Ms. Jordan was able to successfully adapt existing curriculum content of the unit for the benefit of her students. The North Carolina standard course of study competency goal for this U.S. History unit states that students should "analyze the issues that led to the Civil War, the effects of the war, and the impact of Reconstruction on the nation" (North Carolina Department of Public Instruction, 2014). Ms. Jordan adapted the content inferred in this competency goal to accommodate the racial and gender demographics of her students. For example, she incorporated learning opportunities about the roles of women during this time period as she highlighted the importance of individuals like Harriet Beecher Stowe, Harriet Tubman, and Mary Tepe. It is also important to note that Ms. Jordan did not ignore the experiences of white males as she sought to include multiple perspectives about the past. As she helped students to "identify political and military turning points of the Civil War" (NCDPI, 2014), she was sure to include a wide range of people and events, both well known and not so well known. Overall, the adjustments she made to the curriculum led to a deeper and richer understanding of the content by the students.

The scaffolding strategies that were utilized provided differentiation for a diverse group of students. Culturally relevant pedagogy emphasizes the importance of adapting teaching strategies to fit the needs or interests of students (Gay, 2002; Irvine, 2009; Ladson-Billings, 1995a). In Ladson-Billings' (1995a) study, this resulted in a teacher creating an assignment in which students chose the topic they would present. Students created presentations on subjects like basketball, cooking, singing, reading, or mathematics.

Project based learning, as promoted by the New Tech Network, stresses the importance of students obtaining information through diverse sources of information (NTN, 2014c). These sources might include data from the teacher, online services, guest speakers, or other students (NTN, 2014c). There is also a great deal of student choice built into the content and process of the project to differentiate based on student needs.

Ms. Jordan used a number of pedagogical strategies to diversify the learning opportunities for her students. Very similar to the example provided in Ladson-Billings' (1995a) study, Ms. Jordan allowed students to choose an area of interest within the scope of the project. Students were able to decide whether or not they wanted to specialize in creating the battles map, blog, or timeline for the website. She also provided additional tutoring to help the students develop their skills in creating their portion of the final project. Ms. Jordan used diverse instructional strategies to help students with varying learning styles grasp the content of the unit. She provided opportunities for students to analyze primary sources and images, view flipped classroom videos, engage in discussions, conduct online research, and complete graphic organizers to visualize information. The variety of learning activities gave students ample chances to enhance their understanding of the Civil War and Reconstruction.

The variety of scaffolding strategies that Ms. Jordan used provided students multiple opportunities to learn the content. When students were being exposed to information in a variety of ways, it increased their opportunities for developing understanding. For example, Ms. Jordan spoke about one of her students with limited English proficiency being able to learn the concept of the northern blockade strategy in one of our interviews. She stated:

So, for instance, two classes ago they did a flipped classroom video (for homework) on what a blockade was and we broke down what it meant and we talked about the Anaconda plan. Michael (pseudonym) was able to answer the question about the Mississippi River (and the blockade). That's because he did the homework and he knew what that meant.

Ms. Jordan had gone over the blockade strategy in class via a PowerPoint presentation, but the flipped video really helped Michael to understand the concept.

There were a number of instances in the unit when Ms. Jordan would engage in short discussions with students to ensure they understood the material. At one point, Ms. Jordan was working with students to complete a graphic organizer of the advantages and disadvantages of the north and south during the Civil War. One of her female students did not understand some of the information. Ms. Jordan asked her simple, probing questions to scaffold her understanding up to a point where she internalized the relationship of the advantages and disadvantages.

The accountability measures incorporated into the project by the teacher led to high completion rates and opportunities for authentic civic engagement for all students. The NTN project rubric, which outlines how teachers should structure projects, encourages teachers to provide opportunities for students to organize their work in teams, communicate with group members, and develop work plans and deadlines (NTN, 2014c). These accountability strategies support opportunities for student success.

Similarly, proponents of culturally relevant pedagogy explain the importance of teachers believing that all students can learn and "they accept nothing less than high-level success from them" (Gay, 2002, p. 109). Ladson-Billings (1995a) described the various means that teachers used to hold students accountable for learning in her study, including standardized tests, project presentations, and encouraging "students to learn collaboratively and be responsible for another" (p. 480). These accountability measures helped to ensure that students did, indeed, learn the material that they were supposed to learn.

