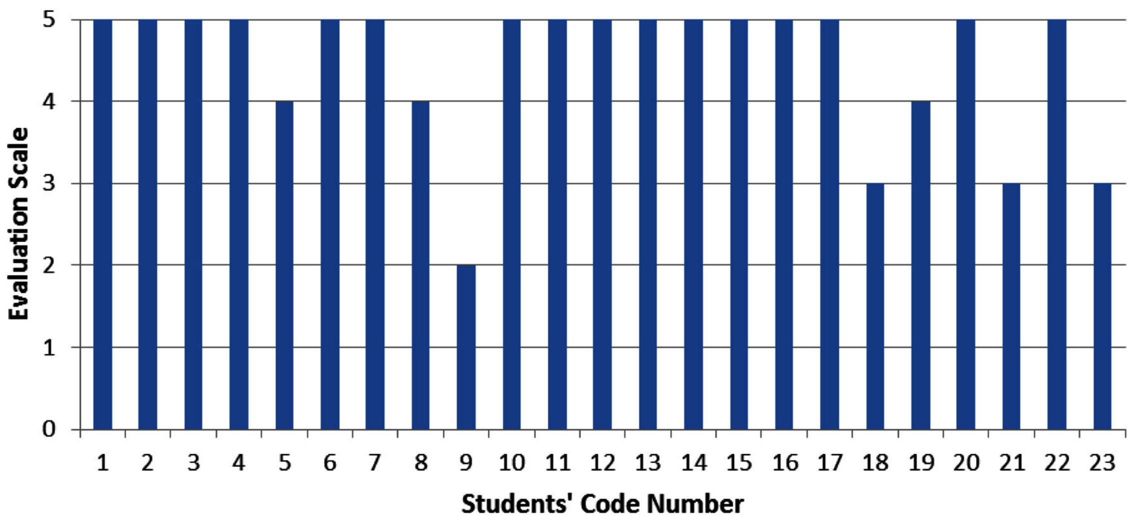


Table 5. Frequency of the students' answers

Question	Levels	Students' Group	Number of Answers	Percentage
Do you use mobile technologies in distance learning?	Very Low	business	0	0%
		engineering	0	0%
	Low	business	1	8%
		engineering	1	4%
	Average	business	0	0%
		engineering	3	13%
	Optimal	business	2	15%
		engineering	3	13%
	High	business	10	77%
		engineering	16	70%

attitude to mobile technologies in distance learning (4.6 and 4.5 respectively) as shown in Table 6.

The findings of the empirical study allow concluding that both business and engineering students demonstrated the high level of attitude to mobile technologies in distance learning (4.6 and 4.5 respectively). The summarizing content analysis (Mayring, 2004) of the data reveals that both business and engineering students' attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education is homogeneous.

CONCLUSION

The theoretical findings on the inter-relationship between students' attitude, mobile technologies and distance learning within the institutionalized blended educational process of higher education in

Table 6. Mean results

Question	Levels	Students' Group	Number of Answers	Percentage
Do you use mobile technologies in distance learning?	Very Low	business	0	Business students 4.6
		engineering	0	
	Low	business	1	
		engineering	1	
	Average	business	0	
		engineering	3	Engineering students 4.5
	Optimal	business	2	
		engineering	3	
	High	business	10	
		engineering	16	

the present research allow determining such outcome and criterion of use of mobile technologies in distance learning within the institutionalized blended educational process of higher education as students' attitude.

The findings of the present empirical study allow drawing conclusions that both business and engineering students' attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education is positive. Students' positive attitude to mobile technologies in distance learning is considered as a favourable opportunity for the increase of the level of students' knowledge and skills as well as competence, in general.

Further on, validity and reliability of the research results have been provided by involving other researchers into several stages of the conducted research. External validity has been revealed by international co-operation as following:

- Working out the present contribution in co-operation with international colleagues and
- Assessment of the present research by international colleagues on the basis of co-operation between universities,
- Participation in workshops given by the international colleagues,
- Presentations of the research at international conferences and
- Use of individual consultations given by the Western researchers.

Therein, the researchers' positive external evaluation of the research of the present contribution validates the findings of the present research.

The following hypothesis has been formulated: students' positive attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education promotes the increase of the level of students' knowledge and skills as well as competence in general if:

- A favourable blended educational (blended teaching, blended peer-learning and blended learning) environment focused on use of mobile technologies in distance learning is organized within the institutionalized blended educational process of higher education,
- Students are externally motivated to use mobile technologies in distance learning

within the institutionalized blended educational process of higher education by

- ◦ Asking students to consider the preconceptions about subject-related topics that they bring to the distance learning (Etkina & Mestre, 2004),
- ◦ Educators' adapting teaching styles (Movahedzadeh, 2011) to the student while use of mobile technologies in distance learning within the institutionalized blended educational process of higher education,
- ◦ Showing students the relevance of the learning topics to their everyday lives (Movahedzadeh, 2011),

- Students as well as educators are provided with technical support in use of mobile technologies in distance learning within the institutionalized blended educational process of higher education,
- Educators are ensured training courses focused on use of mobile technologies in distance learning within the institutionalized blended educational process of higher education.

The present research has limitations. The interconnections between students' attitude, emotions, mobile technologies, distance learning and the institutionalized blended educational process of higher education have been set. Another limitation is the empirical study conducted by involving only the business and engineering students. Therein, the results of the study cannot be representative for the whole area. Nevertheless, the results of the research, namely an outcome, indicators, constructs and levels of students' attitude to mobile technologies in distance learning within the institutionalized blended educational process of higher education, may be used as a basis of analysis of students' attitude to mobile technologies in distance learning in other institutions. If the results of other institutions had been available for analysis, different results could have been attained. There is a possibility to continue the study.

Further research tends to analyse students' attitude to mobile technologies in distance learning within the institutionalized blended educational process in higher education on the basis of the methodological background different from the methodological background of the present contribution, namely the System-Constructivist Theory introduced as the New or Social Constructivism Pedagogical Theory. Further on, application of another methodological approach different from the methodological approach of the present contribution, namely the outcome based approach, to the analysis of students' attitude to mobile technologies in distance learning within the institutionalized blended educational process in higher education is proposed. Future research intends to re-shape applications of mobile technologies in distance learning within the institutionalized blended educational process in higher education. Students' extrinsic motivation on a positive attitude to mobile technologies in distance learning has to be further investigated. The relationship between human emotions and age has to be further analysed, too. An educational model that comprises five phases of the institutionalized blended educational process in higher education to be implemented for the improvement of students' distance learning via mobile technologies is of great research interest:

- Blended teaching,
- Blended teaching with the elements of blended peer-learning,
- Blended peer-learning,
- Blended peer-learning with the elements of blended learning, and
- Blended learning.

Teaching methods of use of mobile technologies in distance learning that increase students' positive attitude to mobile technologies in distance learning are of great interest for a scientific discussion. Efficiency of use of mobile technologies in distance learning within the institutionalized blended educational process of higher education could be analysed in future. The search for relevant methods, tools and techniques for evaluation of students' attitude to mobile technologies in distance learning is proposed. Further research tends to implement empirical studies in other students' groups. Further empirical studies could be focused on the analysis of other indicators of attitude, namely, non-verbal and cultural expression. Constructs of students' attitude to mobile technologies in distance learning are to be further polished. A comparative study of students' groups of other university's programmes is to be proposed. Particularly, a study of student teachers' attitude to use of mobile technologies in distance learning is to be ensured as teachers have a two-fold role:

- In society, teachers are the agents of change and,
- In education and training, teachers are the key actors for the development of learners' use of mobile technologies in distance learning.

A comparative research as well as studies of other countries could be carried out, too.

KEY TERMS AND DEFINITIONS

Attitude: A combination of evaluative judgments about a phenomenon (Crites, Fabrigar, Petty, 1994).

Blended (Hybrid) Learning: One of the approaches that is utilized to help students for meaningful learning via information and communication technologies (Gecer, Dag, 2004).

Blended Teaching: A purposefully organized joint process of educator's sharing experience (knowledge, skills and attitudes) with students (Ahrens, Zaščerinska, Andreeva, 2013) with use of mobile technologies.

Distance Learning: A purposefully organized or spontaneous process of students' improvement of his/her individual experience (knowledge, skills and attitudes) based on cognition with use of mobile technologies.

Institutionalized Educational Process: A process organized, systematized, structured and administered within formal higher education according to a given set of laws and norms.

Mobile Technologies: Smart phones, laptops, tablet personal computers, ultra compact computers, hybrid devices, etc.

Students' Attitude: A part of competence as competence includes knowledge, skills and attitudes.

ABSTRACT

Over the past few years, there has been a rapid increase in the development of technology-based learning and teaching. Professors have become more pragmatic in their approach to technology-based media by using it to supplement or to replace traditional face-to-face teaching. Blended learning, which combines both electronic and face-to-face interaction, has gained more ground as midway between distance and face-to-face teaching approaches. Thus, opportunities for both educators and learners have been created. The teaching and learning approach adopted at Ajman University of Science and Technology (AUST) combines an equal balance of traditional face-to-face and videoconference learning, complemented with the use of a learning management system (Moodle). Student and instructor satisfaction is considered the most important factor in measuring the quality of blended learning. The purpose of this chapter is, therefore, to examine student and instructor satisfaction of blended learning at AUST. The chapter demonstrates that the majority of students and instructors hold positive views but are still attached to the traditional face-to-face learning and teaching. They also show that the level of satisfaction may depend on individual experience as well as on the major studied/taught.

DOI: 10.4018/978-1-4666-8246-7.ch054

INTRODUCTION

Ajman University of Science and Technology (AUST) was founded in 1988 as the first private institution of higher education in the United Arab Emirates and Gulf Cooperation Council States. The university has two campuses, at Ajman and Fujairah. It offers 26 accredited undergraduate programs and six accredited master's programs. In observance of social norms for certain communities, AUST has from its inception adopted an education system of segregation by gender. Each course is taught in two separate sections, one for male and the other for female students. Traditionally, the instructor in charge teaches both sections and thus the same lecture is delivered twice.

Like businesses, universities face pressure to do more and better with less. As a consequence, videoconferencing becomes a way to reduce unnecessary duplication of effort. Drawing on the experience of AUST, this chapter presents a new approach to course delivery that combines traditional face-to-face methods with modern technology. The goal of this blended delivery approach is to provide a virtual environment as close to the face-to-face approach as possible.

In order to assess the effectiveness of the blended learning approach adopted in AUST, students and instructors from different colleges at AUST were asked to complete surveys conceived to gauge whether the nature of courses being delivered using the blended learning model affects the student learning process. The respondents' feedback was used to introduce further improvement.

In other words, the purpose of this chapter is to evaluate the level of student and instructor satisfaction with blended learning, and to explore whether satisfaction differs according to time-related and/or college-related factors.

This study is essential to ensure that high quality learning is achieved when instructors and students are physically separated. The results obtained reveal that even though the majority of students and instructors make positive observations regarding blended learning at AUST, they still prefer the traditional face-to-face model. Results also show that the level of student satisfaction depends on the major being studied, while the level of instructor satisfaction depends on teaching experience.

BLENDED LEARNING AT AUST

Blended learning, also called hybrid learning, is a flexible term which lacks a unified definition. A variety of definitions thus exist, addressing different aspects of instruction:

- A combination of teaching strategies,
- A combination of delivery media,
- A combination of online and face-to-face instruction.

Due to gender segregation at AUST, course instructors have to deliver each lecture at least twice. Instructor office hours are also divided according to gender. The blended learning at AUST combines an equal balance of traditional face-to-face and videoconference learning, complemented with the use of a Learning Management System (LMS), namely Moodle. In this blended delivery approach, the two sections of the course are scheduled to be offered in separate classrooms at the same time. The classrooms are connected using videoconferencing equipment which allows interactive real time video and audio communication between the two rooms. Students may also communicate with their instructor as well as with their classmates at any time using the LMS adopted at AUST.

A videoconferencing classroom features the following:

- Cameras fixed to the ceiling allowing the transmission of a live color video of the instructor in the other classroom and simultaneously transmitting a video of the remote students to a TV screen which may be viewed by the instructor.

- Data Show devices installed in each classroom. These allow the display of video and the instructor's course materials on a smart board and a projection screen. There is one projection screen in each classroom.
- Presentations are displayed in both classrooms.
- Flat TV screens available in each classroom, allowing the instructor to see and interact with all students.
- A control panel enabling the adjustment of the audio system, mixer, amplifier, microphones and speakers that produce high quality audio delivery in classrooms.
- An interactive board (smart board) allowing the instructor to display videos and course materials interactively. The instructor may also use an interactive pen on the smart board.

The instructor alternates between classrooms; thus, in one session, male students are taught face-to-face, while the female students follow the same lecture via videoconferencing. In the following class, female students are taught face-to-face, while male students follow through videoconference. The instructor can see, hear and interact with students in both classrooms, but has to adjust his/her teaching methods in such a manner as to allow students in the remote classroom to follow every aspect of the lesson clearly. Consequently, students from both sections can follow the lecture, see presentations, read notes written on the smart board and interact with the instructor.

At the beginning of each semester, the whole teaching-learning process is initiated through Moodle where course content, learning activities, assessment tasks and schedules are uploaded. Students are encouraged to obtain a printed version of the lecture material in advance so as to prepare for the class.

In class, the computer connected to the smart board is used both to receive material from the smart board and to present the instructor's previously prepared material, including PowerPoint presentations. The instructor can move easily from presentation to smart board writing mode.

The following should be noted:

- Videoconferencing is used for courses with a small number of students, and only for the theoretical part of any course.
- Students in both classrooms have access to the instructor during designated office hours.
- The instructor attends male and female classes alternately.
- Students can access course learning materials using Moodle. They can thus work at their own pace.
- With Moodle, students can request clarification from their instructor in the same way as they would in a traditional face-to-face classroom. They can receive replies from their classmates which can be monitored by the instructor. An answer given by an instructor to one student can also benefit all the others.

The use of videoconferencing in teaching and learning has greatly expanded over the last few years, leading educators and researchers to focus on the effectiveness of videoconferencing. After reviewing the research in this field, Greenberg (2004) concludes that in the delivery of instruction, videoconferencing is neither more nor less effective than the traditional classroom. He adds that compared to other modalities, videoconferencing generates greater interactivity and, when used properly, it is a cost-effective way of delivering educational experiences to an expanded student population.

BENEFITS OF BLENDED LEARNING

A range of benefits for moving to blended learning have been noted in the literature. These fall within four types: institutional, student, instructor and pedagogical.

Institutional Benefits

One benefit of blended learning is that it improves the efficiency of classroom space usage. Universities with a shortage of classrooms can reduce their need to rent extra space (Young, 2002) by offering blended courses. Furthermore, universities can post course resources online instead of photocopying them, and create re-usable learning objects that save both time and money (Sharma & Barrett, 2007). Blended learning also benefits institutions by reducing on-campus traffic and the associated need for parking space. It is equally possible to apply the blended model in innovative ways, both to increase student learning outcomes and to reduce instructional delivery costs (Dziuban, Hartman & Moskal, 2004).

With its blended learning approach, AUST can ensure quality teaching with less use of resources. Instructors do not have to duplicate their efforts in lecturing twice (one for male and again one for female students), which is especially helpful when enrolment is small. As a direct consequence, AUST reduces the course delivery costs while maintaining the same income earned from its face-to-face delivery mode.

Student Benefits

The flexibility and convenience of blended learning benefits students, too. De George-Walker & Keeffe, (2010), for instance, contend that students appreciate the ability to work at their own pace, in times and in places that suit them.

At AUST, instructors alternate their lectures between male and female students. Thus face-to-face meetings are important because of the significance of human contact and its impact on the interaction between learners and instructors. Likewise, meeting face-to-face with classmates allows students to better socialize and interact with peers through Moodle. Leonard & DeLacey (2002) observe that trust among members is crucial and has to be consciously encouraged and supported in the design of activities; people may feel less free to share their personal learning tracks to members of an online community who they do not know well.

Dziuban & al. (2004) have consistently found high levels of student and faculty satisfaction in blended learning courses. According to them, student learning outcomes are higher in such courses than in comparable face-to-face and fully online courses, and student demand is equally high because of the increased convenience and flexibility of these courses.

Unlike most classroom experiences, blended learning allows students to retrieve course content material as often as they need for better grasp. Indeed, students can thus take time to process information before asking or responding to questions. Since blended learning is supported by Moodle, it also allows students to continue asking questions about topics that were not clear in the other side of the blended learning classroom. They can easily communicate directly with their instructors or leave them a question in the discussion section of the LMS (Hijazi, Crowley, Smith, & Shaffer, 2006).

Instructor Benefits

Faculty teaching in a blended delivery model report an increased level of interaction, both among fellow classmates and with their instructor, which suggests that the blended environment offers a less intimidating forum for student participation, specifically accommodating students who tend to be less verbal (Gould, 2003). University of Wisconsin faculties indicated that they could accomplish course learning objectives more successfully within a blended course than within a traditional face-to-face course because of the flexibility of blended learning model (Garnham & Kaleta, 2002).

At AUST, instructors experience greater flexibility in their schedule. They are able to establish online office hours (through Moodle) that are appropriate to their own work /life balance. Additionally, instructors are free to spend as much time answering individual questions as they consider necessary, a luxury that is often unavailable to them in a tightly scheduled classroom environment. Moreover, Instructors are able to enhance their technology skills. They would often experience a shift in their instructional role when they prepare for blended courses. They move from being an expert on a subject, who must engage students, to being a facilitator of students as they engage with the subject. This may increase effectiveness, ensuring that all involved in the learning process play a more significant role. Dziuban & al. (2004) maintain, in fact, that instructors improve and develop as they become more experienced in delivering instruction in a blended learning format.

Pedagogical Benefits

Young (2002) states that the main motivation of hybrid courses supporters is to improve the students' educational experience. Lending him credence, Allan (2007) advances that one of the main rationales for using blended learning is that it enhances the engagement of learners by providing a rich mixture of learning prospects. Osguthorpe & Graham (2003) refer to this opportunity favored faculty in order to increase the level of pedagogical richness in their course delivery. The associated increase in student engagement is an oft-cited benefit of blended learning (Sharma & Barrett 2007; Vaughan, 2007).

At AUST, blended instruction offers faculty and students alike the ability to teach and learn in a variety of different modalities, potentially increasing instructional effectiveness. Making blended learning available in certain courses gives students both the flexibility of online education and the social and instructor support commonly associated with a face-to-face class.

CHALLENGES OF BLENDED LEARNING

The development of information and communication technology in recent years has made the associated technology more reliable than in the past. It is the human rather than the technological factor that limits the adoption and application of technology-enhanced learning environments, as instructors need considerable commitment and training. The transition from a traditional teaching and learning experience to a blended one is not easy in that it requires students and faculty to interact differently both with each other and with the course content. The literature reports several challenges associated with blended learning faced by students and faculty, as well as by the institutions as a whole. There are also many cultural and ethical issues that require consideration.

Student Challenges

The primary challenge for students is the transition from a passive to an active/collaborative learning approach. Blended learning places more responsibility on students, requiring them to rethink their behavior in the blended learning classes. They have to reconsider their time management skills, and use sophisticated technologies (Vaughan, 2007). Blended courses require a degree of self-motivation and independent learning which might be unfamiliar to students who have only experienced traditional face-to-face formats (MacDonald, 2008).

Investigating students' refusal to use materials in blended courses, Orton-Johnson (2009) asserts that students' rejection of blended learning stems from their perception of traditional printed texts as authentic academic knowledge, which results in more trust in these texts than in Web-based sources.

Faculty Challenges

Faculty members at AUST are often resistant to blended learning strategies. They are, thus, reluctant to reduce class time, integrate unfamiliar technologies, and take on the perceived additional work in developing blended courses.

From a faculty perspective, blended learning brings new responsibilities and roles to teachers who already have significant workloads (Alebaikan & Troudi, 2010; Guri-Rosenblit, 2009; Ocak, 2011; Vaughan, 2007). A major concern for faculty members is the increased time commitment involved (Vaughan, 2007) since blended courses take longer to prepare and administer than their traditional counterparts. Faculty support and resources for course redesign, along with the development of new teaching and technology skills, are also important factors in delivering successful blended courses (Gerbic & Stacey, 2009). Bailey & Card (2009) hold that many educators who shift towards blended teaching agree that their institutions provide technical support and training, but that advice and assistance relating to pedagogical and instructional support are limited or lacking.

Likewise, Vaughan (2007) lists major risk factors which have been identified by faculty who have taught blended courses, including anxiety over losing control of the course, lower student evaluations, and uneasiness about how this type of learning model fits into the culture of teaching. However, resistance to blended learning is less forceful than resistance to fully online learning due to its combination of traditional and technological methodologies (Niemiec & Otte, 2010).

Institution Challenges

Universities face several barriers and challenges that must be addressed for successful adoption and expansion of blended learning practices.

First, there is an urgent need for a clear policy concerning the target audience of blended learning that determines where the audience fits within the stated goals and priorities of the institution (Wallace & Young, 2010). To integrate blended learning, a clear vision and action plan have to be integrated into the strategic plans of the university. This minimizes the risk of using scarce resources ineffectively, frustrating users, and generating poor learning outcomes (Wallace & Young, 2010). A study by Abel (2005) clearly highlights the relationship between having a clear policy and success in technology-enhanced learning. The study shows that institutions which were successful in their use of online learning strategies had compelling reasons to support such learning.

The second challenge is lack of appropriate leadership to support and sustain blended learning initiatives. Garrison (2011) argues for "collaborative leadership" which pulls together leaders at all levels of the institution to create a real commitment and ownership through a jointly developed vision and plan.

Finally, faculty members who pursue innovative teaching practices should be recognized and offered incentives, both to value their efforts and encourage others. As to younger faculty members, the majority of whom possess strong technological skills, when they are facing the tenure process, they do not have the time to invest in the research and practice of blended learning. They must, instead, focus on research solely within their discipline. If they are, however, offered the opportunity to do research in the use of blended learning within their own discipline, they may have greater impact on the future pedagogical approaches which are inevitably heading towards the blended learning. Ongoing pedagogical and technological support is essential to faculty throughout both development and delivery of blended learning. Developing a blended course, especially preparing resources and materials for videoconferencing classes, requires faculty to invest much more time than they do while preparing for a face-to-face classroom presentation.

Ethical Challenges

Littlejohn & Pegler (2007) discuss a number of ethical issues related to blended learning. Although having a clear code of conduct that is understood by all participants can address trust issues, privacy and confidentiality are essential in order to maintain security for online resources and communications. Concerns about copyright also need to be addressed, especially when considering the ease with which material can be published online.

Cultural Challenges

There is a strong link between culture and learning that is reflected in how people prefer to learn and how they tend to process information (Samover, Porter & McDaniel, 2009). In the gulf region, religion and culture play a major role in shaping social practicalities and learning experiences. Accordingly, AUST provides a gender segregated environment where students of the same gender can work together in the same classroom. In the blended classroom and through Moodle, students of different genders are able to work together. Similarly, the kind of social environment created when online learning is integrated with face-to-face learning, can exert considerable influence on students' perceptions (Alebaikan & Troudi, 2010).

STUDENT SATISFACTION

According to the Sloan Consortium, student satisfaction is achieved when students are effective in the learning and are pleased with their practice (Moore, 2009). Along the same lines, Sweeney & Ingram (2001) define satisfaction as the observation of pleasure and success in the learning environment. Both definitions focus on accomplishment and success in learning, and pleasure in and enjoyment of the experience. Thurmond, Wambach, Connors, & Frey (2002) describe student satisfaction as a concept that reflects outcomes and exchange that occurs between students and an instructor. Reporting on satisfaction in a blended learning environment, Wu, Tennyson, & Hsia (2010) define satisfaction as the sum of student feeling and attitude that result from aggregating all the benefits that a student hopes to receive from blended learning environment system.

Students spend a considerable amount of time and money, and exert substantial effort in obtaining a quality education. They should, therefore, perceive their post-secondary educational experiences as being of high value (Knox, Lindsay, & Kolb, 1993). Student satisfaction is important because it influences the student's level of motivation (Chute, Thompson, & Hancock, 1999; Donahue & Wong, 1997), which is an important psychological factor in student success (American Psychological Association, 1997). Meeting and exceeding students' expectations also lead them to become advocates who provide a free promotion for the university.

Sun, Tsai, Finger, Chen, & Yeh, (2008) argue that satisfaction of learners is the most significant factor in developing online courses. Their research demonstrates a framework of six dimensions that influences satisfaction of online learners. Among them, learners and technology are two dimensions that obviously relate to the development of e-learning tools and resources. These two dimensions contain several factors that are characterized by three significant features: usability, quality, and flexibility. All of these features are of acute importance due to their effect on satisfaction of learners within online learning environments (Sun & al., 2008).

Sinclaire (2011) reports three convincing reasons for interest in student satisfaction. First, the Sloan Consortium's "Five Pillars of Quality Online Education" declares student satisfaction to be the most important key to continuing learning. It reflects learners' evaluation of the quality of all aspects of the educational program (Sloan, 2011). There is also evidence that student satisfaction is positively related to retention and a decision to take one or more additional courses (Booker & Rebman, 2005). Lastly, student satisfaction is important because satisfied students represent a public relations asset for a college or university. If students are viewed as customers of college education, their satisfaction is important to recruitment efforts. Therefore, there is a need for a greater understanding of factors that affect student satisfaction with blended learning.

FACULTY SATISFACTION

Instructor satisfaction is crucial and should be carefully studied to ensure successful deployment of blended learning. Faculty satisfaction is defined as the perception that teaching in the blended learning environment is effective and professionally beneficial. Because faculty members are instrumental in the success of distance education programs as part of the blended learning, levels of faculty satisfaction are one measure for the assessment of program effectiveness (Lock Haven University, 2004). Hartman, Dziuban, & Moskal (2000) have suggested that faculty satisfaction and student learning are closely correlated.

MAIN FOCUS OF THE CHAPTER

In order to assess the effectiveness of the blended teaching approach adopted in AUST, instructors and students from different colleges at AUST completed forms in order to study whether using the blended learning mode affects the student learning process.

Samples

Data used in this study were collected in two different periods: the first pool of data was completed in 2010 and the second in 2012. In both periods, students and instructors were asked to complete two different survey forms to evaluate their satisfaction in blended learning.

In 2010, eighteen instructors (14 from the College of IT and 4 from other colleges) completed the instructor survey form, and a sample of 334 students (142 from the IT College and 192 from other Colleges), drawn from the pool of undergraduate students enrolled in blended learning courses offered at AUST, completed the student survey form.

In 2012, thirty instructors (21 from the College of IT and 9 from other colleges) completed the instructor survey form and 207 students (108 from the IT College and 99 from other Colleges), enrolled in blended learning courses completed the student survey form.

Instruments

Students were asked to give a value from 1 to 5 for each question (item) of the survey ('1' being 'poor' and '5' being 'excellent'). The scores were collected in order to evaluate the average score by item. Student survey form questions were divided into four factor sections: 1) interaction, 2) technology, 3) student performance, and 4) course management (see Table 1).

Instructors were also asked to give a value from 1 to 5 for each question (item) of the survey ('1' being 'poor' and '5' being 'excellent'). The rating scores were collected in order to evaluate the average score by item. Instructor survey form questions were also divided into four factor sections: 1) interaction, 2) technology, 3) student performance, and 4) course management (see Table 2).

STUDENT SATISFACTION

A t-test was conducted on the category of overall student satisfaction with blended learning courses,

Table 1. Student survey form

Factor	No.	Item
Interaction	S1	A blended learning session always keeps me alert and focused.
	S2	Interaction is adequately maintained with the instructor when s/he is in the other side of the blended learning classroom.
	S3	Having students from the opposite gender in the other classroom listening to what I might say restricts my participation.
	S4	A blended learning course makes it more important for students to visit the instructor during office-hours.
	S5	I would have felt more engaged in a traditional classroom setting.
Technology	S6	The instructor's voice is audible.
	S7	Course content shown or displayed on the smart board is clear.
	S8	The microphone is in good working condition.
	S9	Technical problems are not frequent and they do not affect my understanding of the course.
	S10	The technology used for blended learning is reliable.
	S11	Not having an individual microphone for each student is a reason for not participating effectively.
Student Performance	S12	The use of blended learning technology in this course encourages me to learn independently.
	S13	My understanding is improved compared to similar courses I have studied before.
	S14	My performance in exams is improved compared to similar courses I have studied before.
	S15	I am satisfied with the level of effort this course requires.
Course Management	S16	Discipline is highly observed when the instructor is on the other side of the blended learning classroom.
	S17	The instructor/supervisor always takes attendance.
	S18	Taking the course via face-to-face delivery is more effective.
	S19	If I had known this was going to be a blended learning class, I would not have taken it.
	S20	I am willing to take another course using the blended learning delivery mode.

to evaluate whether the mean was significantly different from 2.5 - an accepted mean for student satisfaction (Giannousi, Vernadaki, Derri, Michalopoulos, & Kioumourtzoglou, 2009). The sample grand mean of 3.38 (SD=0.521) was higher than 2.5, ($t=7.529$, $df=19$, $p<0.05$) for blended learning satisfaction. The 95% confidence interval for blended learning satisfaction mean ranged from 0.634 to 1.122. These results show that students are satisfied with blended learning, whites is compatible with the literature (Alebaikan, 2010; Dziuban & al, 2004; Garrison & Vaughan, 2008; Graham, Allen, & Ure, 2005; Holley & Oliver, 2010; Iqbal, Kokash, & Al-Oun, 2011).

In order to evaluate the overall student satisfaction related to the different factors identified in Table 1, an average of data collected related to each factor was computed. Figure 1 shows a summarized indication of the overall student data collected in both periods, 2010 and 2012.

Interaction Related Factor

The overall mean for student satisfaction in this factor was 3.17 (3.16 in 2010 and 3.18 in 2012).

These results show that students are satisfied with the level of interaction, which is compatible with the findings of several research projects (Najafabadi & Najafabadi, 2011; Napier, Dekhane,

Table 2. Instructor survey form

Factor	No.	Item
Interaction	I1	I believe students are alert and focused most of the time.
	I2	I think interaction is adequately maintained with students on the other side of the blended learning classroom.
	I3	Having students from the opposite gender on the other side of the blended learning classroom has a negative impact on the ability to participate and speak-out freely.
	I4	I believe my interaction with students would be better in a normal class setting (face-to-face).
Technology	I5	Adequate training on how to use the different equipment was provided.
	I6	The laptop used in blended learning classroom is always ready and up to date.
	I7	Using the smart board is more effective than using the white board.
	I8	Audio equipment is always working properly.
	I9	The technical support and maintenance provided are satisfactory.
Student Performance	I10	A blended learning course can promote independent learning.
	I11	Students' understanding is comparable to courses in face-to-face delivery mode.
	I12	Students' performance in exams is similar to courses in face-to-face delivery mode.
	I13	The learning process of students is accelerated.
	I14	For the same course given in a face-to-face delivery mode, students' achievements in blended learning course were equivalent.
	I15	The percentage of students with at least a C grade exceeds 70%.
Course Management	I16	When I am not physically present in the classroom, the presence of a Supervisor is necessary.
	I17	Students are as serious with attendance as in courses taught in face-to-face delivery mode.
	I18	Teaching this course in face-to-face delivery mode is more appropriate.
	I19	I am willing to teach again using blended learning technique delivery mode.
	I20	The same teaching materials were used as in a face-to-face lecture session.

& Smith, 2011; Riffell & Sibley, 2004; Story & DiElsi, 2003; Wingard, 2004). Higher quality level of interaction has been linked to student satisfaction (Arbaugh, 2000; Kaleta, Skibba, & Joosten, 2007; Picciano, 2002; Russo & Benson, 2005; Swan, 2001).

Item S3 is related to interaction with other students having the highest mean, 3.41. This suggests that students are satisfied with the level of interaction. The two items S1 and S2 have the lowest score in this group with an average mean of 2.87 and 2.83 respectively. These scores are understandable because there may be less discipline and more interruption among students when the lecturer is in the remote classroom.

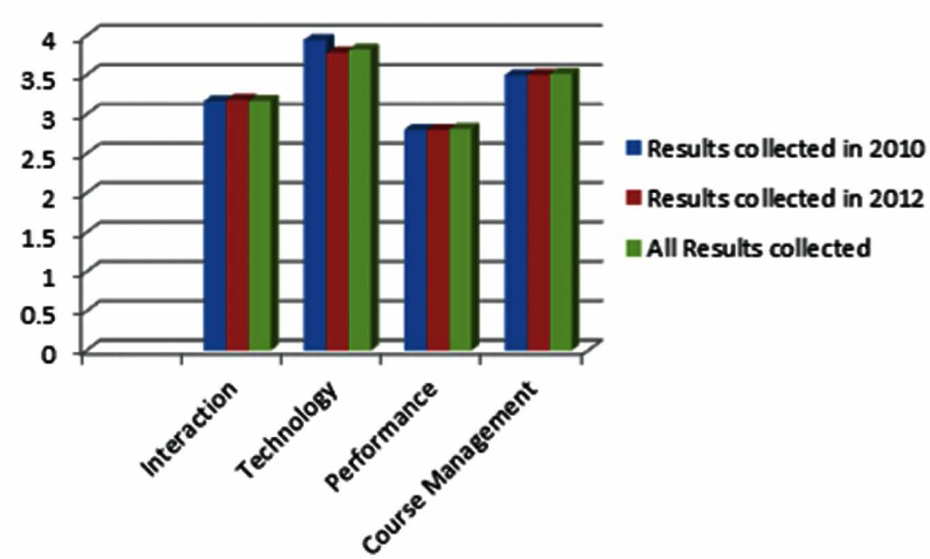
Technology Related Factor

Most students are satisfied with the technology used in the videoconferencing component of blended learning (mean=3.82, SD=0.01). The data collected had shown that 2010 students were more satisfied with the technology (mean=3.94) than 2012 students (mean=3.78). When investigated, this was found to be the result of some technology having become old and less reliable.

Performance Related Factor

Generally, students were moderately satisfied with their performance in blended learning courses (mean = 2.8, SD= 0.18). Item S12 ("The use of

Figure 1. Summary of students' scores



blended learning technology in this course encourages me to learn independently") has the highest satisfaction in this group (mean=3.26). Item S14 ("My performance in exams is improved compared to similar courses I have studied before.") had the lowest satisfaction in this group (mean=2.60). When asked about their satisfaction with the level of effort the blended learning course requires (S15), students showed adequate satisfaction with mean = 2.8 (2.69 in 2010 and 2.92 in 2012). The results suggest that students prefer face-to-face learning, even if their performance and grades with blended learning are similar. These findings are in line with a larger data-mining study of several thousands of students, conducted by researchers at the University of Central Florida. The researchers found out that blending learning courses produced comparable or superior success rates to face-to-face (Dziuban, Hartman, Juge, Moskal, & Sorg, 2006).

Course Management Related Factor

The results show that students are generally satisfied with class management (mean=3.51, SD= 0.02). Although there was some change between 2010 (mean=2.49) and 2012 (mean=3.50), this item still needs improvement. Item S17 has the highest satisfaction in this group (mean=4.31). Students agree that the instructor/supervisor always takes attendance.

However, there were also some areas where the students were less satisfied. When asked whether they were willing to take another course in blended learning (S20), most students disagreed with mean=2.20 (2.02 in 2010 and 2.4 in 2012).

Time-Related Factor

Table 3 shows the mean and standard deviation for student satisfaction among 2010 students and 2012 students who experienced blended learning courses. A t-test was to check the following hypothesis:

There is no significant difference in student satisfaction between 2010 and 2012 students who experienced blended learning courses.

Table 3. Students scores based on time-related factor

Item No.	Students Score Collected in 2010		Students Score Collected in 2012		Students Score	
	Mean	SD	Mean	SD	Mean	SD
S1	2.92	1.29	2.82	1.07	2.87	0.05
S2	2.81	1.36	2.85	1.19	2.83	0.02
S3	3.37	1.47	3.46	1.39	3.41	0.04
S4	3.05	1.30	3.22	1.17	3.12	0.08
S5	3.64	1.37	3.35	1.27	3.50	0.14
S6	4.23	1.13	3.81	1.17	4.04	0.21
S7	4.32	1.04	4.37	0.87	4.34	0.02
S8	4.05	1.15	3.69	1.29	3.88	0.18
S9	4.04	1.66	3.62	1.22	3.85	0.21
S10	3.73	1.14	3.48	1.13	3.61	0.13
S11	3.27	1.47	3.19	1.49	3.24	0.04
S12	3.30	1.22	3.17	1.07	3.26	0.06
S13	2.61	1.27	2.61	1.14	2.62	0.00
S14	2.60	1.31	2.59	1.13	2.60	0.01
S15	2.69	1.32	2.92	1.25	2.80	0.11
S16	3.81	1.32	3.65	1.08	3.73	0.08
S17	4.30	1.15	4.32	1.02	4.31	0.01
S18	4.17	1.18	4.2	1.1	4.18	0.02
S19	3.14	1.05	**3.1**	**1.03**	3.12	0.02
S20	2.02	0.20	**2.4**	**0.79**	2.20	0.19

The result was (t=1.321, df=19, p=.202>.05). Accordingly, the hypothesis is accepted. There is no significant difference in student satisfaction between 2010 and 2012 students who experienced blended learning courses.

College-Related Factor

Table 4 shows the mean and standard deviation for student satisfaction among IT students and students enrolled in other colleges who experienced blended learning courses. A t-test was to check the following hypothesis:

There is no significant difference in student satisfaction between IT and other College students who experienced blended learning courses.

The result was (t= -.365, df=19, p=.719>.05). Thus, the hypothesis is accepted. There is no significant difference in student satisfaction between IT and other College students who experienced blended learning courses. The mean and standard deviations for IT students are 3.366 and 0.537 respectively, while for other colleges they are 3.39 and 0.719 respectively.

INSTRUCTOR SATISFACTION

A t-test was conducted on the category of overall instructor satisfaction with blended learning courses, to evaluate whether the mean was significantly different from 2.5 - an accepted mean for student satisfaction (Giannousi & al., 2009). The sample

Table 4. Students scores based on College-related factor

Item No.	IT Students Score		Other Students Score		All Students Score	
	Mean	SD	Mean	SD	Mean	SD
S1	2.87	1.00	2.86	1.37	2.87	0.05
S2	3.04	1.06	2.64	1.44	2.83	0.02
S3	3.36	1.23	3.44	1.60	3.41	0.04
S4	3.26	1.13	2.99	1.34	3.12	0.08
S5	3.24	1.26	3.79	1.35	3.50	0.14
S6	3.96	1.20	4.17	1.13	4.04	0.21
S7	4.35	0.94	4.32	1.01	4.34	0.02
S8	3.73	1.19	4.07	1.22	3.88	0.18
S9	3.88	1.77	3.88	1.26	3.85	0.21
S10	3.50	1.07	3.75	1.19	3.61	0.13
S11	3.38	1.40	3.11	1.52	3.24	0.04
S12	3.15	1.06	3.34	1.24	3.26	0.06
S13	2.74	1.01	2.50	1.37	2.62	0.00
S14	2.66	1.03	2.54	1.39	2.60	0.01
S15	2.99	1.09	2.60	1.42	2.80	0.11
S16	3.50	1.15	3.96	1.27	3.73	0.08
S17	4.18	1.09	4.42	1.10	4.31	0.01
S18	4.07	1.12	4.28	1.16	4.18	0.02
S19	3.13	1.05	3.12	1.03	3.12	0.02
S20	2.34	0.74	2.01	0.18	2.20	0.19

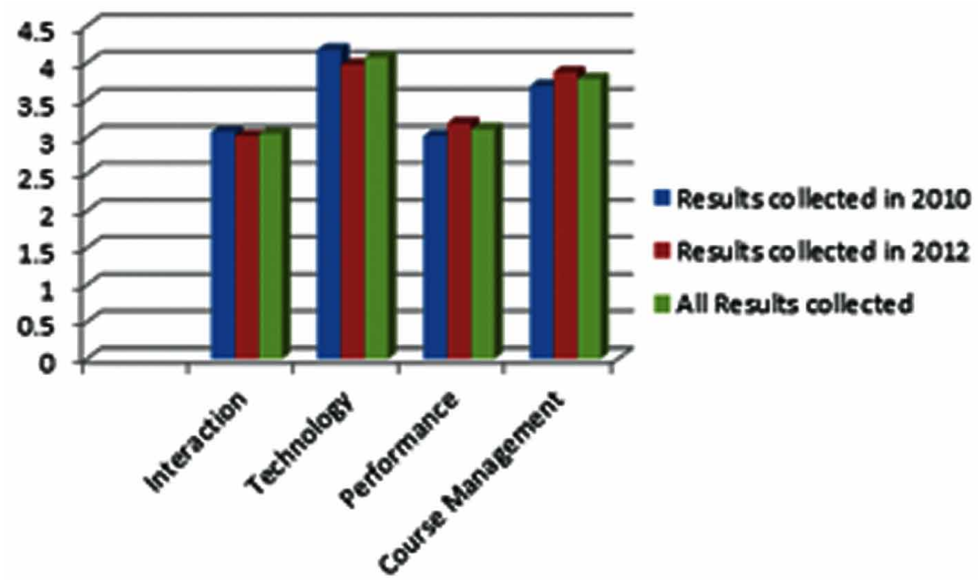
grand mean of 3.41 (SD=.643) was higher than 2.5, ($t=6.342$, $df=19$, $p<0.05$) for blended learning satisfaction. The 95% confidence interval of difference for blended learning satisfaction mean ranged between 0.611 and 1.2143. The results show that instructor satisfaction is higher than the average. These results are in line with other research. 88% of the faculty who taught blended learning courses at the University of Central Florida were satisfied with blended teaching and would teach in a blended format again ((Dziuban & al., 2004). All faculty involved in the blended learning pilot program at the University of Wisconsin were happy with their first blended teaching experience and were willing to recommend it to others (Aycock, Garnham, & Kaleta, 2002). In contrast, a blended learning pilot project at the Rochester Institute of Technology revealed that only 41% were willing to teach a blended course again (Vignare, & Starenko, 2005).

In order to evaluate the overall instructor satisfaction related to the different factors identified in Table 2, an average of data collected related to each factor was computed. Figure 2 shows a summarized indication of the overall instructor scores collected in both periods, 2010 and 2012.

Interaction Related Factor

The overall mean for instructor satisfaction in this factor was 3.04 (3.06 in 2010 and 3.01 in 2012). Item I1 "I believe students are alert and focused most of the time" having the highest (mean= 3.25). This suggests that instructors are satisfied with

Figure 2. Summary of instructors' scores



the level of interaction with their students. Item I4 "I believe my interaction with students would be better in a normal class setting (face-to-face)" has the lowest score in this group (mean= 2.22). This shows that most instructors believe that a higher interaction with students can be achieved in face-to-face instruction.

Technology Related Factor

Most instructors are satisfied with the technology used in the videoconferencing component of blended learning (mean=4.07, SD=.14). The data collected had shown that 2010 instructors were more satisfied with the technology (mean=4.17) than 2012 instructors (mean=3.97). When investigated, this was found to be the result of some of the technology having become old and less reliable.

Performance Related Factor

Instructors were generally satisfied with student performance in blended learning courses (mean = 3.10, SD= 0.12). Item I15 ("The percentage of students with at least a C grade exceeds 70%") has the highest satisfaction in this group with mean=3.43. Item I13 ("The learning process of students is accelerated") has the lowest satisfaction in this group with mean=2.38.

This can be attributed to the following factors:

- Most instructors believe that blended learning does not accelerate the learning process compared to face-to face learning.
- Student performance in blended learning courses is similar to that in face-to-face courses.

Course Management Related Factor

The results showed that instructors are generally satisfied with class management (mean=3.78, SD= 0.13). Item I16 "When I am not present physically in the classroom, the presence of a Supervisor is necessary" has the highest satisfaction in this group (mean=4.25). The lowest mean item was I17 "Students are serious with attendance compared to similar courses taught in face-to-face delivery mode" (mean = 3.17).

Time-Related Factor

Table 5 shows the mean and standard deviation for instructor satisfaction among 2010 and 2012 instructors who experienced blended learning courses. A 2-paired t-test was to check the following hypothesis:

There is no significant difference in instructor satisfaction between 2010 and 2012 students who experienced blended learning courses.

The result was (t=-2.415, df=19, p=.025 <.05), 95% confidence interval of difference ranging from lower= -0.405 to upper= 0.289. Accordingly, the hypothesis is rejected. There is a significant difference in instructor satisfaction among 2010 and 2012 instructors who experienced blended learning courses. Instructors are more satisfied in 2012 (mean= 3.52) than they were in 2010. This can be attributed to the fact that instructors in 2012 have become more experienced with blended learning than were their colleagues in 2010.

College-Related Factor

Tables 6 and 7 show the mean and standard deviation for instructor satisfaction among IT and other colleges' instructors who experienced blended learning courses. A 2-paired t-test was to check the following 3 hypotheses:

Hypothesis 1: There is no significant difference in instructor satisfaction between IT and other colleges' instructors who experienced blended learning courses in 2010.

The result was (t=-2 .366, df=19, p=.029<.05). The 95% confidence interval of difference ranges from lower= -.645 to upper= - 0.395. Accordingly, the hypothesis is rejected. There is a significant difference in instructor satisfaction between IT and other colleges' instructors who experienced blended learning courses. Instructors from other colleges were more satisfied with blended learning than IT instructors. The mean and standard deviation for IT instructors are 3.30 and 0.792 respectively while for other colleges they are 3.65 and 0.675, respectively. This can be attributed to the fact that blended learning started late in the college of IT.

Hypothesis 2: There is no significant difference in instructor satisfaction between IT and other colleges' instructors who experienced blended learning courses in 2012.

The result was (t= -1 .001, df=19, p= 0.329>.05). The 95% confidence interval of difference ranges from lower= -.2827 to upper= - 0.0997. Thus, the hypothesis is accepted. There is no significant difference in instructor satisfaction between IT and other colleges' instructors who experienced blended learning courses.

Hypothesis 3: Overall, there is no significant difference in instructor satisfaction between IT and other colleges' instructors who experienced blended learning courses.

The result was (t=-2 .461, df=19, p=.024<.05). The 95% confidence interval of difference range from lower= -.1730 to upper= - 0.01398. Thus, the hypothesis is rejected. There is a significant difference in instructor satisfaction between IT and other colleges' instructors who experienced blended learning courses. Instructors from other colleges were more satisfied with blended learning than IT instructors. This can be attributed to the fact that blended learning started late in the college of IT.

Moreover, instructors gave some observations regarding the benefits of adopting blended learning at AUST. This delivery mode is more suitable for theoretical courses than for practical ones. It

reduces duplication of teaching time and effort. In addition, instructors give the same material at the same time for both genders; male and female sections are always at the same level and have the same exam questions. Likewise, instructors are better prepared to meet students in two classrooms at once. Any problem discussed on the smart board is recorded and can be referred to in subsequent lectures.

However, the following restrictions were made by instructors regarding the use of blended learning:

- Instructors should prepare reliable and efficient course material and should be confident with the use of the technology.
- More time is needed for preparation and planning, especially when the course is being taught using blended learning mode for the first time.
- Restriction of the lecture style; instructors have to keep an eye on students in the other side of the blended learning classroom.
- It is difficult for instructors to monitor students' behavior when conducting blended learning mode classes.
- More courses have to be taught to complete the teaching load.
- Student control is more difficult.
- There is greater reliance on technology and IT staff.

LIMITATIONS

This study has two limitations. First, the research findings are based on instructors and undergraduate students in the College of Information Technology and the College of Education at AUST, who are taking blended learning courses. While valid, the results should not be overgeneralized by the reader and may not be applicable to other colleges or other universities. Second, the study used a self-reported questionnaire survey form which is limited in nature by the accuracy of the participant's response. Although the researchers took steps to facilitate accurate reporting, such as confidentiality and voluntary participation, these procedures might have not ruled out the bias associated with self-reported data, including social desirability. Despite these limitations, a self-report data is a strong method to measure the level of students' satisfaction.

FUTURE RESEARCH DIRECTIONS

This study was conducted on a sample from one institution (AUST). Further research can be conducted on larger sample sizes in several universities in the United Arab Emirates and in different countries to generalize and confirm the reliability and the validity of these findings.

Further research is needed to find the reasons behind the varying levels of satisfaction in these areas so as to aid understanding of the components of student satisfaction, and facilitate improvements

in the quality of blended learning courses offered. Being able to understand the needs of students, to support students in blended learning courses, and to promote a successful learning experience will be critical to the overall success of blended learning in the university. However, in order to do so, a larger sample will be required, which should include face-to-face and blended learning courses. This would also help to determine the reason for differences in satisfaction based on a wide range of criteria: course, instructor, gender, age difference, socioeconomic status, previous blended learning course experience, organizational issues, proficiency in a learning management system (Moodle), or work experience, personality or other student demographics. Recommendations for improving overall learning outcomes could also be made.

Research should also be extended to investigate the relation between instructor satisfaction and student satisfaction. Further research is equally needed to assess the difference in student satisfaction between blended learning and face-to-face learning through the comparison of blended learning courses with the same courses offered by the face-to-face method.

Future research into the development of effective multimedia resources would be beneficial to students and instructors alike.

Finally we believe that continuous and careful monitoring of learner satisfaction will ensure the success, feasibility and viability of blended learning as a supporting educational technology tool in university study programs.

CONCLUSION

This study has shown that lecturing via blended videoconferencing did not adversely affect students' academic performance or their ability to learn effectively. However, it was found that the approach is:

- More suitable to classes with a small number of students, as instructors may concentrate on delivering the course material rather than on handling distraction and disciplinary issues.
- Less suitable for courses which require the acquisition of practical skills such as learning programming. In such courses, the instructor gives students enough time to solve problems related to teaching objects in the classroom. Solutions are then discussed with the instructor in order to highlight points of strength and those of weakness in each student's answers. This process cannot be fulfilled by the current blended learning classes delivered at AUST.

Contrary to what was thought to be complicated technology, instructors and students have found it reliable, user-friendly and enriching their learning experience. This is important because unreliable technology could frustrate instructors and students in course itself and lower satisfaction level.

Although it had been feared that instructors and students would find the technology too complicated, they have found it reliable and user-friendly, instead. This study has also concluded that instructor satisfaction with blended learning improves with time, and that instructors should therefore be given time and incentives to prepare the course material and adjust their teaching approach to suit the blended teaching/learning approach. To help the instructor control disruptive students in the remote classroom, the university made a class supervisor available upon instructor request. This system has worked well where it has been used.

The study has also revealed that in the blended videoconferencing delivery mode, as in other aspects of the teaching/learning process, the instructor plays an important role. Besides having knowledge of the course material, s/he has to be well prepared, and be a good communicator, presenter and facilitator. For these reasons, the pedagogical skills of the instructor are extremely important.

Finally, we believe that with time, blended learning will become increasingly widespread within institutions of higher education. It offers students the opportunity to be exposed to alternative learning approaches and become involved in collaborative learning, both locally and internationally.

KEY TERMS AND DEFINITIONS

Blended Learning: Blended learning is the teaching practice that combines an equal balance of traditional face-to-face and videoconference learning, complemented with the use of a learning management system.

Face-to-Face Teaching: A teaching method where students and the instructor who is delivering the course material are physically in the same classroom.

Instructor Satisfaction: Instructor satisfaction is defined as perception that the teaching experience in blended environment is a rewarding, effective and professionally beneficial.

Learning Management System (LMS): LMS is a software application or Web-based technology used to administer, plan, implement, track, and assess a specific learning process. Typically, a learning management system provides an instructor with a way to create and deliver content, quizzes, monitor student participation, and assess student performance.

Student Performance: The contentment of students regarding their understanding to the course material and their ability to get adequate grade in the overall course assessment.

Student Satisfaction: The subjective evaluation of a student's behavioral belief and attitude toward the various outcomes and experiences that student receives using blended learning.

Videoconference Classroom: A classroom where students can follow a lecture delivered at the same time by an instructor who is teaching another classroom via videoconferencing techniques.

Chapter 55
Blended Learning Experience of Graduate Students

Wafa Hozien
Virginia State University, USA

ABSTRACT

Blended learning has been in existence for over a decade, and more research needs to be done to determine its efficacy and desirability for colleges and universities. The goal of this chapter is to document the ways in which blended learning has changed the university learning experience for graduate students. End-of-semester student questionnaires were analyzed, and it was found that even in the early years of blended learning, students were generally satisfied and appreciated the convenience of the blended modality. Quantitative and qualitative data was collected through the questionnaires, a student focus group, and faculty interviews. The goal of this chapter is to answer the questions: How do graduate students perceive the BL experience? What are the faculty's perspectives about changes in the delivery of instruction? How has the university learning experience been changed as a consequence of BL? Student priorities were teacher presence, faculty skill at teaching blended classes, and the support that was available to them from the faculty and administration. Faculty voiced concerns with transitioning from teaching face-to-face or online to teaching blended.

INTRODUCTION

To increase access to the growing adult population many colleges and universities offer blended learning programs that include a mix of face-to-face, online and hybrid courses. Teaching in a blended learning program requires that faculty members have instructional skills in multiple teaching and learning environments. This has become more challenging since while some receive training, many learn how to teach adults and multiple course delivery formats through experience. This qualitative study investigates graduate students' and faculty perceptions of how they teach adults within a blended program influences their teaching practices; how faculty describe the process of teaching in multiple course delivery formats within a blended program and to document the ways in which blended learning has changed the university learning experience for graduate students. Data were collected through semi-structured interviews, focus groups, background questionnaires and faculty observations.

DOI: 10.4018/978-1-4666-8246-7.ch055

Blended learning (BL) has sometimes been called the best of both worlds, combining the advantages of face-to- face instruction with the advantages of online learning. It has been in existence for over a decade, and more research needs to be done to determine its efficacy and desirability for colleges and universities (Bleed, 2006). The goal of this chapter is to document the ways in which blended learning has changed the university learning experience for graduate students. End-of-semester questionnaires administered to students were analyzed and it was found that blended learning with graduate students was generally satisfied with the experience and appreciated the convenience of the blended modality. Quantitative and Qualitative data was collected through the questionnaires, a student focus group and faculty interviews.

The goal of this chapter is to answer three questions. Namely, how do graduate students perceive the BL experience? What are the faculty's perspectives about changes in the delivery of instruction? How has the university learning experience been changed as a consequence of BL?

BACKGROUND

Researchers have attributed a number of benefits to BL, from improved learning outcomes, to increased student engagement and lower attrition compared to fully online learning (FOL) alone. Dziuban et al. (2004) studied student success rates (as defined by grades of A, B, or C) at the University of Central Florida for seven semesters beginning in spring, 2001, and concluded that student learning outcomes in BL classes were higher than in FOL classes and comparable or in some cases better than face-to-face (F2F). Even student attrition rates were favorable, with withdrawal rates lower than those of FOL and comparable to F2F. Dziuban et al attributed the success of BL courses to sound instructional design, the most effective courses being wholly redesigned rather than only supplemented with online elements. Osguthorpe and Graham (2003) explain that instructors use BL to attain various goals for their courses:

- **Pedagogical Richness:** Student learning can be improved by using class time for rich, in-depth activities, and online time for dispensing information.
- **Access to Knowledge:** The online portion of a BL course can be used to enhance accessibility to information for students. Web-based resources are vast in comparison to textbook content.
- **Social Interaction:** The social interaction present in blended learning environments (BLEs) may not be as prevalent as in FOL systems. Social contact can take place F2F and continue online.
- **Personal Agency:** The development of self-directedness and control by the learner is an important tenet of instructional design. BLEs offer students the opportunity to make choices in their learning, such as what and how they will study.
- **Ease of Revision:** Most BLEs grow out of F2F rather than FOL models; faculty often modify online components in response to student needs or the speed with which the course progresses. BL "has the potential to create a learning atmosphere that is flexible, responsive, and spontaneous" (p. 232).

Skibba (2006) found that connecting F2F and online activities establishes a *continuous learning loop* that creates an active and meaningful learning experience. When instructors reflect upon their course learning objectives and decide which activities work best F2F and which work better online, they can set up a learning experience that transfers seamlessly from one modality to the other, thus creating a learning loop that takes the student from the beginning of learning to using knowledge in meaningful ways. Skibba noted examples such as sharing students' online postings in class to generate richer F2F discussions, and commencing group work online and carrying over activities to the classroom environment.

QUESTION OF THE DAY

Due to the progress in BL, it is time to assess the effect of Blended Learning has had on the learning experience of graduate students. Has it lived up to its potential? Is it working equally as well for graduate students as for those in 4-year colleges and universities? Earlier research on BL and its effect on the student learning experience focused on community colleges. Colleges and universities are increasingly offering open access, developmental courses, technical training, and transfer programs for their students (Vaughan, 2006), differentiating them from universities as well as accepting Massive Open Online Courses (MOOC) from organizations such as coursera. As many colleges and universities offer both BL and FOL (Allen, Seaman, & Garrett, 2007), it is important for students to know whether pursuing BL as a learning modality would be worth the time and effort.

Some university administrators had urged faculty to present their courses in the BL format for practical reasons, such as utilization of scarce classroom space, but faculty wanted to know how BL would affect the student, the university as a whole, and their course goals.

BL had been in existence since 2005 in some universities in Virginia, and questions had arisen as to its impact on the graduate student learning experience (Donahue, 2010). Administrators and faculty alike wanted to know not only BL's effect on graduate students' effect on retention and graduate student satisfaction. Although faculty had a "gut feeling" about BL's success, department chairs, without qualitative data, had expressed concerns that graduate students may simply be using BL as an excuse for less time in the classroom. BL's appropriateness for university graduate students who were struggling with graduate-level learning also had been in question.

Although offering more BL or FOL courses may be an attempt to increase graduate student access choices, it must be done with an eye on learning effectiveness. Vignare (2007), in her review of the literature on BL, concluded that more studies must be done on BL and its effectiveness, stating that research measuring the constructs of retention, completion, perceived learning, and shifts in cognitive presence is more difficult to find for BL and that it is more ambiguous.

Garrison and Vaughan (2008) urge higher education to "start delivering on its promise of providing learning experiences that engage and address the needs of society in the twenty-first century" (p. 7). They maintain that the lecture method of teaching, originating in antiquity, is a way of disseminating knowledge that is no longer effective in engaging learners in critically filtering and making sense of the overabundance of information confronting them. Constructing meaning of complex topics requires more engagement than is possible in a typical lecture. BL has the potential to enhance both online and F2F approaches, where each is improved by the presence of the other (Melton, et.al, 2009).

In earlier work, Garrison and Kanuka (2004) argued that as new forms of communication alter the way we learn and work, the traditional classroom paradigm is questioned. As tuition rises, graduate students are demanding higher quality learning experiences and wonder whether attending classes on a traditional schedule is worth the commute to campus due to their full time work and parenting schedules. BL may be the answer for both institutions and graduate students as they move toward more flexibility in time and space. But this purported answer must be assessed and evaluated as to its effectiveness. More research is needed on the impact that BL will have in terms of learning outcomes, student satisfaction, retention, and achievement.

THE STUDY

The study took place at a suburban Virginia university. A mixed method research design was followed, but because of the small population (students taking BL courses), generalizability to larger, urban university may be limited. The number of faculty teaching BL courses was also limited, so interviews represented only a small number of total university faculty.

A focus group was convened as one of the data collection tools utilized in the study. Although best efforts were made to populate the group with a representative sample of the graduate student body, the limited number of graduate students who volunteered to participate in the focus group affected this plan. Although the demographics did not perfectly match the population, the focus group did contain an acceptable variety of participants.

LITERATURE REVIEW

Defining the concept of *blended learning* has been the topic of much discussion by those researching it. According to Osguthorpe and Graham (2003), BL is a process that combines F2F and distance delivery systems, utilizing the Internet and pedagogies that are focused on the unique needs of learners. They rebuff the contention that anytime the Internet is used, it is considered BL. Instructors using BLEs make a distinction: They seek to maximize the benefit of both delivery systems, using the World Wide Web for what it does best, and using classroom time for what it does best.

Graham (2006) defines BL as a process that combines F2F instruction with computer-mediated instruction. He rejects earlier, broad definitions that maintain BL combines delivery media or instructional methods. It is his position that those definitions dilute the real meaning of BL and that it would be difficult to find learning systems that did not make use of multiple instructional methods or delivery media. Instead, he prefers the more specific definition involving F2F instruction and the central role computer based technologies play in BL.

Another definition by Garnham and Kaleta (2002), adds the element of *replaced seat time* to the combination of F2F and online activities. To add to the convolution of definitions, Garnham and Kaleta use the term *hybrid* to define what is currently referred to as *blended* in the literature. The goal of hybrid, or blended, courses is not only to combine the best features of F2F and FOL learning, but to promote active independent learning, reduce seat time, and to redesign some course content into new learning activities, such as case studies, tutorials, self-testing exercises, simulations, and online group collaborations. In much of the early literature on BL, a distinction was not made as to the absence or presence of reduced seat-time, but more on the addition of technology supported learning activities added onto a classroom environment that was originally F2F (Bliuc, Goodyear, & Ellis, 2007).

The question of definition, and the terms used to describe it, becomes important in research so that consistency can be attained and valid inferences can be made. The current literature contains discourse on a variety of "blended" and "hybrid" topics, but Osguthorpe and Graham (2003) maintain that the term *blended* best describes the balance and harmony sought in the course delivery method. The key, states Skibba (2006), is that the BL course is learner-centered, providing a variety of choices, meaningful activities, and opportunities for student interaction.

Allen et al. (2007) define blended courses as having between 30% and 79% of content delivered online. They state that blended courses (which they also refer to as hybrid) "typically [use] online discussions, and typically [have] some face-to-face meetings" (p. 5). FOL is defined as more than 80% of content delivered online, and courses with 29% or less online content as "web facilitated," but essentially F2F. Those courses that have no online technology use are labeled as "traditional".

For purposes of the study, the investigator used the following definition, agreed upon by invited participants at the 2005 Sloan-C Workshop on Blended Learning (Picciano, 2007, p. 9):

Courses that integrate online with traditional face-to-face class activities in a planned, pedagogically valuable manner, and where a portion (institutionally defined) of face-to-face time is replaced by online activity.

The term used to define the courses in which BL takes place will be referred to as *blended.*

The key phrase in the above definition is integration *in a planned, pedagogically valuable manner.* Undesirable blends can take place which bring together the weaknesses of F2F and FOL learning, rather than the strengths. For instance, the F2F portion of the course may emphasize poorly-delivered lectures with no student participation, and the online element may stress tedious, over-prompted practice (Osguthorpe & Graham, 2003).

Graham (2006) illustrates the importance of understanding the strengths and weaknesses inherent in F2F and BLEs by using the example of class discussions. Besides being one of the most common instructional methods, class discussions focus on learner interaction, rather than knowledge transmission. This makes the class discussion an excellent vehicle in which to analyze which type of instruction is best suited to meet instructional goals. For instance, one of the strengths of BLEs is that student participation is increased because time and space constraints are removed; this would be advantageous in large-enrollment classes in that everyone has the opportunity to contribute to a class discussion. Conversely, instructors may choose to use classroom time for discussions if they find students are procrastinating and may be unmotivated; a lively F2F discourse, where enthusiasm for the topic can be communicated through voice and gesture, may be the best choice in these circumstances. Graham notes, however, that a weakness of F2F discussions is that dominant personalities may control the discussion at the expense of shy or quiet students. In that case, perhaps an online discussion, where students are afforded the time for more thoughtful reflection on the topic, would be best suited to meet instructional goals.

BL's strengths and weaknesses were further studied by Jackson and Helms (2008) who concluded that blended, or hybrid, courses are characterized by the best and the worst of both online and F2F formats. They utilized the method of SWOT analysis, a technique that facilitates free-form discussion and helps to identify key criteria and issues surrounding a problem or decision. The term SWOT is an acronym for its components: strengths, weaknesses, opportunities, and threats. They surveyed students in three sections of two senior-level business courses about how the students perceived the BL experience. Results showed that students cited an almost equal number of strengths as weaknesses, suggesting the existence of trade-offs in the BLE, and that some of the strengths were simultaneously listed as weaknesses. For example, the advantage of spending less time in class may be identified by a student as strength, while having less time in the classroom for learning from the professor or other students may be recognized as a weakness. Jackson and Helms (year) admit that their findings differ from prior research, and suggest that future researchers validate their findings with additional student respondents.

Results of studies done on the impact of BL on the learning experience range from no significant difference to the transformation of higher education. Carmel and Gold (2007) used the constructs of student satisfaction, retention, and grade point average (GPA) to determine the effect course modality had on program success. As the subjects self-selected either blended or F2F course modality, the authors suggest that the students possessed the attributes likely to have made their learning experiences satisfactory in the chosen modalities. There were no significant differences in satisfaction, retention, or GPA between the F2For blended classes.

BL has tremendous potential to transform higher education (Garrison & Kanuka, 2004). As the Internet and electronic communication technologies have transformed much of society, those components have also transformed education. FOL learning holds the advantage of allowing students to be both together and apart, connected to a learning community without being bound by place or time. Similarly, BL facilitates a community of learners who are connected through Internet communication technologies. When combining the emphasis on writing in an electronic communication, which encourages reflection, with fast-paced, spur-of-the-moment verbal communication, learning possibilities are increased. The F2F community-building opportunities, together with the open communication and unlimited access to information on the Internet, make BL particularly effective at facilitating a community of learning and inquiry. Free and open dialog, critical debate, negotiation, and agreement are the hallmarks of higher education.

According to Shea (2007), a conceptual framework should include answers to questions on how learning occurs in general, how it takes place among adult learners, and how it happens in technology-mediated environments. He suggests Bransford, Brown, and Cocking's (2000) *How People Learn* (HPL) framework to view learning in a blended environment generally. Bransford and his colleagues found that successful learning environments shared the characteristics of being learner-centered, knowledge-centered, assessment-centered, and community-centered. Shea goes on to explain the HPL framework in terms of BL.

For BLEs to be learner-centered, activities must center on the goals, objectives, needs, and interests of the learner. Instructors and designers should not only understand who their students are, but they should also create learning activities that align with their students' abilities—and passions—and that put learners in active roles. For instance, it is desirable to help students understand that their approaches to learning vary, and that they can leverage their strengths and different approaches to make the most of the learning experience. Although Shea (2007) concedes that these issues are also implied in principles of good practice in undergraduate education, the concern in blended environments is how to give learners more responsibility, ownership, and understanding of their learning.

In relation to knowledge-centeredness, BLEs can utilize mechanisms available in F2F and online instruction to emphasize active learning that centers on depth of understanding. Knowledge-centered environments focus on enhancing understanding, rather than on memorization; students *participate in* the discipline, instead of simply learning *about* it (Shea, 2007). BLEs provide the setting in which to combine F2F and online pedagogy to effectively promote learning with understanding. Assessment-centered BLEs, as described by Shea (2007), should help learners "make their thinking visible" (p. 23), so that they may gain feedback and assessment of their understanding. In designing quality learning environments, certain types of assessment are more effective in person or online, and rationales for choosing one type of modality over the other should facilitate frequent evaluation of understanding. BLEs present the opportunity for designing assessments that provide formative feedback, not only conventional, summative evaluation.

Finally, the last characteristic of the HPL framework centers on community. Learning environments that promote a sense of connectedness, collaboration, and safety are more effective in fostering learning (Bransford et al., 2000, as cited in Shea, 2007). To follow through on Shea's (2007) vision of a conceptual framework for BL, understanding how adults learn is an important lens through which to view BL. Perhaps the best known theory of adult learning is that of *andragogy.* Knowles (2005) compared the popular theory of *pedagogy*, the art and science of teaching children, with a more accurate model for teaching adults, *andragogy.* He maintained that the assumptions we make about teaching children do not hold true for adults. For instance, in the pedagogical model, learners are dependent personalities, learning what the teacher teaches and having little say in what is taught and how instruction is delivered. The andragogical model allows for learner self-direction, and the role of the teacher becomes that of a guide, conqueror, or resource person.

Knowles (2005) is careful to point out that the models of pedagogy and andragogy are not mutually exclusive, although he originally presented them as such in his early writings (1970). Through the years, teachers in elementary and secondary schools adopted some of the tenets of andragogy and found that they worked well with their students. Conversely, some teachers of adults found instances where the andragogical model did not work. In practice, Knowles recommended that educators determine which assumptions are practical in a given situation. Sometimes a pedagogical approach is appropriate, such as when an adult learner is dependent because of the newness of the subject matter, or if he has no previous experience with the content area.

However, the ideological pedagogy and andragogy part ways when moving forward. The pedagogy will insist that learners remain dependent upon the teacher, whereas the ideological andragogy will strive to help learners take increasing responsibility for their own learning. The last of Shea's (2007) elements of a BL framework hinges on how learning occurs in technology-mediated environments. The Community of Inquiry (CoI) model integrates the constructs of *cognitive presence, social presence,* and *teaching presence* to guide the design of meaningful learning experiences. Originally developed by Garrison, Anderson, and Archer (2000) as a framework for online learning, Garrison and Vaughan (2008) have applied the CoI model to BL.

CoI model illustrates the interdependence between and among the presences, each supporting the others. Garrison et al. (2000) maintain that these elements are "crucial prerequisites for a successful higher educational experience" (p. 87). Most basic to achievement in higher education is *cognitive presence,* which they define as the extent to which learners in a CoI are able to construct meaning through sustained communication. An essential element of critical thinking, cognitive presence is identified in an online environment by discourse encompassing a sense of puzzlement, exchange of information, connection of ideas, and application of new ideas. Garrison and his colleagues argue that although computer (text-based) communication lacks the dynamics of F2F dialog, it has the advantage of providing time for reflection. The literature suggests that written communication facilitates higher-order learning objectives, such as careful and critical thinking about complex issues (Garrison et al., 2000).