Ms. Jordan incorporated multiple accountability strategies that helped to ensure the success of all students. First of all, she required that students consistently complete their homework assignments to remain in their project groups. The project was structured in a way that would have made it very difficult to complete individually. This requirement served as motivation for students to do what they needed to do to remain in their groups, and resulted in some group members calling students at home when they were absent to check on their project progress. Ms. Jordan also gave quizzes through the project to check for understanding. If students did not perform well on the quizzes, they were required to re-take them during lunch so they would have an opportunity to receive a higher grade. Students also had the opportunity to go on a field trip to view the film *Lincoln* if they maintained a passing grade in the class.

The implications of these practices were numerous and noteworthy. The rate at which students completed homework increased from earlier in the school year. Students had internalized the idea that if they did not complete their homework, they could possibly lose the privilege of working in groups to complete their project. Quiz scores also increased from the previous year. When asked about the evidence of achievement in her class, Ms. Jordan commented on both of these positive changes as she stated:

[There are] higher homework return rates. They've been turning in their homework on time. [There are] higher quiz scores. I can honestly say this year my Road to the Civil War quiz had the least amount of retakes that I've ever had. I think it has to do with the fact that I revamped it.

Students also demonstrated their achievement through the completion of the projects. All students in both classes were in groups that completed and presented the projects and addressed all of the requirements on the project rubric. As part of the extension activity, students created proposals that could be shared at a county redevelopment meeting. Again, all students participated in the creation and presentation of the revitalization proposals, which indirectly taught students that they were not only accountable to each other, but also to their community.

Yet, all was not perfect in the world of achievement during this project. Although Ms. Jordan did a wonderful job of adapting content and pedagogy to make them culturally relevant, she failed to align her unit assessment with these practices. This resulted in a low average for students' test scores. The test included multiple-choice questions that focused on more traditional information. And, as it was a multiple-choice assessment, students were not given an opportunity to explain the rationale behind their answers. Furthermore, about 20% of the material on the test was on information that was covered prior to the Civil War and Reconstruction unit. Students were not prompted to review individuals or topics like Dorothea Dix or the Seneca Falls convention to prepare for the test. I am certain all of these factors contributed to the lower test scores on the assessment. Yet, despite all of these concerns, Ms. Jordan had plenty of other structures in place to ensure students were successful in this unit.

The teacher/student interactions created a classroom community that was highly collaborative. Teachers that practice culturally relevant pedagogy should create classroom environments that encourage collaboration and demonstrate the fluidity of the teacher/student relationship (Irvine, 2009; Ladson-Billings, 1995a). Ladson-Billings (1995a) described how one of the teachers in her study would often ask students if they had consulted their peers before asking her a question. By using this practice, she was reinforcing the idea that the students had valuable knowledge of their own, and they were capable of teaching each other. Irvine (2009) explained how a teacher was struggling to explain "classification" to students, but succeeded after using an idea that was obtained from the students. Similarly, proponents of the NTN model encourage teachers to organize projects in ways that allow students to work with each other and utilize print and electronic resources to find information (NTN, 2014c). As students use resources outside of the teacher, they are less likely to perceive the teacher as being the sole source of knowledge in the classroom.

Ms. Jordan utilized numerous techniques to create a positive and collaborative atmosphere in her classes. First of all, she always spoke to students in a respectful manner and celebrated instances when they mastered information. There were plenty of occasions when she would shout, “See, you know this!” or “Great job!” as a student completed an assignment. Through all of my observations, I did not witness Ms. Jordan say anything to students that would be considered disrespectful, condescending, or demeaning. She treated the students as equals. She also listened to the students and borrowed ideas for instruction from them. For example, she stated in an interview that the idea for comparing the secessions in the U.S. following the election of 1860 and the proposed secessions following the 2012 election originated with the students. She also provided opportunities for students to lead the class as they reviewed warm-up questions and tutorials for selected group members so that they would be enlightened and empowered to inform the rest of their team. In so many ways, her classroom epitomized student-centered instruction.

The positive teacher/student interactions Ms. Jordan nurtured resulted in a productive learning environment in the classroom. Students followed Ms. Jordan’s positive approach and spoke to her and other students in a respectful manner. Throughout my observations, I only noted one instance of disrespect towards the teacher. During one of Ms. Jordan’s PowerPoint presentations, she called on a student that appeared to be asleep and asked him a question about the content she was covering. The student responded with a sarcastic comment. Ms. Jordan proceeded to ask another student the same question and receive a correct response. After class, Ms. Jordan spoke to the student about the comment and how it could have been handled differently. Even with this challenging situation, she was able to address the student’s behavior constructively and respectfully.