Teaching presence is indicated by instructional management, building understanding, and direct instruction. Instructional management involves planning and organizational guidelines, such as setting curriculum, designing assessments, and establishing deadlines. Building understanding occurs when individual contributions are acknowledged and reinforced, discussion is focused, and less active participants are drawn in. Direct instruction, as the term implies, is concerned with content, answering questions, and guiding and summarizing discussions (Garrison et al., 2000). In a BLE especially, teaching presence is the unifying force in bringing together the cognitive and social presences. Its unifying force helps sustain a CoI when students are shifting between F2F and computer mediated communication (Garrison & Vaughan, 2008).

Student Environment

This section will describe the elements that make up the learning experience of graduate university students. As mentioned previously, for purposes of this study, the learning experience will encompass student satisfaction, engagement and motivation; successful acquisition of knowledge; course delivery methods; and faculty and institutional support. Although some authors compartmentalize the learning experience into what happens in the classroom (Fink, 2003), others broaden their scope to include other variables, such as faculty and institutional support, financial aid, and quality of instruction (Herbert, 2006). This section will illustrate the interconnection among the elements of the student learning experience.

So and Brush (2008) define student satisfaction as "an affective learning outcome indicating the degree of: (a) learner reaction to values and quality of learning, and (b) motivation for learning" (p. 323). An understanding of the elements of student satisfaction, while related to engagement and motivation, can be gained by looking at the items most likely to be measured by higher education institutions in determining the satisfaction of their own students.

The Noel-Levitz Student Satisfaction survey includes the following scales measuring student satisfaction (Bryant, 2006):

- **Academic Advising and Counseling:** The comprehensiveness of a college or university advising program, including advisor knowledge, competence, approachability, and concern for student success.
- **Academic Services:** Services, such as library, computer labs, tutoring, and study areas.
- **Admissions and Financial Aid:** The institution's ability to enroll students efficiently; the competence and knowledge of admissions counselors and the availability of financial aid programs.
- **Campus Climate:** The extent to which a college or university fosters activities that promote a sense of campus pride and feelings of belonging; the proficiency of communication channels with students.
- **Campus Support Services:** The quality of support services that allow students to make their educational experiences more meaningful and productive; programs and services such as career counseling and new-student orientation.
- **Concern for the Individual:** Groups dealing with students on a personal level (such as faculty, advisors, and campus staff) and their commitment to treating each student as an individual.
- **Instructional Effectiveness:** The effectiveness of students' academic experiences, the curriculum, and the institution's commitment to academic excellence; the effectiveness of faculty inside and outside the classroom, course content, and sufficiency of course offerings.
- **Registration Effectiveness:** The institution's commitment to making the registration and billing process as smooth and effective as possible.
- **Responsiveness to Diverse Populations:** Commitments to populations that are historically underrepresented in higher education: those with disabilities, commuters, part-time students, and older, returning students.
- **Safety and Security:** The effectiveness of security personnel and campus facilities that promote students' personal safety and security on campus.
- **Service Excellence:** The perceived attitudes of college or university staff, particularly those dealing with students directly.
- **Student Centeredness:** The extent to which students feel welcome and valued.

The National Survey of Student Engagement (2012) measures characteristics of the student experience that are linked to student success. The five benchmarks that gauge the most important aspects of the student experience are described here:

- **Active and Collaborative Learning:** Students learn better when they are actively involved in their education and can apply what they learn in different contexts. Examples of active and collaborative learning include asking questions in class, making presentations, and working with classmates outside of class to prepare assignments.
- **Student Effort:** Students who apply themselves to the learning process, spending "time on task," are likely to achieve their educational goals. Studying, rehearsing, using peer or other tutoring, and reading for academic enrichment are indicators of student effort.
- **Academic Challenge:** Challenging and creative coursework is central to student learning and quality of education. The standards and expectations of instructors, the complexity of cognitive tasks presented to students, and assessment instruments that challenge students to do their best are indicators of the quality of learning.
- **Student-Faculty Interaction:** Personal interaction with faculty helps students learn more effectively, and they are more likely to persist in attaining their educational goals. This interaction strengthens the student's connection to the college, and faculty become role models, mentors, and guides in encouraging lifelong learning.
- **Support for Learners:** Student satisfaction is higher at colleges that are committed to their success; students in particular benefit from career planning and academic skill development. Colleges and universities that nurture positive working and social relationships among different campus groups are also rated higher in student satisfaction.

The items listed above encompass many aspects of the student learning experience and some similarity among items that should be noted. Satisfaction with other course modalities, such as BL and FOL, relies on many of the same constructs. So and Brush (2008) developed a questionnaire on student perceptions of collaborative learning, social presence, and satisfaction in a BLE. Among the items used to measure student satisfaction were engagement (participation in discussions), perceived usefulness of the course learning experience, and achievement of learning expectations. Jackson and Helms (2008) note that meeting or exceeding student expectations in the use and application of technology affects their perception of the quality of education.

Bean and Bradley (1986) and Pascarella, et. al (2005) explored the relationship between performance and satisfaction. An interesting discovery they made related to the differences between men and women in the effect satisfaction had on grade point average (GPA), the measure they used to represent academic performance. For men, satisfaction did not play as prominent a role in performance as it did in women; men were able to perform well or poorly independent of their level of satisfaction. Men's levels of satisfaction were influenced more by academic integration, defined as being "interested, motivated, and confident as a student" (p. 395). For women, the effect of satisfaction on GPA was nearly twice as large as the effect of GPA on satisfaction. Bean and Bradley's study was limited by the fact that their sample consisted of white, single university students with a GPA of at least 2.0.

Today's university graduate student population is quite different. However, it does serve to illustrate that relationships exist between student satisfaction and, as measured by GPA, student success. Povasnik, et. al (2007) and Astin (1993) studied the factors that affect students' college experiences. Lack of student community, one of the variables measured by Astin, was associated with *not* wanting to re-enroll in the same college. Lack of student community pertains to poor socialization among students, little contact among students, and student apathy. It has, according to Astin, the strongest direct negative effect on student satisfaction with the overall college experience. In addition, it impacts negatively on emotional health and student life. Conversely, lack of student community has a direct positive effect on the view that the primary benefit of college is to increase one's earning power. It would appear that creating a stronger sense of community would increase student satisfaction, emotional health, and students' positive perceptions of the college or university experience.

A strong sense of community in the classroom was found to positively impact student enjoyment and learning by McKinney, McKinney, Franiuk, and Schweitzer (2006). McKinney and his colleagues found a strong relationship between sense of community and each of the three variables. After the experimental treatment (classroom activities supporting sense of community) was applied, students perceived they learned better, they scored higher on exams, and they felt satisfied with the course.

More recently, Larson and Sung (2009) conducted a three-way comparison among FOL, BL, and F2F delivery modes. The same course taught by one instructor, but utilizing a different delivery mode, was examined. Using exams and final grades, they determined that there were no significant differences among the three modalities. Using student evaluation surveys, however, they noted interesting results. Regarding the construct of student satisfaction, they found that 52% of students felt that their interest in the subject (Management Information Systems) increased as a result of taking the blended course, versus 38% for FOL and 40% for F2F. Motivation was also higher in the blended delivery mode: more students taking the BL class reported that they were motivated to work at their highest level, 78% for BL, 71% for FOL, and 52% for F2F.

From an institutional viewpoint, student satisfaction has been linked to institutional success; colleges with high levels of student satisfaction benefit from higher retention and graduation rates, lower loan default rates, and increased alumni contributions (Miller, 2003, as cited in Bryant, 2006). Colleges and universities can use the measurement of student satisfaction to identify their strengths and recognize areas that need improvement (Outcomes Working Group, 2003).

Relating Literature to Study

Blended learning has the potential to impact university graduate students in terms of the entire learning experience. As BL becomes more widespread, and universities take the necessary first look at the phenomenon, they will need to know what they are *getting into* and how others have fared before them. There is no doubt, based on the literature reviewed, that this is already happening. There remain gaps, however, in the literature regarding BL and graduate student learning experience; this study will contribute to closing this gap by providing a rich description of how BL has affected this large but relatively under-researched segment of higher education.

RESEARCH DESIGN

The investigation took place at a university in Virginia. The university is classified as a suburban research university, enrolling approximately 5,890 students. The student body is 62.2% female and 37.5% male. The graduate school has 18 full time faculty members are employed by the university. There are 34 full time graduate students and 414 part time graduate students enrolled in the graduate school.

The following characteristics of participants would result in a representative sample of BL graduate students:

- Twelve females and six males, or another combination maintaining this ratio.
- An even mix of full- and part-time students.
- Two-thirds should be age 21 or older.

More than the desired 20-30 participants were invited, as it was anticipated that there inevitably would be some "no-shows" (Stewart & Shamdasani, 1990). A fully representative sample was impossible to attain, but a best effort was made. Based on their extensive review of research on BL, Bliuc, et al. (2007) state that current research should be more *holistic* in nature than previous research, taking into account the different components of the learning experience, how they are integrated, and what this means in terms of learning. For BL, this would be gathering evidence about the online, or technology-supported aspect of the experience; evidence about the learning experience in a F2F context; and evidence of the connections between the two that would describe an integrated learning experience. This study *holistically* explored these complexities. Sharpe, Benfield, Roberts, and Francis (2006) state that holistic studies on blended learning "shed light on the complex interplay of the virtual and the physical and the choices that learners make in finding pathways to successful outcomes" (p. 54). The qualitative measures used contributed to understanding the complexities of the phenomenon.

RQ1: How do students perceive the BL experience?

At the research site, archival research existed that was undertaken when BL was first introduced at the university. This was in the form of end-of-semester questionnaires distributed to students taking BL classes. The first questionnaires were distributed at the end of the Fall 2012 semester and Winter intersession 2012. The nature of some of the open-ended questions included in the questionnaire resulted in broad, ill-defined responses. Therefore, the questions were revised for the Spring 2013 semester to include a set of choices, taken from data extracted from the open-ended questions in the previous instrument. This resulted in more usable data.

Only the demographics, opinion items, and questions relating to student satisfaction were used. Descriptive statistics (Gay et al., 2006) were used to quantitatively describe the learning experience of the students in the BLE at the university.

RQ2: What are the faculty's perspectives about changes in the delivery of instruction?

In order to answer this question an Interview Guide for Faculty was created. The purpose of the faculty interviews was to gain the instructor's perspective on BL. Even if students were generally satisfied with BL, if the faculty were uncomfortable or wary as to its worth for the time and trouble, it would ultimately fail. Therefore, questions were developed that would shed light on the instructor's perception of the worth of BL. For example, one of the questions dealt with changes in teaching F2F and/or FOL courses as a result of teaching a BL class, indicating the potential for professional development, definitely a worthy result. Also, questions dealing with advantages and disadvantages were designed to further investigate the faculty's viewpoint on teaching BL.

Questions were constructed, and then reviewed by five BL faculty members for clarity and ease of reply (Gay et al., 2006). The five faculty members had concerns that the interview questions were too lengthy, and comments from the reviewing faculty members were used to modify the questions to clarify intent. It was important to know how faculty teaching BL courses perceived the experience. Although research has shown (Dziuban et al., 2004) that faculty are generally satisfied with teaching blended courses, it was the intent of this chapter to dig deeper into this part of the student learning experience. Therefore, instructors who had taught or were currently teaching BL courses were interviewed in order to determine their perspectives on teaching in this delivery mode. Specifically, the semi-structured interviews probed for viewpoints on ease or difficulty in achieving course goals, problems inherent in teaching via the BL mode, enhancement of professional skills as a result of BL, and overall satisfaction. Twelve interviews took place.

Seidman (2006) recommends that interviews be audio taped in order to preserve the words of the participants, and interviewers can return to the transcripts to check for accuracy.

The following steps were taken to collect and analyze the data:

1. The investigator transcribed the interviews from the digital recorder. This allowed her to "know the interview better" (Seidman, 2006).
2. Faculty were given a copy of their interview transcript to assure that it was consistent with their intended meaning (Gay et al., 2006).
3. Finally, categories and sub-categories were reviewed and combined to fall under each of the six interview questions. This brought the data together and organized them into analyzable form. In addition, there were several categories that were found to stand on their own and became a part of the analysis of the faculty interviews.

The data analysis and coding was accomplished manually using word-processing software. The amount of data collected, although large, was not considered overwhelming; thus, qualitative data analysis software was not used.

RQ3: How has the university learning experience been changed as a consequence of BL?

This RQ was possibly the most important part of this chapter: It tied together the research that was conducted initially with the goal of this study. The university administrators and registrar were presented with the results of the three RQs and asked for written comments, i.e., to note if there were any surprises in the data (e.g., were the results better or worse than they expected), and if they saw any new opportunities or challenges contained within the data. Gay et al. (2006) state that qualitative research is descriptive and non-numerical; the researcher may choose which type of data collected will contribute to understanding the phenomenon. In this case, written comments were the most helpful in answering RQ3 and facilitated deeper, more well-thought-out responses than would be possible with an *off the cuff* interview.

The analyzed results were presented to the administrators in the form of a packet that was organized according to RQ. This document later became an invaluable tool in tying the data from various sources together. It made possible comparisons and contrasts among respondent groups and contributed to the holistic analysis that was desired for this chapter. Graphs were generated for the questionnaire Likert-type responses, and this made it easier to note trends and possible discrepancies among responses grouped by semester. Quotes from focus group participants and faculty interviewees were also included. The format was informal in nature, mostly in the form of bullet points, and this fluidity contributed to its ease of use, both for the administrators and the investigator.

Focus Group

Considerable care was given to the construction of the focus group, the data collection, and the analysis of the focus group data. Stewart and Shamdasani (1990) characterize the focus group as a well-planned research endeavor, not a haphazard discussion of a group of people who happen to be available. Thus, participants were recruited from several existing blended classes, being contacted personally by the investigator. Out of 35 students expressing interest in participating, 26 actually took part in the focus group. Although all students in the classes were invited, a mix roughly resembling the university population responded; that is, there were more part-time graduate students than full-time students, and females outnumbered males. The focus group convened for approximately 60 minutes on the university campus.

Stewart and Shamdasani (1990) recommend that focus groups take place in a nondescript setting with minimal distractions such as pictures, artwork, or props. In addition, communication is facilitated when participants are seated neither too close nor too far apart. Seating the group in a circle is advantageous for communication and also reduces the tendency for a particular member or members to emerge as dominating the discussion. Therefore, a conference room with minimal wall decorations was chosen, and the seating was arranged as closely as possible to a circle.

A moderator for the focus group was chosen who had experience in facilitating this type of research and who possessed most, if not all, of the above qualities. The moderator had no stake in the outcome of the research, thus reducing bias. The investigator attended the focus group and made notes on non-verbal communication, gestures, and behavioral responses occurring during the discussion (Stewart & Shamdasani, 1990).

RESULTS

The goal was to document ways in which BL is changing the university learning experience for graduate students. This chapter will describe the results of qualitative research undertaken. Qualitative research methods were used to analyze and observe the classroom experience and interaction between faculty and graduate students at the university level. Qualitative methods were used to examine student perceptions of the BL experience, faculty perspective, and to record the comments of administrators at the study site.

End of Semester Questionnaire

At the beginning of each questionnaire, demographic information was collected.

The percentage of males increased regularly from 31% in Spring 2013 to 57% in Fall 2012. However, the courses from which responses were received remained relatively consistent throughout the study period.

Student commute time was queried to determine if the reduction in seat time may be an incentive to take a blended course. More than half the students, 52%, characterized their commute as being between 30 and 60 minutes. Graduate students living near campus, spending 15 minutes or less travelling to the university, represented 12% of respondents. An almost equal percentage, 23%, spent 31-60 minutes travelling to university.

To gain a snapshot of the employment obligations of the graduate students and the amount of time they require, participants were asked if they worked outside the home and the number of hours they worked. More than 95% of graduate students worked, and of those who did work, 94% were on the job for 40 or more hours per week. The next highest percentage of students, 86%, worked 21 32 hours per week.

In general, graduate students did not feel they could communicate better online with either their instructors or their fellow learners. Email or discussion was not considered the favored method of communication. Thirty-six percent of students were neutral on whether they could communicate better with their instructor online than in the classroom.

Graduate students did feel that BL classes were more difficult than F2F classes. Fifty-five percent of graduate students agreed or strongly agreed with the statement, "I felt this course was more difficult than it would have been face-to-face." In fact, 12% of students polled strongly agreed or agreed with the statement, "I did well in this class." They also felt that the online assignments were helpful in contributing to their understanding of the course material; 27% strongly agreed and 41% agreed. A full 72% knew what was expected of them for the online portion of the class. Students also seemed to value the F2F portion of the class. Sixty-six percent of the respondents strongly agreed and 38% agreed with the statement, "Meeting face-to-face kept me motivated."

Graduate students were asked to select as many choices as they wished from a list of possible answers to specific opinion questions. When asked which aspect of the blended format they liked the most, the top three answers were *less time on campus; reduced travel;* and *frees up time for employment.* A close fourth was *convenience of doing work on my own time.* The top two answers describing what they disliked about the blended format were, *not enough class time* and *prefer face-to-face to fully understand material.* The last two questions dealt with graduate student acceptance of the BL model. Eighty-four percent of respondents would take another blended class. When asked if they would recommend blended classes to their friends, 84% answered *yes.*

Focus Group

A focus group was convened in February 2013, to solicit current student opinions on the BLE. During the course of the focus group discussion, three major themes were revealed: teacher presence, faculty skill at teaching blended courses, and faculty and institutional support. Students also commented on what they liked or did not like about BL classes.

The theme of faculty presence came up frequently as being essential to success in blended classes. Throughout the focus group discussion, graduate students mentioned the value of feedback from the instructor. They expressed frustration when they did not hear from the instructor after submitting assignments, and they wanted personal feedback, not just a generic update to the whole class.

The professor made a difference in whether the graduate students understood basic concepts, learned more, the same, or less in a blended class. One instructor, whom the students characterized as "wonderful," would create short, interesting assignments for the online portion of the class, and then the students would discuss the assignments F2F. "You get more out of it," remarked one of the graduate students. She also felt that she was more "active online" than in class. Another student, who enjoyed her blended class because "the teacher we had was terrific," was "furious about the online course" she was currently taking; she was clearly dissatisfied. The importance of the instructor was delineated when she said, "I would be hesitant to take another online course…unless I really knew the reputation of the instructor." Although the focus group discussion was centered on BL, the students sometimes mentioned their experience in FOL classes, making the connection due to the online portion of blended classes.

According to the participants, student motivation (or lack thereof) depended on the instructor. The consensus was that straight lectures, where the professor would "talk for 50 minutes straight" and demand that students "write down everything I say," were unacceptable, as far as motivation was concerned. A male student remarked: I've had professors that I've loved going to class and I've gotten great grades in them and probably learned just as much or more than in classes I've done terrible in, just because I'd go to those classes dreading them, saying, 'Well, for the next 50 minutes we're just going to be sitting here listenin' to those guys…and it's all boring.'

Graduate students cited intrinsic motivation, having the "right mindset to actually want to learn," as being important. However, as one male student noted, "Teachers who keep their students motivated probably have a higher percentage of people who pass the class and stay in the class." He stated that students drop out of classes because they question the value of the class to their educational goals or because of a distaste for the instructor's teaching methods and end up taking the graduate course at another local university.

When asked if they prefer F2F, BL, for FOL classes, graduate students said "it depends" on the professor. They felt that enthusiastic professors who provide feedback are good teachers, regardless of the course delivery system. The students who liked BL classes liked seeing the professor F2F, knew the location of his office on campus, and liked the fact that they could supplement their online learning with in-class discussions. The overall majority liked having the teacher explain assignments F2F.

Faculty skill at teaching blended classes was another theme that came through prominently during the focus group discussion. Some professors were good at teaching blended classes, while students felt that other instructors were uncomfortable with teaching BL and "cram" the material in the short F2F sessions. One graduate student commented that "some professors favor whatever they feel they're better at teaching," and do all their teaching F2F, with very little substance online. Another graduate student said, "They really don't want the online stuff. They say, 'Yeah, there's material online but we're not gonna talk about it…'" Related to this were comments about the graduate students' frustrations when a professor sees that some graduate students aren't logging on, so he or she will say, "That's fine, we'll just do something in class." This makes the students who do go online feel, "Well, what am I going online for?"

Graduate students felt that some teachers were poor at integrating the F2F portion of a blended class with the online portion; instructors assigned "busy work" such as answering questions at the end of chapters for the online portion. One graduate student was quoted as saying, "It just seems with a lot of the online material professors just say, 'Oh, we need to put something up there [online] because it's a blended course! So let's give you some busy work to do!'" At other times, students wanted to discuss their online work during the F2F class but felt they were not given the opportunity to do so. However, two students remarked on the skill of their teacher in integrating F2F and online activities, saying the professor was "very proactive and positive about the blended class, so the professor does a lot of her own personal things in it," like Internet readings and activities not found in the textbook.

According to the graduate students, some faculty had a difficult time with the technology for blended classes, and this presented itself under the topic of skill in teaching a blended class. Some instructors only put the most basic of discussion boards online, while others uploaded copious notes or lectures. Several of the students expressed concern that an instructor, rather than getting help on a technology problem or question, would simply say a student request was "impossible" with Blackboard. An example was given by a female student who experienced difficulty taking a test online with extended time, an accommodation she required. A male student remarked that he had a difficult time communicating with the instructor through Blackboard and that the instructor was unable to help him. Students agreed that faculty must be sensitive to computer problems occurring and should take that into consideration when planning online assignments.

The third major topic that presented itself during the focus group discussion was support from the faculty and institution. As mentioned earlier, graduate students felt that feedback from the instructor was of primary importance to their success, but they also wanted operational support. For instance, students wanted clear instructions as to how the instructor grades their work. One student, whose native language is not English, remarked, "It really stressful with the test issues and then, like the whole grading, it seems like one big mystery because there is no…kind of rules that they ever explain you how do the grade [sic]." The students agreed that some online items were difficult to find in the class Blackboard shell. Items were "in different places depending on the teacher," but once the items were found, they knew what to do. Some professors never showed a grading rubric therefore grades were a mystery, "from beginning to end". The graduate students felt that some consistency across courses may be helpful.

Technology support for both faculty and students was discussed. Students felt that faculty needed support almost as much as they did, as discussed above. Relating to support given by the university staff, one student was pleased that she was offered help with her computer problems, but the staff member only suggested solutions that the student had already tried herself. "If we can't figure it out, sometimes I think there's an issue with the whole system if us [sic] who were raised on computers can't figure it out!" "Technology help is of no help," one student stated.

Students were asked what they liked or didn't like about BLEs. They liked varied, short assignments online with in-class discussion; this was much better received than "one great big assignment" online. They liked working at their own pace, when they wanted, within course deadlines, not having the pressure of "doing everything all at once, like in a class." They also liked the community that was built as a result of the online discussions. A male student remarked, "I like that it creates a community and you see other people's perspective on the situation and what they think." A female student was very happy with her blended class, stating that there was a lot of communication both online and F2F, and that she liked the in-class time for talking to the professor, "getting more feedback, and putting faces to the posts."

Students did not like lectures online, which they found boring, or working in teams. They felt that communicating with team members online was difficult and time consuming.

"Everything's in messages, so you have to have a conversation over the course of the week that could be held over the course of half an hour [F2F]." Some team members did not log on in a timely fashion, making it difficult to get a great deal of work done online. Students who were punctual and wanted to excel ended up doing the entire "team" project as a result of lack of participation from other students.

Graduate students agreed that some BL classes may require more work than other formats, especially if the professor posts a great deal of material online that must be read. "There is way too much reading in BL courses," one graduate student stated. One graduate student suggested that it was easier to listen to a professor in class and take notes than "navigating the online portion." Due to the decreased seat time, students felt that more was being posted online in order to cover all the course material.

Although the students may have used the focus group as an opportunity to air their frustrations, most did like the blended classes best. Of twelve participants one said he liked online best, ten said they liked F2F or online (and only BL if absolutely necessary), and the remaining liked BL best. All the graduate students liked the classroom interaction instead of reading comments online.

Faculty Interviews

Only one of the twelve instructors interviewed was given training in BLEs before beginning to teach her blended class. The others were given no training; however, two of them continue to avail themselves of the training provided by the instructional designer on campus.

Four instructors taught their first blended class as a last-minute substitute for a professor who was either transferred to an administrative position or not able to continue with the class for other reasons. Even so, the seven instructors tried to make the best of a difficult situation. In all cases, the class was already set up by the university technology coordinator, so course materials were available for the new instructor on Blackboard. Some faculty members ended up using google docs and other internet devices to remain blended and interactive.

The fact that there was very little preparation time or training before the class began may have contributed to one instructor's discomfort with BLEs and his impatience with students who were not themselves ready for this new course delivery system. Two of the remaining three instructors stated that their first encounter with BL was not at all as successful as their subsequent ones; one instructor did not teach another blended class. Some of the concerns of the four instructors centered around presenting the course material to the students and making the transition from teaching a F2F class to a blended one: "I had a hard time pacing the first semester, then my skill with the course progressed. I was able to have my blended students post information on Wednesday and Friday…so I covered the same material." "I had to get used to the class itself, the students in the class, to see how much individual time they needed and how much class time." The remaining instructors who were interviewed decided to teach a blended class because of experience with the subject matter and a desire to try something new.

The first question discussed and dealt with ease or difficulty in achieving course goals. All but one interviewee felt that they achieved their goals. The dissenting individual, an instructor who took over the class at the last minute, held the students responsible; when asked why, he replied, "The students were not ready for a blended experience.

There was some frustration in not being able to use comfortable teaching methods online. For instance, one instructor used what he called a *page-through* of textbook material: he would go through the chapters page-by-page with the students, pointing out important facts and discussing graphs and illustrations. "I don't feel as…successful at not being able to do that in the online [portion] because they're not like moving along with me." Another instructor was unable to translate the worksheets he used in a F2F class to a successful online format. He had difficulty in grading students' writings online. He later determined that that particular course was not well-suited for BL and has not taught it again.

The next interview question dealt with the problems instructors encountered in teaching a blended course. These problems ranged from working with the Blackboard Learning Management System (LMS), to those dealing with pedagogy and students. Technical problems in working with Blackboard were mentioned by all instructors. They felt that Blackboard was not user-friendly and were sometimes at a loss as to why it wasn't working properly. Another problem was with the continuity of instruction when the Internet or Blackboard was not functioning properly or at all.

Some faculty was uncomfortable with the drastic change in teaching style/methods. "I've been teaching 30 years," said a female instructor, "and it's a whole new arena, a whole new different thing." One instructor continued to use teaching methods he was comfortable with. Another instructor interpreted the change as an opportunity, not a threat, and spent a great deal of time redesigning his class.

Difficulty in motivating students was mentioned by eight instructors. One instructor put all the responsibility for success in the course on the students and felt that he couldn't—and shouldn't—be responsible for motivating them, saying, "They were immature, unprepared, didn't care." Another instructor commented on the difficulty in finding the correct combination of motivating students and having them learn the material: "how do you do that, I still have not mastered." Six instructors agreed that most students did the minimum for a BL class, nothing more.

Seven instructors felt that the BL format made it difficult to scrutinize how students understood the material. "The students in the class…can be a variety of levels, a variety of backgrounds, a variety of motivation, learning abilities. You know, it's difficult. Face-to-face, if you're a teacher that's aware, you can within a day, you can tell who's going to make it, who cannot… It's hard to tell online or blended."

Increased workload was mentioned by nine instructors, particularly with planning, grading and feedback to students. Lack of planning can result in even more work, when the instructor has not prepared online and F2F activities and is searching for material at the last minute. Creating this culture of preparedness for class, or possession of self-directed study skills, also requires time to develop. Grading in a BLE can prove to be very time consuming. "You have to read like hours and hours of material in order to get the same kind of interaction [discussion] that you get sitting in a class and having people ask questions." One instructor was particularly troubled by "getting behind" on his grading and feedback to students.

The next question asked related to how the instructors supported the students in their blended classes. Responses ranged from nothing at all to giving extra help outside of class. Most support was in the way of feedback on progress and answering questions.

Interviewees were asked how—or if—teaching a blended course changed the way they teach F2F or FOL courses. They answered this question in either of two ways: how it changed the F2F portion of their blended classes, or how it changed their teaching in general. For the F2F portion of a blended class, two instructors would monitor the discussions going on in the online portion of the class for clues on student understanding of the course material. If they found that students were having trouble with a particular concept, they would focus on that topic in the next F2F class.

As far as teaching BL and its effect on the way they teach classes in other formats, one of the instructors noted, "In all of my courses I have assignments online, on Blackboard and the only difference is now a matter of degree." When asked how satisfied they were teaching a blended course? Two of the instructors were not satisfied with the BL format, and five did not teach another blended class. For the others, six instructors stated that the satisfaction in teaching a blended course comes from the "challenge of creating a new model, not of something that is a done deal." They enjoyed the creativity s/he could exercise online but it was time consuming.

Finally, instructors were asked if they would teach another blended class. Although not all instructors were wholly satisfied with the blended modality, five only answered this question with a resounding *no!* Three instructors answered *yes* with no qualifiers. One instructor would teach BL again only if the students were "higher-level graduate students". Interviewees generally felt that online discussions were not as effective as those done F2F in terms of graduate student participation and acquisition of knowledge. They listed blended courses as undesirable because of language barriers for international graduate students and attitudes toward education that differ across cultures.

RECOMMENDATIONS AND FUTURE RESEARCH DIRECTIONS

This chapter presented the results of qualitative research that was undertaken in achieving the research goal: to document the ways in which BLEs are changing the university learning experience for graduate students. A brief history of BL at the research site was provided.

Qualitative methods included a focus group of students currently or previously taking a blended class and interviews with BL faculty. Three themes were uncovered in the focus group discussion: teacher presence, faculty skill at teaching blended classes, and support from the faculty and institution. Student comments highlighted the importance of teacher presence and feedback to assure student success; they were fully aware of instructors who were uncomfortable with BL; and they felt that in addition to faculty support, they required technical support from the institution.

Twelve faculty members were interviewed to gain their perspectives on BL. Some were clearly uncomfortable in changing their teaching styles to match the BL format. Others were more adventuresome and enjoyed the creativity afforded by BL. Satisfaction with teaching a blended class mostly centered on the attitudes of the graduate students and their preparedness for BL. Of the twelve faculty members that were observed in the classroom only five mentioned the online portion of the blended course. Only two continuously referred to the BLE in the F2F portion. The three others only mentioned the BLE in the first five minutes of the course.

All key stakeholders should know how BL affects the students, the faculty, and the university as a whole. They should understand if BL is worth the time and effort. This study sought to inform them. The questionnaires drew a picture of the graduate students working full-time at a job, full time parental duties and attending classes full-time. Online communication between graduate student and teacher was low, as was online communication between and among graduate students. This could be interpreted to mean that graduate students preferred to talk with their teacher and with each other in the F2F classes or that online activities, such as discussion threads or collaborative work, were poorly designed.

There was no required oversight of BL classes from a design or pedagogical perspective; the instructor was totally in charge not only of the content, but the design and features of the online class. This probably affected graduate student perceptions of the quality of the online portion of the class. The focus group resulted in a better picture of how BL learners felt about the modality and how they perceived the teacher's role. It became apparent immediately that graduate students felt a good teacher was one who took the time to give students feedback and to design the class for the BL modality, rather than use BL as an add-on to an F2F class (Dziuban et al., 2004; Garrison & Vaughan, 2008). They were very astute in recognizing an instructor who was uncomfortable teaching a blended class or who had difficulty integrating the F2F and online components of the class. This finding is consistent with the importance of *teaching presence* as described by Garrison and Vaughan (2008) in their work on the Community of Inquiry (CoI) related to BL. In summary, graduate students perceived the BLE to be convenient and allowed them to complete class work at their own pace. Their satisfaction was affected by the skill and presence of the teacher.

CONCLUSION

In summary, many of the themes or issues uncovered during the faculty interviews were consistent with the literature on BL. Also, concerns such as integrating F2F and online activities, motivation, and workload were noted by both the faculty and students. Skill at teaching in the blended format was a source of stress for instructors who were not comfortable with the transition from F2F to BL, and it was noticed by the students. It became clear through the results of this study that training in the art of teaching BL is essential for both student and faculty success.

The results of the focus group and faculty observations showed that, at least in some of the blended classes taken by the participants, discussions have been moved to the F2F portion of the class and have become a better source of student-student communication and learning than those that were posted online. Faculty support, and what it meant for students, was uncovered in the faculty interviews and the graduate student focus group. Faculty knew that timely feedback to graduate students was important, and sometimes they were frustrated with the lack of time available for individual responses. As shown in the literature, this is a universal complaint among BL faculty (Toth, Amrein-Beardsley, & Foulger, 2010). Lack of or little feedback from instructors is also a universal complaint among BL students (Babb, Stewart, & Johnson, 2010; Stewart, 2008).

Institutional support, the final construct of the BL experience of the university with graduate students, was discussed in the focus group. Students felt they needed training or an orientation to be better prepared to take a blended class. They felt that faculty needed technical support, sometimes more than they did. Many of the issues uncovered were consistent with studies found in the literature. One issue in particular, faculty training, may have caused some of the results to differ from the literature. For instance, Garnham and Kaleta (2002) found that BL students at all undergraduate levels were more enthusiastic, wrote better papers, attained higher grades, and produced superior projects. This was not so of the graduate students in these BL courses. All of the professors complained of poorer quality work and submissions rampant with basic spelling and grammar errors.

Had the faculty been fully trained, it could be construed that the discomfort they felt with the blended modality, the difficulty they had with integrating F2F and online components, and the struggle they had in motivating students may have been moot. A solid faculty development program must be initiated at any college or university considering BL as a course delivery method. However, it does suggest that the BLE entails more than just the technology behind the delivery. The human touch is still an essential part of the learning experience, as it has been all along. This study suggests that faculty development and improved course design can increase the student BL online interaction. Simply put, there is no substitute for an enthusiastic educator who motivates students to learn. These educators increase student learning through their continued positive interaction. This just might mean that F2F courses are here to stay.

KEY TERMS AND DEFINITIONS

Blended Learning (BL): Courses that integrate online with traditional face-to-face class activities.

Hybrid/Hybrid Learning: Another term used for courses or classes in which BL takes place.

Learning Experience: A combination of the factors that students experience in the attainment of their educational goals including: satisfaction, engagement and motivation.

Chapter 56
Flipping the Classroom in a Teacher Education Course

Patricia Dickenson
National University, USA

ABSTRACT

Teacher education preparation programs prepare pre-service teachers for K-12 classrooms. In order to best prepare pre-service teachers, higher education institutions must be cognizant of the changes that are occurring in today's K-12 classes. The flipped model is an approach to instruction where direct instruction and lecture is viewed at home and class time is used for collaboration and project-based learning. This approach to instruction is becoming increasingly popular in primary and secondary education classrooms throughout the United States. It is important to examine how a flipped classroom approach may influence pre-service teachers in a university preparation program. This chapter explores a case study that examined the flipped classroom in a teacher education course compared to a traditional course.

INTRODUCTION

In higher education, instructional strategies have been found to influence teacher self-efficacy (Nietfeld & Cao, 2003). Teachers with high self-efficacy tend to experiment with methods of instruction, seek improved teaching methods, and experiment with instructional materials (Allinder, 1994). Two identical courses of a teacher education program were compared to determine if a flipped approach would have a greater impact on pre-service teachers' self-efficacy than a traditional course. Pre and post-test results revealed students in the flipped classroom had a significantly higher gain in self-efficacy than students in the traditional course. This case study will reveal key factors for implementing a flipped approach in a hybrid teacher education course.

What Is the Flipped Classroom?

When traditional lecture is completed at home via video or audio and student-centered activities take precedence in the classroom the approach to instruction has "flipped." Instructors seeking to maximize the learners' capacity to engage in small group discussion, project based learning, or problem solving tasks, will find the "flipped" model an effective means of student-centered collaboration. This constructivist approach to teach-

DOI: 10.4018/978-1-4666-8246-7.ch056

ing calls on learners to become active classroom participants by placing the passivity of listening to a lecturer at the comfort of home so valuable face-to-face classroom time can be used for peer collaboration, inquiry, and project-based learning.

The "flipped" approach emerged as an educational tool in 2006 by Jonathan Bergmann and Aaron Sams (2011) and is characterized by the use of Screencasting to deliver instruction that can be accessed at any time and place. This instructional approach has been embraced by teachers from primary school to higher education as a means of maximizing time to collaborate, problem solve, and investigate content areas.

BACKGROUND

Self-Efficacy

"Self efficacy is the belief in one's capabilities to organize and execute the courses of action required to manage prospective situations" (Bandura, 1995, p.2). Previous experience strongly influences self-efficacy. Self-efficacy will increase when students experience success in the classroom, and when students experience failure self-efficacy will decrease. When observing others perform a similar task referred to as modeling, self-efficacy may be influenced as well. A live model is especially salient when someone has limited prior experience or they are uncertain about their own ability. In the teacher education classroom, pre-service teachers need an opportunity to model and observe strategies that will be particularly useful as classroom instructors. Often times teachers learn about research-based best practices through course readings and lecture, but do not have an opportunity to either experience or observe these practices until they are working as a classroom teacher.

Teacher efficacy can be described as the teacher's belief that he/she has the ability to organize and execute courses of action required to successfully accomplish a specific teaching task in a particular context (Tschannen-Moran & Woolfolk Hoy, 2001). Beginning teachers need strong self-efficacy beliefs in order to continue in the field of education (Mulholland & Wallace, 2001). Teachers who exhibit high levels of self-efficacy are also more satisfied with their job and more empowered (Edwards et al., 2002). Furthermore, a teacher's experience during student teaching practice has also been correlated with higher self-efficacy levels (Bandura, 1997; Mulholland & Wallace, 2001; Pajares, 1997).

Gerges (2001) investigated the factors that influence pre-service teachers variation in their use of instructional methods. Pre-service teachers with little to no experience with a specific teaching method had a lower rating of teacher efficacy and were less likely to implement new teaching methods in their classrooms. Therefore an opportunity to perceive relevant models as well as demonstrate instructional methods is paramount to influencing pre-service teachers with lower teacher efficacy.

Nietfeld and Cao (2003) examined the type of instructional strategies that promote pre-service teachers self-efficacy within a college course. Students perceived active more than passive instructional strategies to be important for increasing their personal teaching efficacy. Moreover, students with the highest gains identified whole-group discussion, peer collaboration and in-class illustration exercises as the most beneficial.

This case study will examine if a flipped approach as compared to a traditional approach to instruction will increase students' perceived self-efficacy in teaching. Students' self-efficacy toward teaching is referred to as teacher confidence throughout this study.

FLIPPED CLASSROOM IN HIGHER EDUCATION

In higher education the flipped classroom model was referred to as the "inverted classroom" and included lectures that were made available on VHS tapes (Alexander, 1995). The inverted classroom is a similar pedagogical approach to the flipped class as students watched prerecorded lectures at home or in a computer lab. Face-to-face instruction was used to answer student questions and engage in hands-on activities. Lage, Platt, & Treglia (2000) found the inverted classroom approach to be favored among undergraduates in an economics class. Students perception of the inverted classroom was examined by conducting end of course surveys to students enrolled in the inverted classroom. Students responded favorable to the inverted approach and preferred this type of instruction to the traditional method. In a study conducted at the University of Irvine, (Moravec, et al., 2010) students enrolled in a traditional large lecture biology class were switched to an inverted classroom that included pre-recorded videos and interactive exercises. Students' achievement in the inverted classroom increased by 21% on exam questions that were covered in lecture and included in pre-recorded videos. Most recently, Moravec, Williams, Aguilar-Roca & O'Dowd (2010) found an increase in student achievement when a flipped approach to instruction was used among undergraduates in an introductory course for Biology. Students showed a small but significant improvement by the midterm and this improvement slightly increased on the final exam to an 8.6% higher score. In addition, stronger self-ratings of students' ability to write application software and high levels of student engagement (Gannod, Burge, & Helmick, 2008) were found when students experienced the inverted classroom approach. Talbert (2011) used the inverted classroom approach as a choice of solution techniques on a final exam problem. Students that watched the solution technique from the prerecorded video had significantly higher success rate than students who participated in the in-class lecture. Relatively little research has been conducted on the flipped classroom and this approach has yet to be explored in a teacher education course.

Traditional Classroom Practices

In a traditional class there is a greater emphasis on lecture, which is controlled by the instructor. Teacher-centered approaches include instruction where the teacher's role is to present the information that is to be learned and to direct the learning process of students (Shuell, 1996). Direct instruction is a teacher-centered approach that includes four components:

1. Introduction and review,
2. Presentation of new information,
3. Guided practice, and
4. Independent practice.

METHOD

The purpose of this case study was twofold to:

1. Investigate the impact of using the flipped classroom model as compared to a traditional approach, and
2. Establish a framework for incorporating the flipped approach in higher education courses.

The following research questions guide this study:

- What is the relationship between students' perceptions of their confidence in teaching and the instructors' pedagogical approach?
- How can instructors use the flipped classroom approach to create a student-centered learning environment?

- What is the instructors' pedagogical design for the flipped classroom model?
- What types of instructor knowledge and skills are needed to facilitate the flipped model?

To answer these questions, a mixed-method research study was conducted to compare the pedagogical approach of two classroom instructors in a teaching education course. Interviews with instructors determined the designed learning activities and classroom format. Participants' pre and post surveys were compared to measure differences in self-efficacy at the beginning and end of the course. Participants were also asked about their classroom activities and what elements of course design increased their sense of classroom community.

Classroom Setting

This case study took place at two hybrid courses of a student teaching seminar at a university in Northern California. The teachers enrolled in the course were pursuing a California teaching credential and were actively participating in 80 days of student teaching at a designated school site. Students were randomly assigned to one of two identical courses at the university. The course content and assignments were identical in each course and created by a university professor that was not teaching either class. Both the experimental and control groups had access to the course material via an online learning management system. Instructors in both the control and experimental group held face-to-face monthly classes with the students throughout the five-month course period.

Each instructor had over ten years of teaching experience in the K-12 setting and had taught in higher education for over five years. All participants completed prerequisite coursework in order to enter this course. 64% had never taught before and about 20% stated they had taught for less than one year. The participants included: 60% who were pursuing a single subject teaching credential and 40% pursuing a multiple subject teaching credential. 50% of the participants identified as female and 50% male. All participants had taken online and onsite courses. In this case study, convenience sampling was used as participants were enrolled in the same course and participation was voluntary.

The control group received traditional course lectures during face-to-face meetings whereas the experimental group received a flipped classroom approach to onsite meetings. In the flipped model, participants watched prerecorded lectures at home and face-to-face instruction was used to have students work collaboratively on project-based activities, student led presentations, case studies and collaborative lesson planning related to course material. Each course met for approximately 4 hours, which included a thirty-minute lunch break. Table 1 illustrates the traditional (control group) and flipped (experimental group) classroom schedule.

In the traditional teacher education classroom a significant amount of time is allocated for lecturing new material. During this time the instructor displayed a PowerPoint presentation that reviewed key ideas and concepts. Lecture was followed by group work in which students explored a concept or question related to the lecture with their colleagues. The teacher would randomly call on students to share their responses and provide feedback. In the flipped classroom the majority of classroom time was allocated for student-centered activities such as group work and presentation (about 67%). Peer evaluation was a key component of in-class presentations, whereas teacher feedback was provided as students worked in small groups.

DATA COLLECTION

The participants completed a pre and post-survey about their confidence toward teaching and a post-survey only about their perception of instructional approaches used throughout the course. Students'

Table 1. Class schedule for student teaching seminar

Traditional Teacher Education Classroom (based on 240 minute block schedule)		**Flipped Teacher Education Classroom (based on 240 minute block schedule)**	
Agenda & Objectives	10 minutes	Agenda & Objectives	10 minutes
Review prior material	20 minutes	Review Podcast Material/ Questions	20 minutes
Lecture	60 minutes	Group Work	60 minutes
Group work	20 minutes	Presentations	20 minutes
Break	30 minutes	Break	30 minutes
Lecture	60 minutes	Group Work	60 minutes
Group work	20 minutes	Presentations	20 minutes
Closing	10 minutes	Closing	10 minutes

confidence toward teaching was measured with the TSES 24-item long form (Tschannen-Moran & Woolfolk Hoy, 2001). These items are grouped into three subscales:

1. Efficacy for student engagement (SE; 8 items),
2. Efficacy for instructional strategies (IS; 8 items), and
3. Efficacy for classroom management (CM; 8 items).
   - **Cronbach's coefficient:** SE (0.89 & 0.92), CM (0.91 & 0.94), IS (0.91 & 0.94), and total scale (0.96 & 0.97).

Teacher efficacy was measured at the beginning and end of the course. The items did not change. Students self-report were measured using a five-point likert-scale ranging from "Not at all confident" to "Extremely Confident." Pre and post-test self-report of students' perceived "Teacher efficacy" was compared between groups and within groups to determine if differences were statistically significant.

Open-ended questions were also asked to determine which instructional strategies promoted a sense of classroom community. Sample questions include "What strategies did the professor implement to help you feel a sense of community?" and "What strategies do you feel the professor should implement to relieve a sense of isolation in a hybrid course?"

FINDINGS

Students' self-report of their perceived confidence toward teaching was explored at the beginning and end of the study through pre and post survey in both control and experimental groups. The following four statistical comparisons among the groups were made: pre-control vs. pre-experimental, post-control vs. post-experimental, pre-post control, and pre-post experimental. The gain score of experimental and control groups were also compared to determine if there were significant differences in the pre and post survey between groups.

Table 2 suggests a higher mean in the control group confidence toward teaching at the beginning of the study. The difference between means of the control and experimental groups was .42, which was found to be significant on a five-point scale. The resulting t-statistic reveals the difference in teaching confidence between groups was significant ($p<.05$). The second comparison on teacher confidence in this study was the post-control vs.

Table 2. Pre-control and pre-experimental groups' confidence toward teaching

Variable	Group	M*	N	SD	t	Df	P
Confidence	Control	3.39	24	0.41	3.56	46	.0009
Teaching	Experimental	2.97	24	.407			

Note: * Higher mean, positive confidence toward teaching.

Table 3. Post-control and post-experimental groups' confidence toward teaching

Variable	Group	M*	N	SD	t	df	P
Confidence	Control	3.92	24	.30	.096	46	.9236
Teaching	Experimental	3.91	24	.41			

Note: * Higher mean, positive attitudes toward mathematics.

post-experimental. Table 3 reports the results of this study.

The comparison on teaching confidence between control and experimental groups at the end of the study indicates no significant difference ($p > .05$).

In order to compare means between pre and post administration of the confidence toward teaching in control and experimental groups, the statistic analysis carried out was an unpaired samples t-test. Tables 4 and 5 summarize the results of the comparison between pre and post administration of the confidence scale toward teaching in the control and experimental groups, respectively.

The difference between means of the pre and post survey was about .53, which was found to be significant. The resulting t-statistic reveals that the difference in teaching confidence within the control group was significant ($p<. 05$). Table 5 reports the comparison between pre and post administration on confidence toward teaching in the experimental group.

The mean differences between the pre and post survey for the experimental group was about .95, which was about an 80% increase from the traditional group. Similarly, for these comparisons, significant difference ($p > .05$) was found within the groups in confidence toward teaching.

Table 4. Pre and post confidence in teaching: Control group

Variable	Group	M*	N	SD	t	df	P
Confidence	Pre-control	3.40	24	0.409	5.19	46	.102
Teaching	Post-control	3.93	24	.308			

Note: * Higher mean, positive confidence toward teaching.

Table 5. Pre and post confidence toward teaching: experimental group

Variable	Group	M*	N	SD	T	Df	P
Confidence	Pre-experimental	2.97	24	.407	7.97	46	.0001
Teaching	Post-experimental	3.916	24	.414			

Note: * Higher mean, positive attitudes toward mathematics.

Table 6. Gain score of pre and post confidence in teaching: control vs. experimental

Variable	Group	M*	N	SD	t	df	P
Gain	Control	.55	24	0.34	3.9	46	.0003
Score	Experimental	.947	24	0.36			

Note: * Higher mean, greater gain in confidence in teaching.

Considering significant differences were found between the control and experimental group during the pre-test measurement, (which may be due to failure in the randomization), an additional group comparisons was conducted. According to Dallal (2013) one way to resolve the differences between groups prior to the treatment is to compare group differences between post-test and pretest, referred to as change or gain scores. Table 6 reports the comparison between pre and post-test gain scores in the control and experimental group.

The resulting t-statistic reveals that the difference in gain score between pre and posttest of teaching confidence between the control and experimental group was significant ($p<.05$). The experimental group was found to have a significantly higher gain in teaching confidence than student in the control group.

In addition to the pre and post survey of teaching confidence, students also responded to open-ended survey questions about their experience in the course. When asked, "What strategies did the professor implement to help you feel a sense of community?" students in the control group were more likely to report personal attributes of the classroom instructor than actual instructional strategies. Responses included "the instructor was very professional" and "he was open and shared his experiences." This reveals the greatest factor for feeling a sense of community was not strategies within the course but the instructor himself. This finding suggests a teacher-centered approach to teaching where knowledge is constructed by the teacher and students are passive recipients of information.

In the experimental group however, students' reported the instructors' strategies to be indicative of a student-centered teaching approach. When asked "what strategies did the professor implement to help you feel a sense of community?" the students stated, "making connections with colleagues," "group presentations," "sharing experiences" "class projects" and "feedback from instructor and colleagues." These strategies are aligned with a student-centered approach to teaching where the teacher facilitates understanding by creating a classroom environment that is conducive to conceptual change. In a student-centered classroom, participants can engage in activities that focus on a deep approach to learning and understanding the content of study.

The majority of participants in the experimental group also reported that "instructor videos" were a useful tool to help students feel connected throughout the course and promote discussion. The instructor used a web-based screen-casting program to record video lectures. She found this to be a useful tool because of the capacity to have unlimited recording time, and provide students with the accessibility to watch course lectures either on their mobile phone or home computer. There were four videos that were created for each unit of study. Video statistics revealed that on average each video was viewed at least 30 times by the end of the course. This data reveals students in the experimental group may have watched the video more than once, as students in the control group did not have access to teacher created videos.

The survey also asked participants "what strategies should the professor implement?" students in the control group were more likely to skip this question or report "not applicable." However in the experimental group students were more likely to give feedback, which included "more time for group work," "more instructor videos," "team building skills" and "rotate groups more often." The responses in the experimental group were identical to the strategies incorporated into the course. This implies students found these strategies meaningful and relevant. The experimental groups' responses also demonstrate a master classroom environment, where the goal of learning is to master new skills and the process of learning itself is valued. This is indicative of the fact participants in the experimental group were more comfortable providing constructive feedback versus participants in the control group who were more likely not to provide criticism. When the classroom environment is focused on getting good grades and looking competent as compared to others this leads students to adopt a performance goal orientation. Students would be less likely to provide constructive criticism if they believed this would impact their grade.

DISCUSSION

The results from this case study support previous findings that instructional approaches do influence teacher efficacy (Nietfeld and Cao, 2003). This is an important finding for higher-education instructors to take into consideration especially as more schools and universities move to alternative classroom environments such as hybrid, synchronous and asynchronous classes. Knowing what type of instructional approach is most effective can help instructors support positive student outcomes such as mastery of course content, retention and graduation.

In this study both the traditional and flipped class demonstrated a significant difference from pre to post test in teacher confidence, however the gains were significantly greater in the flipped classroom model. The flipped class model is aligned with a student-centered approach to instruction, as the focus is more on the students and their learning than the teacher and their teaching. A student-centered approach allows students to construct knowledge, as well as aim toward mastery of content. The teacher in a student-centered classroom has a greater opportunity to scaffold instruction based on individual student needs as teaching is interactive and the instructor can observe students misconceptions. Coffee & Gibbs (2002) found student-centered teachers have been found to use a wider repertoire of teaching methods than teachers who adopt a teacher-centered approach to teaching.

Although both the traditional and flipped classroom incorporated group work into the class schedule, the amount of time allotted for group work was significantly greater in the flipped class than in the traditional class. In the traditional class about 16% of class time was allocated for group work compared to 50% of class time in the flipped classroom. Furthermore in the flipped classroom an additional 40 minutes of class time or about 16% was used for group presentations. This additional time allowed the instructor to create activities that required a higher level of cognitive demand and for students to demonstrate their knowledge during group presentations.

In a traditional course presentations are delivered by the instructor and not the student, this approach fails to provide pre-service teachers with an opportunity to lead a discussion and demonstrate mastery of the content. If pre-service teachers are preparing to enter the classroom they will need multiple opportunities to present ideas and collaborate with colleagues, which is typically what pre-service teachers will do as classroom teachers. The flipped classroom model lends itself to a greater amount of time for group work, thus providing an opportunity for students to collaborate, share ideas, negotiate meaning and receive feedback from the instructor. In addition there is time for presentations, which is a valuable skill for pre-service teachers to acquire, as interviews for teaching positions require presenting to a panel, teacher evaluation is through observation of classroom practices and teachers must present information everyday as a classroom teacher.

Framework for Flipped Classroom in Teacher Education

In the traditional classroom, the focus is on covering material not mastering skills. When the classroom is flipped, students become self-directed learners and instructors have more time to engage students in hands-on activities, group work, discussion, or inquiry. If classroom instruction must shift to meet the demands of an ever-changing workforce utilizing the "Four Cs' will help educators prepare students by incorporating critical thinking, communication, collaboration, and creativity when teaching the core content subjects.

The skills students will acquire when instruction is infused with the "Four C's will prepare future educators for an ever-changing educational landscape. The opportunity to engage with others and construct meaning, share ideas and negotiate understanding is invaluable. In a traditional classroom collaboration is second to teacher direct instruction. In preparing educators for the 21century classroom what is modeled as effective instruction will inevitably be demonstrated when newly authorized educators begin instruction in their own class. Thus a shift must take place for higher education instructors to model the practices that 21 century teachers should implement in their own class. The experience of "flipping" is a relatively new pedagogical approach, however when infused with 21st Century skills the value will be recognized immediately.

Flipping 21st Century Skills

As students prepare to enter the teaching profession they are exposed to a wide body of knowledge that is subject specific "content knowledge" as well as teaching specific, "pedagogical knowledge" (Ball, 2000). Pedagogical knowledge, referred to as the "how of teaching" is emphasized in teacher education programs, whereas content knowledge is knowledge about the subject matter and is often acquired in undergraduate discipline areas. If the purpose of teacher education programs is to instruct students on "how to teach," then the approach to teacher education programs must reflect the knowledge and skills that are valued by society.

According to Ken-Kay, CEO of EdLeader21, "Today's students need critical thinking and problem-solving skills not just to solve the problems of their current jobs, but to meet the challenges of adapting to our constantly changing workforce" (NEA, page 6, 2010). The National Education Association (2010) identified four specific skills that were most important for educators to instill in their practice: critical thinking, communication, collaboration and creativity. These skills referred to as the Four Cs' prepare students for a global economy in which they will interact with people from many cultural backgrounds and be required to think critically and problem solve in order to master job market competencies. Using the Four C's framework can help instructors design classroom tasks that are engaging as well as supportive of developing the skills and competencies that will be valued by employers in a global economy. To emphasize the significance of this shift President Barack Obama stated "I'm calling on our nation's governors and state education chiefs to develop standards and assessments that don't simply measure whether students can fill in a bubble on a test, but whether they can possess 21st century skills like problem-solving and critical thinking and entrepreneurship and creativity."

Critical Thinking

Critical thinking is the ability to think critically about an issue or situation. It involves reflecting rationally about the beliefs or actions that garner the results, as well as using evidence to support a decision. In the teaching profession, teachers must think critically everyday when working with parents, students, or administrators at their school site. Critical thinking allows teachers to make informed decisions when it comes to completing tasks such as analyzing data from student assessments, planning lessons based on students' prior knowledge and developmental ability, and reflecting on the effectiveness of a lesson plan.

Ways to Integrate Critical Thinking into Your Teacher Education Program

Classroom Management

Students read various case studies of students who are exhibiting behavior problems in the classroom. They are divided into 3-5 grade level groups and determine the evidence, next steps and potential modifications for the selected students. Students can refer to textbooks, websites or other reference materials to support their decision. Each group presents their behavior plan and evaluates the effectiveness and potential shortcomings.

Data Decision Making

Students receive classroom data that are reflective of the grade/subject they would like to teach. In small groups students will review the data, assessment, and grade level standards. Students determine which standards the teacher should reteach for whole group, small group or individual students. They determine the effectiveness of the assessment and which questions might be potentially confusing or misleading to students.

Communication

The ability to express thoughts clearly and coherently is a skill that student teachers need to master prior to entering the teaching profession. Teachers should possess the ability to provide comprehensible instructions, motivate others through speech, express thoughts and opinions clearly. In addition to delivering classroom instruction, teachers are expected to communicate with parents of diverse backgrounds, facilitate professional development, lead grade level and school meetings, and communicate effectively in multilingual and multicultural environments.

Ways to Integrate Communication into Your Teacher Education Program

Screencasting

As an assignment or in class activity, students create a screencast to explain a concept or teach a lesson. This type of assignment is valuable as students not only receive feedback from their instructor and colleagues but they can self-evaluate their ability to communicate, and rerecord their screencast with modifications. The instructor provides a rubric, which the students can use to determine their effectiveness of the screencast. The capacity to share their screencast with others is easily transmittable through a link that is sent via email. In addition, if the screencast is shared via YouTube, the setting can be changed to private and comments can be included to provide feedback.

Presentations

When the classroom is flipped, there is more time for students to deliver presentations to their colleagues. Presentations may include demonstrating a specific skill, sharing a strategy or research findings. In order to make presentations valuable, an evaluation tool such as a rubric should be included to provide feedback (see Table 7). The rubric can be distributed to students who will be watching the presentation to provide different perspectives of the students' performance.

Table 7. Group presentation rubric

Presenter's Names:		
Features	**Rating (1 poor, 5 excellent)**	**Comments**
Engagement with audience. Allows time for others to think & respond.	1 2 3 4 5	
Volume of speaker & rate of speech.	1 2 3 4 5	
Eye contact and posture.	1 2 3 4 5	
Enthusiasm of content and delivery.	1 2 3 4 5	
Visuals are appropriate and make presentation meaningful.	1 2 3 4 5	
Introduction to topic is interesting and "hooks" audience.	1 2 3 4 5	
Presentation is well organized. Clear ideas & transitions.	1 2 3 4 5	
Summarizes topic & assesses issue.	1 2 3 4 5	
Critical thinking questions used to involve audience participation.	1 2 3 4 5	
Research is used to support ideas.	1 2 3 4 5	
Support for conclusions.	1 2 3 4 5	
Student's own perspective & position presented.	1 2 3 4 5	

Collaboration

Over the past decade, the culture of schools has changed from teachers working in isolation to teachers communicating and collaborating on a daily basis. There is a large body of research supporting the value of collaboration in the teaching profession. According to Kardos and Johnson, (2007) when school leaders promote collaboration among veteran and novice teachers this can improve teacher satisfaction and retention. Collaboration is a skill that involves working in a group to share multiple perspectives. However the benefits of shared knowledge, will not be valued or understood if students fail to work effectively and respectfully in a group setting. Thus it is

Table 8. Group paper: Individual feedback form

Your Name:____________________________ **Group Members:**____
1. Discuss your contributions to the preparation of this assignment.
2. Do you feel that all members of your group contributed equally to this presentation? ☐ Yes ☐ No (If no, please explain)
3. Discuss your general thoughts on this assignment.
4. Additional questions and/or comments.

important for students to have an opportunity to practice and master collaborative skills so that they can be effective facilitators of collaborative group work when they enter the teaching profession. Collaboration requires group members to share responsibility for collaborative work and make compromises in order to achieve a common goal. Such tasks require group members to communicate clearly and fairly, provide constructive feedback and value the contributions of each group member (see Table 8).

Ways to Integrate Collaboration into Your Teacher Education Program

Lesson Planning Evaluation

Students work in teams to evaluate the effectiveness of individual teachers' lesson plan. Students discuss how well the lesson plan meets the needs of diverse classroom learners, and is aligned with the assessment. Each group designs criteria for evaluating the lesson in advance and grades their work accordingly.

Developing School-Wide Achievement Plans

Students form teams and are asked to investigate the academic performance of a particular school site. Each team receives a school plan, results of summative assessment, demographics of teachers, students and socioeconomic status. Students then formulate possible causal variables for schools performance. They conduct an Internet search to collect data on factors contributing to achievement and prepare a presentation to explain their findings, conclusions and recommendations.

Creativity

According to Sir Kenneth Robinson (n.d.), "Creativity is as important in education as literacy and we should treat it with the same status." Creativity is what drives a global economy. Students who leave school with the ability to create and innovate will be sought after in a workforce that thrives on innovation. Thus it is imperative for teacher educators to know how to create tasks that foster creativity and innovation in all subject areas. Teachers who facilitate creative thinking have the capacity to incorporate a wide range of creation techniques, provide time and opportunity to explore concepts and discover learning. Teachers should also model how to evaluate, analyze and improve ideas so that students understand that creativity is a cyclical process that includes multiple revisions and improvements.

Ways to Integrate Creativity into Your Teacher Education Program

Choice Boards

Students create a choice board related to a specific topic or concept. A choice board contains activities that students can select from to demonstrate their knowledge and understanding of a topic. For example if the topic was fractions the choice board might contain activities such as design a board game using fractions, create an Ad with fractions, perform a skit using fractions, or create a rap on how to add, or subtract fractions.

Action Research

Students can interview teachers and or administrators to identify a problem at their school site (classroom management, testing, bullying, etc.). As a group they design an intervention to address the problem, create data as a result of the intervention, examine research related, and reflect on the results of their intervention. Students present their intervention, data and conclusion to the class.

UNDERSTANDING FLIPPED CLASSROOM IMPLEMENTATION FOR FACULTY AND STUDENTS

The Learner's Experience

With the flipped classroom model no longer do students spend a minimal amount of time collaborating with peers as they enter the classroom. Lectures are watched or listened to when the student is at home, so that during face-to-face instructional students can participate in collaborative problem-solving activities. The role of the learner in the flipped classroom is to demonstrate mastery. With a mastery approach to learning the likelihood of leaving some students behind as the teacher proceeds to increasingly challenging material is minimized (Bloom, 1981; Guskey, 1985; Zimmerman & Didenedetto, 2008). The flipped classroom model is aligned with a mastery approach as instruction allows students to proceed through a unit at their own pace. Since some students need more time than others to master a topic, they can review at home activities, practice skills or concepts demonstrated in a screencast over and over again, and use valuable classroom time to ask questions or seek help from a classmate or instructor.

In a traditional classroom, students who need additional assistance may be so overwhelmed with lower-level tasks such as copying notes or comprehending material, they might not have an opportunity to ask questions or collaborate so that new information can be made meaningful.

In order for the learner's experience to be successful in a flipped classroom, the instructor needs to set clear expectations for the course, and demonstrate how to use and access course tools and videos during the first course meeting. Furthermore, the learner should be held accountable to participate in onsite activities as well as at home videos. Participation might include reflective journal prompts, discussion boards, graphic organizers, quizzes or quick-writes. Using rubrics, self and peer evaluation tools are vital to promote self-directed learning and hold students accountable for their learning experience. There could be an belief on the part of the student that simply "showing up" counts as participation for class meetings therefore it is imperative that the instructor is well prepared for the flipped classroom, sets clear expectations and provides necessary materials to facilitate this experience.

The Instructor's Experience

The role of the instructor in a flipped classroom is two fold. First the instructor should create dynamic lectures that are aligned with the course learning objectives. Lectures should explain, discuss or clarify theoretical concepts that students will need to know and understand in order to participate in classroom activities. Next, the instructor should plan in-class activities that allow students to apply the theoretical concepts discussed in the screencast lectures. Activities should provide students with an opportunity to explain, create, justify, elaborate and/or share their understanding and knowledge in a way that demonstrates transfer of learning.

Bloom's Taxonomy (Bloom, 1956), is a good tool for creating both at home video's (screencasts) and in class activities. Lower level tasks such as "remembering" and "understanding" can be incorporated into at home lectures. Instructors can use a variety of media to create a powerful video experience such as incorporating websites, expert videos and asking reflective questions that would assist students in defining, describing, or explaining concepts and theoretical perspectives. For example, if students were learning about the Constructivist theory the teacher might create a screencast to explains the timeframe from which constructivism emerged, key terms, concepts, and philosophical underpinnings related to the theory. In addition to the screencast the teacher should create a classroom assessment technique related to the video that can be assessed by the instructor. The classroom assessment could be a variety of approaches such as a quiz at the beginning of the class based on the video lecture or a take home activity such as a graphic organizer or discussion board post. The instructor in this course used a variety of classroom assessment techniques such as discussion board posts related to the video, quick write that students would respond to at the beginning of the course, and online assessments created through survey tools such as Google forms. The rational for creating assessments related to the video is two fold, first to hold the student accountable for course content, and second to determine students' understandings and misconceptions. This will allow the instructor with an opportunity to reteach important ideas as well as scaffold content during face-to-face meetings.

Tasks that require students to demonstrate a higher-level of cognitive demand such as analyzing and applying a concept can take a considerable amount of time, effort and assistance from the classroom instructor. Providing an opportunity for students to engage in higher-level tasks creates a challenging classroom environment that allows the student to demonstrate what they know and the teacher to assess the knowledge and skills that students can accomplish independently. In the teacher education classroom higher-level tasks such as applying a specific teaching strategy or modeling classroom management procedures are usually assessed through a written paper, however this type of assessment does not measure what the student is able to demonstrate. A performance-based task such as demonstrating using cooperative groups, or applying a management technique would allow the instructor to assess if this skill would transfer into the students' teaching practice. Being able to define or describe a skill or strategy does not mean the students' has demonstrated mastery. Thus it is imperative to provide students with an opportunity to demonstrate their understanding in multiple ways. An example model of flipped classroom is as follows:

1. Prepare recorded lectures and accompanying quizzes or assessments that students complete on their own prior to class meeting.
2. Review student online assessment to determine what gaps or misconceptions might exist in student understanding
3. Prepare mini lectures to address gaps in student understanding as well as pose open-ended questions that would enable students to engage in whole-class dialogue.
4. Design in-class activities that require students to transfer knowledge from lecture to real application. Activities might require students to negotiate content, apply ideas, create solutions and demonstrate understanding (think of higher end bloom's taxonomy).
5. Prepare evaluation tools such as criteria chart, rubric and/or reflection to check student understanding as well as hold students accountable for group activities.
6. Model instructional practices, skills and strategies that you want students to demonstrate in the classroom. When in doubt create a screencast so that students may practice for accuracy.

FUTURE RESEARCH DIRECTIONS

This study found that students in a flipped classroom had significant gains in teacher efficacy as compared to students in a traditional hybrid class. Future studies should continue to compare flipped and traditional classrooms across academic disciplines and classroom platforms.

Differences were also found in how students perceived the instructor's teaching practices and how their perception is related to their sense of classroom community. Future studies should include classroom observations, to determine how instructional practices are being implemented. Group interviews could also show, which practices are most and least helpful in promoting teacher efficacy. The instructor in the flipped classroom also implemented the Four C's framework in the design of classroom activities, however research has yet to explore what impact this model has on student learning and engagement.

CONCLUSION

According to the American Association of Colleges for Teacher Education (2009), teachers who make a positive difference in their students' lives have the following characteristics: Strong general intelligence and verbal ability that help teachers organize and explain ideas as well as observe and think diagnostically; strong content knowledge up to a threshold level that relates to what is to be taught; knowledge of how to teach others in their content area (content pedagogy) in using hands-on learning techniques and in developing higher-order thinking skills; an understanding of learners and their development, including how to assess and scaffold learning; how to assist students with learning differences, and how to support the learning of language and content for those not yet proficient in the language of instruction; adaptive expertise that allows teachers to make judgments about what will likely work in a given context in response to students' needs.

These characteristics can be incorporated into a teacher preparation program if classroom time is provided in order for mastery to take place. With the flipped classroom approach more time is available for students to demonstrate, explain, model, create and analyze situations that are analogous to the experience of a classroom teacher.

In higher education the "flipped classroom" is a familiar approach to instruction where students watch prerecorded lectures at home so that in class time can be used to collaborate with classmates, work in small groups, and engage in project based activities. The flipped model circumvents the traditional teaching approach of expertise delivered from a professor and provides students with an opportunity to construct knowledge on their own. The traditional approach fails to capitalize on the wealth of knowledge from the collective group and the instructor tends to only support students who seek out assistance. The flipped classroom approach capitalizes on active learning by using in class time to engage all students in meaningful discussions and peer collaboration. This approach requires a considerable amount of planning and preparation to create a learning environment that engages all learners and makes content matter meaningful.

Although this approach is widely known it is not widely implemented. Face-to-face classes tend to be more teacher-centered than student-directed. The online learning environment has reinvented how students take classes it has not replaced how professors deliver instruction. With more than one third of all higher education students taking at least one course online (Allen & Seaman, 2011) and dropout rates for online learning courses 10-20% higher than traditional courses (Carr, 2000; Frankola, 2001) it is vital for higher education instructors to know best practices for student success.

KEY TERMS AND DEFINITIONS

Cooperative Learning: This instructional approach to teaching has students work in heterogeneous small groups and be active participants in the learning process. Five basic elements are incorporated into the cooperative learning environment: interaction, individual and group accountability, positive interdependence, collaborative skills, and group processing (Johnson, Johnson, & Holubec, 1987).