Operational technology was an effective tool for securing student engagement. Technology is a vital facet of the NTN educational model. In the NTN model, students are expected to utilize the online learning system, Echo, to connect with their teacher and other students and find resources that are helpful for the implementation of project-based learning (NTN, 2014c). When working on projects, students may use technology to conduct research and/or construct final products. NTN touts that project-based learning combined with the effective use of technology leads to higher student engagement and academic success (NTN, 2014b). Culturally relevant pedagogy emphasizes the need for students to develop technological skills to be able to actively participate in a democracy (Ladson-Billings, 1995b). In contemporary classrooms, it is very likely that a teacher carrying out culturally relevant pedagogy is also using technological tools.

Technology was a major part of Ms. Jordan’s instruction. Students used computers to communicate with each other, exchange resources, research information, create battle maps, build timelines, craft blogs, and generate websites. Students also viewed videos that were created by the teacher to reinforce their understanding of historical concepts. Additionally, students used computers to research and draft proposals for how to revitalize a historic area of their city. The process of creating these proposals was, perhaps, the main method that Ms. Jordan used to tie culturally relevant pedagogy and technology together.

Of course, there were also some notable concerns with technology in Ms. Jordan’s class. During any given class period, there were at least five non-working computers in her laptop cart. Hence, there ended up being a 2:1 student to computer ratio instead of the 1:1 ratio that is supposed to be a standard component of the NTN model. Most importantly, Ms. Jordan was not able to utilize the Echo online learning system very often since all the students did not have individual working computers and to access the materials or submit assignments.

Despite the concerns with technology, the classroom computers were still useful as tools of engagement for students. When asked about the parts of the unit that students exhibited the most interest in, Ms. Jordan replied, "I think the most exciting thing for them was putting the final thing (project) together that last day… They were engaged when we had to take the battles and put them onto the map and put them into the website." Students were engaged as they worked on the different parts of their project websites throughout the unit. In sum, computer technology enabled higher levels of engagement when it was utilized in a collaborative manner.

Summary

The five themes that emerged in my study had various implications for the students. Because of the manner in which Ms. Jordan implemented project-based learning, her students, who were predominately African Americans and Latino Americans, were engaged and able to experience academic success in terms of higher quiz scores, homework completion, and project completion. In our increasingly diverse society, we must consider what the implications of this study could be for social studies, in general.

IMPLICATIONS

For many years, there has been a concern about the lack of engagement and interest amongst students in social studies classrooms (Shaughnessy & Haladyna, 1985, as cited in Heafner, 2004; Goodlad, 1984, as cited in Ladson-Billings, 2001). The lack of interest is especially concerning because social studies classrooms should be places where students learn to analyze, evaluate, and effectively participate in our political and social systems (Parker, 2008). We should think critically about the future of our society if students are not being prompted to assess our democracy and develop ideas for how it may be enhanced.

Additionally, efforts are being made to transform the nature of schools via school reform movements and the use of more online learning environments. The use of the NTN educational model has multiplied tremendously over the past ten years. There were approximately 14 NTN schools in 2004 and there are over 120 NTN schools, today. This model is intended to increase the engagement and educational outcomes of students through project-based learning in small school and technology-rich environments (NTN, 2014b). Thus, the model may have potential for social studies, where some teachers have struggled with student engagement.

In this study, Ms. Jordan had notable success as she utilized project-based learning and a blended learning environment to teach students in an urban setting about the Civil War and Reconstruction. Overall, Ms. Jordan provided a strong example for implementing project-based learning and culturally relevant pedagogy in a hybrid-learning environment to ensure students from diverse backgrounds experienced academic success and developed political and social awareness.

The findings of this study confirmed those of Halvorsen et al. (2012). In both cases, teachers were strategic about implementing instruction that was inspired by students' lives. The methods that might be used to replicate these practices include utilizing teacher education programs to emphasize blended learning, project-based learning, and culturally relevant pedagogy and providing professional development to experienced teachers. Teacher education programs provide excellent opportunities for college professors to inspire future teachers to think about how education might impact the social and political lives of students. Additionally, Avery et al. (2002) found that exceptional professional development sessions dedicated to authentic instruction helped teachers to utilize "higher order thinking" skills and develop "deep knowledge" of subject matter (p. 53).