Flipped Class: Approach to instruction where direct instruction and lecture is viewed at home and class time is used for collaboration and project-based learning.

Hybrid Class: A format of course delivery that includes face-to-face seat time and online learning activities. Class participation includes both on-site class time and at home activities that are typically performed through web-based technologies.

Modeling: Instructional approach in which participants observe a relevant and capable person demonstrate how to perform a specific task that they will be expected to perform.

Screencasting: Digital recording of the computer screen, which contains narration. Also referred to as video screen capture.

Student-Centered Instruction: This form of instruction focuses on the individual student and their needs. Students are provided with the opportunity to learn independently or from other classmates. The teacher acts as a coach or facilitator in the process.

Teacher-Centered Instruction: This form of instruction allows the teacher to control the classroom discussion, and decisions by instructing the whole class simultaneously. One of the most salient features is lecture, drill and practice.

ABSTRACT

The goal of this study was to assist instructors and leadership of a hybrid weekend pre-service teacher education program at the University of Oradea to improve their effectiveness with students. Specifically, this study sought to gather and analyze data from three program constituents: students, instructors, and program leadership. The preschool and primary weekend education program at the University of Oradea was developed to be suitable for students who for various reasons cannot attend the traditional day classes. In 2011, the weekend program was changed into a hybrid program in an effort to more directly meet the needs of the student population. In order to more effectively meet the needs of the students, it became obvious that the pedagogy and structure of the program needed refinement. The data gathered in this study allowed the research team to develop recommendations for program, pedagogical, and textbook improvements.

INTRODUCTION

The University of Oradea, which was charted in 1990, is housed in Oradea, Romania. There are 108 undergraduate programs, 86 master degree programs and 10 doctoral programs offered by the university. The university is organized into 15 faculties at the undergraduate and graduate levels and three independent departments: the Teacher Training Department, the On-line Department, and the Life Long Learning Department. The University has adopted the European Credit Transfer and Accumulation System (ECTS) in

DOI: 10.4018/978-1-4666-8246-7.ch057

order to allow students to participate in classes throughout Europe and transfer their credits to the University of Oradea. This agreement also allows students from other European countries to attend classes in Oradea and transfer those credits to their home universities. Approximately 11781 undergraduate students are enrolled at the university and 2931 students attend graduate levels classes. The Sciences of Education department houses 457 students. The weekend program for primary and pre-school pre-service teachers hosts 184 students.

The mission statement for the university states that its goal is to promote knowledge, research and training through partnerships among teachers, students and the community. According to its mission the University seeks to train and educate undergraduate and graduate students on a large scale and at a high level. The weekend education program was developed to be aligned with and assist the university in accomplishing this mission.

The Pedagogy of the Primary and Pre-School Education program is housed in the Department of Sciences of Education from the Faculty of Social and Humanistic Sciences. There are seventeen full-time instructors in the department. Associate instructors are also hired by the university on a need basis. The certification program is a three year process. Students progress through the program as a cohort with all students taking the same courses together during their program. Each cohort is assigned an advisor who remains with the cohort for their three years at the university. Students participate in 60 courses in three categories: Core Education courses (9 courses), specialty courses (43 courses), and elective courses (8 courses). Students participate in community schools every semester, usually one day per week. Courses are usually divided into two types, theoretical and practical. In the theoretical classes students learn educational and psychological theory. The practical seminars are organized to give students more real life experiences related to the theories studied in the theoretical classes. In their specialty courses students also participate in laboratory (e.g. music, art, etc.) and practicum courses (methods of teaching), based on the discipline under study. At the completion of the program students are certified as Pre-School and Primary Teachers.

The teacher certification program has a long tradition, starting in 1785 with a vocational high school. In 1989 the state changed the certification process and required all teachers to be college graduates. The first weekend classes for education majors began in 1997 as an independent department. In 2005 the program was transferred to the faculty of Social and Humanistic Sciences in the Department of Sciences of Education. University weekend classes were endorsed by the national government in 2001 based on Government Decision No. 1101, and the law was updated in 2011 by the National Education Law. According to national standards weekend programs can only be instituted if there is an identical program in the day program. The education weekend program at the University of Oradea is the only teacher certification program that uses a hybrid weekend model.

In 2011, during the accreditation process, the weekend program acquired its present hybrid format. The program changed its philosophy from being a traditional weekend program running traditional face-to-face classes to a hybrid program based on a tri-dimensional pedagogical model. Online resources were added to the program and policies and procedures changed to adapt to the new roles of instructors in a more student centered and hybrid process. The program identified the non-traditional nature of its weekend students and developed the present instructional philosophy. Instructors who were not experienced working online had to learn how to use a new platform, new procedures, and new technology. Some instructors quickly adapted to the new systems while others struggled with their new teaching environment. Some instructors use the online portion of the program as a significant part of their teaching while other use the online resources to give out information and class resources for students. The format and content of the class texts changed significantly. Instructors are now required to differentiate their teaching in their texts. The text became a student centered resource to assist the students in their independent learning. The format and activities in the new formatted textbooks are set to assist students in their self-assessments and allow students to learn content in a progressive fashion. Instructors are now asked to include graphics and other visuals to assist students in their learning. In addition, the goals and competencies of the course and the content, activities, formative assessments and summative assessments are connected as an integrated whole in each textbook.

Instructors are also now asked to differentiate their teaching to meet the needs of adult full-time workers. Teachers are also asked to consider the travel issues encountered by their students in the development of the three aspects of their classes (face-to-face, online, and the instructor developed textbook). For example, instructors are asked to integrate the content and experiences of the texts and online experiences with their face-to-face work in order to give students multiple access points to the important course content. As the program has developed during the past three years professionals who work in the program have recognized that the weekend student body is extremely different from a traditional day class program. This recognition allowed the program to identify who its students are: older working adults, with families, diverse educational backgrounds, who live in a large geographic area with transportation issues, and most of whom have been out of school for many years. A group of these students is already teaching but have not graduated from a university, while another group is attempting to make a career change. Once the program recognized who the students are it became obvious that the philosophy of teaching and learning had to change from teacher centered teaching to student centered learning.

The purpose of our chapter is to describe the weekend program's progress as we have attempted to develop a high quality hybrid program for our elementary pre-service teachers. Our goal is to develop teachers who will enter the field prepared both theoretically and practically to engage their students in high quality educational activities. As we reflect on our work and the data we have collected our hope is that other programs will learn from both our failures and successes.

BACKGROUND

Introduction

Most people today would agree that modern technologies have drastically changed our world. Students have different situations and needs and it makes sense that our programs should adjust to meet those needs. The weekend pre-school and primary certification program at the University of Oradea has adapted its weekend program in an attempt to adjust to the needs of our future teachers. Blended learning has become an important area of review for many educators. There are various definitions for blended learning (Staker & Horn, 2012) and the program at the University of Oradea is developing the weekend program to be in line with the following definition: Blended learning is composed of a teaching and learning process in which students spend part of their time in face-to-face practical classes supervised by teachers, in schools supervised by a mentor and a classroom teacher, and at home learning independently. Students and teachers have access to an online platform for a portion of their work and most of the class resources (Staker & Horn, 2012).

The weekend program is a unique program for the University. There are two faculties that employ online programs at the University for students in traditional type of programs. In Romania there are various online teacher education programs (e.g. Cluj, Brasov, Bucharest, Iasi, Timisoara) but the weekend program at the University of Oradea is the only hybrid program developed for preschool and primary certification. Hybrid programs are developing at a rapid rate around the world (Picciano et al., 2013). As these programs develop people are learning how to integrate what they see as best practices from both face-to-face and online learning (Staker & Horn, 2012). To be successful, hybrid programs have to do more than just use technology to start discussion boards. Programs that have been successful work to develop a sense of community with the use of various tools and methods to engage students and their instructors in interacting (Lord & Lomicka, 2008). As the weekend program has developed it has been important to attempt to make it more student centered (Leese, 2009). The goal is to have students become immersed in deep and complex activities (Caine et al, 2009) in which students take more control over their learning (Tucker, 2012). Instructors have to change their focus from disseminators of information to coaches who guide their students in their learning (Tucker, 2012; Whipp, 2009). In this process part of the traditional classroom has been flipped (Berhmann & Sams, 2012) in order to give students more time to interact with each other and with their instructor (Hall, 2007).

At New England College, in Henniker, New Hampshire, USA, we have developed a fully online program for three of our majors, psychology, business, and criminal justice. The college has also developed a hybrid evening program for master of education students who are full-time teachers. Instructors at the college are using flipped classroom concepts in some of their teaching (Berhmann & Sams, 2012). Blended classrooms are becoming popular throughout the nation (Clark, 2011; Lloyd-Smith, 2010; Means et al, 2013). These blended classes take on many forms depending on the preferences of the instructors. The program at the University of Oradea is unique with its ability to include seminar, online, and practicum experiences in every class.

Our search into the relevant literature indicates that the use of blended classes will benefit our students (Clark, 2011; Lloyd-Smith, 2010; Means et al, 2013). We understand that just introducing technology will not give us blended classes (Clark, 2011; Glading, 2004). Therefore, the program has been developed to enhance the teaching and learning process by attempting to adapt the program using basic constructivist activities (Brooks & Brooks, 1999). We believe that our students must be engaged in the development of their own learning and students must interact more with the curriculum, their peers and their instructors (Hall, 2007). Brain research also agrees with the notion that active engagement leads to more student effort and higher achievement levels (Sousa, 2011).

Textbooks for the weekend program are developed by the instructors so that students can independently accomplish the reading assignments and follow-up activities. This version of a flipped class (Berhmann & Sams, 2012) has the students using the text either in hard copy or online to learn the basics of the theories. Then students are asked to apply their knowledge and skills during the practical and in-school portions of the program. This process was developed as an attempt to create an effective blended instructional system for students and instructors (Staker & Horn, 2012) that will enhance their engagement and learning (Clark, 2011; Lloyd-Smith, 2010; Toyama et al, 2013). The weekend program's vision is to create and use pedagogical techniques aimed to differentiate learning (Tomlinson, 2003) and move from teacher-centered to student-centered practices (Sousa, 2011).

Institutional Data

A review of the institutional data was conducted in relation to student numbers, GPAs, student grades by groups (i.e. 9.5 – 10, 8.5 – 9.49, etc.), retention rates, and graduation rates. The graduating class of 2012 began the program with 119 students of which 64 graduated in 2012. This gave that class graduation rate of 53.78%. In their second year there were 88 students for a retention rate from year one to year two of 73.94%. This class began their third year with 79 students for a retention rate between year two and three of 89.77%. The graduation class of 2013 began the program with

61 students of which 45 of those students graduated in 2013. This gave that class a graduation rate of 73.77%. The graduating class of 2014 started the program with 48 students and began their second year with 38 for a retention rate of 79.16%. This class began their third year with 34 students for a retention rate of 89.47%. If all of these students graduate in 2014 their graduation rate will be 70.83%. The graduating class of 2015 began the program with 55 students and in their second retained 49 of those students for a retention rate of 83.63%.

Data in relation to grades for the current program were reviewed for the 2012 – 2013 school year. First year students earned an average grade of 6.32 (using a 10 point scale). Seven students failed due to non attendance to classes, practicums, and exams. When those grades of zero are removed from the data, the average for those students who attended school was 7.09. For this group of students 1.8% earned a grade average of 9.5 to 10; 29; 1% earned an average of 8.5 to 9.4; 20% earned an average of 7 to 8.49; 23.6% earned an average of 5; 25.45% earned failing grades.

Second year students earned an average grade of 7.78 (10 point scale). Two students failed due to non attendance to classes, practicums, and exams. When those grades of zero are removed from the data, the average for those students who attended school was 7.94. For this group of students 6.12% earned a grade average of 9.5 to 10; 36.73% earned an average of 8.5 to 9.4; 43% earned an average of 7 to 8.49; 6.12% earned an average of 5; 8.19% earned failing grades.

Third year students earned an average grade of 8.05 (10 point scale). Five students failed due to non attendance to classes, practicums, and exams. When those grades of zero are removed from the data, the average for those students who attended school was 8.19. For this group of students 20.33% earned a grade average of 9.5 to 10; 30.51% earned an average of 8.5 to 9.4; 34% earned an average of 7 to 8.49; 5.09% earned an average of 5; 10.17% failed.

PRE-SCHOOL AND PRIMARY WEEKEND PROGRAM

Program Overview

The Pedagogy of Primary and Pre-School Education Weekend Classes program works as a hybrid program with face-to-face practical seminars, laboratories, and practical classes and online theoretical classes. Students attend face-to-face activities on Saturdays and Sundays each semester for three years. Students participate in these classes for between twelve and fourteen hours per week. In all cases the curriculum and expectations for students is the same as the regular day program for the university teacher preparation program.

Schedule

Each semester is fourteen weeks in length. Students attend classes on the weekend (Saturday and Sunday) throughout the term. Professors are required to meet with their students between one or two hours per week face-to-face, depending on the course. Students usually attend classes for six or seven hours per day each weekend. For those students who do not have access to the internet at home the library has internet access available for weekend student use. Students are expected to work on the theoretical portion of their courses online at home. Each instructor schedules assignments and activities with her or his individual class. At the completion of each semester the instructors engage with their students in exams during a two or three week period of time.

Curriculum and Instruction

All students in the program are pre-service teachers working toward certification as pre-school and primary teachers. Students participate in sixty courses during their three year program. The curriculum consists of nine core education courses (15%), forty-three specialty courses (72%), and eight compulsory general study courses (13%). All students also must engage in a capstone action research project at the conclusion of their program. Students present their final results and research paper to a professor committee at the completion of the sixth semester.

The program philosophy to create specific pedagogy for our non-traditional students has led us to create a tri-dimensional approach to instruction: face-to-face engaging activities, online access, and independent learning resources. It is important for our program professors to use instructional strategies that are flexible and that enhance independent learning for our students. Our instructors also have to develop strategies that are effective with older and more experienced adults.

One of the goals of the weekend program is to develop our system so that student learning can occur as independently as possible. Each professor must create a text for the course she or he teaches. This class text is written with the understanding that students will have to use the material individually outside of class time.

Online Elements

The weekend classes use Moodle as the technological platform for the online portion of the program. Students have access to all program resources through this platform including syllabi, announcements, discussion forums, assignments, communications from instructors and administration, and textbooks. Students also have access to the Secretariat in order to access schedules, grades and other important information necessary for students. Students are expected to engage in the theoretical portion of their class work using the online text and other resources. Administration and the three mentors post announcements, schedules and important information that students need during the year. Mentors also use the online program to engage with their students in a general forum in which the mentor or any student may pose questions or work to resolve issues that develop during a semester.

Assessment

Students are assessed by all teachers both formatively and summatively. In seminars and theoretical classes 50% of the students' final grade is determined through the use of formative assessments and 50% of the final grade is determined through the use of summative assessments. In laboratory and practical classes 60% of the final grade is determined through the use of formative assessment and 40% of the final grade is determined through the use of the summative assessments. Each instructor develops formative assessments that match the discipline of the course. Every teacher implements a summative exam connected to the organization of the discipline. Instructors may use written, oral performances, final portfolios, writing prompts or real classroom activities as part of their assessment process. At the completion of their program all students develop and implement an action research project that they present either to a panel of professors or at a conference.

Professional Development

Each year instructors must provide evidence of professional development in their discipline. Every five years instructors in the weekend program must participate in training organized by the Department of Online Education. Each instructor in the program must participate in training for teaching in the weekend program. In order to qualify to teach in the program an instructor must pass an online test. In addition, each instructor must successfully develop a weekend course online using the program platform. The Director of Online Learning and the administrator of the program platform review and assess the course developed by the potential instructor. Once both aspects of the exam are successfully completed the Director of

Online Learning awards a certificate of completion to the instructor who is then eligible to teach in the weekend program. The program director and coordinators also attend yearly state run training sessions developed by national online experts.

METHODOLOGY

In order to gather appropriate data for analysis this study used a case study approach for its research. According to Bogdan and Biklen (2003) the case study approach gives the researcher the opportunity to study complex social relationships and processes that change over time in order to develop a more complete understanding of the case under study. This approach enables the researcher to develop the story behind the quantitative numbers. We chose this case study approach because it allowed the researchers to gather both quantitative and qualitative data directly from the participants in our program, instructors, students, and administration. Quantitative data used in this study was gathered by surveying students and instructors and by analyzing institutional data: retention rates, graduation rates and student grades. Qualitative data was gathered through interviews of the director of the online department, the administrative assistant for finances and the weekend program budget, weekend program advisors, and the coordinator of the weekend program.

The student survey consisted of 20 items. The survey was divided into four categories: student background and demographic information, reasons for choosing the weekend program, online platform and technology use, and assessment of and recommendations for the program. The instructor survey consisted of eight sections: the use of the e-learning platform, use of text, face-to-face activities, a comparison of typical day classes to weekend classes, media used in the program, assessment of the program, professional development, and recommendations.

RESEARCH RESULTS

Student Survey

Background and Demographic Information

Of the total students in the program 126 students participated in the student surveys (68.48%). The results indicate that most students have positive attitudes about the program with 96.8% of the students indicating that they recommend the program for other students. The student body is diverse in its demographic make-up with 53.2% of the students living in urban areas and 46.8% living in rural areas.

Weekend program students may be considered to be non-traditional students in other ways. The students are generally older than a typical day program student body. For the weekend program 42.1% of the students are between 18 and 25 years old, 45.3% are between 24 and 39 years of age, and 12.7% are 40 years of age or older. When they enter the program approximately 25% of the students are 23 years old, meaning that although they are in the youngest category, they are older than typical graduating students in the day program. The majority of the weekend program students work (76.3%). Of this group of working students 84.4% of them work full time. From this group 35.7% of the students work as teachers. Of these teachers 23 (51% of the people who work) have been teaching for ten or more years. Forty-four percent of the weekend program students are married and 39.7% of the students have children of their own, with 26 students having two or more children in their homes.

The weekend program students have a variety of program and career needs. Approximately 23% of the weekend program students already hold a degree of some kind and 29% of the students are working to earn two degrees simultaneously. Approximately 50% of the weekend program students enrolled at the university four or more years after graduation from high school.

Transportation is a major issue for many of the weekend program students. Approximately 40% of the students travel to school by automobile, either their own car or through car pooling. The most common mode of transportation is through the use public transportation, bus or train (55%). For students who live in the city in which the college is housed this is not a major issue but for those students who live in other cities or in rural areas transportation schedules cause issues. People often have to travel significant distances to get to a train or bus station and students have to travel based on the schedule of the bus or train (which may or may not coincide with class schedules). The range of distances from the university to the residencies of the students ranged from 3 kilometers to 840 kilometers. The mode and mean distance from the university is 60 kilometers.

Reasons for Choosing Weekend Program

In addition to questions about their backgrounds, the survey asked students to select from a list one or more reasons for choosing the weekend program. The list included: 1. Their older age, 2. Family obligations, 3. Work obligations, 4. Free time, 5. They live outside of the city which houses the university. Students also had the opportunity to add their own reasons (no students did so). The Students indicated that the most important reason for choosing the weekend program was their working obligations (54.8%). The majority of the weekend program students work (76.3%). Of this group of working students 84.4% of them work full time. Approximately 17% of the students chose the weekend program in order to change their careers or job situations. From that group, most of the students chose this program because they work in a school and have decided that teaching would be a good career choice for them. Thirty-two percent of the students chose the program as their university choice upon graduating from high school. Thirty-five point seven percent of the students are already working as teachers and want to or have to complete their degree for their work. The preponderance of these students are forty years of age or older and have been working in the field for a number of years.

The second most important reason chosen was family obligations (34.9%). Forty-four percent of the weekend program students are married and 39.7% of the students have children of their own. Twenty-six students have two or more children in their homes. The majority of these students also work full time.

Their third most important reason for choosing the weekend program was that students live in another city than where the university is (29.4%). Students indicated that transportation is an issue and the weekend program offers them the opportunity to not have to travel every day to the university. Free time was the fourth most important reason for choosing the weekend program (15.9%). The survey did not ask the students to define what fee time meant to them (e.g. leisure, time to work, time for family obligations, etc.). The fifth reason for choosing the program was the older age of the students (10.3%). The students are generally older than a typical day program student body. For the weekend program 42.1% of the students are between 18 and 25 years old, 45.3% are between 24 and 39 years of age, and 12.7% are 40 years of age or older. When they enter the program approximately 25% of the students are 23 years old, meaning that although they are in the youngest category, they are older than typical graduating students in the day program.

Technology Use and Online Platform

All of the students in the weekend program indicated that they are at least somewhat familiar with using a computer to access the internet. Data from the survey indicated that 69% of weekend program students are familiar or very familiar with using a computer. Another 25.4% of the students indicated that they have average familiarity with using a computer. Six students indicated that they were somewhat familiar with using a computer. No students indicated that they were not at all familiar with using a computer.

No students indicated that they were totally unfamiliar with using the online platform for the weekend program. Sixty-five percent of the students indicated that they were familiar or very familiar with using the online platform. Another 29.4% indicated that they were somewhat familiar with the online platform, and 5.6% of the students indicated that they were unfamiliar with the program. As students gain more experience in the program they become more familiar with the program. In the first year 54.7% of students indicated they were familiar or very familiar with the online program; in the second that number was 76.5%; in the third year the number rose to 78.7%.

The survey also asked students to indicate how often they use the online platform for their school work and/or learning. Forty-six point eight percent of the students indicated that they access the online platform on a daily basis. Another 32.5% of students indicated they use the online platform 2 or 3 times per week. Twelve point seven percent of the students indicated they use the platform daily during the exam periods. Five point six percent of students indicated they use the platform at least once per week. Lastly, 2.4% of students use the platform once per month. First year students (64.2%) use the platform at a higher rate than do second and third year students (35% and 33.3%).

Students were asked to prioritize their reasons for using the online platform (scale of 1 – 7). The first priority for students was to access posts uploaded to the platform by their instructors (mean 5.35). Their second priority was to post assignments for their classes (mean 4.95). The third most frequent reason were individual student reasons that they added to the list (mean 4.83). The fourth most important reason to access the online platform was to communicate with their instructors (mean 3.62). Students chose forum discussions as their fifth most important reason to access the online platform (mean 3.45). The sixth priority for accessing the online platform was to communicate with their mentor (3.04). Students' final choice was to use the online platform to communicate with secretariat (mean 1.42).

The survey also asked students about how much help they needed in using the online platform. One third of the students indicated they needed assistance with using the online platform, while the other two thirds indicated they did not need assistance. The youngest group of students (18 – 23) indicated they needed assistance at the highest rate (43.4%). The students from age 24 to 39 indicated the lowest need for assistance (22.6%). Students were also asked by the survey to indicate their preference for lowering the face-to-face time of the program and substituting that time with online work. This would include doing more of their assignments and discussions in the online format. The majority of the students (65.9%) indicated they did not want to change the face-to face to online ratio as it now exists.

In response to the survey students indicated that almost all of them (96%) have access to the internet at home. Three percent indicated that they have access at their work, and one student indicated the she or he does not have internet access.

Program Leaders Survey

Introduction

The program implemented an open ended survey with five people: program administrator, coordinator of the weekend program, and the three program advisors. All participants responded to the same six questions: What are the strengths of the program? What can be improved in the program? What are the needs of the students in our program? What are the needs of the instructors in the program? How effective are the resources provided by the program (i.e. text, online resources, program library)? Are there any other comments you would like to add?

Results

For question one, strengths of the program, there were three major themes raised by the respondents. All five participants responded that although the program is presented in an alternative format the students receive the same level of training and certification as do students in the traditional day program. Four of the five respondents noted that the weekend program offers easier access to the textbooks and classes for their students. Three participants responded that the flexibility of the program and its use of weekend classes, online resources, and independent learning opportunities allow students to be successful within their family and work situations. Two people stated that the cooperation among online instructors and classroom instructors is effective. In addition, two respondents noted that the instructors are well prepared to teach in the program.

The second questions asked for ways to improve the program. Three participants responded that although the program is working with non-traditional students, a significant number of instructors do not differentiated their instruction and assessment practices to adjust to their students' needs. These respondents believe the weekend program should develop a professional development system to ensure that instructors understand the needs of the program, their students, and the program's pedagogical philosophy and best practices necessary for student success. Two respondents noted that they are not sure that the textbooks they created are accurate in terms of the time students need to accomplish the tasks. They recommended that the program could assist instructors in the process of developing texts and of researching the accuracy of the time requirements for the students. Two participants noted that working with smaller classes would improve their effectiveness.

The third questions referred to the student needs in the program. The responses to this question did not develop any major themes. The different responses discussed the general concepts that the students have diverse needs and need flexibility in order to meet those needs. The theme of the responses appeared to be that the program should constantly assess the student needs and respond to each group of students as necessary. For the fourth question, needs of instructors, all five respondents indicated that the salary for their efforts should be more in line with the work required of the instructors, mentors, and administrators in the program.

The fifth question asked about resources in the program for students. Three people noted that the content of texts should be "essentialized" in order to give a more accurate set of activities in terms of the amount of time students need to complete text activities. Two participants suggested that the program should develop more ways to motivate students to access the online platform on a more regular basis.

Participants were asked to give other recommendations. Two people responded to this question. Their suggestion was to improve the consultation time offered by the program. Instructors offer two-hour blocks of time for students to come to the university to get assistance of any kind. Few students take advantage of these opportunities. The suggestion was to have the program look into other ways to format the consultation time (e.g. include online office hours, etc.).

Instructor Survey

Introduction

The program implemented an instructor survey that was organized into eight sections: 1. Online Platform, 2. Textbooks, 3. Face-to-Face Activities, 4. Comparison with Day Program, 5. Use of Media, 6. Assessment, 7. Professional Development, 8. Other Comments. Sixteen full-time instructors (66.67%) responded to the survey. There are two types of classes offered by these instructors, online theoretical classes and face-to-face practical classes.

Results

Section 1 asked instructors three items: How important is the online platform for the weekend program? What aspects of the platform are important for you? How often do you access the online platform? For the first question the instructors' mean was 4.43 (scale of 1 – 5) indicating that instructors believe the platform is important to the program. When asked how often instructors access the program 81% responded that they use the online platform on a weekly basis. Instructors indicated that they use the platform to post information (mean 5.00) for their classes (e.g. syllabus, text book, assessments, schedules, etc.). The second most important reason (4.64) given was to create the buttons for the assessment tasks for students. The third purpose for accessing the online program was for the online discussions (4.40).

Section 2 referred to the program textbooks (12 questions). There were four questions in this section that related to student use of the text. Instructors indicated that the textbooks were effective for students use and needs (means 4.42, 4.57, 4.42, 4.42). The rest of the questions for Section I referred to the required elements of the texts according to program standards. Instructors indicated their texts followed program standards, with mean scores ranging from 4.14 to 4.71.

Section 3 referred to face-to-face activities (eight questions). There were five questions related to the effectiveness of the face-to-face classes in helping students to learn and apply the concepts of each course. Instructors indicated in four of the five questions that the classes were successful for students. The means for those questions ranged from 4.40 to 4.60. The fifth question asked if the materials used in the classroom were useful for the future careers of these pre-service teachers. The mean score for this question was 3.93 which was the lowest mean for this section. The other three questions for this section asked about the content of the classes as they related to program requirements. Instructors indicated that their content was in line with program requirements with means between 4.4 and 4.73.

Section 4 asked instructors to compare the weekend program to the traditional day program. This section gave instructors ten typical teacher functions, and they were asked to choose which, if any, were more difficult in the weekend program as compared to their work in the day program. A majority of instructors (11 of 16) indicated that presenting the same content is more difficult in the weekend format as compared to the day program format. For question nine (motivating students) nine of the sixteen instructors indicated that it is more difficult to motivate their students in the weekend program. Five instructors indicated that it is more difficult to organize the class time effectively in the weekend program format. For the other seven questions a minimum of 13 of the 16 instructors indicated there is no difference in difficulty in preparing and implementing their classes in the weekend program.

Section 5 asked instructors their ideas about video use in the program. Three of the 16 instructors indicated that they sometimes use videos, while 6 instructors indicate that they use videos often or very often. Seven instructors indicated they either rarely or never use videos. Thirteen instructors indicated that the use of videos is somewhat important, important, or very important. Three people indicated that video use in class is not at all important. When asked if the program created videos how they would like to use them three instructors indicated they would like the videos to use in both the day and weekend program and seven instructors indicated the videos should be developed specifically for the weekend students. One person indicated that the videos should be prepared by someone other than her. Five people gave other written ideas which included: three of them suggested recording lessons in the schools and kindergarten and use them as models and for class discussions for students; two of respondents suggested creating an electronic presentation program with audio (e.g. Powerpoint).

Section 6 asked instructors about their assessment practices. This survey asked three questions about assessment, one in relation to formative and summative assessments, one question asking instructors to indicate the formats their assessments take for their students, and one question about feedback to students. Sixty-nine percent of the instructors indicated that they use formative assessment strategies with their students and 94% of the instructors indicated that they use summative assessments. Nineteen percent of the instructors indicated that they also use other forms of assessments: pre assessments and differentiated or personalized assessments.

Instructors were asked whether or not they use oral, written, and practical assessment techniques. Forty-four percent of the instructors indicated they use oral assessments. Sixty-three percent indicated they use written assessments, and 44% indicated they use practical assessment techniques. Thirteen percent of the instructors also indicated they use other assessment techniques which include: portfolios, structured essays, and individual projects. The third question asked teachers to rate at what levels instructors believe their students understand how they receive the grades they achieve on their assessments. The results for formative assessments indicated that 81.3% of the instructors believe that students have a good or very good understanding of why their grades are what they are. Thirteen percent of the instructors believe that students have little understanding of what their grades mean. For summative assessments 75% of the instructors indicated that students have a good or very good understanding of what their summative assessment scores mean about their learning. Thirteen percent of the instructors indicated that students do not understand what their grades mean about what they have learned.

Section 7 asked instructors to share their ideas about professional development. Ninety-four percent of the instructors indicated that the professional development provided by the weekend program was useful to the instructors. When asked how often instructors would like to participate in professional development activities provided by the weekend program 50% indicated they would like professional development to occur every other year, 13% indicated they would like to have annual professional development activities, and another 13% indicated they would like professional development to occur every semester. Thirteen percent also indicated they would like professional development to occur every five years.

The final section of the instructor survey asked instructors for recommendations to improve the weekend program: four people suggested to reduce the content volume of the material taught in the textbooks; four people suggested making attendance mandatory for the face to face meetings; three people stated that the curriculum content should be coordinated throughout the program, three people indicated they thought working with smaller groups of students would benefit teachers and students; three instructors indicated that learning should be more adapted to the individual needs of students.

DISCUSSION

The weekend program consists of students who have diverse backgrounds, experiences, and needs. Students range in age from 18 to older than 50, and their experiences in the world of work and life are vastly differently from each other. A significant group of students work full time, many as teachers, a large group of students has families of their own, and a significant number of students live long distances from campus. These peculiarities mean that the weekend community members have a variety needs for the program to address. This diversity suggests the necessity for a program that is also diverse. From an instructor perspective the program goals suggest flexible teachers who understand older and more experienced students, while at the same time understanding young adults. The weekend program has an obligation to maintain high standards for future educators while creatively integrating the curriculum for its students. Data indicates that instructors could take more advantage of the online portion of the program, especially to communicate with and give feedback to students.

The people who work in the weekend program understand that they are working with a diverse population that has varied needs. An analysis of the data from the study indicates that leaders and instructors in the program should regularly assess the program and its students' and instructors' needs in order to build in the necessary flexibility for the success of its students. The hybrid nature of the program implies a pedagogical philosophy that all instructors should understand, buy-into, and participate in appropriate professional development.

The results of the instructors survey indicates that there is a wide range of experiences and needs among instructors. In general it appears that instructors have worked hard to prepare their classes to be in line with the requirements of the program. There are some areas of concern in these results. For example, the low mean from the instructors with regards to whether the materials used in the classroom were useful for the future careers of these pre-service teachers is disconcerting. Another area of concern is the fact that 31% of the instructors surveyed indicated they do not use formative assessments. Twenty-six percent of the instructors indicated they would like professional development to occur yearly or during each semester. That means that 74% of the instructors indicated they want or need professional development less than yearly, with 13% indicating once every five years. When combined with other results from this research from students and program leaders, it appears that there is a wide range of understanding of and commitment to the philosophy, pedagogical requirements, and goals of the weekend program from its instructors. This area of the program is going to require further review to determine needs and develop appropriate refinements in the program.

From the review of the data in relation to retention and graduation the program appears to maintain higher retention and graduation rates with smaller classes. For the class that started with 119 students the graduation rate was 53.48% and the graduation rates for the smaller classes were 73.77% and 70.83%. As students progress through the program they do better both in terms of retention rates and in terms of grades. The percentage of students who attain low or failing grades during the first year is significantly higher than in the second and third year of the program. The program leaders should look to develop a system to work with first year students in order to help them transition into the university and into the rigors of higher education. Additionally, program leaders will attempt to develop ideas with program instructors to create systems to work with students in alternative ways during their first year. The system in place for class mentors may also be able to adapt to the needs of program students, especially first year students. Strategic online learning strategies could play a significant role in the process of working with program students.

SOLUTIONS AND RECOMMENDATIONS

It is clear from this research that the weekend program should continue to move toward a student-centered teaching and learning structure. Instructors and students indicated that more personalized instruction and materials would be useful. The program would do well to strategically create and implement a professional development program to assist instructors in the creation and use of constructivist teaching and learning strategies. The online component of the weekend program has not been used to its fullest potential. Instructors use the online platform to make curriculum resources, textbooks, schedules, and other information available to students but the interactive potential of more discussions, lessons, meetings, and other kinds of learning activities are underutilized. Students asked for more consistent communication and feedback among instructors and students online. The incorporation of online office hours could assist in this request. Instructors will need training and support to effectively use the technological tools available to them.

In order to develop a more student-centered approach the program might contemplate ways to lower the student to teacher ratio. For example, creating a schedule in which instructors can meet with students in smaller groups with flipped classroom activities for the rest of the class might assist instructors in this matter. The program might incorporate more cooperative grouping techniques to assist with the class size issue. The weekend program has done a great job of developing its ideas in relation to the texts. Students would benefit from further development. The program could consider ways to make the activities more in line with the time required from students to accomplish the requested readings and tasks. It appears that the content of the texts and the content of the practical classes could be more coordinated so that students are getting into complex activities rather than being introduced to a myriad of ideas with little depth. In line with the differentiated instructional philosophy of the program it makes sense to consider creating video lectures and interactive video activities for instructors and students. Finally, we recommend that the discussion aspects of the online platform could be used more effectively. This aspect of the program could allow students and instructors to communicate more regularly and for students to interact more frequently with their peers in connection to important curriculum.

The weekend program is working with a diverse group of students and instructors. There is no question that it needs instructors who are committed to working in such a program because the success of our future teachers cannot be left to chance. The program and its instructors are working hard to identify needs and develop the philosophical and pedagogical structures to make the program highly effective. This will require a full commitment on the part of both the program and its instructors. The program should commit to a systematic and strategic professional development program for its leaders, advisors, and instructors. As part of this professional development system the program should develop procedures to ensure ongoing support and training for all staff. It is imperative that all instructors understand, buy-into, and receive the support necessary to be effective in meeting the requirements and goals of the weekend program. Since teaching in the weekend program is voluntary, people who disagree with the goals and philosophy of the weekend program should not volunteer to work in the program. On the other hand any person who wants to teach in such a program should receive great training and the full support from the program.

The use of hybrid programs such as the weekend program is going to continue to play an important role for students, and the trend appears to indicate that more students will be attracted to and need such programs. We believe that the recommendations made above will assist the program in its continued growth as it works to meet as many needs of their students and instructors as possible.

FUTURE RESEARCH DIRECTIONS

Further research into the connection between online activities and academic achievement would benefit the weekend program and so would research in the area of working with diverse populations in effective ways and exploring the use of texts in a hybrid program, which has potential for such a program as the weekend classes. Instructors agree that individualized learning is important and further research into techniques that work to differentiate instruction and assessment with diverse groups would help instructor growth. Research in relation to the building of a cooperative culture for students and instructors working together in a weekend model would assist all participants in the program. The advisors in the weekend program would benefit from research into the roles of advising in an alternative model such as the weekend program. Finally, research into the development of a highly effective professional development program and support system for instructors in an alternative program such as the weekend program would be beneficial to everyone involved in the program.

The weekend program is developing an exciting model for its instructors and students. This model is probably going to attract more students in the coming years. The program has the potential of changing how universities prepare their future public school teachers.

CONCLUSION

As we move to prepare teachers for the rest of the 21st century and beyond it is clear that to be successful universities must adapt to the changing times and technologies. Teaching in a world in which borders and travel no longer limit access will require adapted or completely different models of teaching and learning. It appears that the model in which professors have more access to information than do the students has to change. In the area of open access the needs of the students is changing and programs should adapt to meet those emerging needs. In this chapter we reviewed one case study of a program that is working hard to adjust to the present and future needs of its students and their future students. The willingness of the people in this weekend program to venture into alternative strategies for teaching and learning is commendable. Hopefully, their hard work will assist others as they contemplate how to adapt for the future in their programs. Teacher preparation programs have the impossible task of preparing students to be successful teachers who exhibit the habits and abilities of veteran teachers on their first day of teaching. University teacher preparation programs must transcend the curriculum and help students to develop into knowledgeable, dedicated, and caring human beings. The job is impossible but that is what great teachers do, accomplish the impossible with their students.

KEY TERMS AND DEFINITIONS

Blended Learning: Blended learning occurs in an environment in which the student work and learn in a classroom part of the time and work outside of the classroom part of the time. For the portion of the work accomplished outside of the classroom students have some control over timing and pace. In a blended environment the use of technology is integrated into the learning process in order to give students more time working with the curriculum, their peers, and the teacher.

Differentiated Instruction: In a classroom that differentiates instruction the teacher attempts to adjust her/his teaching to the needs of the students. The differentiated teacher attempts to teach at different levels using a variety of approaches and thinking level processes to assist all students in learning all of the important material.

Flipped Classroom: The concept of a flipped classroom approach to teaching is to allow students to accomplish the lower level activities outside of the classroom in order to give the students and the teacher more time to work together in higher levels of engagement. For example, a teacher may video her/his lecture and have the students view the lecture as homework. When the students come to class the teacher and students then engage in application and guided practice activities rather than note-taking activities.

Practicum Experiences: Pre-service teachers gain experiences in the field at public schools under the guidance of a university supervisor and a public school teacher. Practicum experiences occur every semester for all students.

Seminar Experiences: In the weekend program students participate in face-to-face seminar classes built each week to give students practical experiences in relation to the theory learned from their text and online activities.

Student-Centered Learning: In a student-centered classroom the focus is on student learning rather than teacher led activities. In this process the teacher sets up the learning activities in ways that engage students in active ways. The teacher role becomes more of a coaching and guiding role as opposed to a dissemination of information role.

Weekend Program: For the purposes of this study, a weekend program is one in which students attend classes on the weekend as opposed to the week days of a traditional program. The weekend program also uses a blended model of learning in which the students are responsible for the text learning in an independent fashion. This includes independent reading and activities, self assessment activities, and online learning. The weekend program utilizes face-to-face practical classes, independent and online theoretical learning, and in-school practicum experiences.

Chapter 58
Blended Learning and Digital Curation:
A Learning Design Sequence

Nathaniel Ostashewski
Curtin University, Australia

Romana Martin
Curtin University, Australia

Andrew Brennan
Curtin University, Australia

ABSTRACT

This chapter presents a case of successful integration of digital curation in a repeating series of blended classroom activities. Digital curation, in education, can be understood as the collection, organization, interpretation, summary, and sharing of online resources by learners on a topic of inquiry. This research reports on a blended digital curation learning design integrated into a third-year university course. A digital curation activity sequence development process and the classroom activity structure form the basis of the educational implementation presented here. In theory, digital curation activities can support the sharing of collected resources between learners. In practice, digital curation learning activities in higher education can also support blended and flipped classroom engagement models while providing opportunities for the development of critical thinking skills. The chapter describes the activities, the learning design, and the outcomes of a digital curation activity sequence. This provides other educators with a learning design roadmap for engaging students in pre-lecture activities or blended learning that adds value to classroom lectures.

DOI: 10.4018/978-1-4666-8246-7.ch058

INTRODUCTION

In a recent study of online learning activities (Ostashewski, 2013) students reported that building a collection of online curated resources that could be later used in their professional practice was particularly valuable. Students reported that their exposure to some of the content-focused hyperlinked websites supporting a workplace topic continued to be helpful beyond the course. Similarly, sharing of the website URLs and short annotations or descriptions of the particular value of those websites provided a "filtering" or "digital curation" of content for others. Digital curation is about "maintaining and adding value to, a trusted body of digital information for current and future use" (Beagrie, 2008, p. 3). A simplified definition of digital curation for education is: "the online or digital curation of content for education can be understood as the sharing and reviewing of online resources using websites" (Good, 2012). The literature supports digital curation activities as valuable learning designs for both blended and online learning (Ravitz & Hoadley, 2005). For example, resource sharing or *sharing and curation of online resource* is reported as a key online-networked learning activity (Wenger, Trayner, de Laat, 2011; Ostashewski & Reid, 2011; Sinha, Rosson, Carroll, & Du, 2010) and may, in fact, represent a learning design suitable for blended or flipped education delivery. In summary, the literature reports that students engaged in online or blended learning describe their joint and shared exploration and evaluation of curricular resources (e.g. materials presented to them in a course or found via researching) as valuable online learning experiences. This was the basis upon which digital curation activities were integrated into a third year business education course in one Australian university. This chapter will provide an examination of how integration of digital curation activities into a blended higher education classroom occurred and presents a learning design sequence arising from the research.

The goal of this chapter is to present a case of successful integration of digital curation as a series of weekly classroom activities. Some ways that digital curation activities can be utilized are by:

1. Taking advantage of a network of curators working for you (building your own customized network) and consuming the curated information.
2. Collecting, organizing, connecting, attributing, interpreting, summarizing vast amount of information on any topic.
3. Sharing knowledge by being the curator for others for a particular niche area of expertise or interest.

The unique implementation of digital curation activities in a university setting described in this chapter demonstrates digital curation activities can provide a method for students to prepare for lectures and critical analysis of topics. The activities are described, including the underlying learning design rationale, and the outcomes of the blended digital curation sequence are outlined in order to provide a roadmap for others looking to actively engage students in pre-lecture, flipped, or blended learning activities that can add value to classroom lectures.

DIGITAL CURATION

Blended learning often requires a considered use of one or many of the online technologies which support educational tasks and activities. Yakel, Conway, Hedstrom, and Wallace (2011) noted that with the ever-expanding collection of digital information all around us, a new generation of digital curators is needed to manage this information. Digital curation, as a process, aligns positively with the affordances of blended learning, and has been defined as an active process whereby content/artifacts are purposely selected to be preserved for future access. In the digital environment, additional elements can be leveraged, such as the inclusion of social media to disseminate collected content, the ability for other users to suggest content or leave comments and the critical evaluation and selection of aggregated content. This latter part especially is important in defining this as an active process (Antonio, Martin, & Stagg, 2012).

Curation of digital information is, according to Mihailidis and Cohen (2013), something that we have been doing in classrooms for decades. They argue that digital curation activities are those where we have been "[i]ncorporating critical approaches to framing, bias, analysis of agendas and perspectives in the information landscape has been going on for quite some time, as evidenced by scholarship dating back decades" (p. 15). In many ways, we all participate in curation of digital information on our personal computers and devices. Incorporating meaningful activities in the classroom that are tied to learning outcomes is one way in which digital curation skills can lead to the development of a more proficient generation of information users.

A digital curation learning cycle proposed by Wolff and Mulholland (2013) which utilizes Internet-based content provides one model suitable for blended learning design. Their curatorial inquiry model is designed to support inquiry learning with the development of a digital artifact as a result of the process. Wolf and Mulholland describe the learning process as one where:

… a learner is assisted in building stories around the primary and secondary source evidence. Learning occurs through the process of developing a coherent story in response to the inquiry question and in curating the web-based source materials to reflect this understanding. (Wolff & Mulholland, 2013)

Their model presents an activity approach whereby the artifact created in the process is represented as a story. This is the same kind of artifact that is shown in museum displays, usually curated by professionals in the field, and often telling a story. The storytelling approach to digital curation activities is also reported in other literature focused on exploring digital curation in education (Antonio, Martin, & Stagg, 2012).

The seven stages of the curatorial inquiry learning cycle in the model developed by Wolff and Mulholand (2013, p. 2) are:

1. **Research:** Choose a learning goal and define the task boundaries.
2. **Content Selection and Collection:** Filtering out the bad resources and highlighting the good.
3. **Interpretation of Individual Content:** Annotate individual content to identify important points.
4. **Interpretation Across Content:** Annotate from a task perspective, finding the important relations linking content and annotations.
5. **Organization:** Organising the content and annotations in respect to an underlying coherent story addressing the learning goal.
6. **Narration:** Presentation to an audience through a chosen medium.
7. **Research/Recuration:** The process through which the audience become participants in a narrative construction based on a previously curated output. Includes reflection (the author can recurate to improve understanding).

The implementation sequence for digital curation activities presented in this chapter differs significantly from the Wolff and Mulholland model in that it incorporates a lecture or presentation and face-to-face student discussion as a key intermediate stage to the process.

LEARNING ACTIVITIES AND DIGITAL CURATION

There are several challenges in providing university students with active learning activities that make effective use of online resources identified by students. Some of the challenges include linking these resources to unit objectives, and providing ways for students to engage in reflective metacognitive activities centered on the related curricular outcomes (Johnson, Smith, Willis, Levine, & Haywood, 2011; Chen and Looi, 2007). A major concern is often one of ensuring the learning objectives are met over the course of study. One recently publicized way to engage students in active learning is to 'flip' classroom activities (Bergmann & Sams, 2012), requiring students to prepare for classroom discussions and presentations by engaging with unit topics prior to the classroom activities. It has also been reported in the literature that students are now coming to university expecting activity structures and designs that utilise this approach (Johnson, Adams, Cummins, Freeman, Ifenthaler, Vardaxis, and Taylor 2013) mainly due to the shift in K12 education activities towards such approaches.

The literature reports that active learning designs in university education, using flipped or blended learning models, can improve student attitudes, performance and critical analysis skills (Armbruster, Patel, Johnson, & Weiss, 2009; Meyers & Jones, 1993) and develop students' metacognitive skills (Garrison, 2006; Garrison & Akyol, 2013). In the study reported on in this chapter, the researchers intended to evaluate an active learning flipped classroom sequence which incorporated a bi-weekly digital curation activity. The digital curation learning activity was designed and developed to engage students in critical analysis of economic policy issues linked to the unit outcomes. The goal of this research is toward the future development of a digital content curation model which incorporates active learning originating from the evaluation of the digital curation learning sequence in a third year economics unit.

Supporting the development of 21st Century skills related to online media, such as the development of critical analysis and sense-making skills, is paramount in a world where digital resources continue to expand in volume and presence (Johnson, Adams, & Cummins, 2012). However, while this need for developing digital resource analysis skills continues to be noted as a key attribute for a 21st Century employee, articulation of educational activities developing these skills is sorely needed (Baker, 2010). The provision of a guided opportunity for students to develop an increased understanding and awareness of the critical inquiry process (metacognition) helps them improve their regulation of cognition by enabling them to select the appropriate learning strategies corresponding to the level of inquiry. These critical inquiry elements informed the integration of the digital curation learning sequence.

Recent literature states that engaging students in meaningful digital curation activities can support the development of analytical and critical thinking skills (Gadot & Levin, 2012; Mihailidis and Cohen, 2013; Verhaart, 2012; Wolff & Mulholland, 2013). Furthermore, digital curation can be described as a system/process for "maintaining and adding value to, a trusted body of digital information for current and future use" (Beagrie, 2006, p. 3) and, online digital curation of content for educational purposes has been described as a learning activity where students share and review online resources (Campbell, 2010; Good, 2012). A number of researchers have suggested that these activities can be valuable for blended and flipped learning activity designs (Antonio, Martin, & Stagg, 2012; Barret, 2012; Miller, 2012; Ravitz & Hoadley, 2005).

THE CONTEXT: UNIVERSITY'S THIRD YEAR ECONOMICS COURSE

Curtin University is a vibrant, international organization, future focused and committed to making tomorrow better. It strives to be an international leader in research and education, changing minds, changing lives and changing the world. Curtin strives to provide a challenging and rewarding education that is relevant to current careers and workplaces. Curtin is the largest and most preferred university in Western Australia, with more than 50,000 students spread across 16 different locations, including campuses in Sydney, Singapore and East Malaysia. It is one of only two Western Australian universities to rank in the prestigious Shanghai Jiao Tong Annual Ranking of World Universities (2012) and the Times Higher Education's 2011-12 world university rankings.

The School of Economics and Finance is a part of one of the Asia-Pacific region's largest multinational, multicultural business schools. The School of Economics and Finance has a cosmopolitan mix of local and international students, offering a range of undergraduate and postgraduate programs in the study areas of economics, banking and finance, financial planning and property. The school is striving towards delivering high-quality research and teaching that influences industry—for instance, the school is home to the Centre for Research in Applied Economics (CRAE). There is extensive and varied research expertise across all of school's discipline areas, including econometrics and quantitative modelling.

One of the most popular program choices among students is the economics and finance double major, which is part of a larger program in the Bachelor of Commerce pass degree (three year duration, studying full time). This double major has been designed for students who seek careers in both the public and private sectors, whereby students acquire good analytical and quantitative skills. This course is accredited by the Economic Society of Australia (Western Australian Branch) and graduates are eligible to apply for professional membership. In the economics major/stream for example, most courses have regular (weekly) 2-hour lectures and 1-hour tutorials. Each course is typically based on a suitable textbook to aid the Lecturer's presentation of the course materials.

The Economic Policy course is a little different to others that students typically undertake. Rather than a set text and syllabus, the undergraduate/postgraduate course comprises of a series of invited lectures from specialists (in academia or industry) in a wide range of policy areas. It provides students with a chance to apply their economics training to a range of topical economic, environmental and social issues and to engage in stimulating debates. Students are most successful in this course when they prepare well by completing the weekly readings and other online tasks, and actively contribute to class discussions.

The course is delivered in two semesters each year and often has enrolments of around 30 to 60 students per semester (over a 12-week teaching schedule). Curtin University has a relatively large international learner cohorts and this is reflected in the activities and expectations of students. The Economic Policy course is usually made up of about 40 percent international students and 60 percent local students. Historically, the course consists of a one 3-hour seminar per week. Two segments split the time during the seminar. Invited guest speakers present on a topic of interest/expertise for about 1 hour, followed by 15 to 20 minutes of class discussion with the speaker. The second half is allocated to student presentations on the previous week's policy topic. A reading list is not set because of the nature of the course. Instead the key references and material for each week's topic is given to students through the Blackboard Learning Management System (LMS).

The course is designed to give students the opportunity to be active agents in knowledge creation and to learn how to apply their economics training to address key economic problems and policy issues. It is based upon lectures that provide an

Review	14	Final Exam	

overview of key issues and explore selected areas in depth; as well as using blended learning technologies such as the digital curation of resources (introduced for the first time in semester one 2013); and student-based seminar presentations during the class that afford students the opportunity to research a specialized topic in-depth and generate some lively academic discussion and debate. An individual written assignment is included in the semester's learning activities.

A range of contemporary policy and current issues are analyzed in the Economic Policy course. Topics vary from year to year and typically address contemporary policy issues. Topics include the goals and instruments of economic policy and the principles of policy analysis, the economics of climate change, competition policy, monetary policy, productivity growth, taxation policy, the social and ecological economics of well-being, and socio-cultural issues of indigenous people. The topics discussed in the course in semester one 2013 and the corresponding link to the digital curation activities are show in Table 1.

There are four learning outcomes for this course:

1. Describe and explain key economic issues facing the Australian economy;
2. Evaluate economic policies;
3. Apply economic theory and empirical analyses to address policy issues; and
4. Research, structure and present policy analysis in both written form and orally.

Learning outcome four, 'research, structure and present policy analysis in both written form and orally', is main outcome assessed for the digital curation activities. More specifically, students are required to submit their three best activities at the end of the semester, and are evaluated (out of 10) on the extent to which they demonstrated the following skills: a) ability to think critically about the policy *issue*(s); b) having a *perspective* that takes into account various aspects of the issue; and c) presents and evaluates policy *alternatives*. In short, developing the students' critical thinking skills is a key learning outcome vis-à-vis the digital curation activities.

PROFESSIONAL DEVELOPMENT SUPPORT

For many university lecturers, educational technologies are becoming available at such a rapid pace that lecturers often feel incompetent in dealing with these new technologies. This challenge is further confounded with institutions requiring lecturers to adopt new tools and techniques whilst at the same time there is a lack of professional development support (Johnson et al., 2013).

There is a need for more training before being asked to teach, and for more professional development opportunities once in the profession. This key challenge is underscored by the widespread belief that most academics are not leveraging emerging technologies for their own work, whether that be in the classroom or in support of their own research. (p. 3)

In response to this need, Lefoe and colleagues (2009) identified five strategies to support professional development for university lecturers in the implementation of learning technologies:

1. Development of a shared understanding of the theoretical frameworks and philosophies of the approach;
2. Development of understanding of the affordances of the technologies at hand, and having a significant amount of time to develop these skills before using with students;
3. Participation in authentic tasks which model the practices to assist the move from theory to practice;
4. Development of a shared language, knowledge and understanding of new pedagogies and the implications for practice and teaching role;
5. Cycles of reflection on the implications for the development of new pedagogies (Lefoe, Olney, Wright, & Herrington, 2009, p. 25).

In the case presented in this chapter, the implementation team had the opportunity to develop the digital curation tasks over a period of four months prior to the course being offered to students. This preparation time allowed for many of the strategies Lafoe and colleagues described to be utilized. As a result, when the learning activities were presented in the fourteen-week course, the lecturer was well prepared to implement and support the activity structure.

The professional development activities, which took place over the four-month period, required careful thought and consideration due to the assessment requirements of the course. As the course had an established assessment pattern and requirements, the activities needed to result in particular assessable artifacts. Despite this restriction, the lecturer fully engaged in the process as a learner and collaborator with a team of two educational design academics. The driving motivation for the review and integration of a technology enhancement into the course came about as the result of a strategic plan focusing on employing the use of blended learning strategies and learning technologies to further enhance courses in that faculty.

The educational design process involved a series of meetings, research, and design sessions to accomplish the development of the learning design centered on a series of digital curation activities. Key to the initiation of the design was the lecturer's willingness to explore the possibilities offered by incorporating educational technology in the course. As the need for lecturer buy-in with the process was understood to be critical, the university department also provided a small incentive to lecturers willing to embed learning designs utilizing learning technologies in their courses.

The educational design process included the following:

1. The design team of two educational designers and the lecturer met on three occasions to discuss what the course was composed of in terms of resources, topics, and learning activities. This also included an audit of the learning technologies that were already in use and overall discussions about the kinds of educational technologies the university had available. One key criterion was that the existing course assessments and learning outcomes were set within a fixed framework and therefore the learning activities needed to reflect this framework and no change to these aspects of the course were possible.
2. The design team worked through the course activities and explored potential technologies that would engage students in peer-peer discussion. Online-based tools such as Twitter and Purdue's Hotseat were considered. As these meetings progressed, it was determined that a pattern of activities which would support the numerous guest presenter topics – in advance of the guest presentation, as well as following the presentation – could greatly aid students in their preparation and understanding of the topics presented.
3. The team identified that the following learning activity tasks were most likely to add value to the course: reflection, sharing of online materials (URLS), and the production of an assessable artifact. The assessable artifact would allow the lecturer to be able to assess students' critical thinking skills and understanding of the topics presented. Critical analysis of relevant topics presented in the course materials was one of the key learning outcomes.
4. Another meeting and a review of the literature in business education and use of blended or online technologies supported the discussions. The sequence of learning activities was drafted taking into account the requirements and learning outcomes to be achieved in the course. This sequence refers to the organization of the activities over the term of the course. For example, in this case it meant planning that in week 3 the lecturer would introduce digital curation activity 2, in week 4 have the guest presentation, and in week 5 students would complete the reflection and critical analysis component of the activity.
5. After developing the sequence of digital curation activities for the semester, the lecturer prepared a set of support materials for students describing the goals, outcomes of the activities, and provided detailed instructions for completing the digital curation tasks. The design team reviewed and revised the digital curation instructions and support materials for students and these were finalized for distribution to students prior to the course start date.

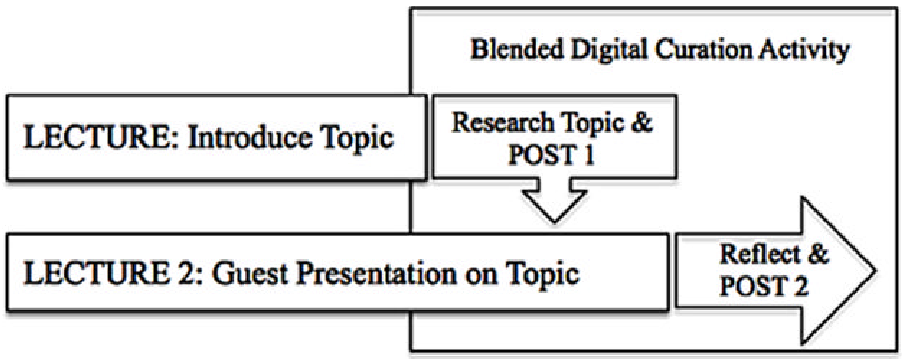
This design process took place over several months, and some of the outcomes of this collaborative design process included a deeper understanding of blended models of education, a critical analysis of the curation literature, and exposure to new technologies supportive of active learning. The result of the process was a learning sequence of digital curation activities that were implemented into an economics course and according to students resulted in beneficial learning activities.

BLENDED DIGITAL CURATION SEQUENCE

The blended learning sequence presented in this chapter is informed by literature, designed to engage students with technology enhanced learning activities, and intended to support critical analysis skill development. Figure 1 presents the details and structure of a single digital curation activity.

During the first week of the digital curation activity the topic being curated was briefly in-

Figure 1. Blended digital curation activity sequence



troduced at the end of the first seminar. In this economics course, the seminar session is divided into two segments, a 1.5-hour guest lecture and then a 'tutorial' session for 1.5 hours. The tutorial component involved students discussing and presenting their analysis of the guest presenter topic. In addition to briefly announcing the digital curation activity at the end of the seminar, a more detailed announcement was posted to the course LMS site shortly after the seminar.

The digital curation activity sequence presented in Figure 1 incorporates three key student tasks: research, questioning, and recuration. The three tasks were described to students as the following sequence of activities they were to participate in:

1. ***Before* Lecture Day:** Research and make Bb post. (research)
2. **Lecture Day:** Listen and engage with the presenter. (questioning)
3. ***After* Lecture Day:** Reflect and make the second post. (recuration)

In order for students to be able to follow and benefit the most from the digital curation activities in the course, an orientation document was developed. This document supported the lecturer's introduction of the digital curation activity sequence at the first orientation session of the course. Additional explanations and support relating to the structure of activities were provided during the course; however, the topic most inquired about by students related to the marking aspect of the activity. In order for readers of this chapter to be able to utilize the experience of the authors in presenting a digital curation activity sequence to students, the complete orientation document for students is provided in the following section.

CONCLUSION

As stated previously, there can be multiple benefits in incorporating digital curation activities into a university course. Some of these that have been reported in the literature include: the provision of meaningful blended learning activities, support of peer learning, preparation for flipped classroom style activities, and critical analysis skill development. Stanoevska-Slabeva and colleagues (2012) also note that digital curation is now also evident in journalism in the form of timely news information validation:

Social media curation is based on the basic concept of media curation proposed by Rosembaum (2011) and deals with large corpora of content from diverse sources and connotes the activities of identifying, selecting, verifying, organizing, describing, maintaining, and preserving existing artifacts as well as integrating them into a *holistic resource (Stanoevska-Slabeva, Sacco, & Giardina, 2012).*

The authors take this as a sign that digital curation is becoming one way in which networked or connectedness and sharing is also occurring in the workplace and is a valuable means for building common understanding of topics and issues supported by a current and reviewable evidence base. As one goal of university business degrees is workplace skill development, for the third year economics students, digital curation provides an authentic activity and an authentic assessment relevant to their future employment.

According to the lecturer, several lessons and key benefits of this digital curation activity became evident over the course term. Anecdotally, students reported that they enjoyed the learning activities. The lecturer of the course reported that, as the person being responsible for inviting the guest lecturer, it was good to see that the students were already familiar with the topic – having completed the Post 1 activity prior to the guest lecture. The lecturer noted that students seemed more able to participate, in terms of the questions and discussions during the digital curation weeks as compared to weeks when there were no digital curation activities embedded. The lecturer also stated that it was a positive outcome that students were ready to ask informed questions, as that in turn made the expert presenter more interested in returning in the future. In summary, the preparation aspect of the activity had real benefits for the classroom activity and resulted in an excellent outcome of a blended design structure.

Some other aspects of the digital learning activity were noted by students. When asked about the value of the digital curation activities students commented:

- The DC (digital curation) exposed me to different policy resources prior to class, which enabled me to be less restricted to participation (views) on different policies presented
- Going to class and actually knowing whats being discussed, DC (digital curation) forced prior reading meant we could engage in discussions and understand presentations

Students further indicated that the digital curation activities also supported the development of their critical thinking skills, analysis skills and research skills. Overall, the benefits of the digital curation design supported student learning outcomes both internal to the course as well as more global skill development.

The intention of this chapter has not been to provide a fixed step-by-step description of the digital curation process and its incorporation into courses. Indeed, we do not prescribe to the view that there is a single way of achieving these kinds of learning outcomes. Nor do we hold the belief that technology should simply be ‘added’ to a pedagogical approach to make learning more up-to-date. Instead, we have presented one example of a learning sequence, supported in the literature, on how to incorporate a blended digital curation activity into a course design.

In conclusion, the authors recognise the professional learning curve can be a steep one for many university lecturers seated with the important task of preparing a workforce for the future. This is especially true in a world in which rapid change is likely to continue and whole ranges of technologies embedded in the workplace are yet to be developed. As described by Sharples, Taylor and Vavoula (2007): “A world in which children own powerful multimedia communicators and where they practice new skills of online file sharing and informal text communication does not fit easily with traditional classroom schooling” (p. 241). Lecturers in universities need to be encouraged to continue to engage with technology enhanced learning activities, in order to prepare students for the challenges of their future workplace.

KEY TERMS AND DEFINITIONS

Blended Learning: Face-to-face learning that incorporates some online-based activities as part of the educational experiences.

Digital Curation: In general is about "maintaining and adding value to, a trusted body of digital information for current and future use" (Beagrie, 2006, p. 3). For education "the online or digital curation of content for education can be understood as the sharing and reviewing of online resources using websites" (Good, 2012).

Educational Design: The sequence of instructional activities planned to be delivered in an educational or learning event.

Educational Technologies: technologies that can support learning or learners during educational events.

Flipped Classroom: Classroom activities requiring students to prepare for discussions and presentations by engaging with course topics prior to the classroom activities.

Resource Sharing: Sharing and curation of online resources using communication technologies.

Technology Enhancement: An enhancement, extension, or addition of technology intended to further support learning activities.

This work was previously published in Models for Improving and Optimizing Online and Blended Learning in Higher Education edited by Jared Keengwe and Joachim Jack Agamba, pages 256-268, copyright year 2015 by Information Science Reference (an imprint of IGI Global).

Chapter 59
Co-Constructed Curricula:
An Adult Learning Perspective

Vivian W. Mott
East Carolina University, USA

Kathy D. Lohr
East Carolina University, USA

ABSTRACT

This chapter describes an adult learning perspective toward effective co-constructed curriculum, beginning with an overview of three distinct models, theories, or concepts felt to be seminal in the field of adult and continuing education. Following the presentation of these constructs, the chapter continues with a discussion of implications for learning involvement and then moves to an explanation of how curricula can be co-constructed. Detailed in this application section are the involvement of learners in the process of co-construction, the ways in which content and design are derived with learners' involvement, and the various roles of co-constructed assessment. The chapter concludes with three case studies as practical examples of co-constructed curriculum initiatives and a closing summary.

INTRODUCTION

One strategic approach to curriculum development is to derive programs, courses, and syllabi from adult learners themselves. Whether for formal or informal education, for credit or leisure learning, traditional curriculum development can be adapted to support significant learner involvement in a wide variety of learning contexts and environments.

Today's learners, in particular, respond positively to having input into their learning opportunities, and embrace assisting in design, development, and evaluation phases as well. This chapter considers not just the models and theories that support stronger learner involvement in the curriculum development process but also provides the rationale for doing so and suggests ways to enrich and ensure success in these endeavors.

There are numerous concepts, models, and theories common to the field of adult and continuing education that support the involvement of learners in co-constructing curricula. This chapter begins with an overview of three prominent adult learning concepts: andragogy, transformative learning, and social learning. Affiliated with each of these concepts is a practice that connects to adults learning

DOI: 10.4018/978-1-4666-8246-7.ch059

in an environment with a co-constructed curricula. These practices include self-directed learning, reflection, and collaboration. These constructs and their associated practices are then recast and summarized in three categories of implications for learner involvement: (a) tapping into and sharing experience; (b) relevancy, practicality, and goal orientation; and, (c) self-direction, internal motivation, and control.

The second part of this chapter describes the various aspects that support a co-constructed curriculum including involvement by students (curriculum co-constructors), curriculum content and design, and curriculum assessment. The chapter then presents three case studies as exemplars and concludes with a summary and implications for more significant learner involvement in co-construction of curriculum of adult and continuing education.

Models, Concepts, and Related Practices

Do adults learn differently than children? In 1968, Malcolm Knowles, a central figure in the history of adult education, claimed they did, and during the second half of the twenty-first century, wrote and taught extensively on the concept, practice, and implications of andragogy. Knowles' model of andragogy is described below along with several other concepts that have shaped the models/ concepts and practice of adult education.

Andragogy and Self-Directed Learning

Nearly half a century ago, Malcolm Knowles proposed the concept of andragogy to explain how teaching adults could – and should be – differentiated from teaching children. While Knowles (1990) did not actually coin the term *andragogy*, meaning the "art and science of helping adults learn" (p. 43), he is responsible for the popularization of the concept in North America. Knowles told of first using the term *andragogy* "in an article in *Adult Leadership* in 1968" (p. 42), after learning of the concept from a Yugoslavian adult educator.

Knowles described assumptions about adult learners that originally included four distinct adult characteristics or predispositions; a fifth and sixth characteristic were later added. These six assumptions that follow are key to the practice of adult and continuing education:

1. **Self-Directedness:** Adults approach their learning in a more independent and self-directed manner as opposed to being dependent on a teacher for one's learning, resources, strategies, and evaluation of outcomes. Knowles went on to explain that self-directedness is always present on a continuum – that all learners, children and adults alike, are more or less self-directed depending on maturity, preexisting knowledge, motivation, and risk involved in the learning experience.
2. **Rich Reservoir of Experience:** As adults mature, "they accumulate an increasing reservoir of experience that becomes an increasingly rich resource for learning" (Knowles, 1990, p. 45). According to Knowles, our experience is important not only as a basis for more meaningful learning, but in providing links and connections teachers can use in instruction.
3. **Readiness to Learn:** Learning in adulthood is often prompted by some real-life need, such as a life transition, developmental change, personal challenge, crisis, or opportunity. So, adults most frequently pursue their learning on a need-to-know basis rather than being ready to learn based on age or developmental stage (as with children), or advancement in a standard or prescribed school curriculum.
4. **Problem or Performance-Centered Orientation:** For adults, learning is a process or endeavor aimed at enhancing competencies or skills needed for a job, life stage, or

encountered challenge. Therefore, adults want their learning to have immediate application and relevance. Children, on the other hand, more frequently engage in subject-centered learning, sequenced according to some prescribed curriculum, some of which will only be applicable at some future time in their lives.

5. **Internal Motivation:** Adults are more often internally or intrinsically motivated to learn. Even though virtually all education includes some external motivation in the form of grades, better jobs, or higher salaries, adults understand that learning is valuable and often its own reward, that the learning will add value to their lives, and that it will improve their tomorrows.
6. **Reason for Learning:** Closely tied to assumptions three and four and the need for relevancy and application, this sixth assumption was added by Knowles based on his belief that adults need to know *why* they are learning something.

Knowles later revised his original assumptions after listening to critics of the construct. He began to visualize pedagogy and andragogy on a continuum of preferences and characteristics found in students in various contexts and at different stages of development. Cyril Houle (1988), one of Knowles' mentors, believed that "education is fundamentally the same wherever and whenever it occurs ... but that andragogy remains the most learner-centered of all patterns of adult education programming" (p. 29). For this reason, we introduce this chapter on co-constructed curricula – an integral tool in the learner-centered classroom – with andragogy.

Before Knowles identified self-directedness as one of the assumptions on which andragogy was based, Tough (1971) and then Houle (1988) were studying and reporting on how adults undertook learning projects on their own. Houle's landmark study of 22 adult learners in 1961 resulted in his now classic *Houle's typology*, a classification scheme that outlines learners' motivation to participate as learning orientation, goal orientation, or activity orientation. In other words, according to Houle, learning was sought solely for either learning's sake, as a means to some end, or merely for the social activity or engagement, respectively.

Self-directed learning (SDL) describes the propensity and ability for adult learners to conceive, orchestrate, implement, and evaluate their own learning. The massive and varied SDL literature differentially characterizes self-directed learning either as an instructional method, a process or approach to learning, or as a learner preference, characteristic, or personality trait. Though the work on the concept began many years prior, in 1994, Hiemstra defined SDL as "any study form [of learning] in which individuals have primary responsibility for planning, implementing, and even evaluating the effort" (para. 5).