RECOMMENDATIONS FOR FUTURE RESEARCH

This study showed the possibilities of integrating culturally relevant pedagogy and project-based learning in a blended-learning environment. However, there are a number of ways that this research could be extended to further substantiate the findings. The sample size in this study was limited to one social studies teacher at an urban school that utilizes project-based learning. Future researchers should continue to examine how teachers effectively use project-based learning to educate diverse students in social studies. There are numerous schools in the United States that implement project-based learning in blended-learning environments similar format to NTN. These schools could serve as sites to identify exceptional teachers with practices worthy of replicating. Furthermore, these practices could be included in the training that teachers typically receive when they start teaching at schools that use project-based learning.

It would also be helpful if future studies included quantitative measures of student achievement to accompany qualitative descriptions. Halvorsen et al. (2012) used a mixed methods approach in their recent study. This methodology enabled them to collect pre and post-test data on students and compare post-test results with students from high SES schools. The fact that students from low SES schools performed as well as students from high SES schools was a noteworthy finding for researchers concerned with closing the achievement gap. This also begs the point of including students and student data in research. This study focused on the practices of teacher. However, it would be very helpful to understand the impact of the teacher's pedagogy on the students by examining the students, themselves.

Lastly, research should be conducted on the various ways that project-based learning and culturally relevant pedagogy could be integrated into schools. In this study of Ms. Jordan, she was utilizing the model that the school had adopted and she inadvertently incorporated culturally relevant pedagogy as she was trying to address the needs of the students. However, there could be other ways of studying teachers' use of project-based learning and culturally relevant pedagogy in social studies. For example, researchers could seek out teachers searching for innovative ways to educate diverse students in social studies. Then, they could work with these teachers to develop project-based learning units aligned with culturally relevant pedagogy that could be implemented in their classes (Halvorsen et al., 2012). Studying the implementation of these units would enable researchers to investigate the effectiveness of these approaches in any school. It might also be helpful to examine the integration of project-based learning throughout schools that have adopted project-based learning as its instructional approach. Ms. Jordan noted in our study that:

I would say it (the NTN model) is a great model. And, I've seen it work where the entire school community has bought into the model… (However) if the kids don't have the buy in, then (it could be a problem). Today, a kid was just telling me that 'This is the only class I'm doing a project in.' And, that really made me upset because I'm pulling teeth to get them to have enthusiasm about they're presentation, and they're just doing worksheets in their other classes. So, it's like, if only one class a day they actually have to collaborate, that's why every class is like starting from scratch.

CONCLUSION

Ms. Jordan enacted the NTN model with her students by utilizing culturally relevant pedagogy within project-based learning. This study helps to fill a void in the research literature regarding the integration of project-based learning in social studies classrooms at schools with a predominately African American population. In this age of school reform (that often impacts schools with high proportions of African Americans and/or Latino Americans enrolled), it is vital that researchers investigate the best practices that teachers are using to implement innovative educational approaches and to support student success. Again, this study yielded the finding that culturally relevant pedagogy and project-based learning can work in a complementary fashion to ensure the engagement and achievement of diverse students.

The findings of this study on project-based learning and culturally relevant pedagogy demonstrated how one teacher's adaptation of social studies curriculum content and differentiated learning experiences led to higher quiz scores, assignment completion, collaboration, and engagement amongst her students. These implications were very encouraging. Perhaps one of the most inspiring realities that emerged from this study was the possibility of replicating the results. Ms. Jordan strategically utilized pedagogical practices that can be developed within current and future teachers. From this point, scholars should continue to research how culturally relevant pedagogy and project-based learning can be effectively integrated in various learning environments and how this integration can be cultivated amongst more educators.

KEY TERMS AND DEFINITIONS

Authentic Instruction: Learning opportunities that challenge students to utilize skills and perform tasks that have relevance for life beyond school.

Blended Learning Environment: Learning environment that consists of face-to-face and online learning opportunities.

Culturally Relevant Pedagogy: Instructional methodology that results in high achievement, cultural competence, and socio-political consciousness in students from diverse cultural and racial backgrounds.

Echo Learning Management System: Online learning management system utilized by New Tech Network Schools.

Hybrid Courses: Courses that incorporate elements of face-to-face and web-based instruction.