In 1977, Guglielmino constructed a Self-Directed Learning Readiness Scale (SDLRS) to determine the degree to which learners could successfully engage in self-directed learning. Her SDLRS is still used to measure self-directedness in adult learners with correlations made to learning style, learning outcomes, self-concept, occupation, and career advancement, to name only a few.

Brockett and Hiemstra (1991) created a synthesized model they termed the Personal Responsibility Orientation (PRO) model based on learner autonomy and the degree to which learners took active control and responsibility for their own learning. Also in 1991, Grow theorized that learners developed self-directed learning abilities in four stages differentiated by the degree of independence and ability. These brief explanations highlight only some of the major contributions to the SDL literature; many other scholars, educators, and practitioners have contributed to the literature as well.

As stated earlier self-directed learning can be characterized as an instructional method, an approach to learning, or a learner characteristic.

Transformative learning, on the other hand, is associated with a substantive change within the learner. The next section elaborates on the principal aspects of transformative learning and reflection.

Transformative Learning and Reflection

Unlike informational learning, in which an individual internalizes news, facts, instructions, or guidance, transformative learning is about change – "dramatic, fundamental change in how we see ourselves and the world in which we live" (Merriam, Caffarella, & Baumgartner, 2007, p. 130). Mezirow is credited with introducing the theory of transformative learning to the adult education field in 1978 (Merriam et Al., 2007). In his text, *Learning as transformation: Critical perspectives on a theory in progress,* Mezirow (2000) articulates this transformation of learning as "the process by which we transform our taken-for-granted frames of reference (meaning schemes, habits of mind, mindsets) to make them more inclusive, discriminating, open, emotionally capable of change, and reflective so that they may generate beliefs and opinions that will prove more true or justified in guiding action" (p. 8).

Over the past 30 years, Mezirow has refined his conception of transformative learning, which has been criticized for its emphasis on the individual's process without regard to context. However, scholars continue to redefine this learning model. Taylor (2008), described seven transformative learning perspectives in addition to Mezirow's psycho-critical conception. These perspectives include psycho-analytical, psycho-developmental, social-emancipatory, neurobiological, cultural-spiritual, race-centric, and plantetary. Even with this abundance of research, Taylor notes that not much is known about, "the student's role in fostering transformative learning. What are the students' responsibilities in relationship to the transformative educator" (p. 13). A look into reflective practice might help understand the student's perspective. Reflection is widely used in educational settings to help a student demonstrate, and the facilitator evaluate, learning.

Integral to many transformative learning constructs is the practice of critical reflection, a process often attributed to Mezirow (2000) and Brookfield (2000) but defended and defined in other fields and practices outside of adult education. According to van Woerkom (2010), "all conceptualizations of critical reflection have a normative character, indicating 'good thinking' rather than describing or observed ways of thinking," (p. 344).

A common criticism of critical reflection is its lack of acknowledgement of other ways of knowing such as through emotion or intuition. Dirkx (2006) is one scholar contributing to our understanding of emotions and learning. Cranton (2006), in her work on transformative learning, has described three types of reflection: premise reflection, which closely aligns with critical reflection; content reflection; and, process reflection. Cranton reminds us, "current definitions of reflection do not differ substantially from Dewey's understanding" (p. 33). In 1933, Dewey described reflective thought as "active, persistent, and careful consideration of any belief or supposed form of knowledge in the light of the grounds that support it and the further conclusions to which it tends" (p. 118).

In addition to Dewey's early work, Donald Schön's (1983, 1987) work on reflection and reflective practice is widely cited. Schön (1983) maintained that reflective practice is grounded in the complex intersection of the "high, hard ground of technical rationality" (p. 49) and the metaphorical *swamp* of professional practice – practice often filled with ambiguous, ill-defined, and conflicting situations. Schön maintained that the "artistic, intuitive processes that some practitioners bring to situations of uncertainty, instability, uniqueness, and value conflict" (p. 49) help mediate such unsettling conditions and "account for practical competence in divergent situations" (p. 49).

Reflective practice is a "developmental process in which practitioners first learn a system of rules and procedures, recognize their appropriate application within particular situations, and then develop and verify new forms of knowing in actual practice situations" (Mott, 2000, p. 28). One's capacity to engage in reflective practice is based on experience, tacit and explicit knowing, knowledge of formal theories and theories-in-use, and critical thinking. Mott (1994) further described reflective practice as the capacity for thinking about … actions while engaged in the midst of practice. This active consideration of one's knowledge and behavior aids in reframing the challenges of practice, and enables the professional to cope more successfully with novelty and uncertainty of practice for a more appropriate response (p. 12).

Reflective practice involves a deliberate quieting or pause that allows practitioners to consider not only their formal knowledge and espoused theories about any given situation, but also their tacit knowing, theories-in-use, and practical knowledge or intelligence about the issue. Such introspection should also provide for the examination of assumptions, consideration of alternative and multiple perspectives, and the deliberation about one's actions in the circumstance. The outcome of our reflection should be the improvement of practice in terms of more reasoned thought and action.

According to Schön (1983), for most practitioners, such quieting and introspection occurs after the fact, or perhaps in the midst of paused action – when a problem has already occurred and we're thinking about it after the fact. Schön referred to this as *reflection-on-action* and suggested that such reflection carries a past orientation to it, in that it cannot affect the action being reflected upon, but only that which may occur in some future time (1983, 1987). Some of the time, however, expert practitioners engage in reflection in the midst of action – what Schön referred to as *reflection-in-action* (1983, 1987), occurring as it does without pause or before the cessation of our action.

In contrast to reflection-on-action, reflection-in-action has a present or even future orientation to it, in which "no interruption of action occurs, thinking and doing occur simultaneously while our reflection and reframing can still make a difference" to the current situation (Mott, 1994, p. 35). According to Schön, reflection-in-action is often unconscious and may occur spontaneously when we sense that some aspect of our actions is no longer working or could be improved. While examples of reflection-in-action are often cited in the arts – such as impromptu jazz sessions or theater scenes, or the painting that emerges differently than planned – examples can also be found in medicine, education, counseling, law enforcement, and other contexts of professional practice in which expert practitioners engage (Mott, 1994, 1996, 2000; Schön, 1983, 1987).

Some reflective practice, if not most, is a personal turning inward to think, consider, and analyze; learning often occurs, however, within relationship to others. Our third set of concepts, social learning and collaboration, reviews such interactions.

Social Learning Theory and Collaboration

Even though the origins of social learning theory can be found in both behavioral and cognitive orientations (Merriam et al., 2007), the cognitive and social aspects of the theory grew in prominence as an organizing framework and explanation of how learning may occur. Social learning theory suggests that learning occurs when people observe others' behavior (a cognitive process) and then follow suit to mimic or amend that behavior – all of which takes place in a social setting. According to Schunk (1996), "people acquire knowledge, rules, skills, strategies, beliefs, and attitudes" (p. 102) by observing others, thus learning the rules, adaptations, and resulting consequences of what was observed. Some theorists maintain that imitative behavior must follow as a result in order for learning to actually occur, while others advocate that learning can occur from observation alone (Bandura, 1976, 1986; Hergenhahn & Olson, 2005; Lefrancois, 1999).

Bandura's (1976, 1986) conceptualization of social learning theory focused primarily on three factors central to an understanding of how the theory works – the social context, self-regulation, and self-efficacy. That learning through observation must obviously occur in some sort of social environment may be an overstatement, but it has given rise to numerous other related constructs about how and where learning occurs. By self-regulation, Bandura proposed that people monitor, control, and adapt their behavior based on the anticipated consequences. Secondly and consequently, adoption and adaptation of observed behavior are assessed and further controlled as a function of their self-efficacy, or people's beliefs about their capacity to produce desired outcomes in their lives based on their behavior. Bandura summarized his understanding of social learning as a three-way interactive model in which the personal, behavioral, and environmental determinants of any learning formed a "triadic reciprocity."

Collaboration is a focused and interactive endeavor, often marked by experimentation, but with the use of shared rules and work on a common "problem" or situation. The hallmark and central advantage of collaboration is that it frequently leads to innovative outcomes that could not have been achieved otherwise (Peters & Armstrong, 1998; Saltiel, 1998; Wood & Gray, 1991). When collaborators come together, a kind of synergy results in which the outcome "cannot be reduced to what either … contributed or knew … [and] is more than the individual contributions added together" (Peters & Armstrong, 1998, p. 75). Collaborative learning is collaboration with the express goal of knowledge acquisition or creation, often utilized in many contexts such as higher education, the workplace, non-formal and informal learning initiatives, and grassroots education efforts. Moreover, proponents of collaborative learning, scholars, organizers, and others have maintained that collaborative learning is most valuable in meeting the needs of less advantaged adults. Among the many noted collaborative learning initiatives have been those that facilitated empowerment and social change. Many such efforts have first been in service of a shared vision of social justice and civic participation, transcending race, class, gender, and other dimensions of human difference (Horton & Freire, 1990; Kadel & Keehner, 1994; Knox, 2003).

Two *masters* of collaborative learning were Myles Horton of the Highlander Research and Educational Center in east Tennessee and Paulo Freire of Brazil. Peters and Armstrong (1998) described how Horton and Freire, working as "teachers/facilitators were able to achieve a delicate balance between bringing out the knowledge of people while going beyond the people's knowledge… while co-constructing knowledge" (p. 75). Research and practice-based experience as well suggest that collaborative learning groups are "more likely to generate creative solutions to complex problems,… [in ways that] actively engage the learner, build community and consensus, and honor the diversity of voices" (Will, 1997, p. 33) of those involved. Effective collaborations require mutual respect, effective communications, understanding of group dynamics, establishment of ground rules, clarification of expectations, and consideration for group size and structure, as well as learning and interaction styles (Cranton, 1996; Kadel & Keehner, 1994; Will, 1997).

To demonstrate how the above learning models and concepts and the affiliated practices can be converted to, or made more relevant for learner-centered environments, we provide the following implications for learner involvement. Included are tapping into and sharing experience; relevancy, practicality, and goal orientation; and, self-direction, internal motivation, and control.

Implications for Learner Involvement

Translating theory into practice is difficult at best, but necessary. To be transparent in the conversion of these above adult learning concepts into practical application within co-constructed curriculums, we provide the following synthesis.

Tapping into and Sharing Experience: Adults and our self-identity are largely defined by our experiences. As Knowles noted, "adults *are* what they have *done*" (1990, p. 50, original emphasis). Although the following example is undoubtedly more culturally specific and common to the United States than in other countries of the world, almost any communication between newly introduced people typically turns to where we work, or what we do for a living, for example. Because of this significant investment in an experientially defined self-identity, adults want to talk about, to share, what they have done, where they have lived and worked, and what they have learned and accomplished. To dismiss this information, to trivialize it, is to dismiss not just the experiences, but the very self.

The rich store of adults' experiences enables learners to connect new knowledge to earlier experiences, thereby anchoring the learning, making it meaningful and immediately relevant. It also allows adults to contribute to others' learning and opens the door for co-creating knowledge.

Collaborative outcomes are more meaningful because of the relationships and synergy produced by collective efforts, by the tapping into and sharing of experiences. Engagement, or the degree of active involvement in collaborative efforts, has a multitude of beneficial effects on those involved, affecting the success of the collaboration as well as ensuring buy-in from those participating.

Relevancy, Practicality, and Goal Orientation: Knowles (1990) maintained that adults pursue learning in problem-centered or performance-centered ways, rather than the subject-centered approach that children are exposed to. That is, learning in adulthood is best related to some real-world situation, opportunity, or problem that needs to be addressed through education or training. Consider these examples: Learning to diagram sentences in grammar school or memorizing algebraic theorems in high school. Even if we dared question the application value of such knowledge and skill as adolescents, we accepted this mandate for accumulated knowledge as part of the schooling experience or something that would somehow show its utility at some later date. Adults rarely settle for such explanations and disembodied knowledge; learning must have applicability in helping solve some current life situation. In Knowles' (1990) words, adults "engage in learning largely in response to pressures they feel from their current life situation … education is a process of improving their ability to cope with life problems they face now" (p. 53). McCombs and Whistler (1997) concur, noting that an increase in motivation, actual learning, and performance is often found when students focus on topics relevant to their interests, needs, and lives.

Many of our current life pressures and our need to learn are tied to what has been termed the "New World Order" brought about by complex and rapid social, technological, and global change, by quickening knowledge obsolescence, and increased ambiguity. Adults must make educated decisions in an environment "characterized by uncertainty, flexibility and incongruities…this contrasted with past ideas of certainty, fixture, and information located with experts" (Pillay & Elliott, 2001, p. 8). Information is overwhelmingly abundant and knowledge constantly changing. As Harris and Cullen (2009) note, "When the focus is on knowledge rather than learning, obsolescence is inevitable" (p. 55). What adults need to know is how to learn, how to think critically, and how to question the status quo – often without the ready assistance or facilitation of an educator.

Self-Direction, Internal Motivation, and Control: According to the SDL model, adults engage in significant learning in which they determine their own learning goals, locate learning partners, determine resources, and monitor the duration and ultimate success of their learning experience. Self-directed learning does not mean learning without a plan; nor does it occur in isolation. SDL can occur in formal and non-formal, as well as informal settings. In Grow's (1991) model of SDL, teachers take on different roles depending on the readiness of their learners. Brockett and Hiemstra's (1991) PRO model similarly suggested that "an educational agent or resource often plays a facilitating role" (p. 24) in the SDL process depending on the learning context.

Self-directedness on the part of any learner must be considered on a continuum. Adults, as well as children, can be self-directed to a minor or significant degree – depending on the maturity of the learner, depth of desire and motivation toward the learning endeavor, sophistication in locating learning resources and evaluating the merit of Web-based and other resources, level of previous experience with the content or skill to be learned, and risk of the learning involved.

Reeve and Jang (2006) discovered several instructional behaviors "correlating positively with student's experiences of autonomy including listening, creating time for independent work, giving the student opportunities to talk … and acknowledging the student's perspective and experiences" (p. 215). Their study involved pre-service teachers in a role-model exercise, recording teacher-role and student-role interactions then analyzing these for autonomy-supportive versus controlling behaviors. Although this role-play exercise was designed to demonstrate a primary education classroom, the student-role players, either consciously or subconsciously, drew on their adult experiences and responsibilities.

Regardless of the placement of individual learners on the continuum of self-directedness, adult learners' ability and desire to plan and carry out their own learning and, consequently, the value of their involvement in curriculum development initiatives are without question. Scholars, practitioners, and learners have long challenged the assumption that adult learning requires the guidance or even presence of an instructor; the same can be said of curriculum development whether one considers SDL an instructional method, learning process, or learner characteristic.

Although Knowles' is attributed most often with assumptions about learners themselves, including self-directedness, within Knowles' writings are suggestions regarding relationships between learner and facilitator. As Pratt (1993) found in his monograph, *Andragogy After Twenty-Five Years*, Knowles came to believe "that the essence of facilitation lies not in one's approach as much as in the relationship that exists between learner and facilitator…. Andragogical approaches require a psychological climate of mutual respect, collaboration, trust, support, openness, authenticity, pleasure, and humane treatment" (p. 19). These same attributes, as well as the previous considerations outlined, are the hallmarks of effective co-constructed curriculum development.

Co-Constructed Curricula

If one of the goals of higher education is the development of critically reflective practitioners who know how to continue their own learning, then the involvement of learners in the development of that learning is crucial. Outside of preparatory education, much of the learning that takes place in one's profession, and even home life, comes about in response to the problems of the practice itself through the processes Schön described as reflection in- or on-action. Hence, the more involvement the learner can have in the curriculum development process, the stronger the learning and resulting link and relevance to practice.

Weimer's thought-provoking treatise on learner-centered teaching offers guidance and rationale for including learners in the creation and development of their own learning experiences. In her landmark 2002 text, *Learner-Centered Teaching: Five Key Changes to Practice*, Weimer proposes changes to teaching practice that creates a learner-centered classroom or experience, changes that can also be integral to co-constructed curriculum development.

Curricula Co-Constructors

Weimer suggests that the role of the teacher change from lecturer to facilitator or coach. To accommodate this, the balance of power needs to shift, with the facilitator sharing decision making about the learning with the students. An adult learner's propensity toward self-direction, internal motivation, and control makes this shift to a co-constructor of curriculum much easier than with younger learners. Still, in order to facilitate a group of adult learners located at various places along the self-direction continuum, the student's current knowledge must be explored. Such exploration may take the form of student-to-instructor sharing as with learning journals, or in peer-to-peer activities such as small group discussions, or through student-to-class presentations. The process of discerning prior experience may be formal (prior learning assessment tools) or informal (life histories). Regardless of the method of 'mining,' what emerges from these activities is not just knowledge. As Ahmed (2013) found, in learner-centered environments "learners' experiences, perspectives, backgrounds, talents, interests, capabilities, and needs come into focus" (p. 24), all of which furthers exploration and collaboration.

A student's perspectives and beliefs become relevant in co-constructing a curriculum, helping the facilitator meet students where they are. This may be as specific as jargon or terminology relative to the field, or as broad as worldview. How students view knowledge impacts the learning process. For example, learners who conceptualize knowledge as dualistic – fixed and existing in discrete units – will find it difficult, if not impossible to "see the need to reflect on and search for connections that integrate elements within the given information and existing prior knowledge" (Pillay, 2002, p. 96).

An instructor's epistemology, or view of knowledge, can also hinder the success of the learner-centered curriculum. As Mott (1998) noted, failure to actively involve learners may be due to a "centuries-old positivist paradigm in which knowledge is thought to be an external commodity, a paradigm in which most of us are not taught to be creators of knowledge used in practice, but merely consumers" (p. 672). Eraut (1994) further argued that the "barriers to practice-centered knowledge creation and development … are most likely to be overcome if higher education is prepared to extend its role from that of creator and transmitter … to that of enhancing the knowledge creation capacity of individuals" (p. 57). Scholars and practitioners alike affirm that the knowledge generated in practice is as valuable, if not more so, than knowledge learned in formal pre-professional education.

When students become co-constructors of curricula, their needs as well as their understandings enter the process. Forrest and Peterson (2006) recommend, "allowing adult learners in a management class to pick their own readings based on the competence they want to develop during the semester" as just one example of self-directed learning (p. 117).

Once the learner-centered instructor moves beyond purveyor of subject matter to designer and coach of the learning process and the associated strategies, the resulting strategies are often infused with critical thinking and reflection, collaboration and cooperation, and discovery and innovation. This addresses another of Weimer's changes required to adopt learner-centered practice: the need to view content as integrally connected to the learning strategy. Intertwining learning skills and learner awareness with content further drives learner autonomy and the learning community to center stage. This is discussed in the following section.

Co-Constructed Curricula Content and Design

As shown in the adult learning models discussed earlier, adults seek learning that is relevant and applicable in the present or near future. This might involve solving a problem, resolving a conflict, learning a skill, or working through a dilemma. Regardless, the teacher trades the role of delivering content for that of facilitating learning. Good facilitators create environments that encourage students to discover and construct knowledge for themselves and in community with other learners.

Cornelius-White (2007) suggests several activities that reflect a co-constructed learning environment. These include learning groups, peer tutoring, community outreach, learning contracts, as well as, solving relevant and real problems. Cercone (2008), who demonstrated a connection between adult learning theories and online instructional strategies also recommends problem-based learning (PBL) and case-based learning (CBL) along with role playing, simulations, and student portfolios.

Morrone and Tarr (2005) offer several practical examples of strategies that acknowledge learners' prior understandings and attitudes, develop self-regulation, and ultimately give the learner more control. These include one-minute papers, class discussions of complex issues, case study analysis, simulations, and collaborative projects. In Birzer's (2004) review of criminal justice programs integrating andragogical principles, he similarly described the use of learning contracts with students defining objectives, detailed plans and resources needed, evidence for evaluation, and method of evaluation.

The instructor, as co-constructor of the learning process, adopts a more complex role including watching and directing this fluid, active learning process. The observant facilitator captures and maximizes teachable moments (Havighurst, 1952). Examples of this would be an impromptu demonstration of how to approach a dilemma from multiple perspectives or how to critically analyze contradictory information, using the learners' experiences and thus building on both self-efficacy and knowledge built. The learner-centered instructor is then modeling situated cognition, a construct that ties learning intricately to "participation in the immediate situation" (Fenwick, 2003, p. 25).

As with traditional teacher-centered curricula, co-constructed curricula show cohesion between content, learning activities, learning objectives, and outcome assessment tools. The learner-centered facilitator as director is responsible for ensuring that students' learning objectives align with the instructional strategies which have been defined to produce clear outcomes that will be accurately assessed by appropriate evaluation tools. Assessment in the co-constructed curriculum, as with content and design, looks different from traditional teacher-directed evaluation, as is outlined below.

Co-Constructed Curricula Assessment

Within teacher-centered curricula, assessment has typically involved summative evaluations such as end-of-term testing. In a learner-centered environment, formative evaluation becomes equally valued. Learning is assessed throughout the term by the facilitator, by the learner, and by the learners' peers. Such assessment takes many forms and ranges from formal to informal. What is consistent, regardless of the assessment tool, however, is that learning versus rote memorization is evaluated.

In the co-constructed classroom, the facilitator assesses deep learning (Marton & Saljo, 1976; Tagg, 2003), and in some cases learning that transforms one from novice to expert (Mott, 2000; Schön, 1983). As discussed earlier, the transformation of learners from novice to expert often involves reflective practice. Reflective practice begins to occur naturally when learners see and practice reflection. As Rogers explained:

Faculty need to let their students see and hear them reflecting both in the classroom and in individual meetings. To the degree that reflection is often a personal process, modeling requires the willingness and ability to self-disclose and to make oneself vulnerable. (2001, p. 53)

Loughran (1996) further demonstrated reflection by thinking out loud and keeping a reflective journal available to students and interspersed coursework with learning journals and writing portfolios.

Critical thinking and associated reflections are often captured in verbal and written forms. Writing assignments are standard in most graduate education programs. Bean's (2001) premise that writing is closely linked with thinking supports the activity of writing as reflective of understanding. "The most intensive and demanding tool for eliciting sustained critical thought is a well-designed writing assignment on a subject matter problem" (p. xiii).

In reference to information systems education, Saulnier, Landry, Longenecker, and Wagner (2008) suggested that learning be "assessed directly/authentically through papers, performances, portfolios, and the like depending on the fit between the activity and the outcome" (p. 171). Engineering education also revealed formative evaluation tools with deeper learning as the goal. "A clear proof that comprehension has been achieved is when the individual can articulate concepts in language, written or oral, therefore, a curriculum that emphasizes learning is both writing- and speaking-intensive" (Harris & Cullen, 2009, p. 60).

In the management literature, Gray (2007) described storytelling and critical incident analysis as useful activities in engaging learners in reflection. Critical incidents are integral to Mezirow's transformative learning theory and the idea of a disorienting dilemma as a catalyst to transformation. Brookfield (1995) uses a Critical Incident Questionnaire, and Angelo and Cross (1995) created a Recall, Summarize, Question, Comment, and Connect (RSQC2) tool, both written of earlier to prompt reflection.

Evaluation in general, and reflection specifically, are not always formal. In a study of engineering students in a first-semester general chemistry class, Lewis (2011) found that incorporating a peer-led team learning (PLTL) process, improved student retention and student performance. Instructors, peer-leaders, and students, received on-going feedback based on observations and reflections including a weekly peer-leader reflective journal. Lewis cited PLTL sources in suggesting, "It is possible the motivational aspects of cooperative learning, such as self-concept, are responsible for the improved gains in retention" (p. 706).

Kane and Lawler (1978) studied student peer evaluations within group work. Lee and Lim (2013), following on Kane and Lawler's work, performed their own study of student evaluations of group work. In an instructional methods and educational technology class, they found that peer assessments contribute a complementary strategy to that of the instructor's. While teachers are typically unable to access the learning process internal to the group, students focus on and evaluate their peers' social competencies such as organizing, coordinating, and moving projects forward.

As demonstrated above, the purpose of evaluation in a co-constructed curriculum is as much about promoting learning as it is assessing learning. To limit evaluation to grading exclusively by the instructor is to diminish the role this process can play in developing self- and peer assessment skills and learner autonomy.

Students who co-construct their own curriculum are resurrected into active learners. Once moved out of the lecture hall – full of inactive bodies and minds passively receiving information – and into a fluid, dynamic classroom, students can begin to construct knowledge is relevant, practical, and multi-dimensional.

Exemplary Case Studies from Formal, Non-Formal, and Informal Education

Case studies are an effective way to demonstrate, as well as clarify and elaborate, how the constructs, models, and theories of adult and continuing education described above reinforce the potential contribution of adult learners in co-construction of curriculum. The following three examples are drawn from formal, non-formal, and informal educational settings. In the first example, a combined Executive Masters of Business Administration and Masters of Public Health degree program involved students admitted to the program as members of a steering committee charged with redesign of the program, course, and syllabi. The second example demonstrates the significant and invested learner involvement of displaced workers enrolled in an outplacement training program for a textile manufacturing facility. And, the third case study details the collaborative curriculum development efforts of several faith communities, human service agencies, and a local technical/community college as they work with adult learners to enhance the reading levels, employability, and quality of life of the residents.

Formal Education

This case study describes an *Executive Masters of Business Administration/Masters of Public Health degree program.* In the mid-western United States, a comprehensive state university is home to five colleges and schools; the university offers more than 30 separate undergraduate and graduate degree programs and is the academic home for approximately 1,000 faculty and just under 20,000 students. The university is a major employer and sole higher educational institution in a relatively small, but vibrant, urban area of approximately 100,000 citizens with an extended metropolitan area of nearly 300,000. Within the city and 25 mile radius are a wide variety of businesses and industry, two hospitals, and a full complement of social services and nonprofit agencies, all of which enjoy a healthy economic outlook.

In response to critical emerging community health issues, requests from practitioners, and pressure from credentialing agencies, two of the colleges and schools in the university decided to collaborate on a unique, interdisciplinary pre-professional degree initiative to serve healthcare practitioners and administrators who would ultimately also be required to demonstrate effective business management acumen. Limited university funding to support development and implementation of the new degree was supplemented by funding from three external grant sources, and a coalition of community healthcare partners. The resulting new degree was a 60-semester hour joint Masters of Business Administration (MBA) and Masters of Public Health (MPH). The joint *Executive MBA/MPH* degree was housed in the College of Business and School of Allied Health, collectively home to 120 faculty. Requirements for admission to the executive degree program included current employment in an administrative capacity in a healthcare practice, hospital, nursing or other community healthcare facility, public health agency, or healthcare-related nonprofit agency. While some of the external funding provided tuition support, much of the cost incurred was covered by the participants' employers.

After completion of two academic semesters of the expensive and specialized joint degree, a formative assessment was initiated by the two academic units – with assistance from the funding agencies, contributing healthcare providers and agencies, and the degree candidates themselves. Through survey, in-depth individual interviews, and focus groups, the evaluation process determined significant dissatisfaction with the program on the part of both those enrolled and their employers. In fact, in only one academic year, the program had lost nearly one-quarter of the original 50 entering candidates. Specifically, the assessment found (a) a lack of awareness and consideration of candidates' competencies upon entering the program, (c) insufficient advising and counseling regarding scheduling, field experiences, and other student concerns, (c) lack of relevance in course content relative to job responsibilities, and (d) ineffective instructional and evaluation strategies.

Following the evaluation, the assessment team, which was originally comprised of instructional designers and subject matter experts, was reformulated to now include contributing employers, and representatives from the degree candidates themselves. The newly comprised assessment team began an intensive redesign and development process of the entire degree – including admission requirements, course sequence, content and texts, instructional strategies and in-class activities, and the field internship and applied project required for graduation. The most valuable insights provided in the co-constructed curriculum redesign of the degree and related course development came from the remaining 38 candidates who were in the early stages of their degree program and the 12 newly entering participants. Specifically, a competency assessment was designed by one group of degree candidates and shared with the instructors for use in building on participants' knowledge base, thus furthering their learning and developmental opportunities by building on existing experiential knowledge. Core and elective course selections were paired to the requisite competencies in their administrative roles. Suggestions were implemented to assign mentors from partner agencies and organizations, and counseling teams were formed with members from both the university programs and contributing healthcare providers. Expert administrators and practitioners from the contributing healthcare agencies were contracted to teach or co-instruct some of the course sections, thus providing current *real-world* applied relevance in the course content. And, applied projects and field experiences were redesigned to be more developmental, aligned with the employers' strategic plans and community needs, and which would build on the candidates' existing knowledge, growing comprehension, and career goals.

Following the second academic year of the three-year joint degree, the continuing formative self-assessment revealed significantly improved satisfaction with the degree program in general, improved course content and outcomes, and enhanced counseling services. As the degree candidates entered their third year of the new joint *Executive MBA/MPH* degree, only 2 additional candidates had withdrawn and the original candidates began their final year of applied projects and internship placements. The second cohort of new candidates is planned with applicants anxiously waiting to begin the redesigned and improved joint degree – made possible in part by the involvement of adult learners in the co-construction of innovative, relevant, and immediately applicable curriculum.

Non-Formal Education

This case study describes non-formal *out-placement training in textile manufacturing*. In a small city in the southeastern United States, a textile manufacturing facility employing approximately 200 workers was recently sold to a larger competitor. During the negotiations, economic developers hoped the sale might mean an expanded facility, new jobs, and a higher tax base for the community with few other industries. Unfortunately, the new owners announced that the facility would be sold and the manufacturing process moved to an off-shore location where lower wages could be paid, thus reducing manufacturing costs. Upper level management team members were offered lucrative relocation packages to other facilities; the 200 line employees, however, were told they would receive 6 month severance packages of incrementally reduced wages and health care/insurance benefits, and be eligible for an outplacement training and job-skills assessment program that should help them secure other local employment. The affected employees ranged in age from mid-20s to early 60s, and some had worked for the company for more than 30 years. For many of the men and women, this was the only paid employment they had known. The majority of the displaced workers had either graduated from high school or had completed their general education diploma through an educational assistance program offered through technical/community college system in the state. Approximately 30 percent of the mid-level line managers, foremen, quality assurance personnel, and technicians had either associate degrees or some college.

A consultant was hired by the parent company to coordinate and implement an outplacement training assistance program. In cooperation with the local technical college and career counselor from company headquarters, the consultant was charged with three objectives: developing and conducting a job skills assessment and interest inventory for all displaced workers who requested it; planning and implementing a training curriculum to prepare workers for available jobs in the region; and evaluation measures that would assess the success of the outplacement initiative. The approach employed by the consultant and career counselor was a collaborative one that included the displaced workers in all aspects of the initiative according to their interest and willingness to engage.

Although some of the displaced workers were involved in administering the early assessments and inventories to their coworkers, it was in the planning process of the various retraining curricula that they were most instrumental. The outplacement team embraced an interactive and collaborative development approach and involved the workers themselves in virtually every step of the curriculum process. The displaced workers certainly assumed a problem-centered approach to the situation. Since what they needed to learn would eventually enable them to find perhaps even more advantageous employment, their interests were not in random content, but in solving the problem of their impending unemployment. The workers also brought their rich store of experience and knowledge to bear on the curriculum development and even subsequent team-oriented training for one another. Given the short time frame in which the consulting team worked to prepare the displaced workers for new employment, building on what the workers already knew and collaborating with them to develop new competencies were crucial. Following the thorough skills assessments and interest inventories, co-construction of curricula that drew on the shared knowledge and experience of the workers enabled the training to be more interactive and dynamic, more relevant, and applicable in their new positions. The involvement of the displaced workers in this example of outplacement training ensured worker buy-in, success in the development and implementation of training, enhanced job skills for the workers, and increased potential for success in their new positions.

Informal Education

The focus of this case study is c*ommunity-based literacy education*. In one south-central U.S. state, literacy rates hover between 35-40%; many residents (both immigrants and native-born) struggle with literacy and numeracy in their own language, not to mention the English necessary to engage sufficiently in daily life. This case study explores the curriculum development efforts of several faith communities, social service agencies, and the local community college as they worked with adult learners to enhance the reading levels, employability, and quality of life of the residents.

In the center of this south-central state lies a sparsely populated, but large county of approximately 250,000 residents. The primarily rural county is a mix of numerous small unincorporated communities, three small towns, and one small city of approximately 50,000. The residents work in agriculture, light manufacturing, and service industries throughout the county; the median family income is approximately $30,000 annually. The unemployment rate, by contrast, is more than 10% and nearly twice the state average; additionally, seasonal employment represents much of the county residents' employment patterns. While many of the county residents, aged 18-65, have high school diplomas, the high school non-completion rate for the public school system in the county is nearly 40%. And, according to the literacy council based in the county seat, the illiteracy rate in the county is over 25%, while the national average ranges between 5-10%. In contrast to the working age residents, the county is also home to a growing senior population; many of these older residents have long-standing literacy needs as well. Because of the depressed rural economy in the county, some of these seniors are also faced with the need for retraining for continued or new employment.

A state technical and community college system serves the higher and continuing education needs of those residents with education beyond high school, as well as for those in jobs with continuing education benefits or requirements. In concert with several faith communities and the county literacy council, the technical/community college system offers a variety of training opportunities to county residents. One model literacy and employment education program is the result of broad interagency collaboration, is supported by a variety of external funding agencies, and enjoys full classes and frequent waiting lists.

The collaboration effort to serve the literacy and employability needs of the county residents was the brainchild of the county's technical/community college system. Following their participation in a county "Workers' Resource Fair," college personnel became aware of the many duplicative but limitedly successful efforts being undertaken by the county's literacy council and several faith communities throughout the county. Leaders discovered multiple literacy initiatives, employability training, computer classes, and career counseling sessions often being conducted throughout the county – each with marginal enrollment and nearly prohibitive costs to each small agency or organization in terms of both actual monetary resources and volunteer capacity. The technical/community college personnel quickly engaged leaders from various agencies, organizations, and faith communities to examine their respective efforts, compare challenges and successes, and discuss how they could collectively improve services to their county residents. In an innovative and responsive manner, representatives from several faith communities, senior and social service agencies, and the technical/community college began to better coordinate the services offered.

The turning point in the team's success was the literacy council's insistency on the involvement of active learners in the process. Thus, the large steering committee including consumers of the various programs was convened to assist with the coordination of the new training and education efforts. Despite their literacy challenges, the invested group of adult learners gathered comprehensive information about the variety of programs being offered in the county – enrollment numbers, costs, locations, course duration, and completion rates. They helped revise a needs assessment survey, including the translation into three languages that would support outreach to even more residents. Also with the assistance of an intern from a nearby university campus, these adult learners contributed significantly to the redesign and development of existing programs and the creation of new advantageous programs as well.

Approximately 36 months following the initiation of this collaborative team and the co-constructed redesign of a variety of programs, a team of evaluators from all of the agencies, organizations, faith communities, the technical/community college, and learners reconvened to consider the success of their collaboration. Their report indicated literacy and English as a second language (ESL) classes had served a total 2,700 residents; GED and adult basic education classes had successfully prepared 135 men and women to pass the state high school equivalency test; a streamlined variety of employability classes, including resume-writing, interviewing skills, and business communication classes had resulted in 350 individuals either securing employment or promotion; and more than 200 residents had completed a variety of computer classes. The report also noted the involvement of nearly 50 underemployed residents, those with literacy challenges, and participants of former and current training sessions as among the key factors in the success of the new programs.

Conclusion and Implications for Education and Practice

This chapter suggests that curriculum development initiatives can and should involve the learners for whom programs are planned. Adult learning constructs and models such as andragogy, transformative learning, and social learning were briefly outlined to provide guiding tenets and justification for such involvement. These conceptual constructs and associated practices were followed by their implications for learner-centered environments, and finally application within co-constructed curricula.

While it may seem intuitive for learners to be included in curriculum development, this chapter provided support and justification for doing so. Given the complexity and dynamics of today's world of work, the quickened rate of knowledge obsolescence, technological innovation, interdependent world political and economic contexts, such collaboration between educators and learners just makes *good sense*. More examples, similar to those provided earlier in this chapter, abound describing the use of master teachers as clinical curriculum specialists, expert nurse educators as subject matter experts, and those in areas such as business management, computer sciences, and medical education (to name only a few) serving in a variety of contributing roles in successful curriculum design and improvement initiatives. Adult learners who are not only capable, but who also have a vested interest in the process and product of curriculum development must be at the table with program planners, instructional design specialists, and subject matter experts.

Implications for involving adult learners in curriculum development processes are significant for both education and professional practice. For formal education, actively involving learners in curriculum development initiatives can result in improved programs of study, course availability and focus, and class activities; it also increases buy-in of potential and existing program participants. Co-constructed programs may also be more innovative, learner-centered, relevant, immediately applicable, and more authentically assessed. In non-formal and informal educational programming, the same can certainly be true, and additional value accrues in the cost savings from involving volunteer learners and community partners. The implications for practice are numerous as well, including increased collaboration and partnerships, enhanced pre-professional education and training, more pragmatic internships and field experiences, among others. From the standpoint of all stakeholders – educational institutions, credentialing and professional agencies, practitioners, and learners themselves, involving learners in co-construction of curriculum is not only legitimate and prudent, it is the wise course of action.

KEY TERMS AND DEFINITIONS

Andragogy: The art and science of helping adults learn; a set of assumptions that guide adult learning and teaching popularized by Malcolm Knowles in the mid 20th century.

Co-Constructed Curriculum: Learning content developed in partnership or collaboration between two or more individuals or parties.

Collaborative Learning: Learning in which the responsibilities for content, design and development, instructional strategies, learning outcomes, and assessment are shared.

Learner-Centered Instruction: A model of instruction authored and developed by Mary Ellen Weimer in the late 20th century that focuses responsibility for learning on the student, rather than the instructor. The work is based on Weimer's five key concepts of the role of the learner, balance of power, the function of content, responsibility for learning, and the purposes and processes of evaluation.

Self-Assessment: The process of appraisal, evaluation, or examination performed on the learning, outcomes, or performance by the learner.

Self-Directed Learning (1972): A model of learning drawn from the principles of andragogy in which "individuals take the initiative, with or without the assistance of others, in diagnosing their learning needs, formulating learning goals, identify human and material resources for learning, choosing and implement appropriate learning strategies, and evaluating learning outcomes.". Knowles, Principles of Andragogy.

Chapter 60
Teaching of Fluid Mechanics in Engineering Course: A Student-Centered Blended Learning Approach

Ataur Rahman
University of Western Sydney, Australia

Md Al-Amin
Monash University, Australia

ABSTRACT

In undergraduate engineering courses, fluid mechanics is regarded as a challenging subject. This is particularly the case for students who do not possess a strong mathematical background. This chapter reviews the issues related to the teaching of fluid mechanics with an emphasis on how e-technology can enhance student learning. It uses the data of 462 students studying the second year engineering course at the University of Western Sydney (UWS) in Australia. The UWS fluid mechanics course, in its past ten years, has undergone significant changes in its content and delivery. It has been found that teaching based on a "student-centered approach" is more effective in teaching fluid mechanics than a "lecturer-centered approach." Further enhancements are proposed in UWS through a blended learning approach involving both e-technology and traditional teaching methods to teach fluid mechanics. The method can also be adapted to other universities.

INTRODUCTION

The delivery of engineering education has traditionally been made via face-to-face teaching aided by a significant component of physical laboratory tasks for most of its core subjects. Engineering curricula have focused to equip students with 'problem-solving skills'. However, it has been reported that lecturing is not a very effective medium to advance problem-solving skills and it does not require much critical thinking, and moreover may not prepare students for the types of problems they face as professional engineers (Johnson, 1999). In recent years, collaborative

DOI: 10.4018/978-1-4666-8246-7.ch060

problem-based learning and use of on-line sources have become popular in engineering education similar to many other disciplines.

In engineering courses, problem-based learning has been used for some years at many institutions which employ real-world problems to introduce new concepts of a subject to students. Johnson (1999) presented the use of a combination of problem-based learning and cooperative learning to revise and teach a hydraulic engineering course. The goal of cooperative learning is that students study in teams so that they can learn from the lecturer as well as from each other. The online courses have not been that popular in core engineering subject-delivery till date in most engineering schools in Australia. This may be due to the fact that engineering subjects have a strong laboratory component and due to the lack of interactive responses that can be provided by a lecturer during solving complex design type problems on writing board.

In recent years, the student profiles in many engineering schools have changed significantly from past years. In the past, the engineering student cohorts were represented by top performing high school graduates (often from top 5% of high school students) with strong mathematical backgrounds. Furthermore, in the past, many students were not in paid employment (part-time or near full time) during the semester. In recent years, students in engineering courses in many universities are not from the top 10% of the high school students; rather they are from the top 20% to 30% range. Some of these students have done only general mathematics in high schools, and most often have not done any physics. When these students are enrolled in engineering courses, in particular, with higher commitment to paid work, it presents a challenge to engineering lecturers to equip these students with the necessary problem solving skills in fluid mechanics they would often require in a professional career. For these students, it is argued that a blended learning approach is likely to be more effective where a number of different approaches are put in place such as face-to-face lectures, tutorial and lab classes, online lecture notes, tutorial solutions, peer mentoring, 'help day' by tutors/lecturers and selection of textbooks having interactive solutions of numerical problems.

This chapter focuses on the teaching of fluid mechanics, which is regarded as one of the most challenging subjects in the engineering curricula. This uses data from fluid mechanics teaching over a three-year period in the University of Western Sydney (UWS) in Australia. This identifies the challenges in the teaching of fluid mechanics generally and then proposes a blended learning approach which might be adopted in the near future to enhance students' learning in this subject in UWS.

BACKGROUND

Catalano et al. (1999) compared aspects of engineering education with several case studies for a variety of subjects from a number of institutions. Comparisons were focused on teacher-centered and student-centered learning methods to identify the effectiveness of learning. They found that the student-centered model is more effective than the teacher-centered one when academic depth is considered. Crouch (2001) reported a ten years' teaching experience with peer instruction in introductory physics courses. Student performance was found to improve in quantitative problem solving skills by this method. They took a number of different approaches such as, the replacement of in-class reading quizzes with a writing report on the topic beforehand and group learning combined with traditional lectures. This paved the way for students developing an increased understanding of the courses.

There have been some previous researches on various aspects of learning and teaching of fluid mechanics and similar subjects. For example, Brohus & Svidt (2004) presented Information and Communication Technology (ICT) for effective learning in fluid mechanics education. They presented an education model with high efficiency learning environment using ICT and showed how the combined effect of physical and virtual knowledge could play an important role in improving the learning platform. It started with ventilation technology combining teacher performance using blackboard and student exercises using paper and pencils. Then it applied past experiences and lessons from ICT to make it possible to achieve the goal of effective learning.

Carlson & Sullivan (1999) dynamically introduced an integrated teaching and learning (ITL) program with a team of faculty and students and used it as a model for the undergraduate engineering education. This program integrated theory and practice that adapts creative ideas and group-based problem solving skills. It described different experimental module features and facilities as an online system. They, in essence, combined the old engineering curriculum with the new ITL program like a living laboratory with the help of online teaching facilities.

Sharp et al. (1999) presented four different proven writing strategies for engineering classes including assignments. The strategies include job related web-based finding approach, peer editing assignments, writing reports using journals and finally, how to write instructions using paper airplanes. These test strategies established that using journal papers assisted students learning of fluid mechanics more effectively.

Litzinger et al. (2011) stated that engineering education should encompass a set of learning experiences that would allow students to construct deep conceptual knowledge to develop the ability to apply key technical and professional skills fluently, and to engage in a number of authentic engineering projects. This implies that students should be engaged with real engineering projects in their final year of study in maturing their learning in the university, which could pave the way for them to become 'expert engineers' in future.

From the experience of the second author of the chapter of this book in delivering a number of medical subjects at Monash University in Australia, it has been found that in addition to traditional lecture notes and text books, e-technology and blended learning involving pre-lab preparation task with real life data, oral presentation on population health and ethics and online quizzes greatly assist student learning. In these courses, students get regular feedback through tutorial/lab-classes and via online modes. In the oral presentation, students are highly encouraged to present issues arising from media and journal articles in public health and medical research area. Through online participation, students discuss many exciting real-life issues, fellow students put their valuable comments and lecturers get involved to enhance student learning experiences. All these methods can be applied to teach fluid mechanics unit in engineering schools.

Leal (1991) addressed some of the challenges of teaching in fluid mechanics and noted that critical attention is needed to solve problems in the areas of teaching and research related to fluid mechanics. Baldock & Chanson (2006) presented a combined work of problem-based and project based learning where physical model data were compared in the areas of fluid flow modeling. This method enabled students to prepare high quality professional reports on fluid mechanics. Chanson (2004) reported that the influence of fieldwork on learning hydraulics courses in an Australian university was very strong. He pointed out that a combination of lectures and field works for these courses enabled students to have better learning outcomes demonstrated by a very positive feedback from students.

Johnson (1999) discussed the weaknesses of only traditional lectures in the areas of hydraulic engineering. Two different effective teaching techniques were presented by him, firstly, the problem-based learning to enable students to take responsibility on assigned work and prepare them to take an active role in learning. The second approach was cooperative learning that prepares students to work in a small team environment consisting of students and an instructor using small project based work and assignments.

Alam et al. (2004) presented development of a teaching and learning process that is cost-effective and user-friendly by integrating hands-on practical experiments, video images of real-world laboratory experiments and computational simulations, which could be useful to on-campus and off-campus students. Furthermore, Alam et al. (2007) proposed a three-step teaching method in fluid science that can greatly enhance students' learning outcomes, be cost effective, user-friendly and attractive. The method consisted of a real laboratory video clip, conduction of a real laboratory and a computer simulation.

Gotler (2006) presented a new approach to teach students in Washington State University where students work in structured groups with hands-on problem-based learning in the areas of fundamental fluid mechanics and heat transfer without the need of formal lectures. This approach increased communication and life-long learning skills of the students involved. It became a successful 'soft skill' for the students without the need of a laboratory space typically used in a standard classroom environment.

Fluid engineering subjects are taught in a number of undergraduate engineering courses such as Civil, Environmental, Mechanical, Aeronautical and Chemical Engineering. Teaching and learning of fluid science is always challenging due to its complex nature and the mathematics involved (Alam et al., 2004). Most of the students find these subjects difficult due to the facts that many students struggle to differentiate the concepts between solid and fluid mechanics; in the former, there is no internal frictional resistance and there is no issue of internal flow characteristics such as viscosity, turbulence and vortex unlike fluid mechanics. Furthermore, many students do not have a strong pre-requisite mathematical background to understand the concepts involved.

Fluid mechanics courses generally involve the use of a large number of variables and constants along with many equations. The new lectures are built heavily on previous ones, and hence students missing a few lectures often struggle to catch up. Depending on the new e-generation's learning habits, the delivery of fluid mechanics and similar heavy subjects needs a complete overhaul, which is still being delivered in the old-fashioned way in Australian universities (Hadgraft, pers. comm., 2013).

FLUID MECHANICS TEACHING IN UWS

Fluid mechanics is a 2nd year 1st semester subject in UWS with 10 credit points; this is one of the four subjects a full time student studies during the autumn semester. It is a core subject for Bachelor of Civil, Environmental and Mechanical Engineering students. It has two pre-requisite subjects, Mathematics 1 and Physics 1. Also, this subject is a prerequisite to a number of subjects in later years of studies e.g. hydraulics, hydrology and fluid dynamics. The subject content of fluid mechanics at UWS consists of fluid properties, fluid statics, energy equations, momentum, dimensional analysis and similitude, flow in conduits, introductory boundary layer concepts, introduction to open channel flow and flow measurements. The subject content of this subject in UWS is very similar to other Australian universities.

The current fluid mechanics subject content in UWS is different to its predecessor subject called water engineering which was heavier in its content. A few years ago, as a part of course restructuring in UWS, the water engineering subject was divided into two separate subjects, fluid mechanics and hydraulics, so that students can focus on individual topics in greater depth. The class size of fluid mechanics in UWS is about 175 on average at the beginning of semester, which falls to about 165 towards the end of the semester due to withdrawal by some students from the subject in the later part of the semester. The fluid mechanics class in UWS in 2013 comprises of 92% male students and 8% female students, with 82% students are domestic and the remaining 18% are international. The bulk of the domestic students have high school rankings in the range of 70% to 85%.

Table 1 lists some of the learning-related observations of the students enrolled in fluid mechanics in UWS based on the last ten years of experiences of teaching this subject in UWS by the first author. It can be seen that students who are better engaged with the lecturers and tutors and who take the advantage of the learning facilities and take their own responsibility in learning using all the available means, do better than the students who are too shy or slack to be engaged in the class activities. Also, the poor performance in the prerequisite subjects is generally highly linked with the poor performance in the fluid mechanics subject in UWS.

From the assessment tasks in UWS, it was found that the common mistakes students do in fluid mechanics include: (a) Students are not comfortable with the units of measurement of various variables defining a system; (b) Students cannot conceptualize a design problem and the break-up steps involved to arrive at the final solution. (c) Students cannot solve the basic set of equations indicating their weakness in high school level mathematics; (d) Students are not fast enough to solve problems in an examination situation that indicate a lack of preparation for the final examination; and (e) Students who do not

Table 1. Fluid mechanics student learning experience in UWS

Students Who Struggle	Students Who Do Well
Students starting the subject after week 2.	Students who engage better with the lecturers and tutors by asking questions and seeking help as needed.
Students who are too shy to ask questions in and outside the class.	Students working in active groups.
Students who often avoid lectures.	Students reading text book on the top of lecture notes.
Students who scored poorly in prerequisite subjects e.g. Mathematics 1 and Physics 1.	Students who did better in prerequisite subjects e.g. Mathematics 1 and Physics 1.
Students who do not keep up with the learning every week and attempt to catch up after mid-semester.	Students who keep up their progress of learning up-to-date every week and seek the assistance from lecturers and tutors immediately when they face problem on particular concept.
Students who do poorly in class quiz tests do also poorly in the final examination.	Students who solve the past examination papers.
Students who do not get familiar with various new variables, their symbols and correct units of measurements.	Students who solve additional problems outside the class and tutorial problems.
Students who are not very good in conceptualizing the problem and do not attempt to make a working diagram/sketch in solving the problem.	Students who show more interest in lab classes and take an active role in the experimentation.
Students who lack in self-confidence and try to pass the subject with the help from other students i.e. those who do not take their own responsibility in learning.	Students who do not blame others for their failure but take their own responsibility in learning using all the available facilities.
Students who are mainly interested in passing by somehow without understanding the concept of the subject.	Students who provides honest feedback to improve the delivery of the subject during the semester rather than waiting for the end of semester feedback.
Students who often provide medical certificates on the day of compulsory assessment tasks, and this generally happens for a particular group of students who do this across most of their enrolled subjects in UWS.	Students who utilize various the online tools of learning e.g. PowerPoint lecture notes, electronic discussion and telephone.

take care of double checking initial calculations, which if wrong often make the remaining part of the solution unrealistic.

From the students feedback on the fluid mechanics subject in UWS, few points are worth noting: (a) Only a handful of students return their feedback forms or complete online feedbacks (rate is about 25%); (b) Two diverse groups, one being highly satisfied with the subject delivery and the other are too unhappy; these are often linked with the top performing and low performing student groups, respectively; (c) Students do not buy and/or read the textbook rather depend on lecture PowerPoint slides which often provide only the synopsis of the lecture materials; (d) There are a few students who attempt to blame all the aspects of the subject; and (e) The overall student feedbacks in fluid mechanics subject is under the average UWS score. This is generally linked to the challenging nature of this subject, as this has not been changed even with the engagement of highly experienced and high-profile lecturers teaching in this unit in the past.

Figure 1 shows the results of the fluid mechanics subject in UWS during the last three-year period. There are a number of interesting observations that can be made from these results. In year 2013, the number of high-performing students (i.e. receiving high distinction (HD), distinction (D) and credit (C)) are notably higher as compared to the previous two years. This might be attributed to the more student-centered approach of teaching that was adopted in 2013 as compared to the previous two years. It should be noted that in 2013, students were asked to solve problems in the class before other students, which assisted the student who was solving the problem as well as the fellow students. Also, students were working on small groups to solve the problems and consulting with the lecturer with their difficulties in greater numbers in year 2013 as compared to the previous two years. It should be noted that in year

Figure 1. Student performances in a three-year period in the fluid mechanics subject in University of Western Sydney, Australia

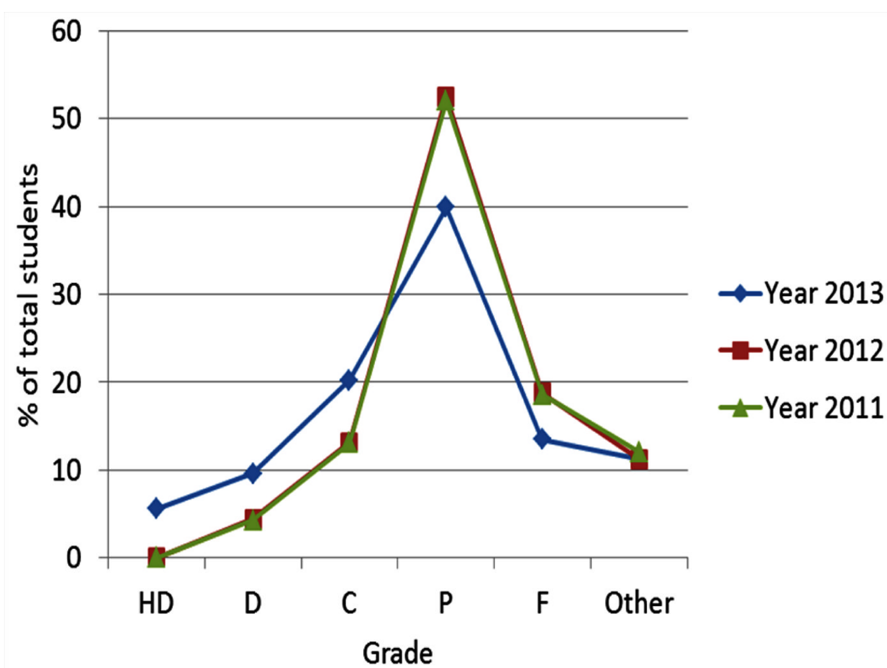

Table 2. An enhanced student-centered approach to deliver fluid mechanics subject in UWS in future years

For Students	For Subject Coordinator	For Lecturers/Tutors	For Lab Teachers
Show genuine interest in self-learning by forming peer groups and working together throughout the semester.	Set up a large practical project such as a catchment where water is to be managed for ensuring sustainable water use e.g. supply for drinking, environment, flood control and electricity generation, and identify different sub-tasks which can be solved after every two weeks using the knowledge gained in the preceding two lectures.	Help the student peer groups to solve the problems in each tutorial class.	Provide clear direction how to write a good lab report. Show examples of the best and poorest lab reports from previous years.
Prepare an equation notebook to put all the new equations from each lecture and their variables and units.	Organize periodic feedbacks from students e.g. in weeks 3, 6 and 9 and identify students with learning difficulties much earlier and offer these students special assistance.	Set up optional two-hour block every week for helping struggling students.	Encourage students to ask more questions on the experiment they are doing.
Work out in a group to derive units of measurements of all the adopted variables.	Change the text book so that the new book has interactive tutorial solution facility such as Wiley-Plus book.	Organize on-line quiz tests on very basic materials of the subject.	Discuss with the subject coordinator about possible questions the students might ask to build a lab question bank.
Overcome the shyness in asking questions to lecturers by various means e.g., using twitters, emails and face-to-face sessions.	Put practice questions beyond tutorial problems. Also put practice class test and final examination questions in the web.	Organize information day on the 'common mistakes done by previous students'.	Know students by names and befriend with them.
Befriend with lecturers by knowing each other and removing barriers in communication.	Organize 'help-out day' before the test weeks.	Know students by names and befriend with them.	Encourage student to take photographs of the experiments and to put these in student portfolios.
Know subject coordinator, lecturers, tutors and lab teachers by name.	Know students by names and befriend with them.	Check student tutorial solution books and see where the students are struggling and help the students accordingly.	Select 'catch-up day' for those who missed the labs for genuine reasons.
Buy and read the text book when a concept cannot be understood from lecture notes.	Reward students who perform better by certificates and engaging them in peer mentoring.	Post tutorial solution immediately after the tutorial day.	
Utilize free on-line learning materials in YouTube e.g. Khan's academy on-line materials.	For students missing the class test, organize alternative tests.		
Understand and discuss with peers about various assumptions and how some of these assumptions are relaxed in solving a complex problem.	Make recorded lectures available to students.		
Diary in the key dates e.g. class tests and labs.	Organize peer feedback from fellow lecturers.		

2013 only one lecturer delivered all the 12 lectures; however, in years 2012 and 2011, there were two lecturers each delivering 50% of the lectures. The results of years 2011 and 2012 are very similar, which might be due to the fact that lectures and the method of subject delivery were very similar in these two years. The percentage of failure in 2013 is about 5% smaller than the previous two years. Interestingly, the number of students who received absent/fail or incomplete grade are very similar in all the three years.

These results in Figure 1 suggest that an enhanced student-centered approach of delivering fluid mechanics is preferable to the more traditional lecturer-centered approach. It is thus argued that fluid mechanics subject delivery should be updated with a blended learning approach which is likely to offer increased student learning in the future years. In this regard a number of strategies could be adopted as summarized in Table 2.

The major thrust of the proposed student-centered approach is to introduce new components in the subject that would encourage students to be more proactive in learning e.g. taking active parts in class and on-line activities, identification of student's own weaknesses in the subject and seeking early help from the tutors/lecturers/unit coordinator to overcome his/her own learning difficulties. Also, the students should engage themselves in solving the practice questions so that their performances during formal examinations are improved.

To introduce the proposed new student-centered approach of teaching fluid mechanics, the subject outline will be modified and the assessment tasks will be redesigned to suit the on-line learning and assessment requirements. The effectiveness of this new learning method will be monitored via a number of student surveys to be conducted throughout the semester.

CONCLUSION

This chapter provides a review of teaching and learning of fluid mechanics in the undergraduate engineering courses using various methods of teaching and learning. From the literature, it has been found that teaching of fluid mechanics and similar subjects would be more effective when different online and project-based sources/methods are adopted. Based on three years of data from University of Western Sydney (UWS) in Australia, it has been shown that an approach supported by student-centered methods of learning is more effective in teaching fluid mechanics contents as compared to a lecturer-centered approach. Based on this finding, an enhanced student centered and blended learning method and associated strategies are formulated that would be examined in the near future for their effectiveness in delivering fluid mechanics subject in UWS. The approach can also be adapted to other universities in Australia and other countries.

ACKNOWLEDGMENT

The authors would like to acknowledge the University of Western Sydney (UWS) for the data used in this book chapter, to Professor Simeon Simoff, Dean of the School, for encouragement, to Associate Professor Surendra Shrestha for guidance on fluid mechanics teaching at UWS, Associate Professor Firoz Alam for his encouragement and Tarek Rahman and Sumya Rahman for editorial assistance.

Chapter 61
The Role of Blogging in a Changing Society: Theory, Practice, and Implications

Efi A. Nisiforou
Cyprus University of Technology, Cyprus

Nikleia Eteokleous
Frederick University, Cyprus

EXECUTIVE SUMMARY

Educational blogs have remained a noteworthy component, even in an age of rapid technological development. The chapter makes an in-depth description of the blogging phenomenon as it tackles the most important findings of the international literature. It provides insights into the connection between teacher identity, within the context of higher education, by incorporating aspects of theory and practice. The practical tone reports on three case studies on the use of blogs in education. A set of evaluation criteria on blogging for educational purposes and a theoretical framework for utilizing blogging as a problem solving approach are addressed. Moreover, it stresses necessity for the development of a pedagogical framework that will guide blog integration as a learning-cognitive tool in achieving specific learning outcomes. The results underscore the importance of essential training for the effective implementation of educational blogging in teaching and learning environments. A compendium of terms, definitions and explanations of concepts are clearly explained.

INTRODUCTION

The chapter focuses on the use of Blogs in Higher Education, and blogging as a Web 2.0 activity. Blogging was chosen because of its unique affordances, which are further explained in a subsequent section. It provides a synthesis of the literature in the field alongside two illustrative examples of how this tool is being used to support evidence-based practices. It draws out the benefits and potential that this appears to offer as an instructional and research tool in the frame of learning and teaching, and highlights the challenges and future implementations on teacher education. The review provides three case studies, which are reported elsewhere (Nisiforou & Eteokleous,

DOI: 10.4018/978-1-4666-8246-7.ch061

2012; Eteokleous & Nisiforou, 2013) and serve as the illustrative examples of the chapter. The case studies focus on the evaluation of blogging criteria on a basis of educational practice, which facilitate the online teaching and learning process. The contextual examples explore the extent to which blogs facilitate the educational practice by promoting communication, discussion, sharing of ideas, reflections on learning and teaching and the potential of blogs to be employed as pedagogical tools in higher education. The locomotive objective of the chapter is to draw on the existing body of background literature in this domain and synthesize empirical evidence on the usage of blogging in pre-service teachers' education.

The use of computer technologies in education is not a new research field, however due to the technological growth it has changed its shape and become more sophisticated in supporting the teaching and learning process (Cakir, 2013). While a wealth of literature focuses on learners' experiences regarding the benefits of blogs in higher education, this work is adding to this field from a less-reported angle; that of examining and defining blogs evaluation criteria from an educational perspective. This perspective lacks real evidence of empirical pedagogical blogging with reference to pre-service teachers' experiences within the framework of educational blogging, showing facts of their perceptions towards the affordances of blogs in teachers' practice and experience within today's educational milieu. The in-depth case studies that follow provide more specific indicators of the extent to which blogs can promote and facilitate the development of blended collaborative learning environments, by proposing the design of a possible valuable theoretical framework. Specifically, the practical part of the chapter seeks to examine blogs' potential to be integrated as tools that will provide a forum to share, discuss, reflect, exchange ideas and opinions, argue, provide feedback, and experience; essential ingredients of real learning. In doing so this serves the dual purpose of building and strengthening the identities of both learners and teachers. Furthermore, the stages of development in the formation of online identities are the same in blogging as the steps found in the use of Virtual Learning Environments with those stages presented in the form of a pyramid in Salmon's (2000; Wallace, 2003) work on the five stages of development in online socialization. There is insufficient theoretical background on the framework to guide the identification and evaluation of blogs' content, activities and purposes when developed for educational use. Due to the lack of previous studies, the current chapter aims to provide its audience with adequate information regarding the possible guidelines and indicators (criteria); an attempt to develop a pedagogical framework in identifying the real benefits of blogging for educational purposes.

BACKGROUND: WELCOME TO THE NEW WORLD WIDE WEB

Computers have played a variety of roles in classrooms for over five decades, and their use evolved from "learning from computers," to "learning about computers," to "learning with computers," or in other words "computers as mindtools" (Dexter, Ronald & Becker, 1999; Jonassen, 2003; Eteokleous,2008). With the rapid diffusion of the Internet, new approaches to learning were created (Crosta, 2004), and as a result, the steady increase towards the interest in the development and use of online learning (Dabbagh & Kitsantas, 2004) to provide anytime and anywhere learning. Specifically, the technological advancement in information technology and telecommunications resulted in the development of the Web 2.0 and created the appropriate framework for user participation. In Web 2.0, users are Contributing, Collaborating, and Creating; the three key factors known as the 3C's (Ala-Mutka et al., 2009). Various online tools have emerged such as blogs, wikis, discussion forums, online collaborative documents, online sharing of documents, pictures and videos, podcasts, RSS feed etc. Millions of people use a selection of social and professional networks that are not limited to Facebook, MySpace, Twitter, Delicious, Flickr, LinkedIn and Live Journal. All of these tools have helped shape an interaction and interplay of identities between the worlds of online and offline realities, so that the borders have almost become blurred between them.

Nowadays, with the advent of Web 2.0, the internet has become truly interactive. The aforesaid tools and networks are outstanding examples of how definitions, ideas, photographs, videos and general multimedia tools can be shared over a powerful Web 2.0. Technology offers a realistic, visually compelling, and motivating interactive environment for developing the life skills and knowledge needed for today's globalized, hi-tech environment (Goddard, 2002). Additionally, technology serves for the enhancement of the 21st century's skills; vital abilities for individuals' success in the today's world, such as critical thinking, problem solving, communication and collaboration. Web 2.0 technologies have become essential tools of daily life and a crucial part of students' personal knowledge tools (Lee, Miller & Newnham, 2008). Consequently, the Web 2.0 tools can be educationally exploited for teaching and learning purposes towards achieving educational objectives, thus transforming social to educational networking.

The era of Web 2.0 technologies has harnessed social networking (O'Reilly, 2005) and became an important tool of daily life and a crucial part of students' personal knowledge tools (Lee et al., 2008). It is notable that working with Web 2.0 tools in general, and these features in particular, require specific knowledge (Baumgartner, 2006) as a part of individuals' continuous professional development.

DEFINITIONS OF KEY TERMS: INTRODUCING BLOGS

The origins of the blog (Blood, 2004) have emerged from the short term of "web log;" an online chronological collection of personal commentary and links that was first used by Barger (1997) and then by Merholz (2002). A blog is a website that is maintained by an individual or a group where readers can comment on blog posts to supply more information and discuss various issues (Allen, 2011). A person who owns a blog is called a blogger and the actions communicating within its environment are known as blogging (Hill, 2004). Most blogs are mainly textual, but there are also audio, video and photo blogs. There are many different categories of blogs: personal, professional and educational. Blogs are considered as one of the most important and popular tools of the Web 2.0 toolbox (Richardson, 2009) and blogging has become one of the most popular Web 2.0 activities. Blogs contain text, graphics, images, videos, and hyperlinks to other websites. Bloggers comment on the posts, discuss, argue and provide their opinions. Blogs create conditions for interaction, reflection, ideas' exchange and discussion (Zawilinski, 2009; Sim & Hew, 2010; Petko, 2011).

Even though they were around for years, they recently emerged as popular means of communication, discussion, collaboration and information sharing; affecting public opinion and mass media. It is supported that blogs have educational value given their characteristics and the opportunities provided to users (Richardson, 2010). They provide teachers and students an interactive platform where text, images, and links to other blogs, or web pages, are posted, mostly focusing on a particular subject. Blogs are most popular among students since they are virtual, and can be worked at any time and place (Richardson, 2010). It is extremely beneficial to integrate Web 2.0 tools; in this case blogs, as learning-cognitive tools, to add value, enhance the teaching and learning process and promote the development of higher-order thinking skills. Given that 64% of the teenagers that use the Internet are considered "content creators" (Lenhart et al., 2007), there is a potential argument that we should take advantage of this and transform "fun" into learning. Therefore, being part of our students' digital world might be more possible to raise their interest, motivate them, transform the classroom environment, and properly prepare them for the rapidly changing information society's needs and demands (Eteokleous & Nisiforou, 2013). Based on the aforementioned and the extended use of blogs in various educational levels and subjects, numerous concerns arise in regards to pre-service teachers' appropriate preparation to design learning environments enhanced by blogs, where real blogging is achieved. While different categories of blogs (e.g. personal, professional and educational) comprise particular characteristics that serve diverse purposes and mostly for the achievement of specific learning goals, in the next paragraph we focus in particular on a delineate description of four types of blogs; Blog as Online Course Tool, Blog as Discussion Forum, Blog as a Research Tool, and Blog as cognitive-learning tool.

Blog as Online Course Tool

This type of blog aims to support class work in both formal and non-formal ways. The instructor from the one side posts assignments, announcements, information, and summaries of lessons. On the other side, students share their learning experiences and post their thoughts to the instructor and peers through course blogs. Therefore, this is helping to develop and solidify their identity as learners, bringing the learning experience outside of the classroom, which is in turn changing teacher identity. The teacher's role is no longer restricted to the traditional classroom in this digital age. As a consequence of learning technologies such as blogs, teachers have become practitioners of blended learning.

Students post examples and exercises related to course essays as well as discussing reflections on course materials. Additionally, blogs of this kind could facilitate extended discussions beyond the classroom sessions. In a study conducted by Lin and Yuan (2006) a blog was used as a reflective learning platform by engineering students.

Blog as Discussion Forum

The blog acts as a forum where students discuss and exchange information related to the course's subject, lectures, assignments, announcements, and readings (Makri & Kynigos, 2007). Additionally, students can share and exchange information, thoughts and ideas on their learning; thus developing their metacognitive skills (Nisiforou, 2009). Yang (2009) reports that student-teachers (in other words pre-service teachers) made use of the blog as a platform to discuss about teaching theories and to critically reflect on their learning processes, whereas Deng and Yuen (2010) have proposed an empirically grounded framework for educational blogging that highlights self-expression, self-reflection, social interaction, and reflective dialogue. Ebner, Lienhardt, Meyer, and Rohs (2010) examined the use of microblogs (blogs via web interfaces and mobile devices) and come up with the finding that microblogging should be seen as a completely new form of communication that can support informal learning in places other than classrooms.

Blog as a Research Tool

Appropriately designed blogs can be used as a powerful tool for supporting academic research and can constitute a platform for literature review for academic purposes (Mejias, 2006). Paulus and Spence (2010) used blogging groups to promote student learning and conceptual change through reflection and interaction in blog conversations. They found that the blog conversations were very useful to the instructors as a source of data on students' understandings and misconceptions of course topics. These misconceptions could then be addressed with further instruction. Some studies examined students' thinking skills or level of reflection by analyzing the contents of their blogs (Hall & Davison, 2007; Loving, Schroeder, Kang, Shimek & Herbert, 2007; Stiler & Phileo, 2003). Thus, this allows for teacher research and academic identity to be shaped by the informal needs analysis or highlighting of needs that occurs through analysis of blogs.

Blog as Cognitive-Learning Tool

Eteokleous and Nisiforou (2013) attempted to define blogs as cognitive -learning tools and examine their role in the teaching and learning process as well their effectiveness in achieving specific learning objectives. Specifically, they suggest that when blogs are successfully integrated as learning-cognitive tools within the teaching and learning process, they have a significant role and promote the achievement of specific learning objectives. The current chapter presents examples of blogs' integration as learning tools and their contribution in achieving specific learning objectives where blogs provide a practical online platform for discussions that hastens the acquisition of knowledge and learning (Liu & Chang, 2010). Along the same lines, blogs give space to students to reflect and publish their thoughts and understandings, opportunities for feedback, scaffolding of new ideas, as well as collaborative learning. Blogs also promote the development of higher-order thinking skills (Nisiforou & Eteokleous, 2012) and improve flexibility in teaching and learning. According to Oravec (2002) blogs encourage self-expression and collaboration, which in turn are reflected in enhanced critical thinking skills (Eteokleous & Nisiforou, 2013). In line with these, the findings of another study indicated how blogging can promote higher order thinking (Zawilinksi, 2009). Additionally, a blog offers extended interactivity, increasing students' involvement and motivation (Eteokleous & Pavlou, 2010). Finally, students can receive instant feedback from the instructor, peers, and other visitors, which enhances learning efficiency (Kaplan, Piskin & Bol, 2010).

THE CHALLENGE OF BLOGS IN EDUCATION: TEACHING AND LEARNING

Given the educational potential of blogging and the positive impact on teacher identity, numerous educators have already started using blogs in the classroom. Blogs can be integrated as educational tools across the curriculum, from primary to higher education, achieving collaboration among students and educators even in different schools and countries. Many studies have explored the features and educational benefits that blogging offers to students, and discussed the major uses for blogs in education (Downes, 2004; Siemens, 2005; Richardson, 2006; Churchill, 2009). Specifically, these studies have examined blog integration in the teaching and learning process evaluating the learning value of blogging (Chen, Cannon, Gabrio & Leifer, 2005; Makri & Kynigos, 2007), i.e. for group teaching (Hanson & Dent, 2011), collaborative learning (Bartolome, 2008) and web-based collaboration (Grassley & Bartoletti, 2009).

Additionally, blogs feature hyperlinks, which help students understand the relational and contextual basis of knowledge, knowledge construction, meaning making and the experience of connective writing (Penrod, 2007; Richardson, 2009; Liu & Chang, 2010). Blogs' integration in higher education is growing rapidly (Weller, 2007), having a remarkable potential to transform the teaching and learning process (Williams & Jacobs, 2004, Maheridou, Antoniou, Tsitskari & Kourtessis, 2012). According to Oravec (2002) blogs encourage self-expression, reflection processes, and collaboration, which in turn are reflected in enhanced critical thinking skills and writing skills, as well as the opportunity of building an strengthening a learning community (Brahm, 2007). A blog offers extended interactivity, increasing students' involvement and motivation (Eteokleous & Pavlou, 2010). Students can receive instant feedback from the instructor, peers, and other visitors, which enhances learning efficiency (Kaplan, Piskin & Bol, 2010). Blog participants perform connective writing since they need to read carefully and critically, and develop context that is clear, organized, and convincing. There is a synthesis of ideas, self-evaluation, and reflection. Experiencing blogs writing promotes critical, analytical, relational and creative thinking. It also combines collegiality and social interaction, developing working and social relationships among teachers, educators and professionals (Davis, 2005; Richardson, 2010).

Another study (Eteokleous, 2011),clarifies how students become educational content creators by the development of student-centered environments, having an increased role in the teaching and learning process when blogs are used as educational tools, while highlighting the importance of the instructor's role in a blog learning environment. Glogoff (2005) underlines that the instructors should be aware of the delicate balance between the synchronicity of time and place on the one hand and the need to keep discussions focused on the topic. Kim (2008) points out that the success of the system relies on teachers' capability in providing the appropriate resources. Thus, one can suggest that although teaching and reflecting through blogs constitutes an effective medium for teaching, it must be applied in a proper way with the direction of the instructor as a means of fostering the best teaching practices (Karaman, 2011).

Several researchers have shown blogs' potential to be used as effective social teaching and learning methods in the classroom environment. Williams and Jacobs (2004) examined the potential of blogs in higher education and concluded that blogs can provide students with a high level of independence. Another study conducted by Ellison and Wu (2008; Top, 2012) analyzed student perceptions of blogging in the classroom and came up with the finding that students enjoyed certain aspects of blogging. Moreover, Goktas (2009) analyzed pre-service teachers' perceptions and experiences in blog-supported ICT lessons. The results demonstrated that pre-service teachers believed that blogs can be used as an effective instructional tool (Top, 2012).

VALUE, IMPORTANCE AND USEFULNESS: EDUCATIONAL BLOGGING

Blogs are open, interactive and user friendly having many hallmarks incorporated such as organization of posts and commentaries, permanent links etc. which have dominated the discussion about educational blogs and their potential for teaching and learning. Educational blogs are currently gaining popularity in schools and higher education institutions and they are widely promoted as collaborative tools in supporting students' active learning. Educational blogs have become a noteworthy component of many web-based learning environments as they provide a practical online platform for discussions that hastens the acquisition of both knowledge and learning. Therefore, integrating such a web-related communication tool as blogs for enhancing the teaching and learning process is a great challenge for educators.

Additionally, well-designed educational blogs can empower and motivate both tutors and learners. Blogs can therefore act as powerful personal learning portals (Angelaina & Jimoyiannis, 2012) and can work both as personal and group platform-publishing areas in which participants can exchange thoughts, share ideas and opinions, insights, comments, feedback and recommendations with fellows.

Angelaina and Jimoyiannis (2012) reported blogs' pedagogical affordances:

- Enhance participation and interactive communication opportunities (Angelaina &

Jimoyiannis, 2012, promoting both individualized (Cottle, 2009; Pinkman, 2005; Shifflet, 2008) and group reflection on learning experiences.
- Promote critical thinking and increases learner autonomy (Richardson, 2006).
- Motivate students to engage positively in the writing process (Barrios, 2003; Cottle, 2009; Shifflet, 2008; Trammel & Ferdig, 2004).
- Facilitate student collaboration within a community of learners (Nardi et al., 2004; Nelson & Fernheimer, 2003; Stanley, 2006).
- Support authentic learning tasks through peer assessment and formative evaluation of student work (Angelaina & Jimoyiannis, 2012).
- Encourage and support blended learning activities by effectively changing formal and informal learning.

Due to the above features, educational blog becomes a significant element of many web-based learning environments since it provides a useful online platform for discussions that accelerates the acquisition of both, knowledge and learning. Therefore, integrating such a web-related communication as blogs for enhancing the teaching and learning process is a great challenge for educators. Due to the lack of theoretical frameworks on the evaluation criteria of educational blogs, this chapter will serve as a frontrunner in investigating and analyzing the effectiveness of blogs as an instructional tool and distinguishing this from the other forms of blogging; an endeavor to provide some possible indicators towards this new promising challenge.

BLOGS EVALUATION CRITERIA

In the literature sundry criteria are given in order to identify and evaluate real blogging. Specifically, in Gill's (2006) taxonomy of asynchronous discussion board technologies, there are some indicators presented to rely on when assessing the effectiveness of discussion boards for pedagogical purposes. These include: (a) kind of participation (whether is voluntary or not), (b) student satisfaction, (c) measures of educational outcomes, and (d) the degree to which a discussion group meets its desired objective. In addition, McCowan, Harper and Hauville (2005) refer to accessibility, insight into the cognitive ability (thinking processes of students), greater ownership of learning and self-empowerment, self-assessment, as features provided by blogging. Conole's (2007) Learning Activity Taxonomy identifies 72 possible learning tasks including: analyzing, creating, explaining, listing, refining and summarizing. Other researchers' ideas for evaluating blogs focus on measuring students skills (Valenza, 2004), cognitive abilities (EET, 2005), blog's content quality (Schrock, 2006) and the Community of Inquiry (CoI) model in educational blogs (Garrison et al. 2000, 2001) to blogging activities by comparing blogs' features with those of threaded discussions.

Studies conducted by Angelaina and Jimoyiannis (2012) and Eteokleous and Photiou (2012) employed the CoI framework in relation to blogs integration in the teaching and learning process. The results revealed the role of blogs in developing and promoting a CoI within a blended learning environment in primary and higher educational settings. Additionally, the efficacy and the applicability of the CoI model in educational blogs were revealed; showing that the students actively participated by creating a CoI learning environment exploiting blogs affordances. The outcomes of a study conducted by Nisiforou and Eteokleous (2012) reveal blog's potential to be integrated as a learning tool since real pedagogical blogging has been accomplished on a satisfactory level based on Bloom's Digital Taxonomy (EET, 2005). The findings have also showed that students' blogging behaviors were varied and depended upon the way in which they addressed each of the elements of the Bloom's taxonomy. It is noteworthy to understand the differentiation between writing and blogging as well as the degree of blogging (simple, real and complex) and the types of blogging activity (no blogging, simple blogging, real blogging, and complex blogging) as Richardson (2009) mentioned, in order to be able to define and therefore appraise the educational blogging.

The following activities cannot be characterized as blogging rather than writing: publishing exercises, keeping journals and adding / placing links online, or even placing links with descriptive annotation. Simple blogging is characterized by the types of activities that include "placing/ posting links with analysis that gets into the meaning of the content being linked" (Richardson, 2009, p. 31). Simple blogging (but complex writing) includes activities involving "reflective, metacognitive writing on practice without links" (Richardson, 2009, p. 31). Real blogging can be achieved through activities where "links with analysis and synthesis that articulate a deeper understanding or relationship to the content being linked and written with potential audience response in mind" (Richardson, 2009, p. 31). Finally, complex blogging is defined as the "extended analysis and synthesis over a longer period of time that builds on previous posts, lists and comments" (Richardson, 2009, p. 31).

DEVELOPING A BLOG

There is a selection of blog providers some of which are: LiveJournal (free), Blogger (free), Bravenet (free), WordPress.com (free), EduBlogs and TypePad. Blogger (www.Blogger.com) is an online service owned by Google and is one of the easiest methods of creating and publishing a blog.. For the purposes of the current chapter Blogger will serve as the preferred example choice among the others. This site publishes single or multi-user blogs created entirely by the user, and has quickly become the preferred option of many novice bloggers. If you are unfamiliar with the service this part of the chapter provides basic guidelines on how to set up an account and create a blog on Blogger. A step-by-step guide for launching your own blog is provided in Table 1.

BLOGS IN PRACTICE: CASE STUDIES

Rationale

Educational blogging turn out to be a significant element of several web-based learning environments as it serves as a useful online platform where discussions, exchange of ideas and thoughts can be formed. In that event, a blog can stand as an accelerator for both learning and knowledge acquisition. For the purposes of the practical session of the chapter, a case study approach was selected as the most appropriate method, because of the discursive nature of blogs which makes them suitable for this approach. Therefore, "a case study is a specific instance that is frequently designed to illustrate a more general principle; it is the study of an instance in action" (Cohen, Manion & Morrison, 2007 p. 253). Case studies strive to portray what is like to be in a particular situation, to catch the close up reality and thick description (Geertz, 1973b; Cohen et al., 2007). The two studies were concentrated on pre-service primary school teachers in Cyprus and the third study on PhD students retrieved from various fields of the technology enhanced learning domain. Therefore, the case study method was selected as the general model of the study, and is being presented thoroughly. The research studies that shape the scientific part of the chapter will provide adequate information for the research community, in the area of teacher

Table 1. Step blogging guide

1. Navigate to www.blogger.com using your web browser of choice.
2. Sign in using your Google Account to get started.
3. Create a Google Account, if you do not have one.
4. Verify and activate your account.
5. Enter a "Display Name" to be used to sign your blog posts and click "Continue."
6. Click "Create Your Blog Now."
7. Select a "Blog title" and an available URL for your blog. You can check if the URL you are considering is available by clicking "Check Availability."
8. Enter the word verification and click "Continue."
9. Choose a starter template, which will act as the basic design/layout of your blog.
10. Click "Start Blogging."
11. Use Dashboard to manage your blog.
12. Create new blog posts, edit posts, and edit pages using the "Posting" tab.
13. Create a Text Post (The "Posting" Tab).
14. Click on "The Settings" Tab.
15. Insert Gadgets - The "Layout" Tab.
16. Choose, adjust and format templates - The "Layout" Tab.
17. Edit Text Post - The "Posting" Tab.
18. Create an Image Post - The "Posting" Tab.
19. Go in the text box next to "Title" to find the title of your post.
20. Access basic text editor functions such as font size, text color, and the ability to insert links the "Compose" text editor.

education, on how primary school teachers experience a blog instrument as learning and teaching tool and from researchers' point of view as an instructional and research tool.

The three case studies employed are descriptive and evaluative (Yin, 1984; Cohen et al., 2007), in terms of their outcomes and fall under the umbrella of the educational blog use since they seek to explain as well as judge if real educational blogging is achieved throughout the tested evaluation criteria. A significant hallmark of this kind of method is that it offers to the researchers an insight into the real dynamics of situations and people (Cohen et al., 2007).

Acknowledging the nature of the inquiries and the objectives of this study which seeks to investigate how educators experience the use of blogs as an educational tool and evaluate a set of criteria in defining its pedagogical role, the case study was selected as the most appropriate method. Three different but closely related case studies were designed for the requirements of the phenomenon under investigation. The following sections take a research approach and present a summary of three published studies on educational blogging (Nisiforou & Eteokleous, 2012; Eteokleous & Nisiforou, 2013).

CASE STUDY 1: BLOGS AND COGNITIVE ABILITIES

Methodology

A sample of fourth year university students (n=63) retrieved from the Department of Primary Education of a private University in Cyprus participated in the current research study. Observations of the usage of blogs were employed as the main method for collecting the qualitative data of the study (Creswell, 2003). The pre-service teachers that were enrolled in the spring semester elective course, "Educational Technology," participated in the asynchronous online discussion and formed the basis for the study. Within the requirements of the aforementioned course, a blog focusing on the use of online social networks for educational purposes was set up. The research instrument and educational tool remained active for 5 weeks and included six questions regarding social media networks that were posted in the blog, allowing students to address the questions by posting their entries online as part of the course grading requirements. Yin (2009) suggested that when one is posting "how" questions it makes the case study method particularly appropriate.

Therefore, the study was aiming to address the following research questions:

- How can blogs be integrated as learning tools?
- How can Bloom's taxonomic levels be used in assessing students' learning process?
- How can Bloom's model be applied to evaluate and define educational blogging?

Results

For the purposes of the current study, the discussions developed in the first and second question were used. Students were also provided with the instructional practice evaluation guidelines and the participation criteria of the online discussion. The data were analyzed in regards to the blog's content with the use of the MonoConc Pro 2.0 Software and the Bloom's revised digital taxonomy. The blog's potential to be integrated as a learning tool was revealed; since real pedagogical blogging has been accomplished on a satisfactory level. The findings have also showed that students' blogging behaviors were varied and depended upon the way students addressed each of the elements of the Bloom's taxonomy. Despite the fact that the results have revealed students' positive attitude toward blogging, pre- and in-service teachers must develop fundamental knowledge and skills in order to appropriately design and develop educational blogs, fully exploiting their added value, and usefulness. Hence, effective learning will only occur if educators can rely on criteria in setting up an educational blog and therefore be able to effectively evaluate its content. This can be achieved through the university programs of study (for pre-service teachers) and continuing professional development (for in-service teachers).

CASE STUDY 2: BLOGS AS A COGNITIVE TOOL

Methodology

Introducing blogs as cognitive tools in the learning process is a great challenge for both instructors and students. The purpose of this study was to examine how blogs can be integrated as cognitive tools within a learning environment in order to achieve specific learning objectives. A case study approach was employed mainly collecting qualitative data from a sample of 40 blogs and lesson plans developed by 63, 4th year pre-service teachers (composed of 12 male and 42 female) attending the elective course entitled Educational Technology, during spring 2012. The pre-service teachers were requested to develop lesson plans for 6th graders, where blogs are integrated as tools within the teaching and learning process in order to achieve specific learning objectives. In particular, the theme of the exercises was Internet Safety. Analysis of the data was conducted using the MonoConc Pro 2.0 Software and the Bloom's digital taxonomy.

Therefore, the research objectives that shaped the study are:

- How blog can be employed in the teaching as a learning-cognitive tool
- How blog characteristics are exploited for educational purposes
- How "learning with real blogging," and "learning with technology" can be achieved
- How Bloom's taxonomic levels can be applied to evaluate and define educational blogging

Results

The findings revealed a twofold necessity in terms of educators' essential training and the importance for the development of a pedagogical framework that will serve as a guide for blogs integration as cognitive tools within the teaching and learning process (Eteokleous & Nisiforou, 2013).

Pre-service teachers developed interesting and motivating exercises for students to address, however those exercises did not educationally exploit blog characteristics. The exercises developed were grouped in three categories: blog-based, computer-based and in-classroom based. Categorizing the blog-based exercises developed based on Richardson's (2009) categories; the majority was classified as non-blogging and simple blogging activities. This was mainly revealed from examining the types of activities in comparison to the directions given to students. The pre-service teachers were providing simple directions to students as if they were requesting them to address an in-classroom or a computer-based activity. Moreover, through some of the designed activities, the blog was directed to be used as a forum to provide and publish students' opinions and views (Eteokleous & Nisiforou, 2013) although no opportunities were given to students to educationally exploit the tools and features of the blogs. Through the exercises designed, teachers promoted "blog journaling," that refers to the verb "understanding" of the Bloom's taxonomic level (lower order skills) and within the educational practice can be characterized as non-blogging (Anderson & Krathwohl, 2001; Richardson, 2009).

In short, the blog was integrated within the teaching and learning process as an educational tool to achieve the learning objectives, however its added educational value and benefits were not fully exploited. Specifically, the pre-service teachers did not manage to appropriately design exercises that exploit the characteristics and functions of the blog within the educational practice in order to reach learning with real blogging and higher order skills. This could only be achieved, if the appropriate directions and guidelines were developed for the students to follow (Eteokleous & Nisiforou, 2013).

CASE STUDY 3: BLOGS AS A PROBLEM SOLVING TOOL

Methodology

Based on the two aforementioned case studies, this study acknowledges the great potential of blogging and made an attempt to employ the interdisciplinary approach for problem solving through a blog-based environment. This methodological approach addressed a specific problem through blogs integration as tools that will enhance the development of blended collaborative learning environment. The proposed method was pilot tested in May 2013 during the 9th Joint Technology Enhanced Learning Summer School workshop on a sample of twelve PhD students from 6 different European countries before its implementation in Fall 2013. Following Hutchison's and Wang's (2012) directions for further research, students were classified into blogging groups based on their background rather than leaving them to comb through all blog responses. In an effort to determine how students might view the commentary added to their posts, they were asked to rate the paramount idea(s) on the given problem. A case study methodology was employed, mainly collecting qualitative data through blogs' observations (Creswell, 2003). The participants were split into 5 groups based on their educational discipline. The qualitative data collected was analyzed based on the method of continuous comparison of data (Maykut & Morehouse, 1994) employing MonoConc Pro 2.0 software. The blogs' observations were analyzed employing Susan Herring's Computer-Mediated Discourse Analysis (CMDA).

The research questions driven the study were as follow:

- How the blogs developed can be employed as tools in achieving:
    - Interdisciplinary problem solving process?
    - Collaboration in a blended learning environment?

Pilot Study and Preliminary Results

The findings were in line with the expected results since students posted their thoughts and ideas in their personal blogs regarding the problem given, based on their educational background and research fields. Both in the personal and team blogs the participants managed to present their ideas in an interesting and motivating way, integrating a variety of modes such as: multimedia tools, text, and links to other websites. An emerged result was that blogs were not employed to the desired degree, as more online discussions were expected to take place. The effective and successful exploitation of various blog's tools, functions and settings by the participants, facilitated the problem solving process. The participants expressed their personal views, thoughts discussions, and opinions firstly in a face to face mode and then posted online, where each team commented on the other team's posts. The workshop instructors were verbally encouraging and motivated the participants to discuss and post their ideas online (Eteokleous & Nisiforou, 2013). Through the suggested methodology approach (problem solving through the interdisciplinary approach) the study aimed to reveal the great potential of blogging in research as well as in teaching and learning into practice. Additionally, it was observed that the collaborative blended learning environment developed through the use of blogs, created the appropriate environment for students' interaction, dialogue and discussion. The preliminary findings determined the need for the instructor's further online active involvement in order to avoid the reputation of the aforesaid phenomenon (Eteokleous & Nisiforou, 2013). Finally, a remarkable finding was the development of a theoretical framework that provides visual information on how blogging and collaborative learning can lead to a solution in a given problem.

PROPOSED THEORETICAL FRAMEWORK

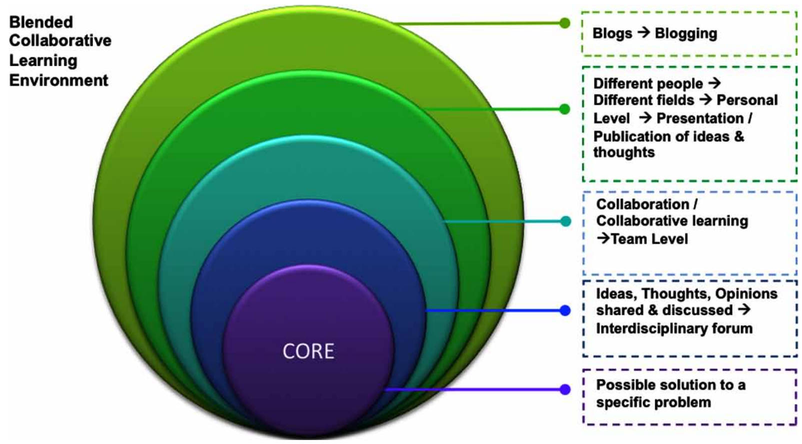
The theoretical framework (see Figure 1) presents the proposed methodological approach that aims to examine blogging as a problem solving process. Particularly, it suggests that the blog facilitates the development of a blended collaborative learning environment where the interdisciplinary approach is being employed. Moreover, it assists participants to move from the personal level to the team level in collaborating, discussing, sharing, interacting exchanging opinions and ideas as a mean to address a specific problem. The blended learning environment facilitates the progress of the development of an interdisciplinary forum, as it brings together people from various disciplines (interdisciplinary approach). Since a unique feature of blogs is that they enable both individual reflection and peer interaction, the proposed framework uses a blended learning approach as a mean to design and implement blog-based learning and teaching activities in the context of higher education. It is hoped that the suggested framework can support online learning environments and will help educators and instructional designers to determine effective teaching practices. Finally, establishing the current framework in the context of mobile technologies is of great challenge to today's educational milieu.

MAIN FOCUS OF THE CHAPTER

The three research studies of the chapter have stressed the need for:

1. A pedagogical framework to guide the development of blogs integration as learning-

Figure 1. Framework leading to a problem solving via blogging, collaborative learning and interdisciplinary approach



cognitive tools in the teaching and learning process aiming to achieve specific objectives. The existence of criteria and parameters to guide blog integration;

2. University programs of study (for pre-service teachers) and continuing professional development (for in-service teachers) that develop the necessary knowledge and skills to teachers/ educators to integrate blogs as cognitive-learning tools in the teaching and learning process to achieve specific learning objectives;
3. Blog' potential to be integrated as tools that promote and facilitate the development of blended collaborative learning environments where the interdisciplinary approach is being employed to address a specific problem.

Along the same lines, concerns are raised as to whether pre-service teachers are appropriately prepared to integrate and educationally exploit the blogs to achieve specific learning objectives and the development of higher order skills. If they are not in a position to design exercises that promote learning with technology, would they be able to put them into practice?

SOLUTIONS AND RECOMMENDATIONS

Overall, the target audience of the research studies of the chapter (pre-service teachers and PhD students) managed to successfully design blended learning environments combining in-classroom, computer-based and blog-based activities. It is therefore suggested that in order to fully exploit blogs' characteristics as effective educational tools in the teaching and learning process, educators and students should first realize its value and usefulness in their lives. The goal is to transform blogs into tools that will promote individuals' higher order skills (e.g. critical thinking, collaboration, communication, creativity and problem-solving) so they can freely express themselves and build upon other opinions and ideas. For the above to be achieved, appropriate training courses and seminars for different target groups need to take place in order to understand blogs' pedagogical value, usefulness and benefit to the teaching and learning environment. Finally, having been made aware of these essential features one will be able to appropriately design and integrate blogs as educational tools in their teaching and learning practice.

FUTURE RESEARCH DIRECTIONS

The chapter revealed blog potential to be integrated as an educational tool and its effectiveness in developing different levels of thinking skills. Specifically, the research section of the chapter highlights the potential of blogs as effective learning tools since real pedagogical blogging has been accomplished on a satisfactory level suggesting a set of criteria for educators to follow to set up a pedagogically valuable blog. Even though the study has concentrated on the practical affordances of blogs and their use as a platform for improved knowledge and practice, there could be further work done on how use of blogging impacts on teacher and student identity.

However, further analysis is needed in order to refine the parameters, criteria and indicators that distinguish the different types of blogging. Future research work needs to analyze blog content with the use of different content analysis tools such as Nvivo software. It is of paramount importance to examine educator's role as well as interview participants in order to gain insights on their perceptions regarding their blogging experiences and blogs potential to be integrated as collaborative content sharing spaces to support project-based learning activities. Furthermore, it will be interesting to conduct social networking analysis (SNA) by identifying the connection patterns between the bloggers, and therefore understand whether real collaborative learning has been achieved. Finally, an emerging trend within the domain of the examined topic is to establish the proposed framework in terms of educational blogging, in the context of mobile technologies. This is a challenge for other researchers to take into consideration as the implementation and the outcomes of such studies will contribute to our society's educational milieu.

CONCLUSION: EDUCATIONAL AND SCIENTIFIC SIGNIFICANCE

The research in this chapter has important educational, theoretical and research significance. Firstly, it reveals the pedagogical value of blogs and how effective real blogging can be achieved through a set of key evaluation criteria. The analysis of students' cognitive presence, ideas sharing and debating showed that educational blogs could be effective tools to support collaborative construction of knowledge. Consequently, this facilitates a crossover of teacher and student knowledge. Through better knowledge of students the teacher is more aware of what is needed in their own practice, and can shape their practice around the needs of students. Thus blogs also serve as a diagnostic tool, a research tool, and a source of classroom knowledge. Moreover, it proposes a methodological approach for problem solving where blogs are employed, to develop a blended interdisciplinary collaborative learning environment. Additionally, it adds to the body of literature related to blogs as tools within the teaching and learning process. Through the suggested theoretical framework it aims to reveal the great potential of blogging in research as well as in teaching and learning practice. This potential will help students to understand how these different disciplinary perspectives managed to create a collaborative spirit that encompasses their interdisciplinary backgrounds and research fields.

The challenge for educators is to determine how to appropriately integrate blogs into curricula to best meet their students' needs, as well as incorporate these new learning technologies into their own pedagogic identities. If teachers want to help and guide their students to achieve simple and real blogging it is extremely important to design and develop the appropriate exercises beyond facilitating the teaching and learning process. Practice is necessary to help them gain knowledge of how to design and integrate blogs effectively into new educational settings. Due to the lack of previous studies on the evaluation criteria of blogs as educational and cognitive tools, the research part of the chapter serves as a frontrunner in investigating and analyzing blogs through a pedagogical spectrum. The results of the case studies suggest that understanding the importance of implementing blogs in higher education will be a key topic for further research especially in the age of mobile technologies.

KEY TERMS AND DEFINITIONS

Blog: A Website allowing users to reflect, share opinions, links to other sites and discuss various topics in the form of an online personal journal. It is one of the most popular Web 2.0 tools.

Blogger: A person who keeps and updates a blog.

Blogging: The act of posting content or comments within a blog environment.

Educational Blogging: Blogging which is mainly focused on the educational process and educational interests.

Web 2.0: The transition from static Web pages to a more dynamic and organized Web with an emphasis on user collaboration, open sharing of information online, and social networking.

Chapter 62
Successful Cases in Technology-Enabled Active Teaching and Metacognitive Learning Strategies in Blended Learning for Globalization

Mohan Gurubatham
HELP University, Malaysia

ABSTRACT

This chapter draws from actual accredited graduate programs. It is essentially a reflection piece drawn from actual experience of successful teaching and blended action learning practices and principles that utilized online discussion forums. The classes were in Malaysia, the USA, and South Africa. The experience of teaching and learning involving metacognition and active online discussion internationally is described in terms of the cognitive literacy value chain developed by the author. Active discussion was seen as part and parcel of the process to nudge insights, critical thinking, and other expressions of higher order thinking that also facilitated peer bonding in very short, six-week semesters. The critical role of fluid intelligence in higher order thinking in a globalized knowledge economy is discussed in terms of the development of wisdom through the experience of transcending conventional thinking while sustaining refined thought processes and cultural values through metacognition. Sample comments and reflection journals are presented.

DOI: 10.4018/978-1-4666-8246-7.ch062

INTRODUCTION

The Need for Novel Thinking and Capitalizing the Opportunity in Education

In my experience as a professor from academia bridging the corporate consulting space I appreciate the need to highlight the emergent learning trends that have resulted from globalization and technology. A recurrent complaint from CEOs as friends, and students in my graduate programs is that MBA's and for other graduate management graduates the mere competency to comprehend texts, articles, and subject matter is inadequate. What then is deemed paramount and urgent? Perhaps the importance is the ability to connect pertinent business and industry themes inductively in order to effectively respond to global and industry drivers. Given a rapid obsolescence of knowledge it is no longer enough that learners comprehend texts, articles, and concepts. The ability to *learn how to learn;* to reflect and synthesize critically, and to process unfamiliar content is the future. Such intelligence is dubbed *fluid intelligence*. Metacognition is mindful thinking often involving fluid intelligence with reflection leading to wisdom. This chapter aims to highlight the salience of higher order thinking as an emergent theme in terms of the various strategies deployed to invoke reflection and metacognition. It is as such a *position paper* and not a specific controlled study partitioned into a one-to-one linear particularistic tracking of a specific methodology. In short, it is drawn from a constructivist paradigm of over 50 classroom cases of immersion into a *milieu* of teaching and learning procedures where online discussion is a major reinforcing component albeit not the only component in the process of active learning. The conclusions and samples are drawn from several classes over 4 years in 3 countries. The samples of refection and discussion selected represent the typical content. A formal systematic content analyses of each component and the coding of responses beyond rubrics is of course welcome. Nonetheless the overall emergent theme represents the prominence of discussion that occurs as an expressive opportunity from personal metacognition along with meditation in short 2-6 week time frames. The real world case based discussion may be difficult to control for in pre-and-post-tests because of social facilitation effects in any specific methodology with control groups. In addition. These classes presented themselves as rare and valuable international classroom settings with intact, formally enrolled learner populations on actual accredited courses.

THE SCIENCE OF INTELLIGENCE AND WISDOM

Fluid intelligence is the critical ability to learn new content and consider novel conditions. *Crystallized intelligence* is the retrieval or recall, and acquisition of prior content (Cattell, 1963). In the knowledge economy, fluid intelligence involves processing data into information and then into knowledge through to higher order cognitive activity results in both knowledge and wisdom (Gurubatham, 2005a). In cognitive psychology, wisdom may be operationalized into higher order and wider intelligence (Sternberg, 1985). Sternberg defines wisdom as creativity synthesized with intelligence, and empathy. Sternberg's balance theory of wisdom (Sternberg, 1998b, 2001), defines wisdom "as the application of intelligence, creativity, and knowledge as mediated by positive ethical values toward the achievement of a common good through a balance among self-interests (intrapersonal) with the interests of others (interpersonal) and of other aspects of the context in which one lives (extrapersonal), such as one's city or country or environment or even God" (Sternberg, 2009). Interestingly Sternberg's long and distinguished career in psychology began with his poor test taking abilities including conventional IQ tests, as he described, and the deleterious effects of the rote learning environments that under value wider and deeper intelligence. Wisdom can also appreciate and anticipate the practical impacts of decisions (Schwartz, 2011).

The hallmarks of such an approach to wisdom are being visionary spatially i.e., looking at impactful events in terms of places beyond immediate locations and boundaries (non-local), and temporally, i.e., beyond narrow short term thinking, having broad comprehension, inclusivity and scope (Izak, 2013), and a deep appreciation of decisional impacts (McKenna, 2004; McKenna & Biloslavo, 2011). Moreover the sustainable impacts of trans-disciplined longer term thinking of interconnections are also emphasized (Max-Neef, 2005) in modern 21st century international education. This is a central theme in modern education as it rises to meet the onslaught of globalization (Jorgenson & Shultz, 2012), and the pressures of a knowledge economy (Gurubatham, 2005a). Active discussion was found to be a major means to facilitate wisdom development involving fluid intelligence.

The ability to identify drivers impacting organizations along with the ability to recommend innovative solutions based on critical and inclusive thinking are essential. Traditional MBAs and textbook approaches may not adequately address these needs. The engagement of learners in topical issues related to the subject matter content in active discussion goes a long a way to develop critical and inclusive thinking. This then is the relentless demand in this 21st century of change and emerging markets, the value addition that commands a premium among human capital include higher value-added thinking that is capable of insights across themes, the adaptability to implement best practices company-wide and nationally, and the ability to enhance the relationship of business with relevant stakeholders and communities.

Legitimacy for the Learning Cases with Active Discussion

Change drivers and evolving trends in sustainability and government or international regulations are discussed in classroom settings that made use of e-learning enabled blended learning – for example, Moodle discussion boards – to help facilitate the *far transfer* of learning. Far transfer is understood as applying conceptual learning beyond the original learning contexts so that higher order principles with commonalties are gleaned, abstracted, and applied in a variety of seemingly unrelated contexts (Salomon &Perkins, 1989). Far transfer is effective in mitigating rapid obsolescence in knowledge and skills. Near transfer often involves the low road of learning with strategies by rote, pattern or template matching and impacts only a limited range of variability in the contexts from original learning. Behavioral learning is much like this.

Overall Approaches

The author applied active teaching learning strategies, involving metacognition, or reflective activity. The discussion and conclusions are thus not restricted to any one method alone. The overall active teaching-learning strategies as an approach subsume specific methodologies in these cases. Learner engagement is the underpinning of active learning where online discussion provides the un-moderated flat channel and space. Graduate courses were offered in the managerial psychology at HELP University in Malaysia and at Maharishi University of Management (MUM) accredited in the United States of America by the Higher Learning Commission and The International Assembly for Collegiate Business Education which is recognized by the Council on Higher Education Accreditation (CHEA). MUM also offers an action learning corporate MBA program for managers at Neotel, a telecommunications corporation in South Africa. All courses were taught in a blocks, or modules, in varied formats amongst the three venues, ranging from two to six weeks in duration but shared the commonalty of one subject matter module at a time. Especially remarkable was the steep learning curve in which students attained reflective and higher order thinking in the relatively *short 6 week* period of time.

Active discussion on the Moodle e-learning platform was found to reinforce the development of insightful thinking. Learning was encultured and encouraged as *Self exploration* with a *connectedness to community and cosmos* with the inclusion of affect. Emotional intelligence targeted values of the heart i.e., refined feeling levels in order to enculture not just higher order thinking but also practical wisdom.

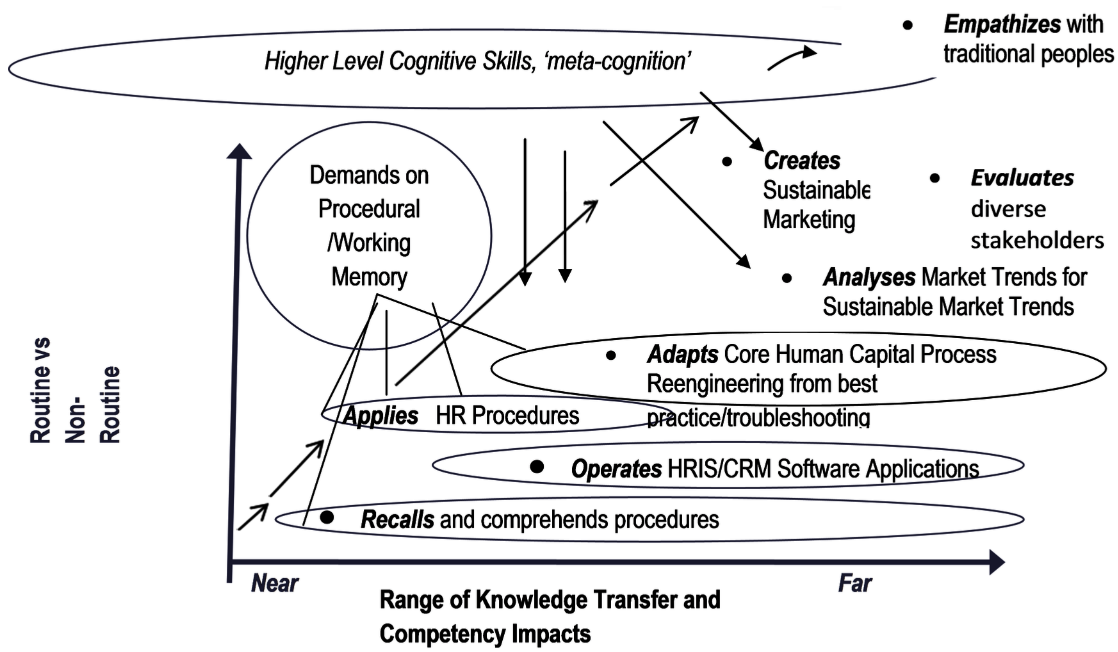
Oftentimes there is a need to disconnect from conventional narratives and wisdom. Learners also have to make practical, and sometimes hard, decisions in life. There is a need to be more than just aware, sensitive or merely just capable of reflection. All the courses included themes as a running thread such as ethics, spirituality, race, interfaith relations, and conflict resolution. Other themes covered were the ways in which globalization is oftentimes framed as mere consumerism and the ways in which sustainability has to go beyond just being green to include the preservation of cultural values and relationships.

Active Discussion on Moodle Forums

Course content was based on current topics and real cases, involving provocative cases with action syndicated learning i.e., learning by doing in groups, and an articulation of the thinking process through student presentations to the class with peer probing and feedback. Additionally, there was Socratic prompting, exercises in thinking on your feet', personal reflection in learning journals, and online Moodle discussion boards. The online discussions required each student to present at least two hot button topics and give insightful responses to two topics posted by other students. The postings had to include not just passive descriptions, but explanations of why the student found it personally interesting, how it could be connected to one's own Self, and how it might be culturally impactful in the 21st century. Learning this way was taking place beyond the classroom walls and enlivening engaged peers. High involvement and high interactivity were design features exploited to engage by information and communication technology (ICT) enabled learning (Gurubatham, 2005b). Interactivity is ergonomic or more concerned with the usability driven features of the Moodle environment. While involvement is psychological bonding triggered upon hot button interests in topics. Learning journals were entered from preconfigured electronic templates containing thought prompts.

The Moodle discussion boards provided a highly communal context. The initial rubric based grading of 3% was dispensed with and combined with reflection journals and face-to-face presentations of totaling 10%. The online discussion process also seemed to acquire a momentum of its own. As a result, at least on a small scale mini-scale, community simulations of networks were initiated and enlivened very much in the manner alluded to in Metcalfe's Law (Metcalfe, 2006). This law suggests that the value of adding additional participants to a network in a community increases exponentially if value is conceived of as insight spontaneously emerging from harnessing a diversity of viewpoints. This indeed appeared to happen. The discussion based learning was peer-driven, flat, and not moderated by the professor. Sample comments are presented at the end of the paper. There were instructions and a rubric for online discussion evaluation but the examples were samples drawn from over 30 classes in different settings and countries. Frankly, the rubric became less important over time as the author observed the buzz with refinement and respect evolving. Cultural reticence was overcome as the online discussion helped in breaking the

Figure 1. The cognitive literacy value chain



ice from direct face to face discussion. Insights and access to participation even for topics deemed too sensitive to broach in face to face discussions in sensitive cultures emerged. The online discussions stimulated the discussions even face to face.

Conceptual Model for Teaching and Learning

The core teaching and learning approach drew from the theory of high road learning involving metacognition by Salomon and Perkins (1989). Such an approach demands pushing the boundaries of concept application that transcend localized boundaries in time and space. Cross-cultural applications of best practices were mindfully and critically discussed both face-to-face and online, and explored for their current relevance. Figure 1 presents the schematic called the Cognitive Literacy Value Chain (Gurubatham, 2005a) and is followed by a discussion of the process of activation in the teaching and learning commonalities of underlying themes and principles. The cognitive literacy value chain is the model while online discussion was part of the process not the parcel, in blended learning albeit a major one.

Wisdom is at the uppermost level of the cognitive literacy value chain often accompanied with global insights. Wisdom is essentially deeper and wider thinking. Wisdom evaluates, empathizes, integrates, and subsumes the lower cognitive levels of thinking. This is the ability to integrate and evaluate that requires use of the lower levels of mental activity such as perception. More critically, wisdom's effectiveness rests on the ability to yield insight that derives from more than the sum-of-parts of data. This process, which can be modeled on hierarchies such as Bloom's Taxonomy, often involves affective and ethical dimensions of human judgment. Thinking was nudged out of the box and conventional narratives deconstructed from cases and topics, facts as declarative knowledge were presented, and actively discussed by the instructor while being available as electronic content. At the top right section of Figure 1 is shown, i.e., Non-Routine Thinking and Far Transfer Competency Impacts, Socratic prompts asked were "who are the protagonists" and "what are the drivers impacting an organization, a country, a region, and a culture." These were analyzed with appropriate tools by discussion and then prioritized and quantified. For example, the process of stakeholder mapping for conflict resolution was illustrated by involving a business case of a timber monopoly in East Malaysia, its business activities were threatening, traditional peoples such as the Penan; stakeholder values were carefully identified, explored and analyzed with strategic tools from both an industrial and from sustainable perspectives.

Unfreezing the given status quo schema of conflict began with a negotiation of interests and values, escalating to a consideration of rights, and culminating in the resolution of issues of power which were found to be positive, resulting in win-win outcomes for all parties. Etic and emic perspectives i.e., within the culture and neutral stances were exchanged by syndicated learners in stakeholder role analysis. Similarly, other stakeholders were identified and their roles scoped, for example, the logging company and its employees, shareholders, the state government, environmental activists, and sustainability conscious consumers.

Cases were explored from multiple perspectives through active discussions in both face-to-face and online forums. Engaging videos from different stakeholders' perspectives were presented and shared electronically as Youtube links. The use of this media for active blended learning engages and involves (Gurubatham, 2005b) learners by being able to see hear and feel the perspectives and emotions of different roles and contexts. Additionally the uses of central and peripheral routes of persuasion (Petty & Cacioppo, 1986) are attention arousing and engaging. Peripheral routes make use of graphics, audio, and music to attract attention. Central routes are more deeply cognitive to activate audience schemas by engaging with compelling narratives. High involvement and high interactivity were design features exploited in information and communication technology (ICT) enabled learning (Gurubatham, 2005b). Interactivity is ergonomic or more concerned with the usability driven features of the Moodle environment that provide the learners the functionality to respond, comment, and post. While involvement is higher order thinking and emotional bonding which is triggered upon hot button interests in topics. Additionally there were presentations of diverse viewpoints and role plays by learners. Evaluation, analysis, and the creation of plans and policies involved lively discussions, which were interactive, reflective, and oftentimes resulted in the unfreezing of the learners' unconscious assumptions and biases. Critical thinking within syndicated peer groups together with instructor coaching provided the checks and balances necessary when using strategic thinking tools in inductive learning. Online discussion boards on Moodle were not moderated, were respectful, and captured controversial themes.

The lower half of Figure 1 illustrates the more localized impact of *routine* thinking. Teaching and learning at this level does not have to invoke higher order critical thinking, nor does it have to unfreeze unconscious assumptions or biases – except, perhaps, for the purpose of adapting best practices to locally or organizationally specific needs. Troubleshooting is another example. Troubleshooting best practice methods can be stored in electronic repositories so that learners have only to read, understand, refer, and apply with coaching. Troubleshooting outcomes here emphasize procedural accuracy or *template matching* from *pattern recognition* paradigms. Troubleshooting skills require operational flexibility beyond routine thinking but not necessarily higher order thinking. They are low level and knowledge management is more appropriate, and not necessarily online higher order thinking discussion. The transfer of prior learning to current tasks is thus still relatively *near*. In the hierarchy of knowledge, data represents the lowest value of information. For example, much of Human Resource Information Systems (HRIS) today are procedural, and is enacted typically at an operational level that can be outsourced or automated by information technology so as to require little or no vigilance by human operators. In the 21st century, this level of the chain has little competitive advantage. For example, process checks in quality control can be automated.

This level of information processing involves the interpretation of data. Typical activities at this level include quickly recognizing critical quality parameters such as in statistical process control, inputting unique customer data in Customer Relationship Applications (CRM) while on-line, and recognizing key or salient customer information in call-centre tasks. These activities elicit perceptual competencies.

Generic Learning Format: Self-Exploration and Learning How to Learn

For the most part, classes were held on-site at three locations: MUM in the U.S.A., HELP University in Malaysia, and the Neotel Corporation in South Africa. The courses were short but intensive and included blended learning. At MUM, the classes were taught as part of the MBA in global strategic management and were comprised of blocks spanning from two weeks to four weeks. At HELP University, the Masters in Managerial Psychology had modules of six weeks. The Neotel Corporation in South Africa had a six week block.

In addition another modality, a meditative technique popularly known as Transcendental Meditation (TM) was learned and practiced by many students at Neotel in South Africa, at MUM in the U.S.A., and at HELP University in Malaysia. This was not a random assignment of subjects to meditation as a treatment variable, such as would have been the case in a formal comparative study with pre-test and post-test evaluations. The experiential comments below, which were reported by these meditating students, are explored in the context of unfreezing prior schemas to facilitate higher order thinking and creativity, to enable insight, transparent thought processes, and deeper and wider thinking. Empirically, there have been several controlled published peer reviewed studies on research in TM that have shown increased creativity and wisdom, or thinking out-of-the-box. What emerges as salient is the ability to process information as opposed to just recalling and recognizing learned data or information. However TM was also found to improve lower level perceptual cognitive tasks such as these. More importantly however is the ability to learn new content. Such ability as described is dubbed fluid intelligence. Processing data into information then into higher order cognitive activity results in knowledge and wisdom. This is a central theme in modern education with the onslaught of globalization pressures in the knowledge economy (Gurubatham, 2005a). Most mainstream standardized tests of intelligence test or IQ tests utilize both fluid and another type of intelligence called crystallized intelligence (Cattell, 1963). Crystallized intelligence involves acquired knowledge, is content based and where content can be revised. Fluid intelligence is process based and is said to be highly vulnerable to aging, (Lee et al., 2005) peaking at the early twenties. Therein lays the challenge for lifelong learning and nurturing productive human capital.

How can fluid intelligence be enlivened and sustained for the information onslaught posed by ICT? Also how can adaptation pressures be balanced with the wisdom of sustainability and preserving cultural integrity? A brief review of previous research follows.

Creativity was suggested to have been enhanced in TM practitioners (Travis, 1979; Jedrczak, Beresford, & Clements, 1985). Divergent thinking is highly correlated with low frequency EEG psychophysiological states of consciousness. Self-reports describe a process free of mood control and manipulation; rather, an innocent, fluid, and spontaneous experience. Again, highly relaxed states of consciousness in transcending are correlated with spontaneous creativity (Molle et al., 1996). The noted British psychologist Guy Claxton has argued that creativity is lost without an instinctive ability to access free-floating mental states (2002). In comparison, TM is reported to be a natural process of contacting the source of thought, which is experienced as a field of pure creative intelligence. Fluid intelligence, as well as general intelligence, has been found to significantly increase with TM as shown by longitudinal controlled studies and random assignments.

The practice of TM is found to: increase intelligence as measured by standardized tests (Jedrczak, Beresford, & Clements, 1985; Dilbeck et al., 1985; Jedrczak, Toomey, & Clements, 1986); develop culture fair intelligence as operationalized in terms of inspection time with control groups (Tim & Orme-Johnson, 2001); result in higher levels of moral reasoning as shown in longitudinal studies with children, as well as in studies with adult inmates in maximum security incarceration in California, according to Kohlberg's stage development mode as reviewed by Alexander (Alexander et al., 1993); and culture wisdom as shown in a 10-year longitudinal study (Chandler, 1990). Other studies on TM have shown increased field independence, which is indicative of perception that is not unduly influenced by the environment (Gelderloos, Lockie, & Chutoorgoon, 1987); increased flexibility of perception and improved verbal problem solving (Dilbeck, 1982); increased creativity along with increased fluid and culture fair intelligence (Dillbeck, Assimakis, Raimondi, Orme-Johnson, & Rowe, 1986; Tim & Orme-Johnson, 2001); and increased brain wave coherence, which is indicative of orderliness of thinking (Travis, Tecce, Arenander, & Wallace, 2002).

In this era of globalization, there is a critical need for higher order, or higher value-added thinking, facilitated by high road strategies such as metacognition. The pressures of globalization demand responses, or optimal responses, to meet the challenges of change drivers that are apparently relentless. What is needed, today, is the cognitive ability to synthesize from cultural schemata the patterns of shared norms and values that exist in latent groups, patterns that can be identified by using cues, appreciating other cultures with more refined values of consciousness, and being cognizant of the universality in humanity while being respectful of differences (Gurubatham, 2001). There is a need to be grounded in one's own transcendent Self while, at the same time, appreciative of the cherished and diverse values of cultural integrity and political sovereignty. Spiritual aspirations of this goal can be found in both eastern and western psychology. For example, Maslow (1971) refers to the Psychology of Being and the Veda or knowledge in Sanskrit espouses the value of transcendence and the essential unity underling diversity, which is expressed in the Sanskrit phrase *vasudeva kutumbutam*: The world is my family. Established in one's true transcendental Self beyond the ego in Being, one never feels threatened by outside influences. William James (1996) wrote of this same state of consciousness in the Pluralistic Universe. Also contributing to the conversation were Martin Heidegger (1962) and Soren Kierkegaard (1985).

CONCLUSION

Globalization and the relentless pace of technological evolution are exerting great pressures on the obsolescence cycles of crystallized, or acquired, knowledge, a dynamic that is commensurate with Moore's Law (Liddle, 2006) which states that raw computing power doubles every 18 months along with an exponentially increasing bandwidth and lowering network costs. The pressures of globalization in an information age are creating challenges for those who do not choose to keep up with the rapidly upgrading ICT as they become available. At the same time, those who choose to increase knowledge via interactive media are being given exponentially growing opportunities. New platforms are providing lower costs, greater reach, and user-friendly design features. More power in computer processing is enabling higher speeds, greater memory capacities, and increasing network bandwidth. Curiously, the ICT enabled outward-looking, global knowledge economy also demands that we turn inward and learn how to learn. Both self-knowledge and active engagement with other learners are necessary. Social media and online Moodle discussions give the student exposure to different perspectives and a potential for enriching value exponentially (Metcalfe, 2006). However, interactivity *per se* is not enough. A high level of involvement is required. Topics must be hot buttons that are close to the student's heart, engaging personal interests and values (Gurubatham 2005b). Using this strategy along with the lively discussion of such topics with peers, facilitates further insights into one's own values and outlook.

Overall, in the amalgam of classroom cases spanning 4 years and 3 countries, 80 percent of the students' attained mastery of concepts as measured in terms of the higher value added outcomes such as utilizing strategic management tools in scenario planning, analyzing, prognosticating and recommending strategies in contemporary global managerial psychology and business cases. As this is a position paper highlighting the emergent theme of higher order thinking, formal evaluations are not presented here because of space considerations. Nonetheless, all classes had ongoing and summative evaluations. At both HELP University and MUM, accreditation boards such as the Malaysian Quality Assurance and the U.S. Higher Learning Commission and The International Assembly for Collegiate Business conduct regular audits of the teaching and learning strategies with their formalized learning outcomes. It was noteworthy because many of the students had little or no prior knowledge of neither psychology nor business content in their prior majors. Often times the higher levels of strategic evaluation invoked a richer understanding of global business drivers, balanced with a fine grain understanding of diverse stakeholder psychology. Globalized content and active debate is enabled by blended learning that allows for reflection beyond the classroom walls, and forays into a virtual world via videos, and links to foreign websites. Frankly, the rubric of evaluating online discussion became less important over time as the instructor observed the buzz with refinement and respect evolve and reticence overcome with insights and access to participation even for topics deemed too sensitive to broach in face to face discussions in reticent cultures. The online discussions stimulated the discussions even face to face.

Sample Moodle discussion comments are presented below. Brief sample comments are culled from the reflection learning journals which students are required to document in a standard template are presented below. As stated at the beginning, no formal systematic content analysis was employed other than the rubric for insight and why it was important to the learner.

ACKNOWLEDGMENT

This paper would not have been possible without HELP University, Malaysia, Maharishi University of Management, USA, and the Neotel Corporation in South Africa.

KEY TERMS AND DEFINITIONS

Blended Learning: Combination of e-learning with face to face.

Schema: Cognitive structures that enable content assimilation.

Transcend: To go beyond or unfreeze from thought or boundary.

Constructivism: Active, iterative and eclectic approach to learning with instructor facilitation.

Metacognition: Reflective cognition.

Far Transfer: Application of learning beyond prior learning contexts essentially metacognitive.

Near Transfer: Application of learning narrowly locked into prior learning context essentially procedural.

Fluid Intelligence: Ability to learn apply novel concepts.

Crystallized Intelligence: Knowledge of prior learned content and process.

Re: Decoding Resistance to Change

by XXX from Malaysia - Saturday, 14 January 2012, 10:39 AM

http://hbr.org/2009/04/decoding-resistance-to-change/ar/1

As discussed, concepts are easy to understand but the resistance to change makes execution tough.

Attached article stated that even difficult people can provide valuable input when you treat their communications with respect and are willing to reconsider some aspects of the change you're initiating.

Supposed to have 5 ways in the article but because I am not willing to pay, we can only see 2.

Take a guess of what are the other possible ways that we can use employee's resistance to effect change more productively?

Re: Decoding Resistance to Change

by XXX from Zimbabwe - Thursday, 26 January 2012, 03:10 AM

There are key important issues that draw my attention from this article Catherine which according to my understanding are key issues worthy discussion. It seems the article is using the long route, only to explain the importance of communication when it comes to organizational change. People tend to think communication in the organization is as easy as it sounds familiar, however, in actual fact there are a lot of variations when it comes to the impact a vehicles of communication have on employees. The millennium generations may require some recent vehicles of communication like Facebook, organizational forums etc while the generation X and the baby boomers may still inclined to meetings, memos, notice boards etc. So in other words forms of communications should target all diverse groups within the organization. 2. Emotional intelligence sounds very key from the article, because it sounds like for a leader to understand others and even to influence others it requires a degree of emotional intelligence.

Free space for posting -> Why Change Is Necessary – Change The Road -> Re: Why Change Is Necessary – Change The Road

by XXX - Thursday, 26 January 2012, 02:06 AM

Wow, its metaphoric nature makes it more interesting. i remember a quote which i once came across which says he who rejects change is the architect of decay. The only human institution which rejects progress is the cemetery. In other words change is part of living humanity. Change will always stimulate the sympathetic nervous system of many employees because they don't want to move out of their comfort zones, and they cannot envision the future state.
We must learn to view change as a natural phenomenon to anticipate it and to plan for it, as the article expresses. The future is ours to channel in the direction we want to go. we must continually ask ourselves, "What will happen if...?" or better still, "How can we make it happen?". This cannot happen overnight, it requires commitment, determination, motivation and courage from the leadership to the whole organizational parts, structure and systems

Entrepreneurship is the highest form of philanthropy

by XXX Malaysia - Thursday, 4 October 2012, 10:45 AM

1. Dear everyone,

2. ***"Entrepreneurship is the highest form of philanthropy."***

3. This is a quote by Flip Filipowski, Executive Chairman and CEO of SilkRoad, during his recent interview on BFM radio. Filipowski is one of the world's most successful high-tech entrepreneurs, philanthropists, and industry visionaries.

4. He is also the former COO of Cullinet, the largest software company of the 1980's, and also the founder and CEO of PLATINUM technology, inc. Flip grew PLATINUM into the 8th largest software company in the world at the time of its sale to Computer Associates for $4 billion dollars, the largest such transaction for a software company at the time. Upside Magazine named him one of the Top 100 Most Influential People in Information Technology.

5. A recipient of Entrepreneur of the Year Awards from both Ernst & Young and Merrill Lynch, Flip has also been awarded the Young President's Organization Legacy Award and the Anti-Defamation League's Torch of Liberty award for his work fighting hate on the Internet.

6. **Interesting excerpts from the interview**

7. Values that guide him: "***Entrepreneurship is the highest form of philanthropy*** – if one is capable of taking the risk, start a business & creating jobs then one is doing more for society than one is capable."

8. "If you have the skills of creating jobs and engaging people, then you owe that to society to continue doing that than to retire."

9. **Is everyone meant to be entrepreneur?**

10. His opines that "It is not for everyone. It is a rare trait that involves the ability to stomach risk and the ability to eliminate all rational thoughts from your behaviour".

11. To hear more, here's the link to the podcast:

Re: Entrepreneurship is the highest form of philanthropy

by XXX Malaysia - Monday, 8 October 2012, 05:25 PM

Hi Fauzi,

Thank you for your response. You brought up a very fair point and one which has been and continually being addressed by the business & corporate communities. For the past couple of decades, there have been growing pressure by various stakeholders e.g. customers, consumers, NGOs, the local governments etc. for large corporations/businesses to be more transparent in the way they run their business and to be sustainable in all aspects of its operations – from mitigating its environmental impact, ensuring that it provides conducive working condition for its people, good governance and to ensure that the communities in which it operates are not negatively impacted by its operations.

Traditionally, successful business people, corporations, leaders have been too focused on the **social** component of Sustainability i.e. Corporate Social Responsibility CSR). You mentioned Foxconn & Apple, which is a good example! Terry Gou, CEO of Foxconn, dubbed "Samaritan of the Poor" is one of the greatest philanthropist, giving away millions annually to charity. You would not think that a person like him would jeopardise the health and safety of his people who helped grow his empire. However, as stakeholders are becoming more sophisticated, issues of appalling working conditions, poor labour practices at Foxconn factory in Northern China came to light and causes uproar among the public and also within the business community.

My personal view, if I may is that situation at Foxconn should not detract us from appreciating & reflecting on what these entrepreneurs through their multi-million businesses have done to the local communities by creating jobs, empowering its local communities etc. In running a successful business, there will inevitably be a trade-off, it is not about running a perfect business which should not cause any negative impact to the environment etc but it is about striking a good balance – which realistically is a very hard thing to do.

Re: Entrepreneurship is the highest form of philanthropy

by XXK Zimbabwe - Friday, 12 October 2012, 11:11 PM

Fauzi i like your insight there, I believe many companies they come in the camouflage of Job creation to acquire glory and honor in the heroic faces that misrepresent their actual faces of profit making, and as result their external image will cover up their environmental immorality in the name of making societal difference. This is definitely affecting sustainability as Dinor commented.

I remember in our previous module , we encounter a British Tobacco company that donated a lot of money for medicine related research. So this was done in the name of saint /saviour face of that company but with self interests to cool down anti tobacco campaign. So the bottom line of point is, an ideal entrepreneurial of our time, should be people of virtue and integrity who operates business with high ethical principles.

	Explore a Learning Experience…		
	Awareness	**Insight**	**Evaluation/Application**
Content (What)	I have a new perspective looking at entrepreneurs. Locus of control and the strengths concept were my interests of studies. The course emphasizing following one's bliss and differentiates a truly successful entrepreneur with a mere business owner triggered me to think further. Apart from that, probably because I am new to the module, I also learned concepts like value network, unique selling proposition and many more.	Internal/External- Believes that result is the cause of own action/thoughts or it is the result of luck/chance factors. I have always think that people with internal locus of control would be more successful as they will be more willing to make changes on their actions to lead to a more desirable outcome. I am glad that research proved the fact too. The concept about strengths changed my thinking paradigm towards a person's development. Other theories also served as a good reminder of what I have learned and also introduced me to more research concepts.	Although Rotter's loc research is quite old, I believe that if tested, it is still quite valid and reliable. Furthermore, researches could probably relate it with other factors, not just entrepreneurial success. I think that the strength theory pretty much changed my stand in education. I felt that our old education needs to be changed so that social problems can be reduced, people are not labelled as talented or slow. Slow learning is merely a sign of weakness and people should not dwell in it. The theory can also be applied in other industries, specifically how its learning and development training works.
Process (How)	I truly appreciate that I have the opportunity to learn the module in various ways and where most of the methods were fun and interactive. In both online discussion and classes, everyone was allowed to share freely and respect was showed, even between course leader and students. The reading was actually made easy as it was a short course and good reading materials have been handpicked and the only thing we need to do is just read! Reflection was also essential for me to often check my progress and clarify my thoughts.	The different models of learning allowed me to learn and think critically in different ways. I felt as if learning took place all the time as after classes, there were online discussions and brainstorming on group projects, I mainly learned much from course mates rather than theorists in books. Learning never stopped after module ends as to be frank, I still have some reading materials that I was not able to finish reading during the modules.	It allowed me to open my eyes to see how steep a learning curve can be in a short period of time. I am able to change my perspective towards a course, knowing that learning a lot does not equals to stress and reading dry materials. It can be very fun and interactive. I am pretty glad that this course is not based on analysing journals and concepts of research. It is true that sometimes researches are confusing themselves and one can be successful in another way.

	Awareness	**Insight**	**Evaluation/Application**
Apply into Personal and career development	I felt as if I am moving upwards a stairs pretty quickly, being able to see more things clearer as I go higher. Interestingly, I managed to go up higher by going deeper into myself and spend time doing reflection after learning something new. I am new in terms of career building and I am glad that I am learning so much to be able to adjust my views accordingly. Personally, I felt that I see how one can develop even further in various ways.	The influence is strong as I have not just learned the core concepts of entrepreneurship but it generally shifted my thinking paradigm and general perspective towards embracing learning and interaction.	It is reliving to know that many times spirituality plays a role too. It is important to pay attention to self and tune in with nature. I always feared that I may not know enough to live a better life, not knowing enough vocabularies to understand concepts but instead, it turned out that I have learned how important it is to not let words shape our thinking. It is true, our mind is too magnificent for us to label it's processes. Ironically, the process to succeed is simple enough, to summarize in words like "Just follow your bliss".

Table 2. Sample reflection journal from a South African manager MBA student

	Think of a Learning Experience in Relation to		
	Awareness	**Insight**	**Evaluation/Application**
Content (What)	The environment I have been exposed to for my entire career focused on the technical aspects of business – either operations or project management. Strategic Human resources brought about an awareness not just focusing on human resources in general but how this can be used in determining strategic direction for a given organisation. During the course schedule, we have become aware of fundamentals, concepts and processes to derive and prioritise these strategic initiatives. The beauty of this was how easily we managed to relate to internal challenges within Neotel. Working with large teams is indeed challenging as we try to derive maximum productivity, efficiencies whilst also trying to keep them constantly motivated. Highlighted in the process was competency levels – where we actually are and where we would like to be at various periods and just as importantly how we can utilise competency levels to our advantage	As a group we brainstormed all factors (internal and external), strengths, weaknesses, opportunities and threats to list key issues relating to competency within our department in Neotel (Field Services) We looked at our successes, and how we actually delivered on those. We also looked at strengths and weaknesses and how best we could utilise these to positively differentiate us from our competitors. After quantifying this we were able to pick key strategic initiatives that were actually worth focusing on.	As an organisation we are driven by revenues and customer satisfaction. Mapping key areas highlighted against models (Ulrich and Brockbank HR Value proposition and Value maps), we were able to illustrate how strategy and assessment of organisation relates to this. It proved to be very valid and also brought about different approaches to thinking. There are various models which can be applied and as we progress through the learning process, we can definitely pick up various theoretical approaches that we can practically apply…successfully

<tr><th></th><th colspan="3">Think of a Learning Experience in Relation to</th></tr>
<tr><th></th><th>Awareness</th><th>Insight</th><th>Evaluation/Application</th></tr>
<tr><td>Process (How)</td><td colspan="2">I must admit the current process is different to learning experience to date. Whereas in the past I have become accustomed to a physical presence of an instructor during classes, this course has somewhat become a combination of distance learning with the use of technology to create a virtual impression lecturer presence (video conference, Skype etc.). being from Durban we were at a disadvantage compared to the Johannesburg team.
Nevertheless, the experience has been fruitful with good interaction amongst lecturer, group members and other groups
Sources of knowledge were in abundance from either lecturer, prescribed textbook, articles, websites and information sharing sessions on allocated site
Knowledge and theory has been applied to workplace scenario and formulated to propose intent to senior management</td><td>The learning schedule and program allowed for constant workload in a structured format that ultimately led to the course goals and objectives
Learning was not just confined to lecture periods but due to assignments, projects, reading material etc., the mind was constantly involved in exploring this module
Group interaction also activated various approaches to a situation I would have otherwise overlooked.
Great learning experience!</td></tr>
<tr><td>Apply into Personal and career development</td><td>I have benefited from this in several ways:
● Having a competent workforce has a significant effect on efficiencies and productivity
● It makes management of activities that much easier when you have a team you can trust and rely upon. It prevents the need for micromanagement
● Boasting a highly competent workforce in a given industry makes for good brand awareness amongst competitors
● Competency addresses a key motivational factor
● As a manager, I have always focused strongly on training and development. This re-inforces my approach to this initiative</td><td>Insight on this has revealed the following:
● Understanding key concepts and fundamentals that drive HR strategy and net effect on business
● Support HR provides in driving business
● Looking at all factors that influence strategy (internal, external, strengths, weaknesses, opportunities, threats)
● Ability to quantify hence prioritise in terms of effect on organisation
● Measure and track from a baseline point and at various intervals until completion or achieving goals
● Think holistically and always look at the bigger picture</td><td>The knowledge and experience gained from a combination of a “tutor” that has shared experiences at a global level with us, interaction with regional and national groups, practical application to workplace situation, being exposed to various sources of literature will put me in good stead in future and will no doubt support me tremendously in career growth…and not in just the field I have been accustomed to for so long during my career.
Strategy is not just a top-down approach as was commonly understood. Driven properly, employees at all levels play a vital role in having a positive impact herewith</td></tr>

Chapter 63
M-Learning in the Middle East: The Case of Bahrain

Evangelia Marinakou
Royal University for Women, Bahrain

Charalampos Giousmpasoglou
Bahrain Polytechnic, Bahrain

ABSTRACT

The introduction of e-learning in higher education has brought radical changes in the way undergraduate and postgraduate programmes are designed and delivered. University students now have access to their courses anytime, anywhere, which makes e-learning and m-learning popular and fashionable among university students globally. Nevertheless, instructors are now challenged, as they have to adopt new pedagogies in learning and teaching. This chapter explores the adoption of m-learning at universities in the Kingdom of Bahrain, as well as the relevant current developments and challenges related to the major stakeholders (educators and students) in higher education. It mainly investigates the educators' views and perceptions of m-learning, as well as its future potential in higher education. Most of the educators use m-learning tools to some limited extent, and there is still opportunity to reach full integration with curriculum and the blended learning approach. Further, it is proposed that professional development should be provided to instructors to enable them to use the available new technologies in an appropriate and effective way.

INTRODUCTION

The rapid technological advancements in the context of globalization have changed our everyday lives at individual and societal level. Universities worldwide are among the first to embrace these changes and prepare their students with the appropriate tools to enter the 'real' world of work. Two decades ago the technological advancements infiltrated the traditional classrooms with the introduction of e-learning. The extensive use of Information and Communication Technologies (ICTs) – especially the use of the Internet – revolutionized and changed for good the design and delivery of curricula in universities around the world. During the last decade, an unseen 'revolution' emerged from the introduction of e-learning and even more recently of m-learning tools in the

DOI: 10.4018/978-1-4666-8246-7.ch063

classroom. The magnitude of these information technology developments is still not very well understood, simply because practice has run well ahead theory. In addition, many argue that the m-learning community is still fragmented among the various stakeholders, with different national perspectives, differences between academia and industry, and between the school, higher education and lifelong learning sectors (Al Saadat, 2009). Whether one looks at this phenomenon of e-learning and m-learning as a fad, threat, or a solution to educators' problems in delivering mainstream learning in higher education (Peters, 2009), it is currently a hot issue that needs our attention.

The emergence of the World Wide Web supported the development and the popularity of e-learning (Peng, Su, Chou, & Tsai, 2009). In addition, mobile devices such as mobile phones, laptops have increased drastically and are widely used in e-learning (Iqbal & Qureshi, 2012; Koszalka & Ntloedibe-Kuswani, 2010). The use of e-learning in higher education has grown in the past two decades, transforming the nature of higher education, as the technologies are supplementing the course delivery (Bharuthram & Kies, 2013). There are ongoing debate and criticisms on using e-learning, nevertheless most of the literature has shown a positive impact of e-learning in educational contexts, as the drastic developments in technologies have produced a new revolution in education.