New Tech Network (NTN): A nonprofit organization that provides professional development for schools to assist with the implementation of its instructional model; this instructional model centers on project based learning, but also includes a 1:1 student to computer ratio.

Project Based Learning: A method of learning in which students work in groups to create a project/presentation that addresses a real-world problem posed by the teacher.

Chapter 68
Starting with the Learner:
Designing Learner Engagement into the Curriculum

Jonathan E. Taylor
Troy University, USA

ABSTRACT

The central thesis of this chapter is that in order for effective learning to occur, teachers must facilitate learner engagement, and in order to do so, learning resistance has to be conceptually understood, acknowledged, identified, and addressed as a part of the curriculum for any given class, course, or program. This chapter provides a comprehensive overview of the literature on learning resistance, identifies three significant disjunctures between the theory and practice of curriculum development and instructional systems design, and analyzes the relationship between learning resistance and that theory-practice gap. The failure to see motivation and learning as an integrated whole, the mass production of curriculum, and the hesitance to teach something that cannot be measured are all discussed in detail, and suggestions are made for mitigating the negative effects of each.

STARTING WITH THE LEARNER: DESIGNING LEARNER ENGAGEMENT INTO THE CURRICULUM

"Wherefore, admitting that I will make use of certain principles which are to be found in the books of the philosophers, I would none the less maintain that they truly and rightfully belong to our sphere and have a direct bearing on the art…" (Quintilianus, c. 45-c. 95 A.D., from the *Institutio Oratoria*). Some liberty has been taken here with Quintilian's quote (he was speaking of the art of oratory), but the spirit of it has been retained. A significant portion of this chapter is dedicated to providing information pertaining to learning resistance, while the overarching purpose of the chapter is to address curriculum development. For those looking forward to immediately being immersed with terminology and thought that falls most regularly within the traditional "sphere" of curriculum design, some patience may be in order.

Nonetheless, the presentation of the former will be brought to bear upon the latter. The central thesis of this chapter is that in order for effective learning to occur, teachers must facilitate

DOI: 10.4018/978-1-4666-8246-7.ch068

learner engagement, and in order to do so, learning resistance has to be conceptually understood, acknowledged, identified, and addressed as a part of the curriculum for any given class, course, or program.

While there are many different ways to approach the concept of curriculum, the approach here will be mainly directed toward Instructional Systems Design (ISD). This is the case because an instructional system is a "vehicle which generates an essentially reproducible sequence of instructional events and accepts responsibility for efficiently accomplishing a specified change from a given range of initial competencies…" (Corno, 1977, p. 235). As such, ISD is a fundamental curricular tool in nearly all large organizations, particularly those in workplace educational contexts. Certainly it is not the only way (or even the best way) curriculum may be approached, but due to its influence and the volume of learners subjected to it, it requires a vital share of the curriculum discussion as a whole.

Many of the most prominent and frequently used instructional design models do, in fact, acknowledge the importance of learner characteristics as well as other contextual factors. This can be seen at least as early as 1949 in Tyler's statement that, "to have a thorough understanding of possibilities and difficulties involved in drawing interpretations about educational objectives, [one should] jot down data about groups of students with whom you are familiar, formulating a comprehensive set of data about their needs and interests (p. 15).

The Instructional Development Institute Model (Wittich & Schuller, 1973) has, as a second step, *analyzing setting*, which includes learner characteristics. The Air Force Instructional Design Model (1975) uses the term *system requirements* to refer to learners, instructors, and other environmental and contextual factors (Dick, Carey, & Carey, 2009). Smith and Ragan (1993), in their model, include an analysis step, which involves an examination of the learning environment, the learners, and the learning task. Kemp, Morrison, and Ross (1994) recommend that learner characteristics be taken into account, and the Dick and Carey Model (Dick, Carey, & Carey, 2009) provides that designers should analyze learners and contexts. Willis's R2D2 Model (Willis, 1995), has gone a little further. Its constructivist basis resulted in a model that not only acknowledged learner and contextual factors, but suggested that these factors must be continually assessed throughout the entire design process. Verduin (1980) and Cennamo and Kalk (2005) more directly and thoroughly than most others, also expressed the need to take the *affective domain* into account.

Since at least lip-service has been paid to the idea of learner characteristics and/or contexts in many of the prominent curriculum and instructional design models, this chapter is, in some ways, not so much an indictment of a prevalent gap in the literature as it is an indictment of a pervasive, albeit unintentional, inadequacy in the practice of curriculum design.