Nevertheless, most studies in e-learning and m-learning focus on its acceptance by students in developing countries (i.e. Rhema & Sztendur, 2013; Wang, 2011), on the challenges and opportunities from the adoption of e and m-learning, but very few focus on its acceptance by instructors or on their perceptions of m-learning and its future potential. Therefore, this chapter discusses the origins of m-learning, its pedagogical value and the current developments and challenges in higher education context; in addition, it presents the instructors' perceptions of m-learning in general in the Middle East and more specifically in the Kingdom of Bahrain. The chapter is organized as follows: the first part provides a summary of the origins and concepts of e-learning and m-learning. The following section explores the opportunities and challenges from the use of m-learning in higher education, as well the instructors' perception and use of m-learning via the survey results. The final part discusses the current and future status of m-learning followed by the conclusions.

THE ORIGINS AND CONCEPTS OF E-LEARNING AND M-LEARNING

E-Learning in Higher Education

Despite the relative recent appearance in literature, the concept of e-learning has fueled a number of debates regarding its usefulness in higher education and more particular, in the development of learning and teaching strategies. The few theoretical models describing this concept are still not adequate to capture the dynamics of the e-learning and m-learning proliferation in universities globally. The growing body of literature is still too narrow and short-sighted to capture the changes that currently take place in higher education. Nevertheless, the future is here, at least from a technological perspective.

In fact, practice has understandably run well ahead of theory, and in some issues and approaches away from theory, for example, the use of virtual learning environments (VLEs) and the use of applications to support them in mobile devices. A VLE is a set of teaching and learning tools designed to enhance a student's learning experience by including computers and the Internet in the learning process (Demian & Morrice, 2012). The principal components of a VLE package include curriculum mapping (breaking curriculum into sections that can be assigned and assessed), student tracking, online support for both teacher and student, electronic communication (e-mail, threaded discussions, chat, Web publishing), and Internet links to outside curriculum resources. There are a number of commercial and customized VLE software packages available, including Blackboard, Moodle and WebCT. A quick search on the Internet reveals that commercial and customized VLEs have introduced e-learning and m-learning applications to allow ubiquitous access for users (i.e. http://www.blackboard.com/platforms/mobile/products/ mobile-learn. aspx). Big search engines for academic content also adopt and follow this trend (i.e. EBSCO, Science Direct, Emerald) as well as international publishers (i.e. Prentice Hall, McGraw Hill, Springer).

Another recent important development is the use of tablet PCs and e-books as integral parts of the m-learning pedagogy. The optimization of mobile devices such as smart phones, e-book readers and tablet PCs, in conjunction with the digitalization of university libraries currently based mainly on e-books in PDF format, has changed for good the way we perceive study in a university environment. The classic view of a university student spending valuable time in a campus library struggling to borrow the last short-loan copies of the books s/he needs, tends to be an image of the past: virtual or e-libraries allow university students access content and borrow e-books for literary anywhere, anytime they wish for. A recent study undertaken as part of the project of the Open University's Building Mobile Capacity initiative, provides strong indications that e-learning is here for good. Despite the various issues reported in this project, it was found that when combined synergistically, the functionality, portability and comprehensiveness of resources offered by e-books, Internet access and mobile group learning, together facilitate rich learning experiences for students (Smith & Kukulska-Hulme, 2012).

As it has been previously discussed, the availability of mobile and wireless devices enables different ways of course contents delivery in higher education. It has also changed the communication between the teacher and the learner, as teachers nowadays are confronted with digitally literate students. In addition, these devices have created learning opportunities different to those provided by e-learning (Peters, 2009). E-learning is also changing by providing instructors and students with a different educational environment that is enabled with the use of mobile devices such as PDAs, mobile phones and other. According to Sarrab, Al-Shihi, and Rehman (2013) e-learning offers two main facilities to improve the educational system. E-learning happens anywhere anytime where learning and educational activities are offered the individuals and groups the opportunity to work online or offline, synchronously and asynchronously via networked or standalone computers and other mobile devices. The main drawback of e-learning according to Sarrab et al. (2013) is that it is bound to the location of personal computers or laptops, hence there is an issue with usability. Therefore, m-learning has been integrated to help make learning more interesting, widely available, more interactive and flexible.

The Emerging Concept of m-Learning

M-learning or mobile learning is an evolving phase of e-learning (Peng et al., 2009), as e-learning is dependent on desktop computers, whereas m-learning is dependent on mobile devices (Orr, 2010). There are a variety of definitions of m-learning, partly because m-learning is a new concept. Most studies define m-learning as an extension of e-learning which is performed using mobile devices such as PDA, mobile phones, laptops etc. (Sad & Goktas, 2013; Motiwalla, 2007). Others highlight certain characteristics of m-learning including portability through mobile devices, wireless Internet connection and ubiquity. For example Hoppe et al. (2003 in Iqbal & Qureshi, 2012), define m-learning as "using mobile devices and wireless transmission" (p.148). Kukulska-Hulme and Traxler (2007, p.35) suggest that "m-learning emphasizes the ability to facilitate the

Table 1. Difference between normal learning and m-learning

Normal Learning Style	Mobile Learning
Individual assessment, group projects, group discussions and project presentations will be done through quizzes and tutorials.	The use of multimedia elements in conveying information and receive online feedback.
Students will go to a class or lecture hall to attend the lecture.	The learning process can be done anywhere and at any time.
Students will interact face to face to allow them to communicate effectively.	Able to organize meetings and schedules of all team members at the same time.
Using chalk and talk method in delivering information.	Students can get the lecture notes quickly without copying from the board.

Source: Devinder & Zaitun (2006)

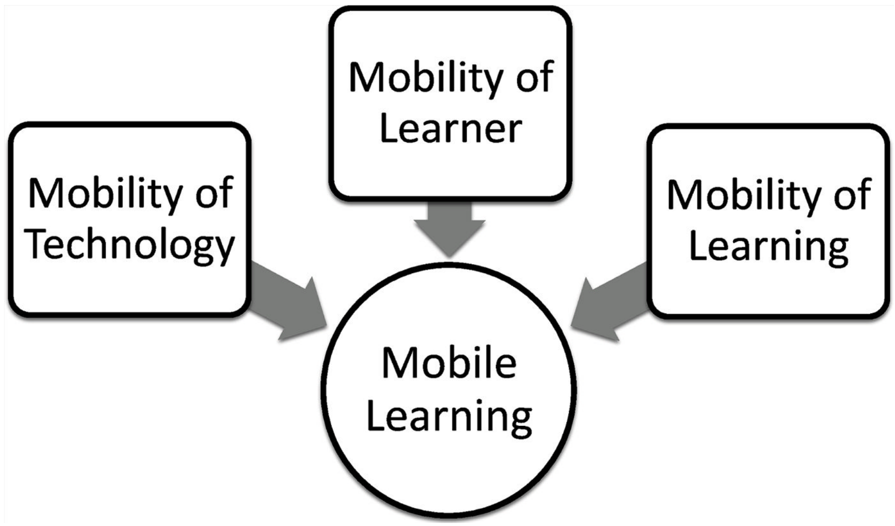
learning process without being tied to a physical location". In the higher education context, the term mobile learning (m-learning) refers to the use of mobile and handheld devices, such as smart phones, laptops and tablet PCs, in the delivery of teaching and learning. Simply put, m-learning is defined as "the process of learning mediated by a mobile device" (Kearney, Schuck, Burden, & Aubusson, 2012). M-learning can be thought of as a subset of e-learning, which is the "the use of computer network technology, primarily through the Internet, to deliver information and instruction to individuals" (Welsh, Wanberg, Brown, & Simmering, 2003).

Brink (2011) divided m-learning in three main types, formal, informal and well-directed or self-directed. Forma learning includes normal learning, which is triggered by notifications and reminders such as short messages. Informal learning encompasses two-way message exchange, hence an interactive relationship, such as Facebook, blogs, Twitter etc. Finally well-directed or self-directed learning uses reference and media-based materials such as videos and podcasts. For example, Table 1 shows the differences between normal and m-learning.

Although, in higher education, students are regarded as pioneers in forcing the faculty to change and adapt m-learning, the literature suggests that there are significant positive outcomes (Sad & Goktas, 2013). The literature suggests that there are several factors that influence readiness for m-learning. For example, demographic influences on users' readiness for m-learning such as gender, age and educational level. Others refer to technology acceptance, ease of use, perceived usefulness, quality of services and cultural factors.

A prerequisite for the delivery of e-learning programmes is the use of fixed locations i.e. in a classroom or where a desktop PC and an Internet connection are available. The remedy to this significant e-learning limitation appeared in the mid-2000s with the advent of m-learning applications for a wide variety of uses such as workplace learning, teaching and social networking. Quinn (2001) argues that m-learning intersects mobile computing with e-learning. The unique features of the new mobile technologies and the unlimited potential they offer in terms of flexibility and customization to individual needs, place it also in the framework of flexible learning (Peters, 2009; Sarrab et al., 2013). In this context, students expect training that is "just in time, just enough and just for me" (Rosenberg, 2001), and that can be delivered and supported beyond the boundaries of traditional classroom settings (Kearney et al., 2012). M-learning emphasizes the *mobility* of learning, whereas others place emphasis on the mobility of learners, and the experiences of learners as they learn by means of mobile devices (El-Hussein & Cronje, 2010, p.14). Similarly, Traxler (2007) claims that m-learning is not about 'mobile' or about 'learning' but is part of a new mobile conception of society. Hence, the

Figure 1. Mobile learning
Source: El-Hussein and Cronje (2010, p. 17)



definition of m-learning depends on how each member of the society understands and explains mobile learning. For example, other definitions refer to the physical way in which technology is used and others emphasize on what learners experience when they use mobile technologies in education, whereas others refer to how it can be used to make unique contribution to education and e-learning (El-Hussein & Cronje, 2010, p. 14). Figure 1 illustrates the above view.

The mobility of technology refers to the mobile cellular devices that link to the internet and deliver content and instruction and can enable learning to learn at anytime and anywhere in a form that is culturally prestigious among people in the same group (King, 2006; El-Hussein & Cronje, 2010). The mobility of learners is linked to the mobility of the devices and the fact that the learner is connected to the internet, hence learning can occur at any time and any place (Traxler, 2009). Finally, the mobility of learning is unique as it is "received and processed withing the context in which the learner is situated" (El-Hussein & Cronje, 2010, p. 19).

While the technical advancements in m-learning progress rapidly by satisfying a consumer driven demand, there are still many barriers in the development of an appropriate pedagogical framework for its application in teaching and learning. The aging instructor population is apparently one of the primary barriers in the smooth transition to the new era in higher education. The well-established learning theories of the past are based on teaching by the textbook and memorizing information. Educating and persuading older instructors to use m-learning as part of their learning and teaching approach poses as one of the most difficult challenges. Another issue in the use of m-learning in higher education programmes is that learning practices are changing while learning theories that support them are not (El-Hussein & Cronje, 2010). In addition, Wang (2011) found that e-learning (including m-learning) development tends to focus on technical issues of design and ignores organizational, social, and pedagogical aspects that are necessary for effective e-learning programmes in the workplace. Most applications are lacking of pedagogical underpins on the use of m-learning, and fail to understand learning behavior that takes place in the organizational and social context. It is also suggested that locating distinctive features of learning with mobile devices is an evolving process interwoven with the maturation of the relevant technologies (Kearney et al., 2012). The design of m-learning content for higher education is a complex and difficult task. Account still needs to be taken of learner's and instructors' specific needs as well as the environment which learning takes place. What also needs to be done is to include appraisal and evaluation for each programme, tailored to the different cultural and organisational needs (El-Hussein & Cronje, 2010). The way that people and organisations perceive this new era in teaching and learning is the key to shape the new curricula in higher education. Sharples, Taylor, and Vavoula (2007) identify two layers of m-learning, the semiotic (socio-cultural) and technological; they argue that these two layers will eventually converge. This convergence requires though a total rethink and redesign of formal learning as we know it: a more open and collaborative model which places educators as facilitators of learning in a connected and mobile world, where students participate actively in the learning creation process. On the other hand, others believe that m-learning will never fully replace classroom or other electronic learning approaches (Liaw, Hatala, & Huang, 2010). However, if leveraged properly, mobile devices can complement and add value to the existing learning models and frameworks.

M-learning and e-learning also differentiate from a pedagogical perspective in the learning approach. While e-learning is based primarily on the objectivist learning model (Wang, 2011), m-learning is building on a *constructivist* approach. The objectivist approach is based on the transfer of knowledge from the instructor to the learner; on the other hand the constructivist approach views learning as a process in which learners actively construct or build new ideas or concepts based upon current and past knowledge. In this interactive environment, instructors should let learners participate in meaningful activities so that they can generate their own knowledge (Brown & Campione, 1996). M-learning is also linked with the theory of *connectivism* which states that learners are actively attempting to create meaning through engagement in networks; learning is the process of creating connections and developing a network (Siemens, 2005). King (2006) proposes that the use of m-learning in higher education, reduces the physical walls of the classroom and replaces them with virtual, as the content of the education it delivered by means of a radical new technology, and he adds that "by breaking down the assumptions and process behind writing and speaking, we can go beyond them and find new ways of thinking about the world" (King, 2006, p. 171). Herrington, Herrington, Mantei, Olney, and Ferry (2009) placed m-learning in the context of the *authentic learning* approach. Authentic learning situates students in learning contexts where they encounter activities that involve problems and investigations reflective of those they are likely to face in their real world professional contexts.

Researchers have also explored m-learning perspectives from a wider socio-cultural view. Traxler (2009) described m-learning as noisy and problematic, featuring three essential elements: the personal, contextual and situated. Klopfer, Squire, and Jenkins (2002) propose that mobile devices (handheld computers) "produce unique educational affordances," which are: portability, social interactivity, context sensitivity, connectivity and individuality. Based on the activity theory approach Liaw et al. (2010) investigated the acceptance toward to m-learning as a means to enhance individual knowledge management. They found that factors such as enhancing learners' satisfaction, encouraging learners' autonomy, empowering system functions and enriching interaction and communication activities, have a significant positive influence on the acceptance of m-learning systems. More recently Kearney et al. (2012) presented a framework, which highlights three central features of m-learning: authenticity, collaboration and personalization, embedded in the unique time-space contexts of mobile learning. Sharples et al. (2007, p.4) provide more details on

Table 2. Convergence between learning and technology

New Learning	New Technology

the convergence between learning and technology as shown in the Table 2.

M-learning has attracted attention due to the increasing number of available mobile devices, which are affordable and their costs are increasingly decreasing making them more accessible to people. At the same time these devices have multiple features and capabilities, such as making phone calls, taking pictures and making videos, storing data and of course accessing the internet (Sarrab, Al-Shihi, & Rehman, 2013). Maccallum and Jeffery (2009) propose that all these capabilities may be used in teaching and learning, for example for classroom activities (Dawabi., 2003). These mobile devices can be used for learning purposes via interactive games, for brainstorming, quizzing and are widely used to support and develop students' own learning and collaborative learning (Iqbal & Qureshi, 2012). Moreover, they are available to users at any time and all time (Giousmpasoglou & Marinakou, 2013). Kukulska-Hulme and Traxler (2007) present several case studies that report and support the experience of educators with mobile technologies in universities. Zawacki-Richter, Brown, and Delport (2009) claim that e-learning and m-learning provide a wide range of opportunities for learners and teachers. However, as it has been previously discussed, Herrington, Mantei, Olney, and Ferry (2009, p.1) claim that it is not still clear whether "m-learning is used in pedagogically appropriate ways".

M-learning is widely used in distance learning as it supports the access to the teaching material for a large number of students, independent of time and space, at low costs. Moura and Carvalho (2009, p.90) suggest that "the development of m-learning as a new strategy for education has implications on the way students learn, on the role of the teachers as well as in the educational institution". Hence, for the purpose of this chapter m-learning is studied as an element of e-learning and blended learning in general not necessarily as a tool for distance learning, as it also helps in constructing problem-based learning as well as any related assignments and projects that meets the students' interest (Kukulska-Hulme & Traxler, 2007). M-learning allows student-centered learning in which students are able to modify the access and transfer of information to strengthen the knowledge and skills of students to meet their educational goals (Giousmpasoglou & Marinakou, 2013; Sharples et al., 2007). In addition, it can support ubiquitous learning and can make the educational process more comfortable and flexible (Sarrab et al., 2013, p. 828).

Higher education may be presented in a more interactive ways as m-learning provides the support for learning and training. Although, technological developments have made mobile devices strategic tools to the delivery of higher education instruction, these fundamental changes pose new problems, challenges as well as opportunities to the instructors and students as they are discussed in the following.

Opportunities and Challenges from the Use of m-Learning in Higher Education

The introduction of m-learning in universities change radically the way we perceive, design and deliver higher education programmes. In this mobile and always connected world, a number of benefits and challenges arise for both educators and students. Literature indicates that three features are most cited by researchers, practitioners and users: mobility/ ubiquity (anytime, anywhere), personalization, and collaboration. Current technology allows learners to disseminate information and complete coursework even when they are away from their desktop PCs and hard-wired Internet connections. A wireless device has the potential to give instant gratification to students by allowing them to interact with the instructors, other students in the course, and access course related content from anywhere wireless connectivity is available. BenMoussa (2003) identifies three key benefits of mobile connectivity for the users. Firstly, mobile devices offer personalized and/or individualized connectivity. Liaw et al. (2010) also suggest that the relationship between the owner and the mobile/ handheld device provides a 'one-to-one' interaction in a personalized manner. Secondly, mobile connectivity improves collaboration via real-time or instant interactivity that may lead to better decision-making. And third, mobile connectivity enhances users' orientation or direction. Kearney et al. (2012) argue that m-learners can enjoy a high degree of collaboration by making rich connections to other people and resources mediated by a mobile device. This often-reported high level of networking creates shared, socially interactive environments so m-learners can readily communicate multi-modally with peers, educators and other experts, and exchange information. Learners consume, produce and exchange an array of "content", sharing information and artefacts across time and place. In addition, Motiwalla (2007) suggests that access to information at the point of relevance may make it possible for m-learners to minimize their unproductive time, which may enhance their work-life-education balance.

The challenges generated from the advent of m-learning in higher education programmes affect mostly those responsible for the design and delivery and evaluation of teaching and learning. Wang (2011) argues that the emergence of Web 2.0. related technologies, brought a radical transformation in e-learning (and thus m-learning) environment: the largely central controlled education system turned to an interactive and conversational learning network. As a direct consequence we observe that learning practices are changing very fast (i.e introduction of e-books instead of traditional textbooks), while the learning theories that support educational practices are not (El-Hussein & Cronje, 2010). Educators are currently unable to follow the needs of the younger generations of learners described as digital natives (Corbeil & Valdes-Corbeil, 2007). These learners do not see technology as something foreign: they readily accept it and consider it as part of their everyday lives; they are totally immersed and addicted to mobile technologies. Young learners also created and use their own language and signs when communicating either via Short Message Service (SMS), e-mail or live chat through a mobile Internet or Wi-Fi connection (El-Hussein & Cronje, 2010); this is how they were called the text generation. Overall, the traditional teacher-centered, classroom situated learning environment, is now challenged by the digitally literate students who view learning as an open collaborate process without boundaries (Peters, 2009).

M-learning provides flexibility in higher education programmes that may result in some challenges that learners may not have imagined (Motiwalla, 2007). For example, a serious implication from the continuous exposure to information and interaction in a connected world can be the creation of confusion and disorientation to m-learners. Then various security issues regarding the information privacy of the users are raised as in any other commercial application. Mobile devices are currently appear to be more vulnerable than PCs, thus personal data are easily traceable for mobile users (Okazaki, 2011). Finally, there are ethical issues reading the use of m-learning in student assessment, where cheating cannot be easily prevented or traced based on the current technologies and learning philosophies (Banyard, Underwood, & Twiner, 2006).

The challenges of the use of m-learning are many for all stakeholders as it may have many technological restrictions. For instructors, m-learning is a challenge as they should be familiar with technology, not only to use it for teaching and learning but also to support developers who are challenged by the limited memory, the lack of keyboard, the small displays especially when compared to computers and laptops (Iqbal & Qureshi, 2012; Wang et al., 2009). Instructors should adapt the design of the courses to integrate ICT; this design should be dynamic, easily scalable and should be applied at all times and places (Marwan, Madar, & Fuad, 2013). Moreover, Marwan et al. (2013) suggest that instructors face the lack of time to prepare for class. There is also concern on the educators' ability to understand and respond to digital learning opportunities, as in many cases they are challenged by the need "to collaborate with a wide range of people such as web developers and programmers to deliver successful web-based education" (Peters, 2007). It is a fact that m-learning enables learning to occur at a less formal setting that is teacher-mediated, hence technical skills are required (Kearney et al., 2012). In addition, m-learning experiences can be customized for the learner to meet different learning styles and approaches, they may provide a high degree of collaboration and making connections to other people, creating further challenges to educators whose roles are changing (Mohammad & Job, 2013; Kearney et al., 2012). Thus, educators should be able to understand and analyze the unique challenges in emerging m-learning environments and facilitate insights to support their design and use of m-learning resources.

Students usually have access to the Internet and other applications via their mobile devices such as Facebook, YouTube, MySpace and other. They are also familiar with its use, hence being well introduced to m-learning may lead to its wide use in their own learning. Nowadays students are active and innovative in terms of their learning, they expect a quick response from the tutor and want an interactive learning, student-centered, authentic, collaborative and effective learning with the use of ICT (Marwan et al., 2013). According to Mirza and Al-Abdulkareem (2011, p. 88) "the learner's attitude and lack of prior knowledge of IT use are major factors that affect the acceptance of e-learning by students".

Previous research suggests that there are various factors that contribute to the adoption of m-learning by instructors and students. Ju, Sriprapaipong, and Minh (2007) claim that the perceived usefulness influences the intention to adopt m-learning. On top of usefulness, Wang et al. (2009) and Sarrab et al. (2013) identified other factors such as the self-managed pace of learning, the social influence, the performance and the effort expectancy. Venkatesh, Morris, Davis, and Davis (2003) added the available infrastructure to support the use of any m-learning system, and Liu and Li (2010) add the playfulness. The interface makes the use of mobile devices more interesting for students, as the learning is personalized, more fun, spontaneous, and engaging users to contribute and share (Sarrab et al., 2013). Marwan et al. (2013) add the interactive learning process, the integrated learning information and the high learning needs. Thornton and Houser (2002 in Moura & Carvalho, 2009) propose that recordings, communication and access to information in the local set, sending reminders or relevant information for students are good options of the use of m-learning. Attewell (2011) propose that m-learning assists in the development of the learners' literacy and numerical skills. In addition, m-learning students are able to experience a dynamic class via interaction. To understand the factors that contribute to the adoption of m-learning will help stakeholders (educators, software developers and technicians) to incorporate these factors into the design of the m-learning systems.

Challenges and restrictions of the use of m-learning include the lack of standardization, the low bandwidth, the limited processor speed and small screen size, low storage, short battery life, lack of data input capability (Sarrab et al., 2013; Maniar & Bennett, 2002), low display resolution, limited memory and less computational power (Shiau, Lim, & Shen, 2001). Marwan et al. (2013) claim that classes are difficult to be rescheduled with m-learning. All of the above benefits and challenges of m-learning could be summarized in Table 3.

If students are provided with the educational context in an appropriate and challenging manner, which is exciting and novel, they will be more inclined to use all these mobile devices and m-learning. M-learning has been considered to be a promising approach to complement student learning. At the same time, instructors cannot just be provided with the technology and left on their own; they should be provided with a vision and the necessary resources and support to use e-learning and m-learning.

E-Learning and M-Learning in the Middle East (ME) and Bahrain

Although e-learning has been growing rapidly in the Middle East (ME), North Africa (MENA) region and the Gulf Co-operation Council (GCC) countries, m-learning has been considered as an alternative learning style and a new fashion. In these countries, according to Hamou, Anwar and Benhadria (2012) several initiatives have been introduced such as proliferation of e-books and e-learning devices, as well as flexible access to distance learning. In fact, the Arab region witnesses an increasing penetration of mobile phones and much faster Internet (Muttoo, 2011). However, these initiatives do not show a clear shift towards e-learning and m-learning in the region.

Nevertheless, there are some good examples and initiatives of educational institutions that have contributed to the development of e-learning and m-learning. For example, Hamdan Bin Mohammed e-University (HBMeU) in the UAE has introduced an effective architecture for

Table 3. Benefits and challenges of m-learning

Benefits of M-Learning	Challenges of M-Learning
Great for people on the go.	May make it easier to cheat.
Anytime, anywhere access to content.	Could give tech-savvy students an advantage over non-technical students.
Can enhance interaction between and among students and instructors.	Can create a feeling of isolation or of being out-of-the-loop for non-techies.
Great for just-in-time training or review of content.	May require media to be reformatted or offered in multiple formats.
Can enhance student-centered learning.	Might render some content outdated because of rapid upgrades – here today, outdated tomorrow.
Can appeal to tech-savvy students because of the media-rich environment.	Could require additional learning curve for non-technical students and faculty.
Support differentiation of student learning needs and personalized learning.	Many be used by a new high-tech package for the same old dull and boring content.
Reduce cultural and communication barriers between faculty and students by using communication channels that students like.	There are different mobile platforms such as iOS, Android etc.
Facilitate collaboration through synchronous and asynchronous communication.	The wireless network trust ability.
Supports distance learning.	

Source: Corbeil and Valdes-Corbeil (2007, p. 54); Sarrab et al. (2013, p. 835-836) e-learning, and also contributed to the development of standards for e-learning programme accreditation (Hadj-Hamou, Anwar, & Benhadria, 2012). The *e-learning Declaration* was drafted at the 2008 e-learning Forum in Dubai, providing a new educational model, which is based on research on active research changing teaching and learning from the traditional approach to the student-oriented approach. In addition, they have launched an e-book and e-reader device to help learners use their iPad/iPhone for their learning. They support the blended learning approach, where they integrate the face-to-face learning with online collaborative learning and self-paced learning, as they make effective use of ICT to support delivery of the courses. They use Moodle, which enables the online collaborative learning, and asynchronous study is enabled by interactions with the professors via virtual classrooms (with the use of Wimba) and access to electronic teaching material.

Moreover, in Saudi Arabia, the rapid advancement in mobile technologies, wireless networks and the acceptance of new smart devices have increased the interest in m-learning. In fact, the Ministry of Higher Education (MOHE) has launched a national project "AAFQ" to develop a long-term plan for HE in order to address future challenges including m-learning (Garg, 2013). They have also established other projects such as the National Centre for E-learning and Distance Education (NCELDE) with its own learning portal, the Saudi Digital Library and the Saudi Centre for Support and Counseling to all beneficiaries of e-learning among others. The aim of the center is to become "an international leader in research, development and implementation of an e-learning architecture and infrastructure using open standards" (Mirza & Al-Abdulkareem, 2011, p. 91). Many universities in Saudi Arabia are utilizing distance-learning technologies. For example, King Saud University has recently initiated a new service that offers users with the ability to send text messages directly from a PC to a mobile phone (Altameem, 2011, p. 22). There is also the Knowledge International University (http://www.kiu.com.sa/website/index.php) established in Saudi Arabia in 2007, which specializes in online degrees programmes in Islamic studies (Mirza & Al-Abdulkareem, 2011).

In Oman, the Ministry of Education has established ongoing relations with Edutech Middle East to integrate 590 schools around the country with e-learning solutions (Mirza & Al-Abdulkareem, 2011). They also state that the Syrian Virtual University offers various degrees including diplomas, bachelor's and master's in business, technology and quality management.

As the GCC countries are endowed with oil and gas reserves they have turned their attention to education and to the improvement of the quality of education (World Economic Forum, 2010).

Table 4. Education rank of GCC countries

Country	Quality of Primary Education	Secondary Enrolment	Tertiary Enrolment	Quality of Educational System
Bahrain	41	36	74	38
Kuwait	79	62	92	88
Oman	48	70	81	43
Qatar	5	49	106	4
Saudi Arabia	54	43	75	41
UAE	29	46	84	27

Source: World Economic Forum (2010)

Although education is a high priority in the GCC countries, considerable ground has to be covered to make progress in terms of enrolment and quality enhancement (Hadj-Hamou et al., 2012, p. 57). Education has strategic significance in the Arab world, but still there are great variations among the Arab states in their literacy rates. In addition, there is limited financial support for education in a large number of Arab countries. According to the World Bank (2007) the rate of total expenditure in education relative to GDP in all Arab countries is nearly 1.3%.

Table 4 shows the education rank of GCC countries among 134 countries.

The same study reports that there is low quality of research, and low number of publications in the GCC countries in comparison to those from fast developing countries. Most universities are teaching-oriented, rather than research-oriented; the rate of researchers in Arab universities as compared with employees is 2.7 per 10.000. Moreover, the report suggests that there is lack of planning and strategies for education at all levels, lack of information and communications technology (ICT) integration into education, there is centralization of education, intellectual migration and weaker linkages between education and labour markets. Hence, decision-makers can respond to these challenges by exploring the potential of electronic communication for spreading education in the countries (Hadj-Hamou et al., 2012, p.60).

Bahrain is one of the countries in the Arab world that have recently considered the potential of distance education with the use of e-learning. A study in the Middle East reveals that only 49% of society members are aware of e-learning (CITC, 2007) and the main reason for the limited use of e-learning and m-learning in the region is the low public and teachers' esteem for online learning (Mirza & Al-Abdulkareem, 2011). The first e-learning project in Bahrain was the Future Project at His Majesty King Hamad's Schools, which was established on January 2005 to serve the public secondary education and at a later level to include the private schools as well. There is also the e-learning center at the University of Bahrain, opened in March 2007 under the patronage of the King's wife, Her Majesty Shaikha Sabeeka Bint Ibrahim Al Khalifa, who is also the President of the Supreme Council for Women. The e-learning center plays a significant role in Bahrain's development as the government of Bahrain takes a regional lead in the launch of a range of egovernment services. The center focuses on promoting the adoption of wireless technology to support teaching and learning programmes across eight university departments. It can be accessed by 8000 students, and both staff and students are benefiting with 145 teaching modules already tailored for delivery on the university's network. The center's facilities include a range of e-learning tools including email, and online university chat and discussion rooms, which enable 24-hour interactivity and access to information for academic staff and students. It ultimately aims to support all University of Bahrain students to become proficient in the use of modern technology in their learning and to develop valuable employment skills. The center has a broader remit to cascade and share the knowledge and expertise acquired through the e-learning and e-teaching with other academic institutes and professionals throughout Bahrain (Albardooli, Alobaidli, & Alyousha, 2006, p. 15).

Moreover, universities in the oil-rich GCC have shown particular interest in m-learning, which currently is treated as fashion (Mohammad & Job, 2013), but at the same time is considered by corporations and educational institutions to be very promising (Sharrab et al., 2013; Unesco, 2012). Nevertheless, there are many challenges identified in the adoption of e-learning and m-learning in the region. Weber (2011) suggests that there are some cultural concerns in the use of the Internet in the region. More specifically, he proposes that cultural taboos prevent or restrict the social interaction of unmarried men and women; hence some of the collaborative tools in the use of e-learning and m-learning "may be at variance with Islamic customs" (Weber, 2011, p. 1). He continues that there might be cultural bias such as language, as in many universities nowadays the communication and teaching and learning language is English. Even the fact that people in this culture are used to communicate mainly orally creates some challenges for the use of m-learning. In his study, Weber (2011) identified women and the issue of literacy as another challenge. He suggests that women's illiteracy in the Arab world is a major concern for women's education and development. Traditional, social and religious affiliations are impacting on women, as they cannot physically attend classes in traditional universities. However, the use of m-learning could be a potential solution to this issue as proposed by Tubaishat (2008) in his study of Zayed University, an all girl university in the UAE.

Finally, Weber (2011) claims that the issue of privacy is also a challenge. Censorship in most ME countries is common practice. There is the fear of misuse of student information similar to this of the use of Facebook. He adds that "Arabian Gulf traditions emphasize the privacy and sanctity of the home and the potential for misuse of online information used in an educational setting is immense" (2011, p. 2). Weber (2011) supports that in the MENA region instructors are concerned about the security of the educational data, and parents are concerned about the use of chats and the safety of the online environment. Mirza and Al-Abdulkareem (2011, p.84) add that exposure to material from the internet "could be considered dangerous to youths and to the religious moral values of those nations".

Moreover, Mirza and Al-Abdulkareem (2011) provide another barrier to e-learning adoption in the ME. They include the passive attitude that some governments took in response to e-learning and the low Internet penetration rate by the general public. They also comment on the conservative religious clerics who were warning of the dangers of the Internet, nevertheless, many adhered to the warning. The low public esteem for online learning was among the reasons for hesitation of many academics to resort to e-learning. This barrier impacted on the lack of online repositories that contain educational material in the Arabic language (Al-Khalifa, 2008).

Although, there is increased interest in m-learning adoption in teaching and learning in the region, there is limited research conducted (Iqbal & Qureshi, 2012; Mirza & Al-Abdulkareem, 2011). Most studies focus on the learners' perceptions and use of m-learning with very little research conducted in the instructors' views (Mirza & Al-Abdulkareem, 2011). Hence, the authors decided to investigate the adoption of m-learning at universities in the Kingdom of Bahrain, and explore the educators' views and perception of m-learning, their intention to use it, as well as its future potential in higher education. This chapter aims to provide an overview of the challenges that instructors face with the use of m-learning and of insights and recommendations on strategies for the use of mobile learning to change and enhance the pedagogies in HE.

SURVEY IN M-LEARNING

This chapter presents the findings of the pilot study of the questionnaire conducted in four out of eight universities in Bahrain; both private and public universities were included in the survey. In order to address the aim and the research questions of the study, Zawachi-Richter, Brown, and Delport (2009) questionnaire titled 'Mobile Learning: From single project status into the mainstream?' was used after having acquired the authors' permission for its use. Instructors were asked to rate the mobile learning and teaching experience of distance educators, the development and growth of mobile learning, the impact of mobile technologies on teaching and learning, mobile learning applications and mobile learning activities, mobile learning and access to (higher) education, and the future development of mobile learning with a 5 Likert scale from (1) strongly disagree to (5) strongly agree.

For the pilot study, a total of 45 questionnaires were collected between April and June 2013, in which educators were asked to provide their attitudes regarding m-learning as a tool in their teaching. The participants in the study were from different faculties such as Business, ICT, Humanities, Art and Design, and from different academic rankings, with the majority being PhD holders (53.3%). 35.6% were female and 64.4% were male.

In order to identify the instructors' perceptions of m-learning frequencies, means and standard deviations were calculated. Moreover to identify the main ideas about the future of m-learning the frequencies of responses were calculated.

M-Learning Survey Results in Bahrain

The current status of the use of m-learning at the institutional level was identified and the results are shown in Table 5. For the purpose of this paper the authors present the most frequent answers or the majority of answers.

It is evident from the above that the majority of the institutions in the study were face-to-face with limited use of e-learning. M-learning was non-existent and most did not have any plans in developing m-learning. In addition, there was no technical support or in the cases that there was, it was limited. However, 31.1% claimed that a new unit within the organisation has been created for the purpose of m-learning. In reference to the current status on m-learning the participants expressed their opinions on their knowledge on m-learning and on the use of mobile devices. The results are shown in Table 6.

Interestingly, most respondents are aware of m-learning, but only 15.6% are currently doing research and only 4.4% are involved in projects relevant to m-learning. Similarly, 15.6% of the respondents have not heard about mobile learning. The use of mobile devices is shown in Figure 2.

Most of the respondents (43.52%) used a laptop for connecting to the internet, and then their smartphone (22.27%), 16.20% use a tablet PC and only 1.1% use PDAs. Moreover the participants were asked to evaluate their experience in m-learning. The results are shown in Figure 3.

The majority of the responses to this question were towards the strongly disagree (1) area. 28% of the participants have been involved in m-learning projects, however, 22% of them state that these projects are not within their universities. 14% of the participants were not involved in projects on m-learning but were aware of others who were, and still 20% were not exposed to m-learning at all.

Further, respondents were asked to rate the importance of learning tools for students, the learning activities that are appropriate for mobile devices and the importance of applications. The findings are shown in Table 7. The results suggest that the respondents found very important 'being connected anywhere, anytime' (B4.5), and 'sharing texts, notes and documents' (B4.4), hence they did not find the text messaging or voice calls and

Table 5. M-learning status at institution level

	Response (N=45)	Frequency (%)
C1	A traditional face-to-face or contact-based teaching institution	34 (75.6)
C2	Non-existent	27 (60)
C3	No, there are no institutional plans for developing course materials for use on mobile devices	27 (60)
C4.1	No, there is no institutional support.	14 (31.1)
C4.2	Yes, a new unit at the organisation/institution has been created for this purpose.	14 (31.1)

Table 6. Current personal status

	Response (N=45)	Frequency (%)
B1.1	Yes, I am personally doing research on mobile learning	7 (15.6)
B1.2	Yes, but I am not personally doing research on mobile learning	11 (24.4)
B1.3	Yes, I am involved in mobile learning projects	2 (4.4)
B1.4	I have read a number of articles and papers on mobile learning.	4 (8.9)
B1.5	No, but other persons in my institution are knowledgeable.	14 (31.1)
B1.6	No, I have not heard about mobile learning.	7 (15.6)

Figure 2. Mobile devices

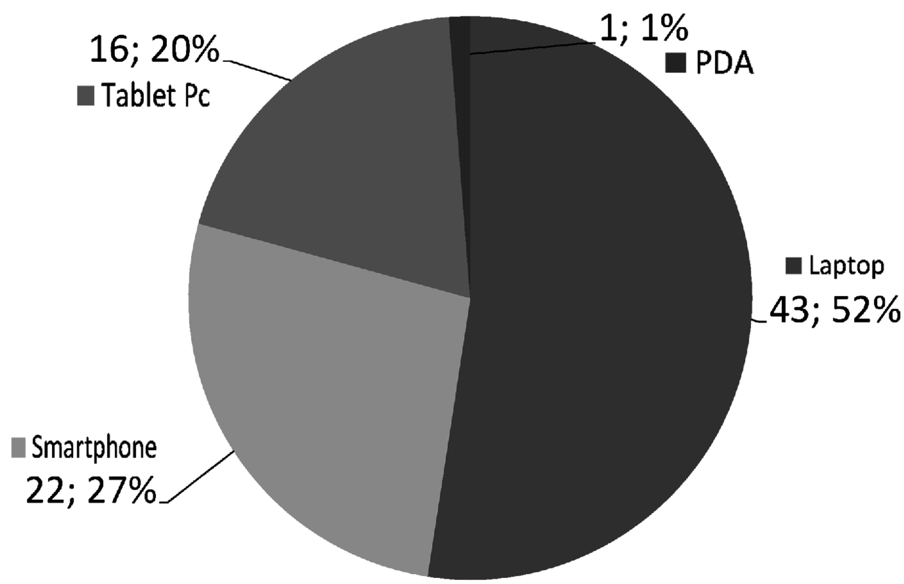

Figure 3. Experience in m-learning

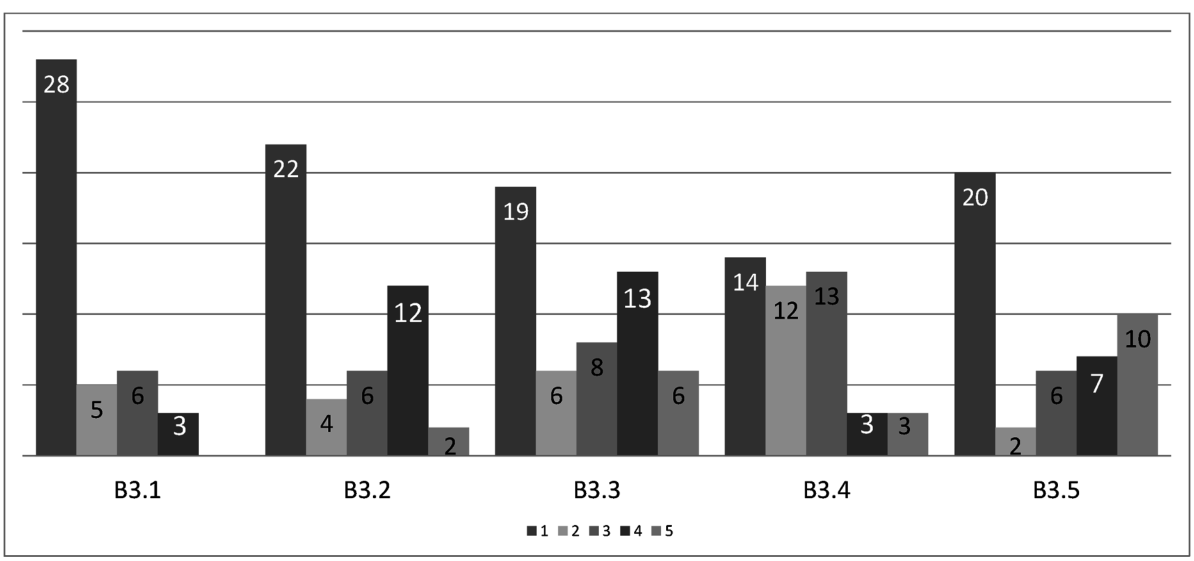

e-mails as highly important tools for students. Moreover, they identified as appropriate learning activities for mobile devices 'coursework' (B5.1), 'collaborative learning' (B5.3) and 'information retrieval' (B5.5). The applications found to be more important were all those included in the questionnaire such as mobile office (B6.1), diary and scheduling (B6.2), audio and video applications (B6.3), imaging (B6.4), other accessories (B6.5) and online data services (B6.6). Finally, the most useful tools were accessing information such as notes, documents etc (B7.2) and again 'being connected anywhere, anytime' (B7.5).

The respondents were asked to rate the new strategies and methodologies that are facilitated by m-learning. The results are shown in Table 8.

Except the 'assessment' (B8.2, Mean=2.69), the rest of the variables were rated close to agree and strongly agree responses. It was evident that they would use m-learning mainly to assess students' knowledge short time before a lecture or a discussion. Interaction (B8.4, Mean=4.02) was the most important of all the strategies that are facilitated by m-learning. Hence, the respondents suggested that m-learning provides more support for collaboration, more support for bottom-up content creation and could be used to consult peers. Next important strategy for m-learning was the resources for m-learning (B8.3, M=3.84). The participants use it for generating information, sharing resources, navigation and other. The major weaknesses of mobile devices that might hinder

Table 7. Importance rating of importance for tools (B4), learning activities (B5), applications (B6) and learning tools (B7)

Item (N=45)	1 (Freq)	2 (Freq)	3 (Freq)	4 (Freq)	5 (Freq)
B4.1	7 (15.6)	7 (15.6)	10 (22.2)	10 (22.2)	11 (24.4)
B4.2	7 (15.6)	8 (17.8)	13 (28.9)	10 (22.2)	7 (15.6)
B4.3		5 (11.1)	12 (26.7)	18 (40.0)	10 (22.2)
B4.4	3 (6.7)	1 (2.2)	5 (11.1)	18 (40.0)	18 (40.0)
B4.5	3 (6.7)	1 (2.2)	3 (6.7)	14 (31.1)	24 (53.3)
B5.1	6 (13.3)	7 (15.6)	10 (22.2)	6 (13.3)	16 (35.6)
B5.2	3 (6.7)	12 (26.7)	5 (11.1)	12 (26.7)	13 (28.9)
B5.3	2 (4.4)	3 (6.7)	7 (15.6)	19 (42.2)	14 (31.1)
B5.4		5 (11.1)	12 (26.7)	18 (40.0)	10 (22.2)
B5.5		4 (8.9)	10 (22.2)	10 (22.2)	21 (46.7)
B6.1	5 (11.1)	5 (11.1)	7 (15.6)	9 (20.0)	19 (42.2)
B6.2	2 (4.4)	6 (13.3)	8 (17.8)	10 (22.2)	19 (42.2)
B6.3	2 (4.4)	4 (8.9)	15 (33.3)	7 (15.6)	17 (37.8)
B6.4	2 (4.4)	7 (15.6)	10 (22.2)	12 (26.7)	14 (31.1)
B6.5	2 (4.4)	1 (2.2)	11 (24.4)	15 (33.3)	16 (35.6)
B6.6	2 (4.4)		2 (4.4)	7 (15.6)	34 (75.6)
B7.1	1 (2.2)	7 (15.6)	12 (26.7)	11 (24.4)	14 (31.1)
B7.2	2 (4.4)	3 (6.7)	11 (24.4)	15 (33.3)	14 (31.3)
B7.3	1 (2.2)	9 (20.0)	10 (22.2)	12 (26.7)	13 (28.9)
B7.4	1 (2.2)	8 (17.8)	8 (17.8)	15 (33.3)	13 (28.9)
B7.5	1 (2.2)	1 (2.2)	5 (11.1)	10 (22.2)	28 (62.2)

Table 8. Strategies and methodologies

Category	Typical Examples	Mean	SD
B8.1 Learning Activities	(Inter)active learning, authentic learning, explorative learning, project orientated learning, situated and informal learning, Qs & As.	3.60	1.286
B8.2 Assessment	Security for testing and evaluation procedures, assessment to determine students' knowledge a day or two before a lecture/discussion to determine which topics need more attention.	2.69	1.411
B8.3 Resources	Generation of information, sharing resources, data sourcing, access to information, navigation, m-library.	3.84	1.127
B8.4 Interaction	More support for collaboration, more support for bottom-up content creation, enhanced social support, consulting peers & experts. Distance Educators will teach again instead of providing teaching material only.	4.02	1.033
B8.5 Personalisation & Individualisation	New strategies might emerge from better knowledge of learner behaviours and study patterns with technology, which were never examined that closely before, just-in-time learning, addressing learner styles or needs, keeping it simple, focus on small 'chunks' of learning, just-in-time support/job aids.	3.76	.957

m-learning were also rated by the respondents as shown in Figure 4.

Most of the respondents agreed or strongly agreed with all the variables except the screen size (B9.2). This showed that the size of the screen of mobile devices was not considered to be a hindering factor for m-learning. On the contrary, the small size of the displays was found to be a challenge for m-learning activities. Similarly, the costs of network, the memory size, the device capabilities and the limited battery time were among the most important challenges for applying m-learning.

When respondents were asked their views on the latest trends and developments in teaching and learning as well as on when m-learning will be an integral part of mainstream in HE, this is reflected in Table 9.

Most of the respondents (51.1%) supported the view that although the technology should impact on the teaching and learning, currently this was not the case. 26.7% agreed that teaching and learning strategies and methodologies adapt to the constant changes in technology. In addition, most of the respondents (75.6%) believed that m-learning will become an integral part of mainstream HE within 5 years.

Finally the participants were asked to present their views on the future trends of m-learning. For the purpose of this paper only the majority of responses are illustrated in Table 10.

The majority of the respondents (55.6%) supported the view that new teaching and learning strategies will emerge due to IT developments. In addition, they proposed that they will enhance the teaching and learning, nevertheless, they proposed that the mobile devices will be the preferred device for learning. They also supported that m-learning will widen access to HE, because of the profileration of mobile phones and wireless infrastructure and the devices are expected to be small in size. Most of the respondents (84.4%) agreed that m-learning will facilitate new strategies and methodologies for learner support.

CONCLUSION

M-learning as a relatively recent phenomenon in higher education, enjoys high popularity among university students globally. In the ME region change has already started and e-learning and m-learning are becoming part of the educational system. Some may still be unfamiliar with the technical advancements in e-learning and m-learning, but plans are in place to make these technologies widely known and usable in the near future.

Figure 4. Major weaknesses

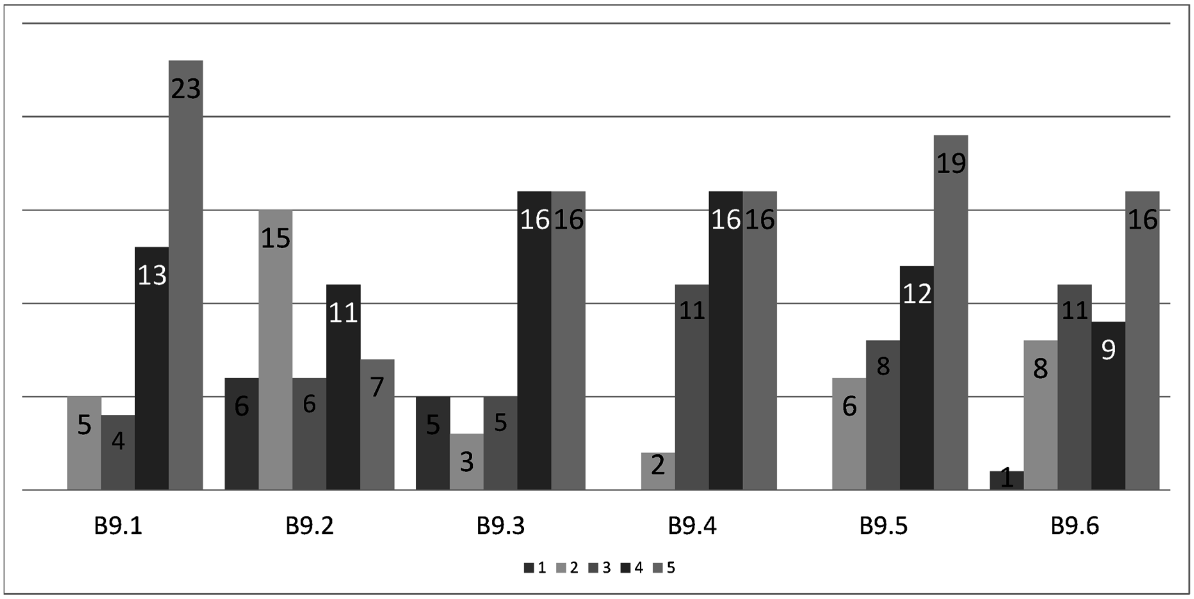

Table 9. Respondents' views on trends and developments in m-learning (and in years)

Responses	Technology changes should not have an impact on our teaching & learning strategies and methodologies.	Technology changes should have an impact on our teaching & learning strategies and methodologies, but this is currently not the case at present.	Teaching and learning strategies and methodologies adapt continuously due to new affordances that technology provides.	Technology changes bring about radical changes to our teaching & learning strategies and methodologies.

The key opportunity identified in this chapter is the ability of m-learning to provide learning that is "just in time". Mobile devices have the potential to deliver the kind of learning that is embedded in our daily lives, as the use of these devices is well established. Many instructors in higher education, including Bahrain, recognize the benefits of m-learning, but there is limited adoption for educational use. The main challenge identified in the chapter is the age and ability of instructors to use these mobile devices and technologies.

In order to support a strategic response to the opportunities and demands of mobile learners, the higher education sector needs to be informed about the actual use of mobile devices, and about potential future trends in mobile learning. This requires the re-examination and re-design of the foundational assumptions and presuppositions on which all previous understandings of the term "higher education" are constructed. It is imperative that this process foregrounds pedagogy rather than technology. In addition, these on-going structural changes in higher education, provide the potential to make learning more efficient, personal and culturally acceptable for learners. Training and workshops should be provided to increase faculty perception of e-learning and m-learning. This change and the integration of m-learning

Table 10. Future trends of m-learning

Statement	Frequency N=45	Percent
Teaching and learning theories in 20 years…		
In essence remain the same, but new learning paradigms and learning strategies will emerge because of technological developments.	25	55.6
Change completely with new learning theories replacing behaviourism and constructivism due to the radical impact of future technologies.	15	33.3
The attributes and opportunities that mobile technologies afford will…		
Be very helpful in enhancing teaching and learning independent of time and space.	33	73.3
Mobile devices and applications will in future be…		
Only one of many types of computing devices used.	22	48.9
The preferred access and learning device for any type of learning.	15	33.3
The development of m-learning will have an impact on HE		
It will widen access to (higher) education, because of the proliferation of mobile phones and wireless infrastructure – especially in developing countries.	29	64.4
The ideal mobile devices in the future will be…		
Small but still laptop sized devices because of its all-in-one device nature.	12	26.7

requires a change in the pedagogical paradigm in agreement with Moura and Calvalho (2009). The authors propose that this change should include transformation in the design and the development of teaching material.

It is also important to introduce by laws that governs the e-learning and distance learning which encourages students to participate at this type of learning. Regardless criticisms and debates, m-learning is now part of the academic curricula; what remains to see is how smooth the transition from the traditional to the contemporary teaching and learning environment can be.

IMPLICATIONS FOR FUTURE RESEARCH

The purpose of this chapter was to investigate the instructors' views on m-learning and its use in teaching and learning in higher education in Bahrain. It is evident from the above that m-learning plays an important role in teaching and learning strategies. Although, most of the participants work in institutions that do not offer m-learning strategies and they use face-to-face teaching, the instructors are considering its use, and some already conduct research in m-learning. Students and faculty will find ways to integrate m-learning in all aspects of their lives including the tasks of teaching and learning. Nevertheless, educational systems should not assume that instructors are proficient in using new technologies. Similarly to Ferry (2008), this chapter proposes that there is a need to integrate appropriate technologies into existing education systems. Professional development programmes should focus not only on the technology, skills and knowledge required to implement m-learning strategies, but also on the targeted use of technologies that support overall learning goals. Hence, further research is required to identify and determine such professional development programmes for instructors in higher education, especially in the Kingdom of Bahrain and the region.

Moreover, it was interesting that the majority of the respondents have not heard of m-learning.

The findings proposed that m-learning could be considered a continuation of traditional learning methods as well as an alternative to the methods of effective learning. It is mainly used for coursework, information retrieval and collaborative learning. The most important elements of m-learning included the fact that instructors are connected anywhere anytime, and they can share texts with their students, supporting the view of Giousmpasoglou and Marinakou (2013). Hence, instructors should be cautious when including e-learning as part of their assessment as the infrastructure and the support is not available at the institutions in the study. This study agrees with Venkatesh et al. (2003) that the available support and infrastructure are important for the use of e-learning and m-learning. Similarly to Sarrab et al. (2013), the main weaknesses identified include the small size of displays, the cost of network, the memory size and the mobile devices capabilities. However, the participants proposed that the new technologies should have an impact on teaching and learning in HE, and they believed that new may emerge, as they may enhance the learning and the teaching strategies. Macallum and Jeffery (2009) also propose that mobile devices may enhance m-learning, and the teaching and learning pedagogies.

Understanding the factors that contribute to the effective use of m-learning may help stakeholders to incorporate those in the design and implementation of m-learning. It is necessary to identify the practices in terms of instructional design and adapt them to reflect the number of changes that have taken place in education from the use of e-learning and m-learning. A transformation towards m-learning requires not only the use of the devices but also awareness and familiarity with new technologies (Wang, 2011), hence mobile tools should be aligned with the course objectives, and instructors should be aligned with m-learning requirements. M-learning should be used appropriately in order to be effective (Herrington et al., 2009), thus instructors should have the technical know-how as they are an essential part of m-learning.

This study proposes that informative meetings and instructors' training on m-learning can enhance the perception and the use of m-learning in higher education in Bahrain. Nevertheless, more empirical research is required to test the effectiveness of e-learning. Future studies can focus on identifying the factors, challenges and weaknesses in specific disciplines as the use of technology varies depending on the field of study for example it can be limited in liberal arts. It would also be interesting to explore the above findings in terms of gender differences.

KEY TERMS AND DEFINITIONS

Bahrain: The Kingdom of Bahrain is a small island country in the Persian Gulf. Since 2012 was ranked 48th in the world in the Human Development Index, and was recognized by the World Bank as a high income economy. Currently, there are 12 universities.

Blended Learning: A method of learning which uses a combination of different resources, especially a mixture of classroom sessions and online learning materials.

Collaboration (Collaborative Learning): Learners making rich connections and sharing resources to other learners and/or educators; this type of communication is mediated by a mobile device.

E-Learning: Any type of learning conducted via electronic media using specialized software, typically on the Internet.

Higher Education: The education offered after secondary education, usually available through colleges, universities, including vocational training, trade schools and other professional certifications.

Information and Communication Technologies (ICTs): The term stresses the role and importance of unified communications and the integration of telecommunications with computers as well as necessary enterprise software, middleware, storage, and audio-visual systems, which enable users to access, store, transmit, and manipulate information.

M-Learning (Mobile Learning): Any activity that allows learners to be more productive when interacting with, or creating information, mediated through a mobile device that the learner carries on a regular basis, has reliable connectivity, and fits in a pocket, a purse or a handbag.

Teaching and Learning: Teaching is undertaking certain ethical tasks or activities the intention of which is to induce learning, to impact knowledge of or skill of. Learning is the act or process of acquiring knowledge or skill.

Ubiquity: The ability of users to access content "anytime – anywhere" though the use of mobile devices.

Virtual Learning Environments (VLEs): A set of teaching and learning tools designed to enhance a student's learning experience by including computers and the Internet in the learning process.

Section 5

Issues and Challenges

This section contains 13 chapters, giving a wide variety of perspectives on Curriculum Design and Classroom Management and its implications. Within the chapters, the reader is presented with an in-depth analysis of the most current and relevant issues within this growing field of study. Crucial questions are addressed and alternatives offered, and topics discussed.

Chapter 64
Using a Task-Based Approach for Supporting a Blended Learning Model for English as a Foreign Language

Anita Ferreira Ferreira
Universidad de Concepción, Chile

Jaime García Salinas
University of Queensland, Australia

Sandra Morales
Newcastle University, UK

ABSTRACT

As Computer-Assisted Language Learning (CALL) has taken an important role in foreign language teaching and learning, not only is concrete data about the usefulness of technology- mediated environments for these purposes necessary, but also how the learning process is improved in such environments when learner training for CALL. The objective of this paper is to present an investigation which sought to explore empirical evidence regarding the effectiveness of a blended learning model, and also the use of language learning strategies in this kind of learning environment in order to increase its methodological potency with language learners. Consequently, this paper shows the findings of 2 experimental studies which aimed to provide data on (1) the efficiency of a blended learning (BL) model for language teaching and learning which combined task-based instruction, cooperative learning and optimal methodological principles for online learning (Doughty & Long, 2003), and (2) the use of learner training strategies for CALL in order to support and enhance the language learning process in this blended learning environment. The results from both studies suggest that the experimental group improved their language proficiency when compared to the control group. As a result, it is possible to conclude that (1) the blended learning design that included online tasks and cooperative instruction was beneficial for the development of language skills and (2) the use of learner training strategies for the blended learning model was highly beneficial for the students' language learning experience.

DOI: 10.4018/978-1-4666-8246-7.ch064

INTRODUCTION

One of the main objectives in CALL research has been the search and analysis of language learning and teaching models which are able to optimize the amount of input and practice that language learners receive inside and outside the classroom (Hubbard, 1996; Warschauer & Kern, 2000; Chapelle, 2001; Lamy & Hampel, 2007; Levy & Stockwell, 2007). Currently, with innovations such as mobile devices, it is possible for language teachers to implement methodological models which combine face-to-face teaching and technology-mediated tasks in order to support language learning using different resources for content delivery. Generally, the limited amount of practice hours tends to hinder the language learning process and the development of linguistic skills. In addition, the tasks assigned by the teacher (during or after the lesson) normally receive minimal attention due to the lack of time for feedback. Even though online learning provides valuable resources for language learning in general, it is in some cases the speaking skill which is left aside because of the lack of appropriate resources that enhance its development in virtual environments. This is why teaching in a context which combines e-learning and face-to-face instruction makes it possible to balance the development of the different language skills. The advantages of e-learning allow the implementation of eclectic models for language learning by including the best elements of these two areas (Gruba & Hinkelman, 2012; Lamy & Hampel, 2007).

Taking this into consideration, a model which includes face-to-face classes in e-learning contexts empowers this blend to improve language learning. The CALL methodological framework indicates that teachers have an important role acting as a guide in technology-mediated language learning contexts. The existing generation of technological resources offers advantages compared to the traditional class in terms of accessibility to authentic materials and experts in the field such as the case of using a computerized tutor, which may support certain aspects of students' learning like metacognitive monitoring (Aleven & Koedinger, 2002). Moreover, including task-based language teaching - defined by Nunan (2004) as a piece of classroom work that involves learners in comprehending, manipulating, producing or interacting in the target language while their attention is focused on mobilizing their grammatical knowledge in order to express meaning and in which the intention is to convey meaning rather than to manipulate form - and cooperative learning - defined as the use of small groups designed to encourage students to work together to maximize their own and each other's learning (Johnson, Johnson, & Holubec, 1998) - in a blended learning model provides many advantages to the language learning process. The use of the *tasks* (i.e. real-world-related projects) as the main pedagogical input in face-to-face or online setting connects the students with authentic situations, emphasizing communication and an appropriate psycholinguistic environment for language acquisition (Doughty & Long, 2003; Ellis, 2003; Richards & Rodgers, 2001). In addition, cooperation fosters critical thinking, responsibility for learning and interaction with peers (McGroarty, 1993; Olsen & Kagan, 1992).

These teaching methodologies, however, present certain challenges for teachers as well as students in terms of developing learning strategies in order to use a variety of virtual resources effectively. As a result, learning a language using the blended learning approach requires students to develop plans of actions to make the most out of this learning experience. Several investigations in this area (Cohen, 1990; Oxford & Crookall, 1989) suggest the necessity to train students regarding the use of language learning strategies in online contexts, in order to manage technology in the language class and learn the target language efficiently in computer mediated environments. Bearing this in mind, in addition to observe the effectiveness of a blended learning model for language learning, this research intended to explore how training students to use different learning strategies in a blended learning context allowed them to be more autonomous. The aim was, therefore, to explore if they managed to improve their language proficiency levels by setting goals, monitoring and evaluating their performance in the target language. This learner training sought to foster students' autonomous learning by raising their awareness on how to take advantage of the blended model so they could be more competent to organize their learning, control their anxiety and foster language learning skills development.

The organization of this paper is explained as follows: Firstly, a literature review concerning the major theoretical principles of the foundation of this research is analyzed. In this section, concepts such as blended learning, task based instruction; cooperative learning, learner training and language learning strategies will be defined and examined. Secondly, a description of the experimental study which targeted the efficiency of a blended learning model for language teaching and learning is presented. Thirdly, the investigation related to learner training and language learning strategies is introduced. Finally, data analysis is examined and conclusions, as well as implications drawn from both studies, are presented and discussed.

LITERATURE REVIEW

Blended Learning Approach

Among the different methodologies for foreign language learning and teaching through technology-mediated environments, blended learning can be seen as a valid alternative that combines face-to-face sessions and computer-assisted language learning (CALL). It involves learning language in any context with, through, and around computer technologies (Egbert, 2005). Incorporating online and offline resources may provide greater support to foster language learning and also autonomy in students. This exposure to different content transmission channels not only would enhance language skills development among learners (i.e. reading, writing, speaking and listening), but also their electronic literacy. The aim is that students are able to learn the language effectively by making optimal use of online applications for educational purposes (Doughty & Long, 2003).

Blended learning combines the elements of virtual learning (technological resources and internet) with the possibility to interact with a teacher or tutor (and the rest of the students) as a guide and facilitator for learning (Marsh, 2003). When using this methodology, it is possible to organize how the contents will be delivered in a more strategic and flexible way considering the students' needs (Morrison, 2003). According to Graham, Allen and Ure (2005), if a blended learning methodology is used, it is possible to develop pedagogy, improve access and flexibility, and increase learning and teaching effectiveness. In terms of design, Neumeier (2005) recommends that in order to implement an efficient blended learning model that helps to meet a language course's objectives, it is necessary to have a methodological framework with clearly defined parameters that mix theory and practice of the taught contents. Taking this into account, it is possible to include the theoretical background from different language teaching approaches such as task-based language teaching, cooperative learning, and the communicative approach. This is done in order to effectively combine the core elements from each aforementioned approach, thus increasing language proficiency in online and offline contexts.

When working with blended learning models, students can take more advantages of the resources to develop their language skills and have a substantial learning experience. If they have access to different technological resources, they can acquire and employ a range of learning strategies that can promote autonomy. In the face-to-face sessions, the students are forced to carefully think about the procedures they use to make decisions, monitor their learning (and that of their peers sometimes), set objectives, and self-evaluate their learning. All of these actions will have a direct repercussion in their learning process and help them to reach their goals.

Task-Based Language Teaching and Cooperative Learning

Over the last decades, the supposition that the quality of second language (L2) teaching will improve if teachers themselves improve their teaching techniques has resulted in a variety of new approaches, methods and practices that can be adapted or implemented depending on their current needs (Richards and Rodgers, 2001). The two latest approaches in use are: task-based language teaching (TBLT) and cooperative language learning (CLL).

Task-based language teaching is characterised by the use of tasks, also known as "activities", "objectives", "practise exercises", "complex work plans", "actions" and "responses" (Bygate, Skehan & Swain, 2001; Ellis, 2003; Skehan, 1996; Willis & Willis, 2007) as the main pedagogical input for teaching; the absence of a grammatical sequence or any other systematic program; and by the use of real communicative activities to carry out those tasks which are meaningful for the students, emphasizing authentic communication (Richards & Rodgers, 2001). This approach is theoretically and practically supported by Gass and Mackey (2007) regarding input, interaction, and output in Second Language Acquisition. This is due to TBLT being seen as a teaching method that simulates real-world situations which activate learners' prior knowledge and incorporate additional understanding of the target language. Furthermore, the meaning focus of tasks permits the students to use the language communicatively without paying central attention to the linguistic form. For this reason, interaction and negotiation increase, creating an appropriate environment for a significant learning experience.

Cooperative learning (CL) is the result of a more general approach known as collaborative learning. Collaboration encourages interaction through collaboration in a sociocultural way in order to co-construct knowledge with others (Oxford, 1990; Johnson, Johnson & Holubec, 1998; Johnson & Johnson, 2005). On the other hand, Cooperative learning emphasizes different language teaching and learning strategies which can be used to design and implement cooperative activities which are student-centered. By means of these activities, students develop their critical thinking skills and are responsible for their own, as well as their classmates', learning by making use of structured information exchange actions among peers and small groups (Olsen & Kagan, 1992; McGroarty, 1993). Unlike some other language teaching approaches for L2, cooperative learning is founded in solid empirical research evidence. Each student is responsible for planning, monitoring and evaluating his or her own learning, which implies active and direct participation (Richards & Rodgers, 2001). The teacher's role in this case is more of a facilitator who is in charge of creating a highly structured and organized environment, setting goals, structuring tasks, setting the classroom physical arrangement, establishing groups and students' roles, selecting materials and allotting assignment time (Johnson & Johnson, 2005). In this context, computers contribute to work cooperatively due to their inherent characteristics. To structure cooperation among students using a computer, the teacher will have to include mixed-ability students, establish positive interdependence and individual accountability and teach the use of social skills (Salmon, 2011).

An essential element of effective cooperation is promotive interaction in which individuals encourage and facilitate each other's efforts to complete tasks to reach the group's goals (Gillies, 2007). In order to create opportunities for the students to use the target language, engaging tasks involving group work and projects which combine online and face-to-face interaction should be designed and implemented in the language class. Johnson and Johnson (2009) state that promotive interaction occurs as individuals encourage and facilitate each other's efforts to accomplish the group's goals. This interaction is characterized by individuals acting in trusting and trustworthy ways, exchanging needed resources, providing effective assistance to friends, being motivated to strive for mutual benefit, influencing each other's efforts to achieve the group's goals, providing group participants with feedback to improve their subsequent performance and challenging each other's reasoning and conclusions.

Learner Training to Foster Autonomy for Effective Use of CALL

In order to enhance language learning methodological models involving technology-mediated tasks, one of the objects of interest in the field of CALL is appropriate learner training for use of online and offline learning resources. According to Hubbard (2004) most students do not have the proper skills to work in these contexts and need to be oriented to do so effectively. Even though learners today relate and know how to interact with current technologies, they may lack skills and may not be prepared to use them appropriately to improve language learning. One of the main principles in CALL states that students must have control of their learning, but if not treated carefully this can have a negative effect on their learning process (Hubbard, 2004). Boling and Soo (1999) explain that the fact that the students control their process does not always promote effective learning. It is necessary for learners to understand the alternatives they have (e.g., search engines) and how to use them in a correct way. It is vital that they are aware of their learning and develop different kinds of techniques to foster knowledge and increase autonomy when using online applications. In this context, Hubbard (2004) suggests that autonomy is strictly related to the learners' capacity to acquire language deliberately and systematically outside the language classroom, with or without the guidance of a teacher, tutor or classmate. Therefore, the main objective of training is that students learn how to manage the pace, time, and procedures to reach their goals and the evaluation of their progress in learning a new language (Healey, 2007). In addition, when developing learner autonomy, Healey (2007) emphasizes the role of the facilitator (i.e., teacher, tutor or guide) in terms of fostering the use of materials and methods as well as explaining their correct use to improve learning. Generally, when students go through a computer-mediated learning experience (i.e., distance education) without appropriate guidance, they tend to get overwhelmed with the amount of information which causes difficulties when making decisions regarding the importance of the contents and how to manage them with technology (Healey, 2002). For these reasons, blended learning possess the characteristics to foster learner autonomy in a context that mixes offline sessions with a facilitator to obtain training, practice and guidance, and online sessions where students work independently based on previous learning strategy training (Coaten, 2003; Garrison and Kanuka, 2004; Hinkelman, 2004, Graham, 2006, Gruba & Hinkelman, 2012).

The principle of using strategies in foreign language learning is based upon conclusions of different research conducted in order to clarify the characteristics of a good learner (see Anderson, 2005; Bruen, 2001; Chamot & El-Dinary,1999; Green & Oxford, 1995; O'Malley & Chamot, 1990; Wharton, 2000). The findings of these studies suggested that being skillful and/or motivated to learn a language was not sufficient, but that an active attitude in this process throughout the use of individual language learning techniques was also necessary. In general terms, a strategy can be defined as a "sequence of procedures for accomplishing learning" (Schmeck, 1988). Edward Cohen (2005) also defines a language learning strategy stating that they are the students' thoughts and conscious or semi-conscious behaviors in order to improve their knowledge and understanding of the target language.

These strategies include a series of steps with the aim of improving their linguistic skills. They empower the student to increase their attention spam to learn the target language, promote the learning of the new content, improve the retention of new material related to language, and increase language knowledge recall when necessary (Oxford, 1990; Mayer, 1988).

EXPERIMENTAL STUDIES

The experimental studies conducted for this investigation sought to obtain empirical evidence of the effectiveness of (1) blended learning (BL) vs. face-to-face instruction for English as a FL and (2) BL instruction "with training" in language learning strategies vs. BL "without training" in language learning strategies for English as a FL. The experiments were carried out within a quasi-experimental approach consisting of an experimental and a control-group with pre and post-test administration. Participants were randomly assigned to form two groups, each containing 12 students.

The Efficiency of a Blended Learning Model for EFL Teaching and Learning

The First Experimental Study was conducted in order to determine how the theoretical was conducted in order to determine how the theoretical principles of task-based teaching, cooperative learning and CALL can be used together in the design of activities for the improvement of linguistic abilities in the context of a blended learning environment.

Method

Our Research Question: *Will English language proficiency improve in those students who are exposed to the blended learning model?*

Along with this research question the following hypothesis was suggested:

Hypothesis: The students who employ the blended learning module based on the task and cooperative approaches will show a *greater improvement* in their language proficiency compared to those who use the face-to-face method.

Participants: The group of participants in this study consisted of 24 first year students enrolled in the English Teaching program of a private university in Concepción, Chile. The students were enrolled in the subject called *Developing Communicational English I* and did not possess any previous experience working in technology-mediated contexts for language learning purposes. The age range for the participants was from 18 to 23 years old. . The majority of the participants were female (79%) and 21% were male. For this study, the students were divided into 2 groups of 12 students each: One group was the experimental group and the other one was the control group.

The Experimental Group: They were given a pre-test before the study and a post-test after the completion of the study in order to compare the results. It is important to mention that the pre-test and post-test were formulated using the Preliminary English Test (PET) exam format and parameters. These adapted tests evaluated the students' proficiency level in the four language skills (reading, writing, listening and speaking), each carrying 25% of the total marks, before and after their exposure to the blended learning model. The experimental group was exposed to the blended language learning methodology throughout 14 sessions. The contents of the online/offline classes were linked to the course syllabus and delivered using several technological resources such as webpages, chat, email and blog in order to provide richer input and improve language skills. The face-to-face sessions were used to practice speaking skills, mostly, and were connected to the tasks developed in the online work.

The Control Group: The participants in the control group studied the same contents as the experimental group, but in a traditional face-to-face manner. The teaching materials just included the course book and audio CD prescribed for the course. Technological resources were not used in the sessions with the students in the control group.

Blended Learning Module Description

In order to collect data for this first experimental study that this research is based on, a blended learning module was designed and developed using the principles of CALL, TBLT and cooperative learning. The design of the blended learning model for the development of the language skills was connected to the communicative goals and grammar structures from course syllabus. The online tasks for the practice of the language skills were elaborated using Computer-Mediated Communication (CMC), both synchronous and asynchronous. The design of the online tasks considered seven of the ten methodological principles proposed by Doughty and Long (2003): Use task as the unit of analysis; promote learning by doing; provide rich input; focus on form; provide corrective feedback; promote cooperative/collaborative learning; and incorporate individualized instruction.

In addition, the following techniques from cooperative learning were included in the blended module design. The aim of incorporating this type of learning was to foster peer interaction and language exchange. This would add communicational value to the tasks, as the students were asked to conduct most of them by working in groups or pairs:

1. **Learning together:** The students worked in groups to complete the tasks. Each learner was assigned a specific role so they could all contribute to a successful task completion. Responsibility and commitment to the learning process were the key elements for including this technique into the design;
2. **Group Investigation:** The students were assigned a topic and a situation they had to resolve by searching for the appropriate information. They were asked to organize themselves to undertake the research. This would put them in direct contact with authentic materials in the target language, therefore increasing the opportunities for learning and practice;
3. **Jigsaw:** Using this technique the students were given different pieces of information to share with their group members. The 'experts' were supposed to contribute with their knowledge to complete the given task.

The objective of the blended module was to give the students enough opportunities to use the target language through interactional and communicative tasks, in order to promote the development of the different language skills. The main idea was to assign tasks associated with 'real-life' situations so that the students were able to perform them successfully. The tasks were focused on form and meaning in order to foster interaction and negotiation. In Figure 1, and Table 1, the distribution of the lessons of the blended learning model is outlined.

The students made use of the module comprising 14 sessions, divided into online and offline classes. The activities were elaborated based on clear grammatical and communicational objectives to foster the contact and interaction opportunities with the target language. These tasks were organised into a task cycle of pre-task, main-task and post task (Ellis, 2003) in order to help and guide the students to achieve their final outcome.

Chat	2 sessions
Application JCLIC	14 sessions
Group Work	
Face-to-Face	5 sessions

In this case, the purpose of the tasks was to gather information and do activities to elaborate a brochure outlining the tourist attractions of Scotland.

Before the students started to work on the activities included in the blended module, they underwent training which guided them to use the materials in an appropriate manner and foster language acquisition. The training incorporated academic and technical aids, as well as learning strategy-based sessions to help the learners make this experience instrumental to their learning process.

After the pre-test, the students in the experimental group studied the contents of the BL module based on the task and cooperative approaches during 16 sessions: one introductory, 9 online, 5 offline and a final evaluation session. The themes and grammar topics selected were directly related to those of the course syllabus, so the students worked with the linguistic forms in a blended manner instead of the traditional face-to-face method used in the university program. Regarding the offline sessions, the students performed cooperative tasks such as role plays, interviews and oral reports mainly based on the materials presented in the online sessions.

Moreover, the focus on form contents were studied through drill-type exercises contained in an e-learning platform created with a free access authoring tool called JCLIC 3.0 (2010). It is important to mention that all the grammar exercises provided corrective feedback and a record of the students' performance in terms of correct/incorrect answers as well. This feedback was based on the taxonomy presented by Ferreira (2006, 2007) regarding effective feedback strategies in

CALL. This information was valuable for post data analysis related to the students' learning process. The following strategies were considered for the grammar exercises and included in the feedback messages provided by JCLIC:

1. **Elicitation:** The main objective is to obtain the correct answer from the students through questions that guide them to come to the correct conclusion on their own, rather than simply giving them the correct answer. For example:
   a. One more time! What would you do to warn people?
   b. Maybe next time! What would you do if someone needed guidance?
2. **Metalinguistic Cues:** The grammatical information given will help the students to notice what their error was and try to answer again. Some of the cues included in this study were:
   a. Try again! Use the negative form;
   b. Are you sure? Remember to use the correct question form;
3. **Clarification Request:** They are intended to communicate that the message wasn't conveyed clearly. Therefore, the student is forced to reformulate the sentence. Some of the requests included in this study were:
   a. Could you do it again?
   b. What do you mean?

Pre and Post-Test Data Analysis Interpretation

Tables 2 and 3 show the results obtained by both the experimental and control groups. Table 2 shows the language proficiency development achieved by the experimental group, which is clearly visible in the post-test results. All of the students improved their language skills after being exposed to the blended learning model and their improvement averaged 0.5 points, which is a meaningful improvement (in statistical terms) in learning for the whole group.

According to the results obtained once the process was completed, it was possible to confirm our hypothesis and to point out that there were

		42			**48**

significant differences between the average of the pre-test and post-test of the experimental group. The results showed that the learning improvement in the students in the experimental group that employed the task-based-cooperative blended learning model was statistically significant (Experimental group, F-Test= 1.196, P= 0.7717 and T-Test= 3.148, P=0.0047; Control group, F-Test=1.149, P=0.8217 and T-test= 1.508, P=0.1458).

Task-Based Language Teaching provided the rationale for the design and implementation of online and offline tasks in the blended learning model. In addition, the learning-by-doing principle from Cooperative learning enhanced the model in order to meet the objectives to validate its efficiency. The organization of the model proved to be effective in this study because the four skills were developed in a balanced way. The incorporation of technology was crucial in the design of the model due to the fact that when using technological resources, it is possible to create tasks to improve every skill.

In this study, feedback was fundamental when the students used the JCLIC application in the offline sessions in order to support their learning process in virtual environments. Also, as JCLIC provides different resources to present materials, the students were given richer input concerning grammar than they would be given in traditional contexts. Feedback from the teacher was also given via email or blog posts. In the face-to-face classes, students received error correction from their peers and the teacher.

Use of Language Learning Strategies in a Blended Learning Environment to Foster Student Autonomy

This second study was conducted in order to determine if constant language learning strategy training in a blended learning environment turned out to be effective in promoting learner autonomy and supported English as foreign language learning. For this specific study, we used the same blended learning model as in experiment 1, which employed a task-based and cooperative approach. For a better use of the courseware designed, students were trained in the use of language learning strategies which foster a more effective learning process:

Our Research Question: *Will explicit and constant language learning strategy training help to improve learner autonomy and support EFL language learning in a Computer-Mediated context?* Along with this research question, the following hypothesis was suggested.

Hypothesis: Regular and explicit training in language learning strategies for a foreign language, adapted to a blended-learning context, can help students improve their learning of the target language.

Methods

Participants: In this research, the sample was composed of 24 freshmen students of English as a foreign language from a private university enrolled in "Developing Communicational English I" as a requisite of their program. This subject is taught 4 times a week, with 8 pedagogical sessions of 40 minutes each, and is divided into two sections of 20 students each. As for their linguistic abilities, 13 of them (54.2%) were at the basic level and 11 of them (45.8%) were at a pre-intermediate level. The students' English level was assessed with the use of the "Quick placement test" (Oxford University Press) which measures their reading skills, their grammar knowledge, and their listening comprehension through multiple choice items. Students were divided into two groups, the experimental and control groups, with 12 students each.

The Experimental Group: It was made up of 12 students with language levels ranging from basic to pre-intermediate. They were exposed to a blended language learning methodology providing them with specific training to foster the use of language learning strategies in CALL environments. Throughout the 14 sessions, the students were trained to make a more efficient use of the courseware designed.

The Control Group: It was made up of 12 students. They were also exposed to a blended language learning methodology, but they were not provided with any kind of training in language learning strategies for that context.

Language Learning Strategy Evaluation Tool Description: Both the experimental and control group were given as pre and post-test an adapted version of the Strategy Inventory for Language Learning (SILL) to measure their entry level as well as the final level they reached after the training period. This inventory was developed by Oxford (1990) and it has been used to determine the types of strategies used by students to cope with the language learning process; it assesses the frequency of use of such strategies (Oxford, 1990; Oxford & Burry-Stock, 1995; Cohen 1990; Nyikos & Oxford, 1993; Olivares-Cuhat, 2002).

The inventory used for this specific study was adapted to reliably assess strategy use in a CALL environment. The original instrument is aimed at assessing the use of strategies in a traditional language learning context. Adaptation consisted of modifying specific items (out of the 50 original ones, divided into 6 different parts) to identify language learning strategies in blended contexts.

The 50 items retrieve personal information on previous language learning experiences that students have (see Appendix 1).

Test questions aim at assessing the use of:

1. Memorization strategies (9 questions)
2. Cognitive strategies (14 questions)
3. Compensation strategies (6 questions)
4. Metacognitive strategies (9 questions)
5. Affective strategies (6 questions)
6. Social strategies (6 questions)

Procedure

According to Hubbard (2004) students should not be released into powerful learning environments unprepared. Despite the cost in time and effort, most students will profit from some formal, sustained training in how to take operational competence in a given computer application and transfer that into learning competence. This training calls for student's autonomy as one of the five learning goals listed by Warschauer, Schetzer, and Meloni (2000). Therefore, students underwent the intervention process to increase their language learning as well as their conscious use of language learning strategies.

Before the whole intervention process took place, students were explicitly trained in the use of the different learning strategies (metacognitive, cognitive, affective, and social strategies) that they were going to make use of. They also received information regarding the type of work they were going to undergo. When the actual intervention process started, and throughout 14 sessions, participants reflected on and made comments in respect to the different activities to which they were exposed during the day. This was made in the light of the prior training they received keeping a log book in which they reflected on the use of those strategies previously taught.

The whole process was divided into the following 3 stages:

Stage 1: Pre-Test Administration: During this stage two instruments were administered. One of them was the adapted version of the Strategy Inventory for Language Learning (SILL, Oxford, 1990) taken by both groups that were exposed to a blended learning language approach. The other test was aimed at assessing students' linguistic skills. This test consisted of 3 different parts aimed at assessing students listening, reading, and writing comprehension. It was created following the PET format. There was a fourth component, the oral part, but that was assessed separately;

Stage 2: Language Learning Strategy Training: The training process lasted 14 sessions, during which the students were instructed in the use of different activities to promote language learning strategy in a blended learning context. The teacher showed and modeled the different types of activities which fostered the development of metacognitive, cognitive, affective and social strategies. This training in language learning strategy use was based on the framework proposed by Pearson and Dole (1987) and Oxford (1990) which has a pre-established sequence. There is an *initial strategy modeling* done by the teacher, including a direct explanation about the strategy and its importance, which is then followed by *guided practice* using that specific strategy. In the *consolidation* part of the sequence, the teacher helps students to identify and decide when the strategy has to be used. Finally, there is *independent practice* carried out by the students who are, at this stage, able to make use of the strategy on new tasks.

During the first session there was an introduction to concepts as well as language learning strategy clarification in blended contexts. After being introduced to the different types of strategies, the students received printed material to reinforce the different strategy concepts: metacognitive, cognitive, affective and social. Printed material also included a list of specific activities which fostered the use of each of these strategies. They also received a log book in which they registered their information regarding strategies used while working in a blended learning environment. The aforementioned tools were used throughout the whole training process and encouraged students to reflect upon the data. It was also at this stage that the students were familiarized with the blended learning environment in which the training was going to take place, and what it consists of.

On a daily basis, after each of the 14 work sessions, students had to attend a reflection workshop to discuss the strategies used which, as a result, promoted the internalization of strategy use:

Stage 3: Post-Test Administration: Once the whole training process had taken place, the students were given both instruments again: the adapted version of the Strategy Inventory for Language Learning (SILL, Oxford, R. 1990) and the test which was aimed at assessing the students' linguistic skills improvement (described above).

Pre and Post-Test Data Analysis

Tables 4 and 5 show the results obtained by both the experimental and control groups. Table 4 displays the increase in language learning achieved by the experimental group, which is clearly visible in the post-test results. All of the students improved their language learning strategy use, and their improvement averaged 0.5 points, which is a meaningful improvement (in statistical terms) in learning for the whole group.

Data shown in Table 5 illustrates that even though there was a slight increment in post-test results for the control group, this could be due not to language learning training, but to the blended learning approach. As presented in the experimental study 1 of this investigation, the blended learning model had already been proven effective to develop language skills and improve proficiency. Therefore, in the second experiment, the control group was expected to have some increase in their linguistic skills development even without the training.

To prove the statistical significance of the results, a T-test was administered: the value obtained (T= P value = 0.29369) in the control group showed that there are no significant differences between the pre and post-test means, which shows that without explicit training in language learning strategies in blended contexts, they cannot seem to make the most of the courseware designed. The value obtained in the experimental group (P value= 0.00201) showed that there are significant differences between the pre and post-test means.

Median		3.2		3.4	
Standard Deviation		0.33		0.31	

This means that explicit training in language learning strategy use in a blended learning context promoted courseware use allowing the students to make a more efficient use of it. This resulted in a better understanding and learning of the different topics covered. This result is similar to the one obtained by Nisbet and Shucksmith (1991) who showed that less skilled students benefit from the use of language learning strategies and are then able to adapt them to specific situations. In relation to language learning strategy use, we can say with a 95% confidence level that there are significant differences between the pre and post-test results regarding their use, which is not the case in the control group. There is a clear relationship between language learning strategy use and language competency. Students with a better language proficiency use a wider variety of strategies (Anderson, 2005; Bruen, 2001; Chamot & El Dinary, 1999; Green & Oxford, 1995; O'Malley & Chamot, 1990; Wharton, 2000).

This means that students made progress in the efficient use of the four strategies they were trained in. These results ratify a previous study conducted by Cohen and Ishihara (2005), since participating students made great progress in the learning of the target language, showing that language learning strategy training allows them to learn the target language more effectively (see Table5).

In addition, the F-test was used in order to identify the model that best fits the population from which the data was sampled (see Table 6). In statistical terms, the F-test is used when testing differences in means in more than one group. An F-test for the null hypothesis shows that two normal populations have the same variance.

CONCLUSION AND IMPLICATIONS

This article has focused on reporting the results of an investigation that aimed to examine (1) the

Table 6. F-test for the null hypothesis

Variation (F-test)	0,87
Confidence level (nivel de confianza)	95%
P value	0,29369

effectiveness of a blended learning model for language skills development and (2) the use of learner training and language learning strategies in order to take advantage of the resources to increase language proficiency. Our main concern was to analyse empirical evidence in order to determine the efficiency of this mixed model that included Task-based instruction and a cooperative approach for English language learning in technology-mediated environments. In establishing concrete tasks with clear goals, the students worked in an appropriate context which incorporated useful elements and guides to help them reach the task outcome successfully. In addition, the principle of using authentic communication situations allowed the students to focus and reflect on selecting the correct linguistic forms and structures to elaborate their texts and speech. The use of chat, blog, email and internet allowed the students to practice the language in established contexts. The use of corrective feedback in the e-learning application supported the importance of using effective feedback strategies in CALL materials for second language acquisition. By including different strategies, the students deeply analysed the structures and contents in the target language. In this study, feedback was fundamental when the students worked with the application in online sessions. Also, as JCLIC provides different resources to present the materials, the students were given richer input concerning grammar than they would be given in traditional contexts.

Even though students use language learning strategies in an incipient way, constant and explicit training fosters their continuation. Being able to control anxiety, carefully plan their learning, and monitor the course of action to finally assess the whole process are important aspects which motivate students and help them learn at their own pace and in a more effective way. The language learning strategy training is a key element which triggers better understanding and learning by allowing students to make the best out of the means available to them. The fact that the use of learning strategies is mainly a cognitive process helps the students become aware of their benefits. This also supports explicit instruction in language learning strategy use which can be internalized through constant use in communicative tasks.

Metacognitive strategies play an important role since they enable students to reflect on their own way of thinking, fostering planning, monitoring, setting of objectives to finally evaluate the whole process. Language learning strategy use results in a better learning of content as well as in the capacity for students to express themselves more accurately and fluently, which in turn improves motivation.

Results show that the hypothesis for this study is correct, since regular and explicit training in foreign language learning strategies, adapted to a blended-learning model based on TBLT, can help students improve their learning of the target language. This training and its results show that the general objective was achieved. It is possible to say that students learn much more effectively in a blended learning context when there is constant training in language learning strategies. The use of a blended learning approach enriches the design and implementation of communicative tasks. This, in turn, provides students with access to meaningful materials that naturally motivate their curiosity.

All of this results in a more autonomous student who is able to be in charge of their own learning. The learners are now more able to set objectives, monitor and evaluate their own learning process, mostly underpinned by metacognitive strategies. Since new approaches in language learning are more student-centered, this type of training assists with fostering students' autonomy.

Finally, this chapter also shows the benefits that constant training in language learning strategies had on the students. Their use of these strategies improved the acquisition and learning of linguistic skills required to master the target language. This is clearly shown in the results obtained in the pre and post-tests. The inclusion of effectively proven approaches and materials in this model successfully improved the students' foreign language competence, particularly in contexts that are usually established by educational institutions. As is the case with every investigation, this one was not free from limitations.

It is important to mention that the sample used in this study was limited due to the availability constraints of students. Therefore the results can be more generalizable if a more significant sample is used in a follow-up study. Time available to devote to the execution of this study was another drawback. We therefore suggest that more studies be conducted to further validate the conclusions of this research. Another similar study consisting of more participants and sessions could be conducted. For future research, it would be interesting to determine how intrinsically related language learning strategies are and to pinpoint how appropriate it is to consider them as a unique construct to be taught.

The findings will help us to provide valid guidelines for the development of materials using technological resources for foreign language learning. It was found that the experimental group, which worked with the blended model, had a considerable improvement in language skills compared to the control group that used the face-to-face methodology. Considering these results, we advocate the importance of the blended learning models in foreign language learning and strongly recommend researchers and practitioners to include them when designing CALL materials.

ACKNOWLEDGMENT

This investigation was sponsored by the National Council for Scientific and Technological Research (FONDECYT, CHILE) under Grant No. 1080165: "A Blended Learning Task-Based Approach and Cooperative Learning for Foreign Language Learning". Chapter 65
Using Blended Principles to Bridge the Gap between Online and On-Campus Courses

Panagiota Gounari
University of Massachusetts–Boston, USA

Apostolos Koutropoulos
University of Massachusetts–Boston, USA

ABSTRACT

Blended learning, and its relative HyFlex (Hybrid Flexible), are garnering up a lot of attention these days from both academics and administrators on college campuses. Organizations like the Sloan Consortium offer training in Blended Course Design; free Massive Online Open Courses (MOOC) such as BlendKit provide ways for educators to start thinking about and begin implementation of blended course design. Despite the pedagogical benefits, not all institutions are equipped to handle blended courses, instructors are not ready to jump on the blended bandwagon if there is no institutional support, and on-campus students are not very comfortable with it yet. One proposed way to ease the transition into blended learning is to combine two sections of the same course, one running online, and one running on-campus. In this chapter, the authors describe a pedagogical trial in which they adopted this proposal as a way, based on HyFlex principles, to get students thinking about the benefits of blending two sections, thus bringing in some benefits of blended learning, while retaining the "safety net" that some students feel they need when they sign up for on-campus courses.

INTRODUCTION

In the fall semester of 2011 a unique opportunity for pedagogical experimentation and innovation was presented to us in the department of Applied Linguistics at our Institution. One of our faculty members was teaching two sections of the same course (Foundations of Bilingual Education) online and on campus. While the mere fact of teaching two sections of the same course isn't always enough for pedagogical innovation, the fact that these two sections of the course were designed and implemented for different modalities and serve different populations of students, gave us reason

DOI: 10.4018/978-1-4666-8246-7.ch065

to pause and ponder the pedagogical possibilities of blending these two sections. Just as there are different types of "blends," as proposed by Singh & Reed (2001), we thought of blending together an on-campus course with an online section of the same course to see if there is merit in bringing together two different groups of learners to learn together and what might be some of the benefits and pedagogical lessons.

Program Information and Student Background

Our on-campus program in Applied Linguistics has existed since 1981 and has played a pioneering role in preparing K-12 teachers in the fields of bilingual education, English as a Second Language, and foreign language pedagogy, including English as a Foreign Language. It is the largest of its kind in the state of Massachusetts with approximate enrollment size of 124 students each year, and is consistently recognized as one of the most noteworthy graduate programs at our Institution. From 2001 to 2006, Applied Linguistics students comprised approximately 23% of the College of Liberal Arts graduate student body, including both masters and doctoral degree candidates. With the inception of the online program in 2006, the Applied Linguistics Department enrollment figures showed a significant increase. Since 2006, the Applied Linguistics enrollment has virtually doubled, representing 36% of the College of Liberal Arts graduate student body. Applied Linguistics faculty consists of highly qualified, well-published and diverse scholars in the field.

The Program´s mission is "to ensure (1) that our students master the technical aspects of applied linguistics; and (2) that they understand the political and ideological dimensions of language teaching and learning given their work with low socioeconomic status linguistic minority populations who often speak language varieties that are often perceived in biased and uninformed ways by the layperson" (Applied Linguistics Mission Statement 2011). In line with this mission, we have set the following fundamental core values: Languages and cultures are important individual and societal assets; All languages, dialects, and cultures deserve to be respected and cultivated; Multilingualism and multiculturalism are beneficial for individuals and society; Accurate information and research should be the basis for policies and practices that involve language and culture; Effective language education should be widely available, and; Civic-minded teacher education should help prepare language professionals that can theorize the world around them and make informed, critical and ethical decisions. These values inform both our on campus and our online program.

The online program was a pioneer in Distance Learning, being one of the very first degree-awarding Applied Linguistics programs worldwide to be fully online in 2006. The synergy between the two programs has been part of the conceptualization of the online program since its inception. The on-campus and the face-to face program run in parallel ways; they share the same curriculum, goals, objectives and learning outcomes. The ratio of on-campus students to online students has changed from a 63% face-to-face to 37% online ratio to a 50%-50% ratio in the last couple of years, with some years having more online enrollments than on-campus.

Our two modalities serve two different types of student population. Our on-campus students are predominantly focused on the English as a Second Language (ESL) track, with a number of students in the past few years also pursuing initial licensure to teach ESL in a K-12 environment. Our on-campus Foreign Language track, including English as a Foreign Language, has been smaller as compared to the ESL track. The on-campus program also attracts many students who are local to Boston and the surrounding cities and towns, thus the proportion of local to out-of-state students is higher in our on-campus program.

Our on-campus students are, for the large part, also commuting professionals.

Our distance students on the other hand, are a more balanced yet diverse student body. There are students both from the United States and from abroad, teaching in both K-12 and university settings, and teaching English as a Second Language, English as a Foreign Language, and Foreign Languages. We view this great diversity as an important asset to our distance education program. Some of our on-campus students who have taken elective courses that were only offered online, have also benefited from this diversity.

Hyflex Course Design

Looking at the various models that were available to us for consideration, the HyFlex model (Hybrid Flexible) made the most sense as a basis for our pedagogical experimentation. Some of our current on-campus course offerings have in the past been taught at times as Web-Enhanced, or Web-Facilitated in Sloan-C terms (Allen, Seaman & Garrett, 2007), where the course used web technologies, chief among them the Learning Management System, to facilitate the on-campus course and to bridge the gap between weeks. Our online courses were designed to accomplish the same goals as our on-campus course in a different modality. Having one instructor teach both sections gave us the great opportunity to bridge the gap between the two student groups and modalities of instruction.

The universal principles of HyFlex (Beatty, 2010) also struck a chord with us. There were two of the universal principles that we already had in place, in both sections. The principle of *equivalency* was already in place in our online section: Learners had a path to equivalent learning outcomes regardless of the fact that the course was online. According to Beatty (2010) "alternative modes should lead to equivalent learning" (p. 6) where equivalence does not imply equality; our goal was not to replicate what is happening in the classroom in an online environment in a one-to-one fashion. *Accessibility* was also something that we had in place, making sure that materials in both the online course and the on-campus, web-enhanced course were accessible to a wide variety of learners. Since the on-campus course had also in the past been taught at times as web-enhanced, this meant that in cases of school closings the class would be able to go on. Given that we already had these two HyFlex principles in place, it made sense to expand to a third one: *Reusability*. A variety of materials are reusable between classes, and between sections. Videos, podcasts, readings, and now recorded class presentations! If there were opportunities for speakers to come to class, locally, to address the on-campus course, this became an opportunity to have distance learners benefit from this as well. Peer-produced materials are also another instance where reusability could come into place. On-campus students could produce artifacts of learning that they would share with their campus peers. Because these artifacts are usually born digital, they could easily be shared with their online peers. The converse is also true, thus they could not only enrich their online peer's learning but also their on-campus peers.

The only HyFlex principle that we opted to not strictly adhere to is the principle of *learner choice*. Beatty (2010) describes this principle as "[P]rovid[ing] meaningful alternative participation modes and enable students to choose between participation modes weekly (or topically)." One of the reasons we opted to not give our on-campus learners the choice of which mode was their "home" mode (online or on-campus) was that this time we only wanted to experiment with one additional change to the curriculum, as opposed to wondering, each week, who might show up in the on-campus classroom. At the same time, we wanted to keep online and on-campus students together but separate since we expected on-campus students to be physically present in class every week. Our on-campus students are not always familiar with Web-Enhanced courses, so we did not know, in advance, how they would fare if they decided to do the course mostly online. In addition, because this was an individual faculty initiative, we were also unsure of the technical support availability to enable our learners to be successful. Thus our course was Hybrid and *somewhat* flexible because on-campus learners could catch up and participate meaningfully online should they miss an on-campus session due to unforeseen circumstances. This type of design is very close to what Bonk (2005) described as "classes or training experiences [that] can blend students located at various remote regions or perhaps instructors collaboratively teaching a class at two or more locations" when he wrote about the future of blended learning.

EXISTING COURSE DESIGN

On-Campus Version: APLING 614 (Foundations of Bilingual/Multicultural Education) is a required course for ESL concentration students and it has been running as a regular on-campus course without any Web-enhancement. Class attendance is mandatory and students are expected to prepare readings before class in order to meaningfully participate in class discussions. The instructor presents the main issues at the beginning of the class in a mini lecture and raises pertinent questions. Students are required to present one of the assigned readings one time during the semester in class. The day they are assigned to facilitate, they are expected to summarize the readings, frame the discussion, raise questions for the class and keep the discussion focused. They are also expected to write a short paper where they address the article or book chapter they chose, and demonstrate the ways they understand it. They are encouraged to not merely summarize the readings but try instead to raise some points that they consider important and ask questions that they think could generate an interesting discussion.

Their presentation should include the following: (1) a presentation of the main argument made by the author(s); (2) a critical analysis of it; (3) suggestions as to how it could be expanded to address questions, concerns, assumptions and they way these relate to your own philosophy and practices as educators. A written 2-3 page paper is also due at the day of their in-class presentation. Beyond that students in the on campus section are also required to write a *Linguistic and Cultural Profile* that is a reflective paper where they briefly introduce themselves in terms of their social, cultural, gendered, ethnic background and personal and group histories. This course further requires a field-based component (twelve clock hours) in which students produce a *mini ethnography* of any aspect of ESL, Bilingual or Multicultural Education. Finally, students work collaboratively to produce a *Position Research Paper* on Language Policy that they present on the last day of class. Groups are created randomly and students get to choose from a variety of topics. There are final in-class presentations where students share the findings of their research.

Online Version: The course requirements for the online modality are equivalent to the on-campus course. *Class Participation* and *Attendance* are important components of success and are assessed by observing postings on the Message Board. The Discussions area in Blackboard works as a virtual classroom and it is the area where the class meets weekly to discuss, pose questions, and exchange views and ideas about the readings and other issues that emerge throughout the course. Students can post as often as they want but they are required to post at least twice a week. The two postings minimum requirement includes: (1) an original message that demonstrates engagement with the readings, and (2) a response to somebody else's message.

Along the lines of the in-class presentation described above for the on-campus class, each online student is responsible for starting, moderating, and summarizing the weekly discussion forum at least once during the semester. Moderators are expected to post a two-page reaction paper or presentation at the beginning of the week. Their presentation should include a short outline of the argument and a critical analysis of it. They can pose questions and concerns, or highlight points of agreement that they feel will generate some discussion. The discussion leader's presentation must address the assigned readings and demonstrate the way they understand them. During their week to moderate, students will also monitor the message board area daily and keep the discussion focused, generate useful discussion by responding and creating new messages as needed, involve everyone in the discussion, and introduce weaving messages throughout the week. As is the case with the on-campus class, online students also submit a *Linguistic and Cultural Profile*, a *Mini Ethnography* and work in groups for the final *Position Research Paper* on Language Policy. Groups are assigned randomly via Blackboard and each online group has their own virtual space on BB that includes a discussion board, a blog, and individual messaging. All assignments are submitted via the Blackboard learning management system.

Combined Course Design: The goals for the combined course design in this particular instance were (1) to increase meaningful interaction between on-campus and online students; (2) to take advantage of and build on diverse student experiences, understandings and perspectives, especially given that the student body in the two modalities differs; (3) to bridge the two types of learners in order to create a community of learners; (4) to make online students feel more connected to the brick-and-mortar institution; (5) to familiarize on-campus students with the online platform and its potential for enhancing learning; and (6) to use the Blackboard course shell as a repository of readings, discussions, multimedia and other material easily accessible at any point by both on-campus and online students. The conceptualization of this combination was very much based on what Rovai & Jordan (2004) hypothesized; that blended courses provide "a greater range of opportunities for students to interact with each other and with their professor. These interactions should result in increased socialization, a stronger sense of being connected to each other, and increased construction of knowledge through discourse, thus providing stronger feelings that educational goals were being satisfied by community membership" (p. 4).

The combined course design was built into the on-campus syllabus as something new and experimental. On-campus students were informed that there was a group of APLING students taking the same course online and that we wanted the resident students to collaborate and exchange ideas and experiences with the online students, while maintaining the two separate course delivery systems. On-campus students still had to come to class every week but they were given access to the online course shell. They were asked to access the Discussions area every week, read their classmates' postings and post a minimum of two messages. We didn't view this as a "course and a half" symptom (Aycock, Garnham & Katela, 2002) because the few web-enhanced courses in our department have a similar discussion requirement. By "course and a half" we mean the perception on the students' part that there is too much work that feels as if they are taking more than one course at the same time. This happens when instructors start with a classroom-based course and add online activities which results in increasing the workload for both instructor and student. According the McGee and Rice (2012) "the course-and-a-half phenomenon reflects what many students dislike about blended courses: there is too much work" (p. 11).

Osgoodthorpe & Graham (2003) make a claim that blended learning can increase the learner's personal agency by increasing the personal choice of learners. We believed that by having a course shell, and exposing campus students to online students (and vice versa) this was giving students the choice to exploring something outside of their normal everyday situations. For online students it would be exposing them to a specific K-12 ESL environment in Massachusetts, and for on-campus students, most of which are seeking to teach in a K-12 environment in Massachusetts, it would empower them to seek a more global perspective on the issues from their online peers. In addition, having access to a course shell, we were hoping to capitalize on the findings of Means et al (2010) that found that "classes with online learning (whether taught completely online or blended) on average produced stronger student learning outcomes than did classes with solely face-to-face instruction" (p. 18).

On-campus students were also asked to post their Mini Ethnographies online (in the Blackboard Discussions) for the whole class to read. Both online and on-campus students used a rubric to evaluate each other's work. In order to facilitate the collaboration and break the ice, the first week of classes during "Personal Introductions" we asked both groups to introduce themselves online. In addition, the first two weeks were conducted entirely online for both groups in order to get to know each other and get the chance to engage with the readings and exchange ideas at an intellectual level. The combined sections in this course resonate more with what has been termed by McGee & Reis (2012) an "enhanced blend", that is a blend that "allow(s) for incremental changes to the pedagogy but do(es) not radically change the way teaching and learning occurs. This can occur at both ends of the spectrum. For example, in a traditional face-to-face learning environment, additional resources and perhaps some supplementary materials may be included online" (p. 8). Enhanced blends have the potential to become Transforming Blends that is, blends that allow for a radical transformation of the pedagogy, a change from a model where learners are just receivers of information to a model where learners actively construct knowledge through dynamic interactions. These types of blends enable intellectual activity that was not practically possible without the technology later on with more work.

The most "collaborative" part of the course was the final Position Research Paper on Language Policy. Eight groups with four students each were created randomly but care was taken to include students from both the on-campus and the online class in each group; in groups of four students, two were on-campus and two online. Topics were also assigned randomly. All members of each group had equal responsibilities (division of labor is mandatory) in the conceptualization and materialization of the project. Each student was responsible for authoring part of the final paper and one student was responsible for putting the final project together. In this project, part of the learning has to do not only with working in a group, but also with the way the group understands, interprets and frames the topic as well as the perspective they are going to adopt. Final group presentations were scheduled for the last two weeks of classes, and each group was given 20 minutes of class time to present. Online students were encouraged to think about participating with pre-recorded Videos or audio, or call in using Skype. Students were also encouraged to use multimedia, including audio and video. Online students who happened to live in the near the Boston area were encouraged to attend the last two classes on campus.

The last two class meetings were dedicated to class presentations where students shared their findings with the class and submitted their final project.

In collaboration with the institution's Video Production Center, we planned to record the sessions but also to provide synchronous streaming for the online students. The result was two days of group presentations using a variety of tools. The presentations were streamed live so that online students could also watch. Different groups came up with different configurations; one group had worked on an Adobe Presenter presentation with pre-recorded narration by all members of the group and coordination by the two on-campus students. Another group had two on-campus students presenting live and a third member joined it from Spain and presented her part using Skype. We also had a couple of students on Wimba Live Classroom viewing presentation slides and chatting with a support staff member. Unfortunately, technology affected the way that students were able to participate. For instance, while Wimba allows presenter video, the campus network has a hard time supporting it. All students, both those who were physically in the presentation room and those watching from the live streaming had to complete one Peer-Assessment Rubric for each group and submit them directly to the group at the end of the course.

Tools Used, Content, Assessments

Multiple tools were used to support student learning both for online and on-campus modalities. Blackboard was used as a "meeting space" for both online and resident students. Both groups had access to all the Discussion fora and were free to post, comment and interact. Online students obviously used the LMS as the main space for course materials and interactions. On-campus students used Blackboard in addition to regular weekly on-campus seminars. They participated with two postings in the Discussion Board, shared their Ethnographies and received peer feedback, and had access to all material and readings online.

Adobe Presenter was used on a weekly basis for different purposes; the instructor either used it to create a narrated presentation (mini lectures) of the readings and issues discussed and/or at the end of the week to summarize students' points, clarify, comment and wrap up the discussion. Adobe Presenter was also available to students and some of them used it as part of their final group presentation.

Wimba Live Classroom has been employed for two class meetings during the semester with the online students only. What has proven challenging for this synchronous tool was to find a time that would accommodate people in radically different time zones since the students reside in different parts of the world (at least three continents are usually represented in our online courses). Immediately this lowers the participation rate even when the two class meetings are announced ahead of time at the beginning of the semester. Wimba Live Classroom was not used at all with on-campus students.

Skype was used for two purposes; the instructor held office hours on Skype during particular days and times of the week for both online and on-campus students; and some students used Skype to participate in the final group presentation.

What was particularly interesting and purely experimental was to bring the two modalities together in working on their final project in mixed groups. The groups collaborated over email and Blackboard Group Discussions. Their final projects were scheduled for presentation during the last two class meetings. The instructor worked with the Video Production Services to set up a synchronous video streaming. This presupposed holding the last two classes in a specialized presentation room with camera and video conferencing capabilities. On the day of the presentation different tools were used to facilitate participation, including Wimba Live Classroom, Skype, and live streaming. Despite many glitches, mostly with timing the presentations and some technological issues, since so many modalities were used, the presentations were constructive, imaginative and quite fascinating as the two modalities came together.

LESSONS LEARNED AND FUTURE IDEAS FOR COURSE DESIGN

Undoubtedly this blended learning setup was challenging both for the instructor and the students in terms of material organization and student coordination. However, it proved to be a very rich learning experience for both groups of students as evidenced in their final projects. In terms of student performance and learning outcomes, even though we don't have enough quantifiable data that we could compare with previous years, it seems that group projects were richer in terms of content and perspectives and unlike in an on-campus class, they included a more international take on language policies.

In reviewing the course evaluations we noticed that the biggest challenge for both on-campus and online students seemed to be coordination of groups for final projects. On campus students expressed discontent about having to conduct all group work virtually with peers located in different geographical areas and time zones. A couple of on-campus students were plainly resistant about engaging in that kind of work. It is possible that the mixed groups caused trouble, particularly to on-campus students who were not ready to dedicate time and energy outside class to use a different modality for communication. Similar concerns were voiced by online students who did not rate very high the "hybridity" because of group logistics. As did Koh & Hill (2009), we also discovered that group work is something that seems to always come up as an issue in most courses, but it seems that the varying time zones in which students were located caused some problems with on-campus students who were not used to working with partners in different time zones. As such, in future offerings of this course where we attempt to connect online with on-campus learners, it would be worthwhile to try to help scaffold on-campus learners to be able to work with students across different time zones. In addition, a good idea might be to create more structured groups with clear tasks and responsibilities for each member to avoid in-group conflicts that nevertheless might arise in all group work on-campus or online.

Another point of feedback from on-campus students was a complaint that they were signing up for an on-campus course and they were not aware that there would be an online component. They felt that since they were attending class in person every week, online participation was great deal of extra work for them. To this extent some students mentioned that the "hybrid" format of the course was not preferable and that they would have preferred to take the class entirely face-to-face. This is interesting because it is the opposite of what studies, such as the Waddups & Howell (2002) have found, meaning that in this previous study students rated the quality of the blended experience equally or higher than the face-to-face-only experience. This was a bit of a surprise to us.

We have a few ideas on how to address this particular issue. First, there seems to be cultural component to this resistance to this type of hybrid learning in that students expect that their learning experience revolves around a 150 minute class each week. This isn't true since students have readings to prepare, write ups to do, and assignments to complete outside of class. The online component served as a way to connect each other in-between the weekly sessions when they didn't see each other in person.

Another area that was a bit of a challenge was the technology side. Many students in the on-campus courses have the technology available to them, but they don't connect the technology to their own learning and to the learning process. This seems a bit odd because as teachers themselves, they should be using such tools to enhance their own classrooms. To address the cultural expectations of what an on-campus course is, and to address the issue of technology, there is a two-pronged solution that we would like to implement. First, as Davis & Fill (2007) recommend, instead of changing one course to the blended format, it would be better to undertake a review of the entire curriculum in order to identify suitable places for the blend to take place. This means that students on-campus would have many opportunities to work with fellow students who are in the online-only environment earlier on in their studies, not midway, or as they are mostly done with their studies.

Chen, Pendersen & Murphy (2011) have concluded that "most students in [their] study indicated that the orientation sessions were an immense help in resolving technical problems, as well as offering an opportunity to understand the course requirements and the instructor's expectations. Thus, an orientation meeting may be the key to preparing students for the online course" (p. 114). Since our department has welcome sessions for newly matriculated students, this venue would be a great place to introduce the idea of the blended classroom and begin the preparation of on-campus students to use the technology in the classroom to be successful learners. Finally, it would be worthwhile working with our Blackboard administrators to make our courses available one week before the semester starts. The implementation of a "week 0" in both sections would serve as a way to introduce learners to one another and prepare on-campus students for the blend.

While the introductions to the program and "week 0" could address some of these issues, we believe that it is important to also have the instructor address any feelings of the "1.5 course syndrome" that students may have. As Gerber, Grund and Grote (2008) note "as long as the students do not see a relation between their activities during the online course and their performance at the end of the course, they will not be motivated to participate more in their classes – which is a waste of opportunities especially in a blended learning scenario with many different learning settings" (p. 242). By working at blending the curriculum, addressing work amount issues both at the program level and in the course level and making connection on how online work with remote peers, and on-campus work connect, we hope that on-campus students will seize the opportunity to engage more meaningfully with their online peers. Depending on the course subject, learning to be had, and the campus calendar, it may also be advantageous to eliminate some on-campus sessions in favor of online only.

Finally, Swan Garrison & Richardson (2009) write about teaching presence and they mention that there will be a need for the instructor to guide that discussion in a meaningful manner. This ensures that students stay focused and is essential for students to stay engaged and to build a collaborative community of inquiry. Online learners may be more expert in interacting online than on-campus students. Even though there is teacher presence on-campus, there are probably ways in which the instructor needs to modify this presence in this type of blended classroom in order to encourage and foster that collaborative community.

KEY TERMS AND DEFINITIONS

Blended Learning: A mode of course delivery where 30%-70% of the instruction is delivered through an online medium.

Community of Inquiry (CoI): A group of individuals involved in a process of empirical or conceptual inquiry into problematic situations.

ESL: English as a Second Language.

Hybrid Flexible (HyFlex): A type of blended learning where learners have the flexibility of choosing their modality of participation on a week to week, or module by module, basis.

K-12: Kindergarten through 12th grade (High School).

Learning Management System (LMS): An online software system for the administration and delivery of online courses.

MOOC: A course where the participants are distributed and course materials also are dispersed across the web. The course is a way of connecting distributed instructors and learners across a common topic or field of discourse.

Wimba Live Classroom: A technology, by Blackboard, Inc., which enables synchronous interactions in an online classroom.

This work was previously published in Practical Applications and Experiences in K-20 Blended Learning Environments edited by Lydia Kyei-Blankson and Esther Ntuli, pages 178-190, copyright year 2014 by Information Science Reference (an imprint of IGI Global).

Chapter 66
Triumphs and Tribulations of the Flipped Classroom: A High School Teacher's Perspective

Frederick J. Carstens
Tapestry Charter School, USA

Milton Sheehan
Tapestry Charter School, USA

ABSTRACT

This chapter focuses on the experiences of a Social Studies teacher who has recently introduced the concept of the flipped classroom to his students at an inner city school in Buffalo, NY. Despite his technological issues and struggles with homework completion, his perseverance throughout this process provides valuable lessons for educators seeking to implement similar initiatives in their own classrooms. Ideas for improving student engagement and literacy in the flipped classroom as well as first hand accounts from his ninth grade students are discussed.

INTRODUCTION

I have been teaching ninth grade Global History and Geography at Tapestry Charter High School for the past five years. Tapestry is an Expeditionary Learning School (EL). The Expeditionary Learning model is unique in that it connects academically rigorous curriculum with real world issues and current events. As a teacher in an EL school, my students utilize case studies, projects, fieldwork and service learning as a means of learning their global history. By engaging in "learning expeditions," students learn in authentic and meaningful ways to produce high quality work (Expeditionary Learning, 2013). EL is a great way to harness students' curiosity about the world around them, while improving their academic skills and content knowledge through a variety of teaching methods. This year, I have expanded upon the teaching methods utilized within the Expeditionary Learning model with my attempts at using the flipped classroom approach.

BACKGROUND

Tapestry Charter School

When I was hired by Tapestry, I had no idea what a charter school was, or Expedition Learning for that matter. Since then however, I have come to realize that there are several aspects that make Tapestry Charter High School unique. These aspects include weekly professional development opportunities, student led conferences, team building trips and intensive experiences.

One of the primary differences between Tapestry and other traditional high schools is the professional develop opportunities afforded to its teachers. Tapestry sets aside two hours every Monday morning for professional development. Essentially, every Monday is a half-day for students, as classes start for students at 10:20 instead of the normal school daytime of 8:20. While some teachers may think that this is a waste of time, this professional development is unlike anything I have ever experienced elsewhere.

Typically, school administrators organize professional development. They will hire an outside firm to facilitate a lesson to teach their faculty about some new buzzword that is taking the profession by storm. This may only happen between 2-3 times a year, and despite their best intentions, many teachers are unengaged. At Tapestry, professional development is grassroots and teacher driven. Having this sort of professional development every Monday is beneficial because it allows teachers to hone their skills, share best practices and collaborate across grade level and within their departments. Teachers not only have a choice in what learning cycle they would like to participate in, but their input in the process is crucial to its success. Every teacher is engaged in his or her learner cycle. Every teacher is also empowered with the ability to make suggestions and lead the discussion.

Student Led Conferences (SLC's) are another worthwhile structure at Tapestry. Three times per year normal classes are suspended to accommodate this process. Student Led Conferences are similar to parent teacher conferences, except that the process is entirely student driven. During these hour-long appointments, students present their portfolios to their parents. These portfolios consist of student work samples and reflections upon their progress towards meeting their learning objectives. They receive feedback from their teachers and parents as to their strengths and areas in need of improvement. Although a very powerful structure, it does occupy between three to four days of classroom instruction.

Tapestry also differs from traditional high schools in the extracurricular opportunities that are afforded to its students. Every fall, Tapestry students and staff engage in overnight camping trips. Through well-structured team building activities and initiatives, students are able to bond with their teachers and peers in ways that would otherwise not the possible.

Then every spring, Tapestry provides students with enrichment experiences known as intensives. Intensives are designed to give students meaningful experiences outside the classroom. For three days students work on an intensive project that challenges them both academically and socially. Often these intensives involve students exploring possible career choices or working on service projects in the larger Buffalo community. Last year Tapestry students had 21 different intensive options, ranging from enrichment activities involving culinary arts to music production. In a school wide end of the year survey, more than fifty percent of our students pick intensives as some of their most memorable moments at Tapestry. This is a close second only to their teambuilding camping trips.

Intensives, Student Led Conferences, professional development, and team building trips are just a few of the things that make Tapestry different from traditional schools. While these are key elements that make Tapestry successful, all of these extra initiatives amount to the loss of precious seat time with the students. This subsequently puts pressure on teachers who must comply with New York State standards, and must ensure that students learn the required curriculum in order to be successful on state assessments. This becomes difficult when teachers lose anywhere from 8-14 days to these EL structures.

In order to make up for this lost time, I often find myself picking and choosing one to three topics from my curriculum every year. Since these are topics that I would have had time to teach at a traditional school, but cannot in this situation, this always creates a great deal of anxiety during exam week. All I can do during exams is have my fingers crossed, hoping that those topics do not reveal themselves in that year's final exam.

THE FLIPPED CLASSROOM

The flipped classroom model has intrigued me from the moment I learned about it last September, because no one wants to teach to the test, the reality is that state assessments have become a fundament part of any teacher's job. The idea of the flipped classroom has provided me with a new way to get students the content and skills they need.

Based on the summary guide presented to me by my school's curriculum coordinator Elizabeth Smallwood, (personal correspondence, September 20, 2012), a flipped classroom is:

- A means to INCREASE interaction and personalized contact time between students and teachers.
- An environment where students take responsibility for their own learning.
- A classroom where the teacher is not the "sage on the state," but the guide on the side."
- A blending of direct instruction with constructivist learning.
- A classroom where students who are absent due to illness or extra-curricular activities such as athletics or field trips, don't get left behind.
- A class where content is permanently archived for review or remediation.
- A class where all students are engaged in their learning.
- A place where all students can get a personalized education.

Initially sparking more questions than answers, this also led me to wonder:

- What is the best use of face-to face class time?
- What information could students gain on their own, using Internet resources, rather than listening to classroom lectures?
- How would the ability to replay lectures and explanations increase student obtainment of content information?
- What higher-level activities could take place in the classroom with the time saved?
- How could this help parents and others support students with their work?

These questions have helped guide my lesson planning.

GETTING STARTED

Tip #1: Backwards Planning

Before flipping a classroom, I would highly recommend backwards planning. This means that you will need to brainstorm the knowledge and skills you need your students need to master by the end of the lesson or unit. Then create learning targets based on this essential knowledge, and create summative assessments that align with those targets. By identifying what you want your students to know and creating the summative assessment and learning targets first, your lessons will be less ambiguous to your students.

Tip #2: Ample Time Allotment

It is important to give yourself a realistic timetable to create and implement a flipped lesson, especially if it is your first time flipping the room. I recommend starting the flipped routine on the very first day of school for two reasons. First, it gives you time over the summer to backwards plan, build up your website, modify your notes, and create amazing screencasts. Second, by getting students trained on how the flipped class model works from the beginning, you will be less likely to experience the classroom management issues that often occur when you transition from one routine to another.

If you are like me and cannot wait to try something new, then I recommend that you pick a topic or unit that gets little recognition on state assessments. I decided to start with Ancient Rome because this is rarely asked on the New York State assessment and I tend to find that students have a great deal of prior knowledge on this civilization. So this way, if my experiment went away, the stakes would not be as high as they might be when teaching another topic.

FIRST ATTEMPT TO INTRODUCE THE FLIPPED MODEL TO STUDENTS

When I first introduced the flipped model to my ninth graders, I purposely introduced it in small increments for several reasons. First, I wanted them to get used to the new structure, and to make it user friendly. I did not want them to have the excuse that, "Mister, your website did not work on my computer" or to give them any other technological excuse for not doing their homework. Since I started the flipped classroom three months into the school year, I was also fearful a new routine would upset the positive learning environment my classroom routines created. In order to accommodate these concerns, I initially went at a very slow pace in introducing the flipped model to my students.

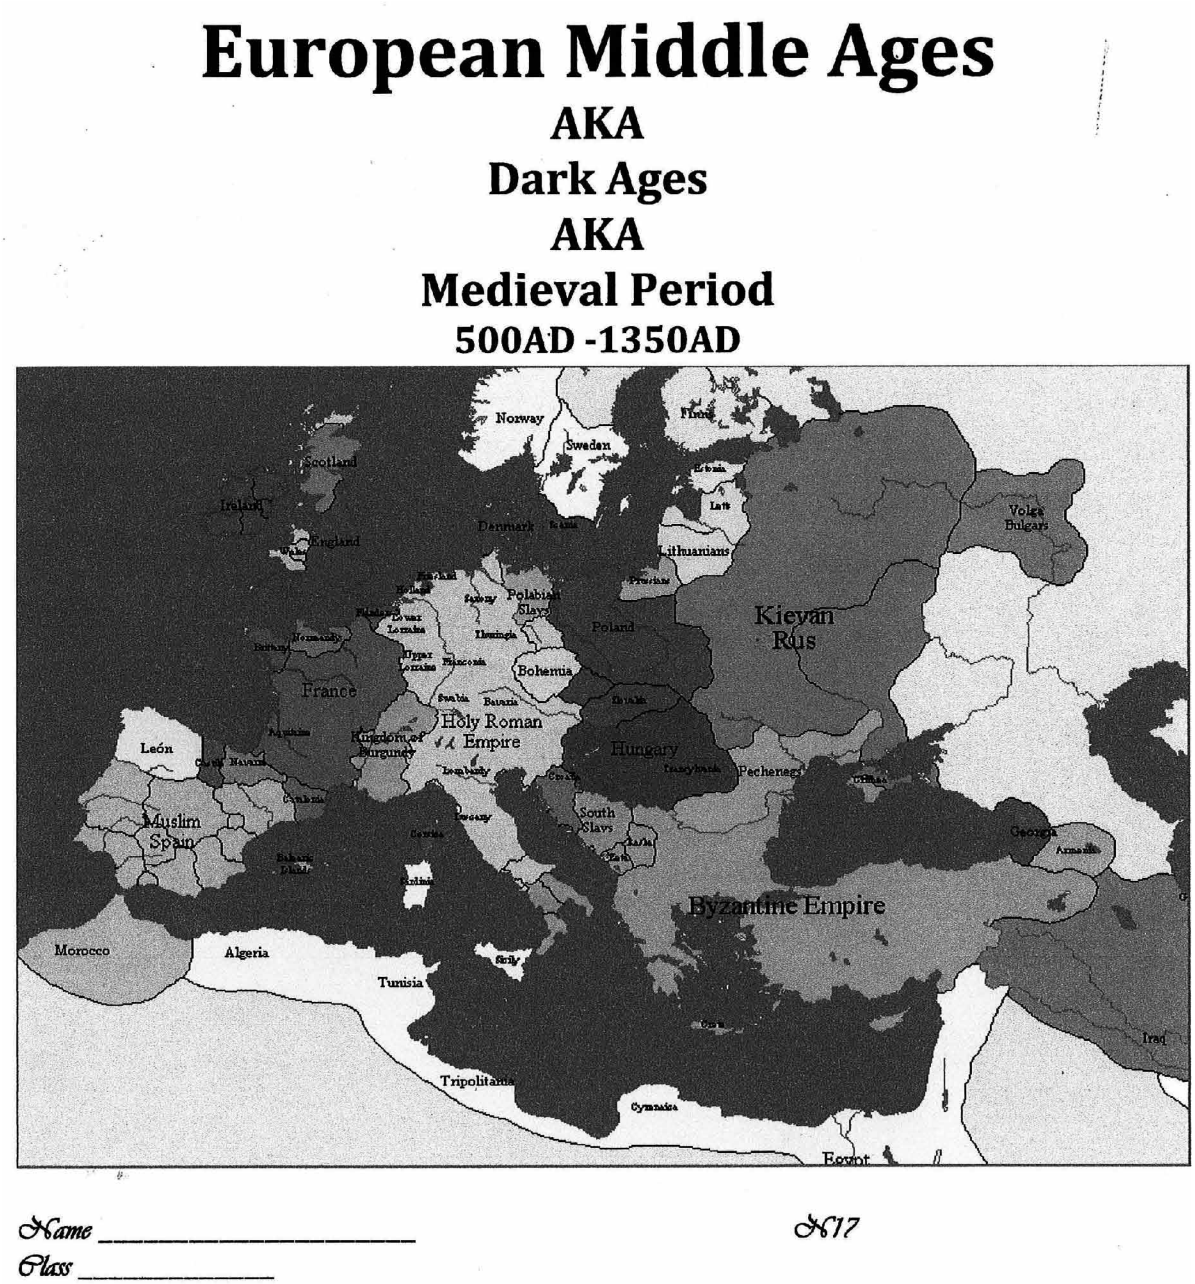
The first flipped lesson I created technically was not flipped. Since I had never used screencast before and I did not have a lot of planning time, I just modified a PowerPoint I previously used for in class lectures, and posted it on my website. However, without a screencast where I could add a voiceover explaining the slides however, I became nervous that my students would not understand the general bullet points of information I typically put into my slideshows during my traditional classroom lectures. To overcome this issue, I decided to add more notes.

At the time, my rationale for adding the extra notes was to help students better understand the content. When creating that lesson, and all the lessons since, I never had to start from scratch. That is the beauty of the flipped class; all of my lecture notes, PowerPoint's, and other materials can be and should be incorporated into my screen or podcasts. I stress the word "incorporate," because some adjustments needed to be made, but I was mindful not to make too many changes at once.

With what planning time I had, much of my focus was on creating better student note packets. I turned my old lecture notes into guided notes, with pictures, making it easy for students to follow along as they watched my PowerPoint (and future screencasts) at home. The cover pages became color-coded, with each color representing a unit of study. Blue represented Rome, yellow would become the Byzantine Empire and so on. Color-coding makes the packets easy to spot in what I like to call, "A black hole for a book bag." It is also important to number every page, and make sure your headings on the screen cast match the headings in the guided notes. This makes it easy for students to follow along as they follow the screen cast. Figure 1 shows the cover and a sample page of from the Ancient Rome packet I created.

I gave the students a note catcher and instructed them to visit my website, take the notes and bring them to class the next day. We talked about the

Figure 1. Student notes



importance of taking good notes and I even told them, "I don't care if you copy each other," because the homework was notes, and not a skill based assessment. I was looking forward to the next day, excited to see if there would be an increase in the amount of homework turned in.

As it turns out, with the flipped model, 75-80% of my students had the assignment fully completed and turned it in on time. The students had got their notes at home, and the project they complete the next day in class uses and reinforces the knowledge they got from the PowerPoint.

Further, the project allows me the opportunity to help them improve their literacy skills. In my mind, this was a flipped class.

The next day, I stuck with my same entry routine. Students completed a "Do Now" or "Bell Work" assignment as I walked around checking homework and taking attendance, but all of a suddenly I was perplexed. I was not sure how to go about grading their homework. For most teachers this may not have been a problem, but at Tapestry we have a standards based grading system. It is on a four-point scale, and we give two types of grades. Students receive an academic grade based on a specific long-term learning target for all summative assessments. Essentially this grade reflects what they know. The other grade they receive is a Habits of Work grade or H.O.W. grade. This represents the work ethic, and includes but is not limited to meeting deadlines, classroom attendance, participation, and behavior.

Going from packet to packet, writing down their grades on tracking folders, I realized that because their homework was essentially notes, I could not give them an academic grade. I also felt doing this everyday would inflate, or deflate their H.O.W. grades. I was also concerned about the kids that did not finish, or only finished half the notes. Forget about grading them, how was I going to make sure they got the information they had failed to get? As I realized the students that chronically chose not to come to class prepared made the same choice that day, and started to doubt how successful this model really would be.

Adding to my mounting anxiety were the results from the Do Now question. Students were supposed to describe the myth that helped explain the founding of Rome. The answer was straight from the previous night's notes. To my dismay, the percentage of students that got the answer correct was drastically smaller than typical Do Now solution.

Looking back on that day, adding those extra notes was a mistake on my part. I wanted the technology to excite them, and hoped it would fuel their intrinsic motivation for learning. Unfortunately, that first attempt was a bore to them. Those extra notes turned some kids off to the flipped model, especially my auditory learners. To make matters worse, I lectured for most of the class, out of fear of they did not understand the notes from the website. The only time left was used to explain the project, which was assigned for homework. This was not what I intended.

I make it a point at the end of the day to take five minutes and reflect on my teaching. I asked myself:

- What went well, and why?
- What did not go well, and why?
- What changes can I make to improve it for next year?

Walking away from that first attempt, I came to the conclusion that the class was not flipped. I left school that day with two regrets. First, I wished I had done a better job with my backwards planning. I should have used the questions from the summary reading the school's curriculum coordinator had given me. My second regret was that I wished I had not waited until December to start experimenting with it in my classroom. Despite my lackluster first attempt, I still saw promise using this method of teaching.

IF AT FIRST YOU DON'T SUCCEED, TRY, TRY, AND TRY AGAIN

Over the next two weeks I made other attempts at the flipped classroom, all with mixed results. Again, the lessons online consisted of PowerPoint presentations with guided notes, and most of the class consisted of teacher lecture, instead of practice and application. The closest I came to flipping the room was when I gave a PowerPoint lecture on the Roman "bread and circus" and "gladiatorial contests" for homework.

Typically, when teaching this unit, I would show a clip or two from Ridley Scotts' Gladiator movie, and have students take notes on how the gladiator games was used by the Roman Government as a means to control the masses. Determined to make the lesson more engaging and student centered, the next day I planned a classroom debate, and the question I used to guide the debate was, "Is the NFL the modern day bread and circus?" I got the idea after watching sports center. During a post game interview, a Kansas City Chief's lineman went off on a rant after the fans cheered for their quarterback getting knocked out of game because he was playing so poorly. The lineman said, "This is not the Roman Coliseum and we are not Gladiators."

After checking the completion of their guided notes, reading relevant articles on both the Romans and the NFL, I finally I had the students take out a blank sheet of paper and gave them thirty seconds to flush out their thoughts for the following questions:

1. If the gladiator games were held today would you go?
2. Why do you think the Caesars welcomed the games?
3. How is the NFL like the games?
4. Is it okay to cheer for violence?
5. Do we have anything else in our society that compares to the Romans Bread and Circus?

Before the class was able to complete those questions, the bell rang, so I collected their papers as an exit ticket, and we never did get the chance to discuss their ideas using the Socratic seminar like I had planned. Disappointed, I went home that night, and began to read over their answers. To my surprise, I was rewarded with answers that showed an abundance of analysis and evaluation. One student with special needs, answering question #3 wrote:

The NFL is not like the gladiator games because President Obama does not use the NFL to control United States Citizens.

This particular student certainly made the connection I intended without my explicitly placing it in his notes. Another student, one of my better writers, answered question #5 with this provocative response:

I feel many of my classmates will compare the Bread and Circus to boxing or mixed martial arts fighting… However, I believe a truer 21st century comparison to this ancient institution would be modern media. In the past, CNN would use reports to share meaningful news across the world. Now, they use their empire to gain profit, by reporting on celebrity court cases to gain viewership, which, in turn, brings economic gain to the company through advertising revenue…

After reading this cynical, yet fascinating response, I was devastated that I had run out of time. Those viewpoints, I believe, would have attracted and stimulated a noteworthy discussion. Due to my tight schedule, I knew I would not have time to take another day on this topic and therefore there would be no Socratic Seminar, yet I did make it a point to keep the comments to use as a model for next year.

It was at that moment that I decided to revisit the summary of the flipped model I received at the beginning of the school year. Particularly the section on questions all teachers should consider when flipping the room. *What is the best use of face-to-face class time?* The question was the one that most resonated with me. I was determined to have more one-on-one or, at least, more small group contact with my students, and a classroom where students have more of a choice or say in what and how they learn.

I made the decision to go 'all in' with the flipped classroom in my upcoming unit. I spent that weekend backwards planning and screen casting. As a teacher who tends to micro-manage, I knew I needed to let go of the reigns of instruction. Too often during those first attempts, I did not trust the system. I was fearful the majority's of students were not taking good notes, and therefore would not have the information needed to be successful on the state exam.

BEST USE OF FACE-TO-FACE TIME

The next unit would be on the Medieval Period. After pondering how to best use student-teacher face-to-face time, I decided to create a unit around a learning contract. This method would allow the students to work on higher-level activities during class time where I normally would be lecturing. The learning contract format I chose can be found in Appendix A.

Learning contracts can be found on the Internet in a variety of different formats. They are easy to create or modify. I was first introduced to learning contracts three years ago, but never used one because I thought they were too time consuming. By flipping my room I now had the time and a new tool to get students engaged in their learning. The contract I choose for this unit was based on a points system. I specifically allowed students the option to add a chose your own project, with teacher approval of course. It is important while running a flipped classroom to provide students a place to personalize their education. I believe adding a chose your own, helped accomplish that goal. It also allow for some differentiation by choice. I specifically outlined project ideas that would meet the creative needs, and learning styles for all students. The learning contract provides several ways students can connect to their multiple intelligences when learning about the middle ages.

With standards based grading, some students at my school tend to disregard their H.O.W. grades, and only focus on their academic grades. By using the flipped classroom, in conjunction with the learning contract, I now had a way to motivate them to improve their work ethic. Each student had one month to complete nine points worth of projects. The contract was a ticket to take the unit test. If all nine points were not completed on their contract, the student would not be allowed to take the test. They would be assigned an afterschool help class to complete their projects, once all nine points were accounted for, they could then take their test.

For twenty-one days straight, the students would go home every night complete a flipped lecture on the middle ages, and the next day, I would take ten minutes after my entry routine to answer any student questions or explain important concepts. I still included the PowerPoints, but I added background music, and "OmniDazzle" to spotlight important points displayed on the screen as my voiceover explained what was being shown. The students would then visit my student center. The student center consisted of folders containing rubrics for every contract project, a bin full of hanging folders containing leveled articles labeled by topic (Serfdom, Manorialism, Architecture, etc.). Inside each hanging folder were multiple articles on a specific topic. Having received the students Scholastic Reading Inventory (SRI) scores (Lexile/reading levels) from the literacy teacher, I made it a point to make sure the articles Lexile scores fit within their ranges. Also at the student center was a large contingent of art supplies, which student should use to complete their learning contracts. I felt this method was a better use of time because it freed me up to walk around the room, answer questions, check for understanding, and work on a one to one basis.

Another way the flipped method helped make better use of face-to-face time was in regards to teaching the Document-Based Question essay or DBQ. The Middle Ages unit has always been a unit where I would focus on student writing. In the past, before the flipped classroom I would have students complete the documents in class, go over the answers together, create an outline, then send them home to write the essay. No matter how many practice essays we would go over in class, I would always get a large contingent of student questions the next day and many unfinished DBQ essays. Now that the students were taking notes at home I had more class time to work with them on their writing skills and answer writing related questions they would typically have formulated at home. I decided to create three stations for this unit. Learning stations can help improve individual writing skills while preventing me from boring a portion of the class by teaching them skills they have already mastered.

With the flipped model and proper planning time, if possible, I strongly recommend bringing other content teachers in to help students grow. The English teacher and I have been collaborating since the beginning of the year. I brainstormed with her before writing this lesson. Together we agreed upon a common vocabulary that we would use when teaching literacy skills in each of our classes to help reinforce student learning.

During our common planning period, I sat down with the English teacher to discuss the specific writing skills that our students needed to improve. We came to the conclusion that transitions should be the focus of one station. I asked our school's literacy specialist if she would like to plan and monitor a station around transitions, which she was happy to do. I also analyzed essays written by students earlier in the year, and I determined that my higher functioning students could use some improvement with their analysis of the documents, and my mid-level students struggled with how to properly use and cite a document in the essay. I recruited the buildings AmeriCorps volunteer, who just so happened to be an English major, and I invited him to create a lesson on citing and using documents in an essay I created the station around document analysis.

As we implemented this lesson, we made it clear to the students that they would have two days to visit two stations. Unbeknownst to them, out the of the three stations one was a mandatory station that they would have to visit based on prior their performance in my class, and the discussion I had had earlier in the week with the English teacher. Then they would have to choose between the two remaining stations. We made it clear their choice should be based on what skills they needed to improve. If any students finished early, there was a fourth station for peer editing to take place. The stations themselves were student centered; the teachers in the room essentially were there to monitor student progress. I know many schools may not have AmeriCorps, or literacy resources available, and if that is the case you may want to consider using direction cards. Direction cards clearly state what each student should be doing at their station. They are easy to make and cut down the time wasted answering procedural questions. Even with extra teachers in the room, the use of direction cards at each station was helpful. In order for students to finish a station and move on, they had to complete a formative assessment questionnaire. They then would have to staple that questionnaire to their final essay, and use their answer in their essay. On the third day, students were able to write their essay in class, which allowed them to ask either the AmeriCorps volunteer or myself questions.

This lesson demanded a lot of work upfront on the part of the teachers, but the lesson itself kept the students engaged. I believe only focusing on a couple skills and not all of the skills needed to correctly write a DBQ essay made a huge difference. The skills not taught were scaffolded into future lessons. Without applying the flipped model during this unit, I would not have the three extra days to successfully implement this lesson. This was the lesson that washed away any and all apprehensions I had in regards to the flipped structure. After reading over the student's final drafts, I was in awe at how quickly they grew as writers. Although there was growth to be seen within all the students' paper, one particular student whose papers that stood out. She was a student that usually does well on multiple-choice tests, however her writing skills were subpar. Her thoughts were "choppy" and in desperate need of transitions. Simultaneously, she has not been able to properly use documents to support her outside information.

In response to the DBQ essay prompt, "discuss life during the feudal period," She wrote:

Violence was another problem people had to deal with during the feudal period. According to Document 1, "the Hungarians and other tribes burned down churches and then departed with a crowd of captives. There is no longer any trade, only never ending terror." Soon after there was so much chaos during this time, people looked for some type of order.

Overall, using the flipped classroom model for an entire unit in my mind was a great success. However, I would like to point out some changes I will be making to my lesson plans for next year. First, it is important to set clear deadlines when using learning contracts, especially with freshman. By setting deadlines, students will not feel as overwhelmed, and it will help space the grading out over three weeks. This is a lesson I learned after having them complete nine projects each, without deadlines. Before I knew it, I spent an entire weekend grading hundreds of projects. Another change I plan to make is in regards to Lexile scores. After students take the SRI in the beginning of the year, they are given their reading level. Their class advisor sits down with them and explains how they can use the score to improve their reading. Next year, I will attach the Lexile score to all of the articles in those research-hanging folders. This way, students can choose an article that is in their Lexile range, and use it to challenge themselves. By visiting Lexile.com, a teacher can get a Lexile range on any books or articles by typing in a couple of sentences.

SCREEN CASTING

It was during this unit that I delved into screen casting. I will not be going into great detail on how to screen cast, but will discuss throughout this section common mistakes to avoid. My original casts, though simplistic, were more advanced than those primitive power points I had used earlier. Originally, I started screen casting with QuickTime. Besides it already being installed on my computer, other major advantages are it costs nothing, and is simple to use. One downside for this software is that it is not equipped with a pause button. Any mistake during recording, may force me to start from the beginning. I highly recommend finding a quiet place when recording, and making sure your cell phone is off. When I posted those original casts, students could hear my dog barking in the background, or my ESPN app alerting me to another Buffalo Bills loss. Several times during class, if I wanted to gauge how many students actually were watching my videos, I would post a Do Now that would ask, "What animal sound could be heard during last night's video." Asking questions like that would give me a real-time look into how many watched and how many were just copying a friend's note packet. Regardless of the quality of the note packets, they served their purpose.

Recently, I switched to using Snagit, another free service. One advantage of Snagit over QuickTime is Snagit allows the user to screencast while having the speaker's face displayed in the corner, as they are lecturing. To me, this is more personable. There were times when using QuickTime that I felt like Oz, a voice behind the curtain. I am not at this point yet, but I have seen Camtasia used at a recent tech seminar I went to. It is the Rolls Royce of screen casting. It can virtually do anything you can think of, but it comes with a $299 price tag. Despite what software is being used, it is important to prepare notes or an outline of what needs to be presented in the cast. One recommendation I have for those teachers new to the field, or veterans switching into a new content area, is to start with reading excerpts from textbooks, while blending interesting anecdotes into the lecture.

Screen casting is also helpful with trying to incorporate Geo-Literacy skills. The Late Show with Jay Leno was a favorite of mine in high school. One of my favorite skits, was when Leno would take a small film crew out onto the streets and ask random citizens questions like "Where is the Statue of Liberty located?," or "What state is Washington D.C. in?" The people answering would give the most ridiculous answers. After becoming a teacher I promised myself that my students would never become pray for the likes of Jay Leno or Jimmy Fallon. One way I keep that promise is by displaying a map on the screen to help my students make geographic associations to people and events. For example, when referencing the Battle of Tours, I use a free Mac App called omnidazzle to magnify or put a spotlight on the area in France where the battle took place. It is important for all content teachers to download some kind of spotlighting tool. It is essential for screen casting, and many of the free screen casting software products do not include one. To download a free spotlighting tool whether for Mac or PC, run a quick search on Cnet.com.

My casting has evolved over time, and I have recently introduced Google Earth into my online lecture. Google Earth, is the tool needed for incorporating geographic literacy into a lesson, whether in a screen cast or in the classroom. While screen casting a lecture on the power of the Catholic Church, I have used Google Earth to display a 3D overlay of the medieval cathedrals, like Chartres in France. I have not done so this year, but in the future, I plan to use Google Earth in the classroom after a lecture on an ancient civilization and have students create Google Earth tours from our school to the historical sites of the civilization being studied. A Google Earth tour can be programmed so a class can see a 3D tour of anywhere in the world from a bird's eye view, down to street level all on a classroom projection screen.

Once I finished a screen cast, I would upload it to YouTube. I like YouTube because it is popular with the students, and I find many students already have created accounts. The upload time is quick and efficient. A user simply needs to drag and drop the video into YouTube's drop box, and there is no need to degrade the video quality in the process. After the video is uploaded, YouTube provides a link that I embed on my website. This allows students several ways to find their homework; they could either go to my website and use the link, or subscribe to me from their YouTube accounts, every time I post a new video, as subscribers, YouTube will send them an email notification.

Despite all of the pros for using YouTube, it is by no means perfect. Most of the first screen casts I created were between 15-30 minutes. This meant I had to go through an extra step on the YouTube website, by confirming an email stating that all videos I posted met the requirements of their website. Essentially, the company wants to make sure all videos were of original content, and no copyright laws were being broken. By keeping videos under 15 minutes this step is not warranted. Another concern about using this site was if questionable content in videos posted by others would pop-up off to the side, when students were watching my videos on their home computers? I did not want a risqué advertisement or inappropriate video appearing next to mine.

Due to this concern, I tried teachertube.com, which is essentially like YouTube without the suggested videos off to the side of the screen. The problem with teachertube.com is that its upload time takes a substantially longer than up loading the same video to YouTube. I may try it again in the future, but it seemed to be double the wait time when uploading. Until I find a hosting website with better capabilities than YouTube.

WHAT INFORMATION COULD STUDENTS GAIN ON THEIR OWN?

When constructing my day to day lesson plans for the Middle Ages unit, I was cognizant of a second question found in that flipped classroom summary: "What information could students gain on their own, using Internet resources, rather than listening to classroom lectures?" I remember being a high school student that loved the middle ages, but my teacher only spent a week covering the content, and left me wanting more. By using the flipped model, I can help make sure my students never have that feeling. I feel all students, regardless if they perform well in my class or not, connect with at least one civilization on some level. I use my flipped lessons as a way to enrich my teaching and provide resources for students that may wish to delve deeper in the content of a particular civilization. For example, during the Middle Ages unit one of my screen casts briefly discussed the role of Vikings. I knew many students find the Vikings to be of interest, so I told the students to visit my website to a link to history.com. They can access videos from the History Channel miniseries on the Vikings, and use their website to interact with the video content. During the bubonic plague lesson I had the students visit a link to a YouTube video where the band "History Teachers" created a spoof about the plague, by covering the Gwen Stefani Song, Hollaback Girl. Through the use of technology, and the Internet, there are abundant ways the flipped classroom can connect students to vital information, and all can be linked from your website.

CHALLENGES

Even the most preeminent planned lesson can face adversity. No matter how much planning teachers put into any lesson, challenges will always arise. As teachers, we continually have to contend with an infinite number of variables on a day-to-day basis that sometimes catch us off guard. To improve the future flipped lessons, it is a smart idea to have students reflect on their work. Periodically assigning students to write a self-reflection may not only supply them with insight to their metacognition, but it may also enlighten the teacher on challenges they may having with the class. Having students self-reflect is not time consuming, and both the student and teacher can gain a wealth of knowledge. I typically have students complete a self-reflection either as an entry ticket or an exit slip. They are short, sweet and to the point. For the first reflection, I simply posed two questions:

1. What grade would you give yourself for the pervious unit and why?
2. If you were a teacher using the flip classroom model, how would you improve it?

The top two suggestions given for improving the flipped model were to put time limits are put on my screen casts, and all screen casts should have music. From that point forward, every screen cast I recorded was 15 minutes or less, and I mixed music into the background. I did my best to match the music to the topic being studied. For example, I would play medieval monks chanting over my lesson on The Power of the Church.

Far too often when assigning traditional homework, students are tempted to cheat. Since most homework is skill based, it becomes nerve-wracking for teachers. Earlier, I mentioned how, in my first flipped situation, I didn't care if students copied each other. I simply wanted them to get the notes so they would have material to study, but freshman being freshman; a mob of students took to my nonchalant attitude on the subject literally. I was a month into flipping the class was when I received news of another setback into my experiment with the flipped classroom. Just before my third period class, the librarian called my room stating that "numerous" students were lined up at the student copy machine to photocopy the note catchers of other students. She was calling to get clarification, because the students claimed that I said it was O.K. for them to copy each other's homework. Needless to say, this was not what I meant, when I said I didn't care if they copied one another. The phone call made it clear that I would need to rethink how to introduce the flipped model to students, and be careful of what I say. Next year, when I introduce the classroom to a new class of freshmen, I plan to define what a flipped class is, show models of my screen casts and note-catchers so they get a feel for it, layout the grading policy, and have them take a student survey.

Looking back on this past year, the part of the flipped class I struggled with the most was how to properly grade. I do not want to punish kids by lowering their grades, yet, if I assign work, I want them to complete the work. So next year I decided on expanding my student center in the back of the room, and on the wall above the table, I plan on posting these two posters in large font.

1. What happens when I don't complete the homework?
   Answer: After Mr. Carstens checks everyone's homework; students that didn't complete the assignment will have to:
   - **Step 1:** Move to the back table and copy down the notes (More than two students will have to share a computer).
   - **Step 2:** Once the assignment is completed, have Mr. Carstens check your notes.
   - **Step 3:** Quickly and quietly transition into what the rest of the class is working on.
   - **Step 4:** Any classwork missed while you were copying the notes will have to be made up in Freshman Academy (After school help class).
2. If I don't do the homework, how does it affect my grade?
   Answer: For all homework assignments that are not finished on time, you will receive a **"1"** for a H.O.W. (prepared for class) grade. *This grade cannot be changed.*
   - However, you are still responsible for getting the notes (Refer back to Question #1)
   - **Remember H.O.W. Grades are important:** Have *INTEGRITY*, and complete the work on time.
   - If you are having technology issues or are struggling with the content, you need to see me during office hours.

I want to send the message that in my class everyone does the work. I know at first I maybe making more work for myself, but after a few months, it will pay off. For those students that are forgetful, I recommend using a website called remind101.com. This website creates a generic phone number for teachers that students can send texts to. By sending a text to this number, students are aligned with that teacher. Then, whenever a teacher assigns new homework, a mass text gets sent to students reminding them to complete their work. Remind101 is a great tool, but is only beneficial for kids with access to a cell phone.

I have also come to realize that the reason for some students not completing their assignments on a regular basis wasn't because of apathy, or a poor work ethic, but because of a lack of access. Despite the abundance of technology out there, it is important to remember that many students still lack the means of consistent access. After the Middle Ages unit, I gave a quick student survey (found in Appendix B).

Essentially, I asked students about their access to technology, including if they have a smart phone, or DVD player. The survey gave me a plethora of information, and I noticed that five students did not have access to a working computer at home, and for whatever reason never told me about it. In the future I plan on modifying the survey and having students complete it on the first day of school. Teachers should never abandon the idea of flipping their class because they are worried that students will not have access to the proper technology. There are always ways around this.

In a recent article of Educational Leadership, Sams (2013) suggested offering DVD's as a solution (pg. 18). Simply burn all of your screen casts onto DVD's, put them in a box in the back of the room, and let students know they are there when they need them. DVD's are inexpensive, easy to use, and virtually everyone has a player. Another solution could be flash drives. Students that attend Tapestry are required to buy a minimum 4GB flash drive. A teacher could upload all their screencasts to a school computer in the library, and students can just drag and drop the file into their flash drive in order to complete that night's homework assignment, or better yet, they can sit there and watch them on the school computer.

Currently, I am in the process of uploading all of my screen casts into Google Drive. I am doing this for two reasons. I put a lot of work into these videos, and I am fearful that one day my computer will crash and I will lose everything. Google Drive is free, and there is no flash drive, or external hard drive to lug around. The second reason is Tapestry students receive a free Gmail account at the beginning of their freshman year. This means I can share all of my videos with them and they would be able to access to files from most major devices. This is an advantage because occasionally, depending on school security filters or what teacher was in the computer lab or library last, students may have restricted access to YouTube. This periodically hindered students that wanted to stay and complete their assignment afterschool. Uploading all the videos to Google Drive circumvents this issue. On the other hand, I acknowledge that technology is changing rapidly which can be overwhelming at times. To help keep up, I tend to listen to tech podcast during my commute to work. They are free and easy to find on iTunes U (university).

WHAT HAS CHANGED?

Since implanting the flipped model, I have become more tech-savvy. First impressions go a long way with students, and I now realize screen casts need to be user-friendly from the beginning, and should be more than just a voice over and/or PowerPoint. My casting abilities have evolved since that first attempt at screen casting. By making the casts easier to access and use from the beginning, the less questions student will likely have, and the more likely they will continue to use it. Another change is how my students take notes; they are more detailed and precise. The flipped model grants them the ability to pause and copy down all the notes, unlike in a classroom setting.

I have seen an improvement in study habits. By having the screen casts accessible throughout the unit, students can go back and replay a particular concept before they take the summative assessment. Having students watch the lesson the night before, acts as a form of pre-teaching. The next day in class when they are working on skills based on the lesson, I find they have more thought provoking questions and are more engaged in the lesson. In the survey, students themselves rallied around the flipped model. When prompted to answer survey questions #14, *Do you think the flipped classroom has helped or hurt your learning? Explain.* One student responded, "It's helped my education because you put things in the videos that keep us up to watch them." He pointed out, "It's helped because I can stop the videos and replay them and take in information at my own speed," and May simply wrote, "it helps me learn because I can stop and think."

The quality of student work has also increased. Figure 2 is a scale model of a medieval gothic cathedral a student created for one of their learning contract projects. This student was able to apply the knowledge they learned from their research about flying buttresses and stained glass windows in a three dimensional form. If it was not for the flipped classroom allowing students to get the notes from home, I would never have been able to employ that type of project-based learning. Along with the cathedral, I also received some amazing "Serf Raps," and "Medieval paper bag Puppets with scripts."

COLLABORATION

It is important to share our best practices with colleagues whenever possible. As I mentioned in the introduction, Tapestry a structure in place that allows for continually professional development every Monday. Back in January, I was asked by my curriculum coordinator create a presentation modeling my use of the flipped classroom. Through those demonstrations, more teachers in my school are attempting to flip their classrooms. One of those teachers is Mr. Milton Sheehan a math teacher at Tapestry Charter High School. The next section of this chapter will look at the flipped classroom from a math teacher's perspective.

A Mathematics Flipped Classroom: By Milton Sheehan

Every teacher has a different style with which they teach. Classroom systems, personality, and expectations can vary drastically from one room to the next. For this reason, experiences with new and innovative techniques can also produce radically different results for each individual. My classroom structures and expectations lend themselves very well to the "flipped classroom" model. Each aspect of my classroom creates a specific dynamic, which I work hard to maintain every

Figure 2. Student's project

day. The following is a brief walkthrough of my experience thus far with flipping the classroom.

Probably the most important part of any classroom is the structures in place for daily routines. Every student I have has a working folder that they check as they enter the room. In these folders are all of the papers they will need for the day including the "do now," any worksheets, and the homework. I also return papers via these folders to save the time normally spent walking around handing out papers. After students have emptied their folders and taken a calculator, they are to sit down and begin working on the do now.

Following the same routine every day allows the students to know what is coming next. Once in their seats students are expected to complete a daily quiz and SAT prep question. The quiz consists of two questions from the previous night's homework. The first question is basic, while the second is more advanced. For example, from a unit on geometric transformations, the first question would ask students to translate a point using verbal phrases like, "translate the point X (1,4) three units right and two units down." The second question would press for more complex understanding like, "$X(1, 4) \rightarrow T_{(3,-2)}$." Utilizing a different notation requires a better understanding of the process in order to complete. As students work on the quiz and SAT prep, I walk around completing three tasks.

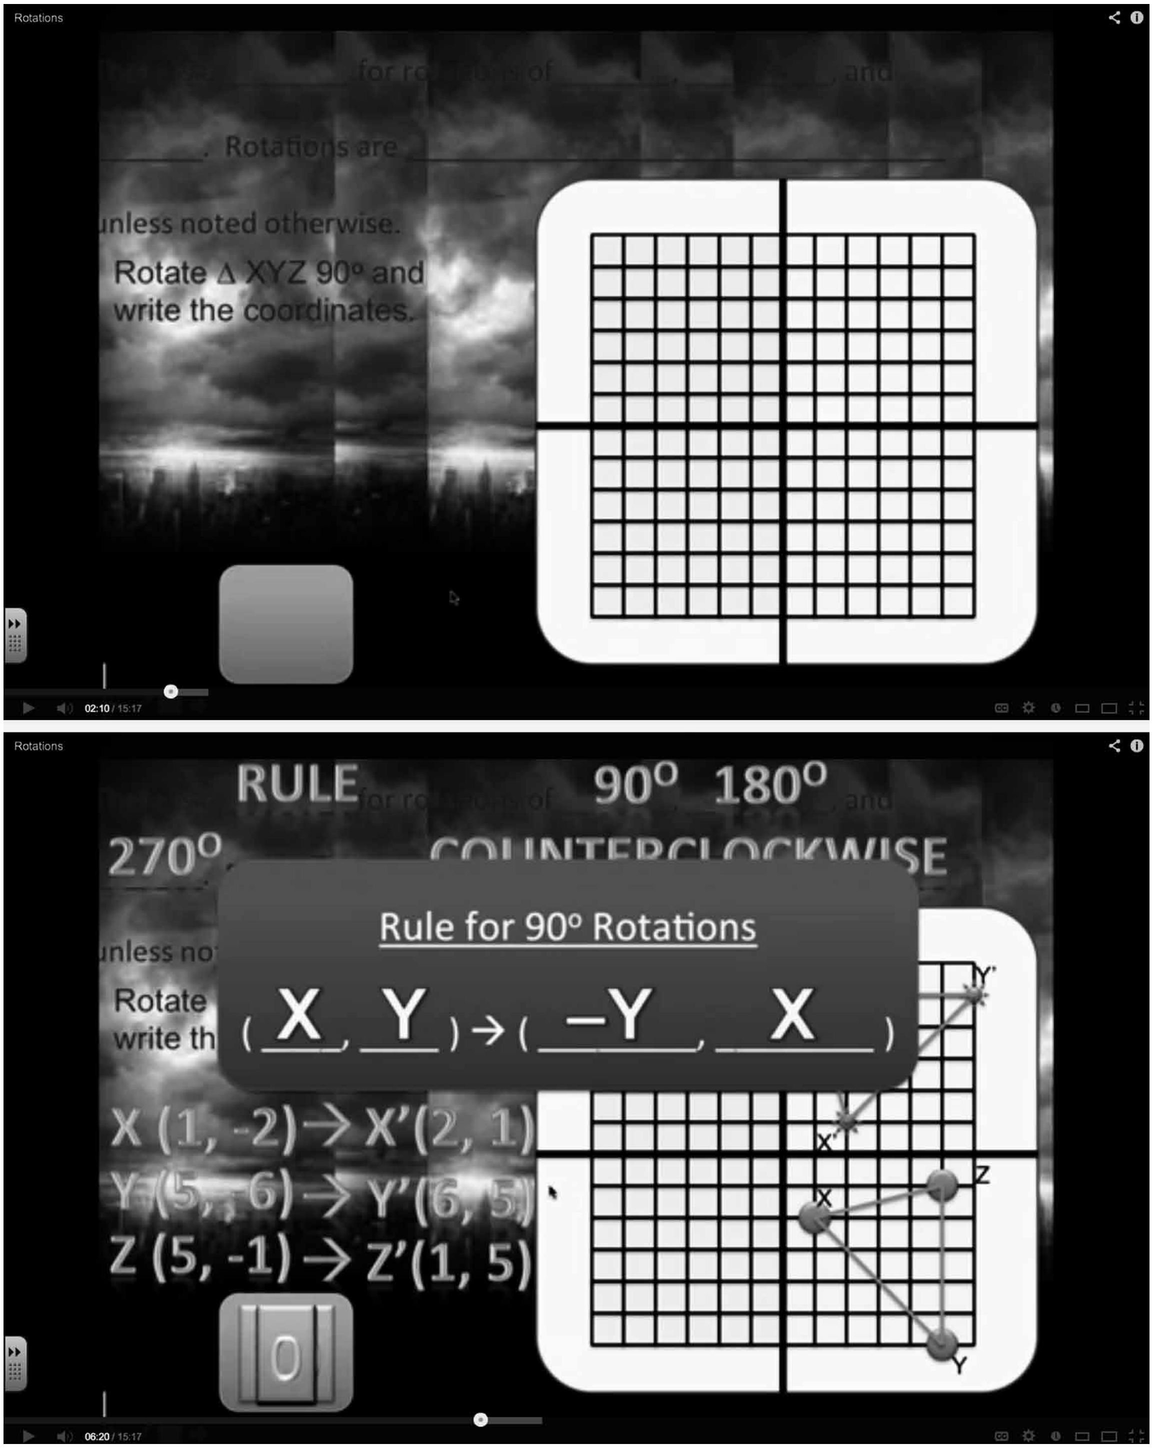
First, I check to see who has completed the homework; second, I check completed quizzes; and third, I group students according to quiz results. Students who are able to correctly answer both questions are in the "advanced" group, students with both questions incorrect compose the "basic" group, and students with a combination of correct and incorrect are the "proficient" group. This process usually takes somewhere around 8-10 minutes to complete. We then go over the SAT prep question together before the day's activity begins. Because students have already been grouped I begin by explaining the "advanced" assignment followed by "proficient" and then "basic." Students work through the day's activities until there are about five minutes left in class. At this point they complete an exit ticket before leaving.

Having a daily routine forces students to be prepared for what is coming next: check folders, complete do now, go over SAT question, practice activity, exit slip. This leaves little room for excuses during class. The same is true for my students outside of the classroom. They are all given my email and personal phone number at the beginning of the year with the expectation that if something comes up and they cannot complete an assignment they should contact me to avoid consequences. Additionally, I stay after school every day anywhere from 45 minutes to 2 ½ hours in case they need extra help.

There are multiple advantages and difficulties associated with a successful flipped classroom. Much of the work has to be done up front which is a huge time commitment, often times far exceeding that of planning a regular lesson. Creating a guided notes packet as well as a video for every lesson takes a substantial amount of time and effort, especially if you want the videos to be dynamic and interesting. A 15 minutes video may require an hour or more of work. This is in addition to creating practice activities to be completed in class along with grading of any assignments/quizzes/assessments. For my classroom I must create guided notes, a video, an entrance and exit slip, and three differentiated activities for each lesson. The light at the end of the tunnel is that if I create quality products, the future will only require fine-tuning of what I have already done.

There are also issues with students completing homework assignments. Initially, I had several students inform me that they had no access to the Internet at home. Through a bit of work, mostly on my part, we were able to find ways around each dilemma whether it involved using a smart phone or simply staying after to use a school computer for the 15-minute video. Even students who did not have Internet issues often did not get everything they could out of the homework videos. They

Figure 3.Screen cast used to get math notes



just blindly copied what appeared on the screen (Figure 3). This was a concern from the beginning and in order to curb such actions I had the students watch a video in class on effective note taking. Additionally, during my videos students are expected to pause and write notes as well as attempt problems on their own. To execute this, I include a timer on each slide that counts down from ten seconds during which students can pause before the lesson moves on. Some students utilize this, others do not, but it allows the motivated ones an opportunity to take control of their learning.

On the flip side, I have encountered more benefits than I had initially thought. My hope was that having students complete practice in class would increase their ability levels as well as confidence. Having a teacher available to help allows students to ask questions immediately rather than wait until the next class (when they either forget or are not afforded the opportunity). The experiences so far have exceeded my hopes. Not only have students' skills improved but their confidence in themselves and their classmates has as well. This welcomed side effect has also increased the amount of collaboration that occurs in the classroom. Students are aware of which group is "advanced," "proficient," and "basic." At first I was concerned that this knowledge would lead to ridicule of students who were having difficulty, and so I was surprised that the opposite held true. As a whole, students placed in the "advanced" group were willing to collaborate with no push from me. This is most likely because they knew that everyone in that group had been able to answer both quiz questions correctly. Those in the "proficient" group were also willing to collaborate but asked me to check things more regularly. The "basic" group was pretty much unwilling to work together, again, most likely because they knew their peers had not performed well on the quiz.

This increase in collaboration allowed me to spend more time with the "basic" and "proficient" groups, only occasionally checking in on the "advanced" group. Furthermore, as "advanced" students completed their work they were willing to help other classmates. *And other classmates were willing to accept their help!* This is a huge accomplishment in a non-Regents geometry class. For students to have trust in one another surpasses any expectations that I initially had. Furthermore, no single student was placed in the same group every day. In fact, most students varied between the three depending on the topic. This allowed each of them to feel "advanced" and "basic" at some point through the unit.

The most frequent question I am asked is "what if kids don't watch the video?" The structures and routines I have in place make this a workable scenario. Students who do not watch the video have little shot at the "advanced" group. Most of the time they end up in the "basic" group, which is where I spend the majority of the time. If there are a number of students who do not complete the homework, I take 10 minutes with this group and do a quick mini-lesson on the topic before letting them work on their own. Using this system, I had only a few experiences where unpreparedness created a problem. Moreover, lack of effort or lack of understanding on one student's part does not influence the learning of the rest of the class. If necessary, students can even go back and refresh their memory later in the year if they are so inclined.

As a whole, my experience with the flipped classroom thus far has produced desirable results. Student collaboration is up, student confidence is up, and student grades are up. As with anything in life, however, you get out what you put in. The amount of time necessary to prepare for and implement this instructional technique is extensive and at times stressful. Frustration can build if you make a mistake on the *last slide* of a 15-minute presentation and have to start over. The important thing is to remember that as with most teaching, videos will not be perfect, some activities will be unsuccessful, and some students will put forth less than acceptable effort. With this in mind, flipping the classroom creates more opportunities for students to take control of their learning than any other instructional method currently in practice.

CONCLUSION

Since September I have been experimenting with the flipped classroom model, and Mr. Sheehan shortly after. The concept have changed our approach to teaching; we are currently on pace to teach all of the required New York State content, and our students have taken control of their learning. They are more engaged in the lessons, and we can see a significant improvement in their literacy skills. We believe the improved literacy skills are attributed to the projects and stations we now have time to implement, thanks to the flipped class. Over the past year, this model has continued to evolve. This chapter has been an honest and open view into our experience with the flipped model. We are by no means an experts, and it is our wish that every teacher who reads this, does not repeat the mistakes we made, and can build off of our successes.

KEY TERMS AND DEFINITIONS

Camtasia (techsmith.com): A top of the line, paid for software program that allows teachers to create and customize screen casts and videos.

Document-Based Question (DBQ): An essay prompt that uses historical documents to support the thesis.

Geo-Literacy: is the ability to understand and use geography skills to make help make thoughtful decisions that impact the world around us.

Google Drive: A free, Web-based data storage service provided by Google. It allows users to create, edit, and collaborate on documents, videos, and office based products in real-time.

iTunesU (itunes.com): A free catalogue of college courses provided by iTunes.

Learning Targets: Are the essential piece of knowledge or skill students need to learn. Lessons are based on the learning target. Formative, and summative assessments are used to determine whether the student has mastered them or not.

Lexile: Can either be a measure that is used to rate the difficulty level of a piece of information, or a person's reading ability.

Remind101 (remind101.com): A website that allows teachers to text students reminders for test and homework, while keeping students and teachers contact information private.

Scholastic Reading Inventory (SRI): A test used to evaluate a students' Lexile range.

Student Led Conferences (SLC's): Are similar to parent teacher conferences, except the student drives the discussion, and through reflection of their learning while utilizing a self-created portfolio.

APPENDIX A

Medieval Study

Directions: You will choose and complete any of the assignments as long as you earn a total of 9 points or more.

H.O.W. REQUIREMENTS - To earn the points you must:

- Follow the directions for each assignment
- Work is neat and high quality
- Show details and use examples from your research
- Use correct spelling and grammar
- Do your best!

** ***IF YOU DON'T MEET THE ABOVE H.O.W. REQUIREMENTS, YOU WILL BE ASKED TO REMEDIATE YOUR ACTIVITY IN ORDER TO RECEIVE YOUR POINTS.***

1-POINT ACTIVITIES:

a. Write a song that could have been sung by a serf working on a medieval manor.
b. Draw a picture that showcases the influence of medieval architecture.
c. Create flash cards for all the money words and add a picture to the flash cards to help you remember the word.
d. Read the story *Crusaders at the Walls*, and answer *Questions for Review* #1-5, and *Understanding the Story* #1-8.
e. Create a one-point project of your own. (must FILL OUT CREATE MY OWN FORM AND TURN IT IN TO be pre-approved by teacher.)

2- POINT ACTIVITIES:

a. Create a set of five baseball cards representing real life people living in the middle ages.
b. Create a timeline for the Middle Ages that include five significant events with a description for each event.
c. Create a two-point project of your own. (must FILL OUT CREATE MY OWN FORM AND TURN IT IN TO be pre-approved by teacher.)

3- POINT ACTIVITIES:

a. Create a Medieval Journal for a fictional person represented on the feudal pyramid, living during the Middle Ages. Must have a minimum of three entries.
b. Create three paper bag puppets and write a script for them to preform. Each puppet must represent a different person on the feudal pyramid.
c. Write a one-page research paper on feudalism. Must be typed, single spaced, 12 font, and turned in to "Turn-It-In.com.
d. Create a three-point project of your own. (must FILL OUT CREATE MY OWN FORM AND TURN IT IN TO be pre-approved by teacher.)

APPENDIX B

Flipped Classroom Survey

This is the first year I have done the Flipped Classroom. Hopefully you noticed the difference. Notes and lectures are online, so more hands-on projects; and papers can be started in class. It allows more time in class to ask me questions, and for you to begin work on your major assignments. Keeping this in mind, please answer the following questions.

1. Do you have access to a computer at home? Yes/No
2. Do you have Internet access on your home computer? Yes/No
3. If so, what kind of Internet access do you have? Fast or Slow?
4. Do you have access to a smartphone with Internet access? Yes/No
5. Do you have access to both a smartphone and Computer with Internet? Yes/No
6. Do you have a working DVD player at home? Yes/No

7. If you don't have Internet access, but have a DVD player, would you take home a DVD with the homework videos on it?
8. How many times have you visited my website? Never, 1-2, 3-10, 10+
9. If you have never been to my website, or rarely go, why is that? Explain.
10. Do you plan on signing up to receive text messages for homework and tests? If not why?
11. Do you feel the work you turn into me is of a higher quality than previous years or for other teachers? Yes or No, explain.
12. How challenging is this course to you? 1. Toughest class I ever had, 2. Difficult but I am learning a lot, 3. Average, 4. Easy, but I am learning a lot, 5. Piece of Cake, I learned this material before.
13. Since September, do you think your writing has improved, especially when it comes to DBQ Essays? Yes or No and then rate your improvement: 4-By leaps and bounds, 3-it has improved, 2-somewhat improved, 1-is about the same, 0-got worse.
14. Do you think the flipped classroom has helped or hurt your learning? Explain
15. If you have been doing your homework, keep it up! But if you haven't been, what is your #1 reason why it doesn't get finished?
16. Have you ever watched my YouTube videos more than once? Yes/No and how many times did you watch it _______.
17. In regards to the YouTube videos, would you say I put too much information in them, just the right amount of information, or not enough information?
18. Have you ever used the YouTube videos to study for my test? Yes/No
19. Other than doing homework, have you ever used any of the other links I posted just because you are curious about the subject matter? Yes/No
20. What have your previous social studies teachers done to help you learn that I haven't? Don't say make it "fun," play more "games," or don't be "boring," be specific with your answers, describe and discuss.
21. Is there anything that needs to be changed or updated on my website to make it more user friendly?
22. What is the best thing about the flipped classroom?
23. What is the worst thing about the flipped classroom?
24. What changes do I need to make? Be specific!

Chapter 67
The Integration of Culturally Relevant Pedagogy and Project-Based Learning in a Blended Environment

Daniel Kelvin Bullock
North Carolina State University, USA

ABSTRACT

The use of blended learning environments is rapidly expanding in education. This chapter examines a teacher's enactment of the New Tech Network educational model, which utilizes a blended learning environment, and the teaching strategies she used to engage students and gauge student achievement. Detailed teacher interviews, classroom observations, and analyses of student assignments were the sources of data for the study. The findings centered on the integration of culturally relevant pedagogy and authentic instruction within this learning environment and the implications of this integration. Recommendations for future research include a more expansive study of the use of blended learning in social studies and different means of integrating culturally relevant pedagogy and authentic instruction into blended learning.

INTRODUCTION

It has been noted that traditional teaching methods, such as completing worksheets, reading from textbooks, and memorizing information, are overly utilized in social studies (Levstik, 2008). Additionally, the content taught in many social studies classes lacks the cultural diversity that reflects the demographics of the United States and the global community. These issues are often exacerbated in urban settings where there may be a higher proportion of African American and Latino American students and, hence, more differences between the culture acknowledged in the social studies curriculum and the culture of the students. It is possible that concerns of engagement, diversity, and achievement in social studies classes may be addressed by project-based learning and the blended learning environment within the New Tech Network (NTN) educational model.

DOI: 10.4018/978-1-4666-8246-7.ch067

The NTN model centers on project-based learning in a small high school (less than 100 students per grade level) and technology-rich (1:1 student to computer ratio) environment (NTN, 2014b).

In this chapter, findings from a qualitative case study are utilized to demonstrate how a teacher's enactment of the New Tech Network model was effectively used to engage diverse students in social studies and help them to master curricular content. In the fall of 2012, a researcher conducted interviews, observed classes, and analyzed documents to gain insight into the pedagogical practices and beliefs of Ms. Olivia Jordan (pseudonym), the Engagement High School 2012-2013 Teacher of the Year. This study occurred in a social studies classroom for an entire instructional unit centered on the lasting impact of the Civil War and Reconstruction on an urban area in North Carolina. The objectives of this chapter are to:

- Describe how Ms. Jordan utilized the blended learning environment within the New Tech Network model to engage students and ensure student mastery of curricular content;
- Explore how culturally relevant pedagogy and authentic instruction contributed to Ms. Jordan's success in this learning environment.

BACKGROUND

There is substantial evidence that students tend to like social studies classes the least amongst all school courses (Shaughnessy & Haladyna, 1985, as cited in Heafner, 2004; Goodlad, 1984, as cited in Ladson-Billings, 2001). Heafner (2004) noted, "Many teachers struggle with the lack of student interest in the content which translates into a lack of motivation to learn. This is especially prevalent in social studies classrooms" (p. 43). This lack of interest may be true for a variety of reasons. First of all, the instructional methods that are used in many social studies classes tend to be non-collaborative in nature. The National Assessment of Educational Progress (2010) noted that direct lecture, reading from the textbook, and taking tests and quizzes that assess a student's ability to retrieve memorized information were typical teaching methods utilized in social studies. Additionally, social studies content often lacks an acknowledgement or celebration of student culture (Ladson-Billings, 2001). In an increasingly diverse society, it is very important to make sure the social studies curriculum has cultural relevance for students and will prepare them for life in a multicultural society.

In this section, an overview of scholarly literature is provided that has been written on engagement and achievement in social studies. Specifically, there is a focus on authentic instruction and assessments, blended learning environments, project based learning, and culturally relevant pedagogy, which have been found to engage students in social studies and to promote their academic achievement.

Authentic Instruction and Assessment in Social Studies

Research shows that students' interest and engagement increases when learning is connected to authentic, real-world problems (Newmann, King, & Carmichael, 2007). Through authentic instruction and assessments, students are engaged in activities that require them to use skills and perform tasks that have relevance for life outside of school. Newmann, Bryk, and Nagaoka (2001) also explained that there was evidence "that when teachers organize instruction around assignments that demand higher order thinking, in-depth understanding, elaborated communication, and that make a connection to students' lives beyond school, students produce more intellectually complex work" (p. 2). This authentic intellectual work has been found to heighten student engagement and achievement (Carmichael & Martens, 2012).

It is the notion of addressing real social questions or problems that makes authentic instruction and assessment so compelling in social studies. For example, if students wanted to increase their understanding of current conflicts over immigration policies or American involvement in foreign affairs, Wiggins (1993) suggested that students could conduct oral histories of relevant community members (as cited in Mathison & Fragnoli, 2006). Similarly, Avery (1999) described an effective social studies assignment on migration where students collected information on their family's move to the region, compared their findings with the research of classmates, and wrote an essay where they summarized the significance of their findings and themes. In these examples of authentic instruction, students utilized critical thinking and collaborated with peers and community members to address social issues. These types of instructional strategies heighten interest and achievement in social studies classes.

Authentic instruction goes hand-in-hand with assessment as students learn to evaluate their work in comparison to a standard (Sleeter, 2005). The process of constructing effective authentic assessments consists of defining expectations for achievement, communicating those expectations with students, and evaluating final products in light of prior communication. Authentic assessments also incorporate real-world issues and skills that have meaning outside of the classroom.

It has been argued that the move towards more authentic instruction and assessment will not be effective with populations of students that have typically experienced difficulties with traditional learning methods (Newmann, Bryk, & Nagaoka, 2001). This idea rests on the rationale that students, who have not mastered the basic knowledge that has been provided through traditional means, will not have the foundation to build the complex understanding that is achieved through authentic instruction. Newmann et al. (2001) explained the misconception that:

> *… it is widely believed that more sustained attention to didactic methods is essential. From this perspective, the best way to teach is to present students with the desired information and ask them to memorize it, whether this be facts, definitions, algorithms, vocabulary lists, rules of communication, procedures… and so on. Through various drills, exercises, and tests, students are expected to recall and repeat what they have memorized. (p. 9)*

Yet, their research revealed that, "students exposed to teaching that demands complex intellectual work are likely to do as well or better than students exposed to basic-skills-only instruction" (Newmann, et al., 2001). Levin, Newmann, and Oliver (1969) found this to be true in high school social studies, in particular (as cited in Newmann et al., 2001).

Furthermore, Newmann et al. (2001) supported the notion that traditional teaching methods (i.e., didactic instruction) should not be totally discarded to make room for authentic instruction. Instead they proposed the idea that, "Significant intellectual accomplishments build on prior knowledge that has been accumulated in the field… This is usually the central focus of direct instruction in basic skills" (p. 15). Hence, didactic methods still have a place in a classroom that utilizes authentic instruction. Direct instruction might be utilized, in moderation, to provide a concise baseline of information upon which students may construct new knowledge through authentic instruction.

Blended Learning Environments

In 21st century learning, it is vital that teachers utilize online tools, resources, and information to provide authentic learning experiences for students. Blended learning environments may be ideal, because they include the "integrated combination of traditional learning with web-based online approaches" (Oliver and Trigwell, 2005, p. 17, as cited in Sharma, 2010). Research shows that blended learning aligns with accepted notions of how individuals acquire knowledge because it often incorporates visual stimulation, a sense of academic community, differentiation, practicality, and an ability to spark curiosity (Pregot, 2013). Furthermore, critical thinking skills are frequently more evident in online environments than in face-to-face settings (Pregot, 2013). This is likely due to the fact that students may be able to take more time to reflect on and research responses to a provocative question outside of class than within the time allotted in a normal class period.

Research is beginning to show that students are learning better in online environments and it may be advantageous to employ more hybrid courses (Young, 2002, as cited in Mansour and Mupinga, 2007). Hybrid learning, which is synonymous with blended learning, was utilized in Doering and Veletsianos's (2008) study of Adventure Learning (AL) in five elementary classrooms in three schools in a Midwestern city:

Adventure Learning (AL) is a hybrid distance education approach that provides students with opportunities to explore real-world issues through authentic learning experiences within collaborative learning environments (Doering, 2006; Doering, 2007; Doering & Veletsianos, 2007)… Within the program students are faced with real-world problems while they identify and pose questions, analyze data, interact and collaborate with colleagues and experts, and take action within their own community. (p. 25).

The majority of the teachers in this study utilized AL in social studies instruction. For example, one teacher challenged students to create Adventure Learning activities to spread knowledge and awareness on the social effects of climate change. Students shared ideas and developed their plans online in collaboration zones and eventually published electronic presentations that were available on the World Wide Web. After reviewing findings, researchers hypothesized that the flexibility of the AL hybrid curriculum, combined with the social, authentic, and interactive aspects of the learning environment, made it effective for teachers and students.

Project-Based Learning

Project-based learning as it is utilized in the New Tech Network model, is a prime example of authentic instruction and assessment within a blended learning environment. It "begins with the vision of an end product or presentation" and "creates a context and reason to learn and understand the information and concepts" (Buck Institute for Education [BIE], 2009). The Buck Institute for Education (2009) defines project-based learning as "an extended process of inquiry in response to a complex… problem" where "students learn key academic content (and) practice 21st Century Skills" through the creation of a project (para. 1).

As early as 1918, there were efforts to describe a method of instruction, which centered on the creation of projects. F. E. Heald, who was a specialist in agricultural education for the U.S. Department of Agriculture, wrote a report where he made suggestions that educational projects should include contracts and an alignment with work done at home (Kliebard, 2004). Also, in 1918, William H. Kilpatrick published an article in *Teachers College Record*, entitled "The Project Method," which became a centerpiece for debate in education (Kliebard, 2004). In the article, Kilpatrick (1918) defined a project as a "whole-hearted purposeful activity" that is "the typical unit of the worthy life in a democratic society" and should be "the typical unit of school procedure."

There was not much literature written on the "Project Method" or "project based learning" in America before the topic was rejuvenated in the 1990's. This was when the Buck Institute for Education (BIE), which was created in 1987 as a non-profit organization dedicated to educational research and development, began to research and focus on project based learning due to its successful implementation in various schools in the western

United States (specifically California) (BIE, 2011). The BIE created its own project based learning model and developed instructional materials to assist schools in implementing it (BIE, 2011). This particular model became a leading approach for project based learning due to its adoption by the NTN and other educational reform organizations. Ultimately, the model and materials created by BIE have an impact on schools as they are used as a framework to help teachers execute project based learning (BIE, 2011). The NTN (2013c) has also developed resources such as the "Project Idea Rubric" to assist teachers with the implementation of project-based learning.

Project based learning has been implemented in the social studies in various forms for many years. John Dewey, while he did not coin the phrase "project based learning," indirectly advocated this type of learning through his scholarship and lab school (Kliebard, 2004). Dewey believed that, historically, knowledge was created as humans tried to solve real-world problems (Kliebard, 2004). For example, architecture was an outgrowth of people's desire to build durable, reliable dwelling places. Thus, when Dewey started his school at the University of Chicago, which was officially called the University Laboratory School, the students were involved in a variety of activities that were rooted in current and historical real-world problems (Kliebard, 2004). While learning about a particular time period, some students constructed buildings and devices that were utilized by people in that era (Mayhew & Edwards, 1936 as cited in Kliebard, 2004).

Some scholars have also utilized PBL in the social studies and experienced positive results compared with traditional practices. For example, Parker, Mosborg, Bransford, Vye, Wilkerson, and Abbott (2011) conducted a study on the usefulness of project based learning in the instruction of AP US Government and Politics. They utilized projects where students had tasks such as advising "a new nation just emerging from a long dictatorship about the various forms and features of constitutional democracy" and proposing "public policy and action that will improve society" (Parker et al., 2011, p. 541). They found that students who engaged in project based learning performed as well or better than students who used traditional learning methods on the AP exam (Parker et al., 2011).

There have also been a number of studies conducted on the use of project based learning in elementary social studies. In their study of second grade social studies, Halvorsen, Duke, Brugar, Block, Strachan, Berka, and Brown (2012) found that students from low socioeconomic-status (SES) schools "made statistically significant gains in social studies and content literacy" and "showed no statistically significant differences from the students in the high-SES schools" when they implemented their projects (p. 198). The particular projects that were used in the study included an economics project that focused on raising money for a local charity and a civics project that centered on studying a local park and making recommendations for improvements to a local government official (Halvorsen et al., 2012).

Although some scholars have noted the successes of project based learning in the social studies, other researchers have reported a lack of scholarship in the field. For example, Summers and Dickinson (2012) mentioned their surprise in conducting their study when they found that "social studies (project based instruction) research was unexpectedly sparse" (p. 83). Walker and Leary (2009), in their quantitative study of project based learning implementation in various subjects also noted, "There is… a clear need for additional quantitative controlled studies in… social science… and a less dramatic need for work in the sciences" (pp. 21-22).

Critiques of Project Based Learning

There have been a number of critiques of project based learning. Kirschner, Sweller, and Clark (2006) argued that problem-based learning (and consequently project based learning), which was labeled as minimally guided instruction, was an ineffective teaching strategy because learners needed more direction to understand challenging content. Research was cited from various scholars in cognitive studies to support this notion (Kirschner et al., 2006). However, Hmelo-Silver, Duncan, and Chinn (2007) responded to this critique by explaining that problem-based learning and inquiry learning approaches (such as project based learning) were "highly scaffolded" and thus "powerful and effective models of learning" (p. 99). To identify these instructional techniques as minimally guided was misleading, erroneous, and would likely lead to misconceptions about the benefits of the approaches.

Halvorsen et al. (2012) also posed possible concerns with project based learning:

Others might wonder whether it is possible to curricularize (i.e. instantiate in formal unit and lesson plans) for widespread use an approach to learning that is, by definition, somewhat dependent upon the specific students, classroom, and community in which the learning takes place. (p. 204)

Halvorsen et al. (2012) essentially resolved this issue in their study by "providing… support to teachers," "aligning project-based units to specific learning standards," and making efforts to curricularize project based learning so that it could be replicable (p. 204).

Some researchers have also argued that project based learning was more appropriate for gifted learners and not necessarily a proven instructional strategy for raising the achievement levels of struggling learners (Mergendoller, Maxwell, & Bellisimo, 2006). For example, Diffily (2002) argued that, "Project-based learning (wa)s particularly suited to the needs of gifted children" (p. 40). She explained that this type of instruction lent itself to gifted students expanding their knowledge on a particular topic by investigating it in depth (Diffily, 2002). Furthermore, since students were assigned different roles in the project, there would be no stigma attached to a gifted student working on something different, or more complex (Diffily, 2002). This was important to note because the purpose of using project based learning at Engagement High School was to increase the previous performance of a low performing school. If it was not proven that this was an effective method of increasing student engagement and achievement for struggling learners, then one should have questioned why it was being used.

Hertzog (2007), in her study of the use of project based learning in two 1st grade classrooms, argued an opposing point from Diffily. Hertzog (2007) believed that the critical thinking skills employed through project based learning were the types of skills commonly utilized in gifted education. In her study, she researched the effects of implementing project based learning in elementary classrooms composed of students from low socio-economic status (Hertzog, 2007). She found that students were definitely more engaged and better behaved during the projects, but teachers were not sure if students learned more. Filippatou and Kaldi (2010) employed pre and post-tests in their study of the effectiveness of project based learning with primary school students with learning disabilities in Greece. They found that students with learning disabilities made gains in academic performance, motivation, and their ability and efficacy in working in groups while learning through projects. MacArthur et al. (2002) also conducted a study on the use of this pedagogy with general education and special education elementary students and found that both groups made significant gains in their knowledge of the subject matter. Also, Thomas (2000) in his research on project based learning, found that it "had value for enhancing the quality of students' learning in subject matter areas" (p. 35) and seemed "to be equivalent or slightly better than other models of instruction for producing gains in general academic achievement and for developing lower-level cognitive skills in traditional subject matter areas" (p. 34). The conflicting conclusions of some of these scholars prompted me to conduct further research on the possible benefits or disadvantages of project based learning.

Again, with our society becoming increasingly diverse, it is advantageous for us to analyze project based learning and authentic instruction and assessment through a lens of cultural relevance. Ultimately, the pedagogy that is enacted with students will need to take into account their cultural background and experiences.

Culturally Relevant Pedagogy

Culturally relevant pedagogy is a viable framework for rethinking authentic instruction and assessment in social studies classes. Essentially, culturally relevant pedagogy is a methodology that results in high achievement, cultural competence, and socio-political consciousness in students from diverse cultural and racial backgrounds (Ladson-Billings, 1995a). Ladson-Billings (1995a) described the achievement of students in classrooms utilizing culturally relevant pedagogy in various ways as she stated:

Students in these classrooms were at or above grade level on standardized achievement tests. Fortunately, academic achievement in these classrooms was not limited to standardized assessments… students demonstrated an ability to read, write, speak, compute, pose and solve problems at sophisticated levels--that is, pose their own questions about the nature of teacher- or text-posed problems and engage in peer review of problem solutions. (p. 475)

Subsequently, cultural competence was described as "a way for students to maintain their cultural integrity while succeeding academically" (Ladson-Billings, 1995a, p. 476). Similarly, in her writings on culturally responsive teaching, Gay (2002) stated, "when academic knowledge and skills are situated within the lived experiences and frames of reference of students, they are more personally meaningful, have higher interest appeal, and are learned more easily and thoroughly" (p. 106). Ladson-Billings (1995a) emphasized that teachers helping students to develop socio-political consciousness, identified and helped students to understand the "political underpinnings of the students' community and social world" (p. 477).

During her study of eight elementary teachers in California, Ladson-Billings (2001) described how culturally relevant pedagogy might appear in social studies. She noted that one teacher encouraged students to discover information by conducting oral histories and creating migration maps with family members. This instructional style supported the teacher's philosophy of "history as a way of uncovering truths" (p. 206). A second teacher used a conversation with students on community problems to fuel a project where they proposed renovation ideas to the local city council. The project required the students to research the historical uses of community space and how the area could be more useful to members of the neighborhood. Both of these were examples of authentic instruction or, more specifically, project based learning, and culturally relevant pedagogy being utilized simultaneously.

Various scholars have conducted studies and written articles on the idea of culturally relevant pedagogy since Ladson-Billings framed the idea in 1995. Essentially, researchers have found that educators who utilize culturally relevant pedagogy share similar "conceptions of self and others," "conceptions of knowledge," and structures of "social relations" in the classroom (Ladson-Billings, 1995a, p. 478). In regards to the ideological resemblance within teachers' conception of self and others, Ladson Billings (1995a) found that the teachers believed that all the students were capable of academic success, saw their pedagogy as art, saw themselves as members of the community, saw teaching as a way to give back to the community, and believed in a Freirean notion of "teaching as mining" (1974, p. 76) or pulling knowledge out (pp. 478-479). Several scholars have corroborated these findings while researching successful educational experiences of minority students in America. Irvine (2009) provided the example of an elementary teacher who had a class, composed of predominantly African American and Latino American students, learn about the concept of classification by using vegetables. When the students became discouraged because they did not recognize some of the images they were using, the teacher decided to refer to something she heard the students speak about in a non-academic conversation—cars. Thus, the teacher was able to use a topic that was familiar with students to teach the concept of classification. This example reflected the teacher's conception of self and others because the teacher did not accept the fact that students could not learn the concept of classification because the first teaching effort failed. She believed the students could learn and used a creative method for helping the students construct an understanding of the desired concept.

Teachers that utilize culturally relevant pedagogy also tend to create a collaborative atmosphere that ultimately educates both the student and teacher. Ladson-Billings (1995a) noted that exemplary teachers develop healthy student/teacher relationships, show an ability to connect with all types of students, create a supportive classroom community, and encourage students to take responsibility for each other's education. Again, various scholars have found that successful teachers of minority students create a collegial classroom environment. Milner (2011) discussed how a white male science teacher, Mr. Hall, successfully implemented culturally relevant pedagogy by focusing on building relationships with students and embracing them as family members. Milner (2011) documented the following quote from Mr. Hall:

I like the family aspect because I mean if family's not important to you, then what [or who] is? I mean family should be the thing that's most important to everybody. And I mean that for some people it's not, so hopefully in here they kind of get that aspect… I care about everybody; I love them all… just like I would my own [biological children]. (p. 85)

The notion of caring relationships is vital to the social relationships found in culturally relevant pedagogy. In her study of a teacher implementing this methodology, Irvine (2009) noted the tendency of culturally relevant teachers to form compassionate relationships with students. She stated, "If you have a true, caring relationship with your students, you will know what their interests are, what information they relate to" (p. 61). Gay (2002) also described one of the essential elements of culturally responsive teaching as "demonstrating caring and building learning communities" with students (p. 106).

Finally, Ladson-Billings (1995a) discovered that teachers that implement a culturally relevant pedagogy have similar epistemologies about knowledge. The teachers tend to believe "knowledge is not static; knowledge must be viewed critically; teachers must be passionate about knowledge and learning; teachers must scaffold… to facilitate learning, [and] assessment must be multifaceted" (Ladson-Billings, 1995a, p. 481). This understanding of knowledge connects to Marshall's (2001) research in which she found successful teachers of African American students had the "the recognition that no knowledge is sacrosanct" (p. 108). Banks (2006) also elaborated on the notion of the contingent nature of knowledge by stating:

Much of the knowledge institutionalized within the schools and the larger society neither enables students to become reflective and critical citizens nor helps them to participate effectively in their society in ways that will make it more democratic and just. This chapter proposes and describes a curriculum designed to help students to understand knowledge as a social construction and to acquire *the data, skills, and values needed to participate in civic actions and social change. (p. 203)*

Irvine (2009) has also noted that, "knowledge and meaning are constructed." This contrasts with a traditional transmission model of knowledge that values the facts that are presented in social studies classes as the most valuable information for students to acquire and utilize.

It is equally important to understand that within this model the teachers must value the backgrounds and experiences of students to help them obtain the knowledge and skills necessary to improve society. Ladson-Billings (2001) borrowed an idea from Giroux and Simon's (1999) writing on critical pedagogy as she explained educators who implement culturally relevant pedagogy "strive to incorporate student experience as 'official' content" (p. 202). Howard (2003), in his study on the importance of critical teacher reflection, noted how "Teachers need to understand that racially diverse students frequently bring cultural capital to the classroom that is oftentimes drastically different from mainstream norms and worldviews" (p. 197). Teachers should recognize the value of this capital and build upon it. For example, in Ladson-Billings's (1995a) study, a teacher provided an opportunity for students to utilize outside knowledge and interests (i.e., basketball and cooking) for a project in which they shared their expertise in a domain of their choice. As the teacher allowed students to utilize information that extended beyond the curriculum, she exemplified a conception of knowledge that valued the experiences and wisdom of her students.

A teacher utilizing culturally relevant pedagogy should also utilize innovative assessment methods. In Ladson-Billings' (1995a) study, there were teachers that prompted students to conduct oral histories, create migration maps, and present plans for community restoration. In Tyson's (2002) research, children's literature was used to inspire students to "develop understandings of social action and ways of thinking about social action in their own communities" (p. 50). Various activities like journal writing, class discussions, and research assignments helped students to gain deeper knowledge of social action and civic responsibility (Tyson, 2002).

Critiques of Culturally Relevant Pedagogy

Despite the large body of research that has been developed to substantiate culturally relevant pedagogy, it is not without its critics. Hirsch (2010) has argued that the proper path of educating for social justice involves teaching a core body knowledge in all subjects. Eisner (2002) summed up Hirsch's viewpoint as an understanding that "not all content is created equal" (p. 65). Hirsch (2010) noted that, "The chief cause of our schools' inefficiency is… curricular incoherence" (p. 36). Essentially, Hirsch's argument stems from the belief that centering learning on students and their backgrounds may lead to them not learning information that will be vital for cultural capital and social change.

Yet, this argument, with certain interpretations, could support a rationale where educators ignore injustices in curriculum. It should be the primary goal of American education, and specifically the social studies, to enhance our democracy. This enhancement can only occur as social issues (which often lie beyond the traditional body of knowledge) are studied and analyzed. This does not mean that certain traditional ideals should be avoided (i.e., democracy), but that some long-established historical points might be sacrificed (i.e., one dimensional portrayals of historic figures). Efficiency, thus, becomes a secondary concern to the broader goal of a more developed democracy and engaged citizenry.

Summary

Current literature shows that there are efforts being made to reform instruction and assessment practices across all disciplines. This task is particularly important in social studies, where there is a reputation for not engaging students. Authentic instruction and assessment methods will likely become more common in schools in the coming years. In this study, I hope to bolster this area of research that has been sparsely documented and help to increase our understanding of how a teacher might maximize the use of project-based learning in a social studies classroom.

THE CASE (STUDY) FOR PROJECT-BASED LEARNING AND CULTURALLY RELEVANT PEDAGOGY

Research shows that students lack interest in social studies for a number of reasons (teaching methods, lack of diversity in content, etc.). In this case study, the researcher investigated how a successful teacher of U.S. history engaged students in social studies content and gauged their academic success. This teacher, Ms. Jordan, taught at Engagement High School (EHS)—a school founded upon the New Tech Network (NTN) model.

New Tech Network model

The NTN model was developed by the New Technology Foundation (now known as the New Tech Network) after the success of Napa New Technology High School. This high school was formed in 1996 after local educational and business leaders met to address the concern that students were not "graduating with the skills needed to meet the needs of the new economy" (NTN, 2014a, para. 2). New Tech Network (2014a) reported that:

As Napa New Technology High School thrived, local business leaders and education advocates came together to ensure the school's long-term success and sustainability by establishing the New Tech Foundation. In 2001, New Tech was awarded a $6 million grant [and] charged with launching 14 schools over three years. From this initial launch, New Tech has continued to grow… Today, our name is New Tech Network and we support 120 schools in 18 states and Australia. (para. 4)

The New Tech Network (NTN) model centers on project based learning in a small school and technology-rich environment. New Tech Network (2014b) defines project-based learning as "contextual, creative, and shared" where "students collaborate on projects that require critical thinking and communication" (para. 2). The small school settings are considered to be high schools with less than 100 students per grade level, while the technology-rich environment implies a 1:1 student to computer ratio. The technology-rich component also consists of the Echo learning management system:

Echo is... designed to support Project-based learning (PBL), facilitate communication and collaboration, and improve teacher practice. Teachers, students, and parents at New Tech high schools use Echo on a daily basis to access course resources, project plans, assignments, a multi-dimensional gradebook, online groups, and an extensive library of instructional resources for teachers. (New Tech Network, 2014d, para. 1)

The NTN model may be considered a blended learning environment due to the fact that students use Echo on a daily basis to access course resources, communicate virtually, and collaborate on projects. Additionally, a significant portion of course content is accessed beyond the school, as students have continuous access to curricular materials, rubrics, instructional videos, etc. The model is intended to create a higher level of engagement amongst students by helping them to "gain the knowledge and deeper learning skills they need to succeed in life, college, and the careers of tomorrow" (NTN, 2014b, para. 1).

Engagement High School

In 2007, the New Technology Foundation model was selected as a transformation model to be implemented at a school in an urban district in North Carolina. This model was intended to help increase student achievement. Using the NTN model, a new school would be created within the existing, traditional school that would provide an additional, innovative educational opportunity for the students in the area. The school, named Engagement High School (pseudonym), was housed within the larger, traditional school, but had a distinct principal and faculty. Although it was intended to serve the same population as the larger school, the students would only be admitted to Engagement High School (EHS) through an application process. The school was officially classified as a "Redesigned STEM High School" and was the site of my qualitative research study.

The student population at EHS is about 94% Black, 2% Asian, 2% Hispanic, and 2% White; approximately 51% of the students receive free or reduced price lunch. There are no more than 100 students in each grade level. The school's campus consists of one wing of one hallway of the larger, traditional school and a large modular unit on the southern part of the campus that houses five classrooms. The average class size is 21 students. The school's culture is themed around "Trust, Respect, and Responsibility;" these ideas are emphasized in each classroom and serve as the foundation of school rules. All of the core classes are considered "honors" or "Advanced Placement". In addition to fulfilling standard graduation requirements for the district, students are required to complete 150 hours of community service and participate in an internship. EHS's first graduating class had a 100% graduation rate and 97% college acceptance rate. The second graduating class had a 97% graduation rate.

Method

This qualitative research study focused on two primary research questions: 1) how does a social studies teacher in an urban school enact the New Tech Network educational model with her students, and 2) which teaching strategies does she use to engage students and gauge achievement? According to Creswell (2007), qualitative research should be conducted when a problem or issue needs to be explored in a complex, detailed manner and methods such as interviews and observations best serve the purpose of addressing that problem. In this case, the problem that needed to be explored was the lack of engagement in social studies. The researcher decided that it would be helpful to study a successful teacher to understand how he or she was able to utilize the New Tech Network model to engage diverse students in social studies. Three common methods of qualitative data collection (interviews, field observations, and document analysis) were used.

Specifically, case study methodology was employed for this research, as the methods of data collection included an exploration of a particular educational model (the New Tech Network model) in a bounded environment (one urban, secondary social studies classroom). According to Stake (1995), this type of case study is categorized as "instrumental," because it developed from an interest in an issue. In this particular case, there was an interest in the utilization of the New Tech Network model in an urban setting and the prospect of increasing engagement and achievement in social studies classrooms. The researcher decided that it would be ideal to study a teacher that had experienced success in the model and utilized strategies to spark student engagement. After investigating possible sites, Engagement High School (EHS) was found to be the only school in the area that satisfied the criteria of the researcher. Once EHS was selected as the site, Ms. Olivia Jordan (pseudonym), was found to be an ideal teacher for the study because of her recent selection as the 2011-2012 Initially Licensed Teacher of the Year and reputation for engaging students in U.S. History. Thus, the prospective sample was selected using Merriam's (1998) idea of "purposeful sampling" (p. 61). There was much that could be learned from studying Ms. Jordan, who had been able to continually capture the interest of students in social studies and enhance their learning.

Data Collection

Data collection began in the fall of 2012 as the researcher received a signed, formal agreement from Ms. Jordan to participate in the research. This agreement included information on the purpose and scope of the study and what would be requested of the teacher. It was also decided that U.S. History would be the most appropriate course for the study because of the fact that it served the 11th grade students at EHS with more diverse learning needs. Next, the researcher conducted a pre-interview with Ms. Jordan on topics such as the NTN educational model, the Honors U.S. History course, student engagement and achievement, her educational philosophy, and the successes and challenges of project based learning in the social studies.

The study consisted of data collection that lasted throughout the duration of a single project-based unit and an accompanying extension activity. The unit (including the extension activity) lasted for five weeks. Within that time period, two interviews were conducted with Ms. Jordan at the beginning and middle of the project. The interview questions focused on the implementation of the project, student engagement, and student achievement. Audio recordings were also collected and transcribed. Finally, there was a post-interview with Ms. Jordan after observations were completed to reflect on the project.

Twelve observations were conducted every other day, consecutively. The semi-structured observation protocol was based on "questions of interest" that were developed from the research questions. For example, the researcher looked for evidence of student engagement, achievement, and how the New Tech Network model was enacted. Specifically, for student engagement, notes were recorded of the types of activities in which students participated and the quality and duration of their participation. The researcher also noted occurrences that were specific to culturally relevant pedagogy, including the social relationships in the classroom and evidence of student achievement, cultural affirmation, and socio-political consciousness. As such, field notes were scripted verbatim during the class observations in the researcher journal.

Finally, the researcher collected all documents that were distributed to students throughout the project and additional documents that reflected the utilization of the NTN model. Merriam (1998) noted that "finding relevant materials is the first step" in effectively using documents in case study research (p. 120). Documents such as the project rubric, graphic organizers, class readings, written assignments, quizzes, tests, etc. were all collected.

Data Analysis

Following data collection, the extensive process of coding findings for the study began. First, the researcher read through the transcribed interviews and observations and made notes on general points that were raised by Ms. Jordan and ideas that emerged from the observations (Merriam, 1998). Then, connections were drawn between the different issues that were raised in the interviews and observations and preliminary categories were created (Merriam, 1998). Next, the researcher reviewed the documents that were collected, categorized them according to their purpose, structure, and content, and found connections between the documents and the preliminary categories for the observations and interviews. After reviewing those categories, the researcher identified specific categories that generalized the findings from the study and could be used to interpret the results. Those codes were compared and weighed against each other to understand which codes took precedence in the data and which codes were correlated or subordinate (Merriam, 1998). This allowed the data to be presented thematically via tables and text.

FINDINGS

After analyzing the qualitative data collected in the study, the researcher found that there were five interconnected themes that emerged: real world application and relevance, the utilization of scaffolding strategies, accountability and structure in student collaboration, positive teacher/student interactions, and the benefits and challenges of technology.

Perhaps the most important theme to emerge in this study was the prominence of real world applications for the history taught in Ms. Jordan's classroom. She made a concerted effort to ensure that students could find connections between historical content and current events. During the pre-interview, she emphasized that this was a feature of the New Tech Network model, "One of the key components of this model is to implement with fidelity project based learning in which students take real world situations and create products or projects, which address those issues." In terms of culturally relevant pedagogy, Ms. Jordan's use of real world issues enhanced student achievement, cultural competence, and socio-political consciousness (Ladson-Billings, 1995a). She accomplished these ends by a variety of methods that included incorporating content that was culturally relevant to students, inviting community members to be a part of instruction, using the community as a center-piece of the curriculum, and providing opportunities for students to learn outside of the classroom.

Ms. Jordan also utilized a number of cognitive scaffolds to ensure her students mastered the curriculum. This is a technique often implemented by teachers of culturally relevant pedagogy (Ladson-Billings, 1995a) and schools that utilize project-based learning (NTN, 2013d). Hmelo-Silver, Duncan, and Chinn (2007) explained the necessity of some traditional approaches to teaching in the midst of innovative strategies like project based and inquiry learning:

A mini-lecture or benchmark lesson presenting key information to students is used when students understand the necessity of that information and its relevance to their problem-solving and investigational practices. Such just-in time direct instruction promotes knowledge construction. (p. 100)

From the first day of the project, Ms. Jordan incorporated teaching strategies that could be considered traditional, such as literacy activities, graphic organizers, visual aids, questioning, and discussions to engage students in the historical content.

Within her classroom Ms. Jordan embedded a strong sense of accountability and structure to support student collaboration. There were various levels of support she included to ensure students were held accountable and were responsible for each other's learning. These levels of support included accountability measures by the teacher, group contracts and division of responsibilities in classroom assignments, meetings to reinforce group roles, the requirement that students had to complete their homework to continue the project in groups, and various project tasks and responsibilities that were vital for the finished product.

The nature of the communication between Ms. Jordan and her students was another important theme. Culturally relevant pedagogy emphasizes the important of positive, caring relationships between students and teachers (Irvine, 2009; Ladson-Billings, 1995a). Ms. Jordan constantly encouraged students, engaged them in discussions to help them learn content, and used conversations as a means of evaluating their understanding of content.

Technology is listed as one of the three primary elements of the New Tech Network model. Specifically, the NTN website (2014b) states:

The smart use of technology supports our innovative approach to instruction and culture. All classrooms have a one-to-one computing ratio. With access to Web-enabled computers and the latest in collaborative learning technology, every student becomes a self-directed learner who no longer needs to rely on teachers or textbooks for knowledge and direction. We use Echo, an online learning management system to create a vibrant network which helps students, teachers, and parents connect to each other, and to student projects across the country. (para. 3)

Despite the positive perspective of technology touted in the website, through interviews and observations, the researcher quickly realized that Ms. Jordan was not able to utilize technology in a manner that reflected the ideals of this statement. There were a number of broken laptops throughout the project that prevented a one to one student to computer ratio. This lack of working computers hindered Ms. Jordan's ability to utilize the Echo learning platform and technological teaching strategies she wanted to use. Despite these challenges, Ms. Jordan found other ways to use technology as a collaborative and instructional tool.

DISCUSSION

The purpose of this study was to research how a social studies teacher in an urban school enacted the New Tech Network model, engaged students, and ensured student mastery of curricular content. My central research questions were:

1. How does a social studies teacher in an urban school enact the New Tech Network educational model with her students?
2. Which teaching strategies does she use to engage students and gauge achievement?

Five themes emerged from the study, which described how Ms. Jordan enacted the NTN model with her students and the strategies she used to engage them and gauge achievement. After analyzing these themes, the researcher developed five assertions (Table 1) that further organized and refined the findings. These assertions demonstrate how Ms. Jordan's success in engaging students and supporting student achievement rested in her ability to integrate culturally relevant pedagogy (Ladson-Billings, 1995a) into project based learning (BIE, 2009) via the New Tech Network model (NTN, 2014c).

A more detailed discussion about each assertion and the implications for students is provided below.

The use of real world applications that were culturally relevant ensured that the content focused more deeply on the culture and community of the students. Project based-learning within the NTN model seeks to address real world problems that would likely be addressed by adults, as well (NTN, 2014c). With this approach, teachers are able to connect students with people outside of the school that would be interested in the students' solutions and ideas. This aligns with a culturally relevant pedagogy, which utilizes the interests of the students, concerns of the community, and social issues to engage and educate students (Gay, 2002; Ladson-Billings, 1995a). Specifically, culturally relevant teachers tend to embody a conception of self in which they see themselves as members of the students' community, moving them to incorporate issues or concerns from the community into the curriculum (Ladson-Billings, 1995a).

In her teaching, Ms. Jordan was able to successfully blend project-based inquiry and culturally relevant pedagogy in a way that made real world problems culturally relevant. Ms. Jordan saw her-

Table 1. Five emergent themes and five thematic assertions

5 Themes	5 Thematic Assertions
Real World Application	• The use of real world applications that were culturally relevant ensured that the content focused more deeply on the culture and community of the students.
Scaffolding/Teaching Strategies	• The scaffolding strategies that were utilized provided differentiation for a diverse group of students.
Accountability	• The accountability measures incorporated into the project by the teacher led to high completion rates and opportunities for authentic civic engagement for all students.
Teacher/Student Interactions	• The teacher/student interactions created a classroom community that was highly collaborative.
Benefits and Challenges of Technology	• Operational technology was an effective tool for securing student engagement.

self as a member of the students' community as she made their city and community a focal point of the project. The entire project on the Civil War and Reconstruction was focused on the role and growth of their city during that time period. The city was a hub of African American progress in the late 1800's, which provided an important cultural anchor for the students. Ms. Jordan was able to incorporate community members into the project, including a colleague who spoke to the class about her experience growing up in the city during urban renewal. Ms. Jordan also set up an opportunity for students to present their ideas for revitalizing a historic part of the city to a county redevelopment team. She was effective in taking the idea of a real world problem and situating it in the lives of her students.