It is the author's position that a number of different factors have given rise to this inadequacy and the unintended consequences of its outworking, and this chapter will provide an examination of three of these factors. However, before getting into the specific nature of the disconnect between curriculum design models and the practice of curriculum design and its use, a brief overview of learner engagement and a rather more comprehensive overview of learning resistance need to be provided.

Of some magnitude is the lack of sufficient instruction for teachers, trainers, and instructors in the phenomenon of learning resistance and how it relates to all aspects of education. The need to fill this gap is a foundational premise for this chapter, and taking this into account, the first half is used to provide an overview of the theoretical framework for learning resistance. Following this, the common failure to take learning resistance seriously, at least from the point of curriculum design, and three of the more easily detectable potential antecedents of this failure will be discussed. The chapter will culminate with a suggested paradigm shift and some specific recommendations for acknowledging learning resistance and designing it out of the curriculum as a part of the curriculum design process.

Learning Engagement and Learning Resistance

Learning engagement is used here to refer to "a psychological process, specifically, the attention, interest, investment, and effort students expend in the work of learning" (Marks, 2000, pp. 154-155). It includes both *cognitive investment* (Fredricks, Blumenfeld, & Paris, 2004) and *psychic energy* (Csikszentmihalyi, 1990), and it implies a learner's openness to learning in a given context (for a brief discussion of the relationship between openness and resistance, see Taylor, 2010). Learning requires a degree of willingness to mobilize the necessary energies (i.e., physical, emotional, and psychological), and learners who are willing to commit to this in any given learning context can be said to be engaged. Walberg (1995) defines engagement as the "extent to which students actively and persistently participate in learning" (p. 56). (Tyler (1949) referred to this, without using the word, when he wrote, "Education is an active process [and] it involves the active efforts of the learner himself" (p. 11). The concept of learner engagement should not be confused with *student engagement*, which is a term that has been written about often and refers to a student's overall engagement in the greater culture of the learning institution (for a review, see Trowler, 2010).

Learning engagement and learning resistance can be seen as two end points on a continuum (see Figure 1), and while it is conceivable that a learner might be completely neutral in a given learning situation, this tends to be a more theoretical than practical consideration largely because the point of intersection between passive engagement and passive resistance would be very difficult to detect. Using engagement as a starting point is consistent with positive psychology, but can result in the learner's difficulties being marginalized or even ignored. It is because of this that learner engagement is used here as the desired learner characteristic but is addressed through its opposite pole – learner resistance. There may be some debate as to the efficacy of focusing on the more negative end of the spectrum in order to achieve the more positive end, but there are solid grounds for doing so and they will be addressed later in this chapter.

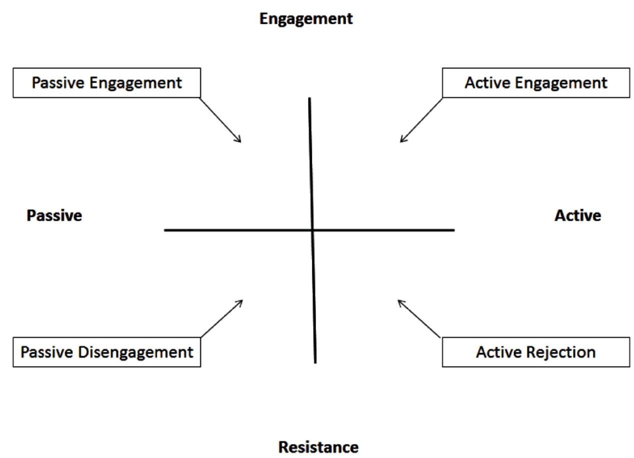
One of the chief difficulties in studying learning resistance is getting past the false dichotomies that mire it within the literature of educational psychology, sociology, anthropology, workplace education, and the many other fields from which it is addressed. Atherton (1999) expresses this well in saying, "to speak of 'resistance to learning' is in some measure to beg the question" (p. 77). An examination reveals a construct so varied in meaning and inconsistent in use, that it is difficult to determine how to clarify the term and integrate its various lines of scholarship into a coherent whole. The terms *resistance* (Brookfield, 2006; Illeris, 2007, 2011), *mislearning* (Jarvis, 1992), *defense* (Illeris, 2007, 2011) *blocking* (Illeris, 2007, 2011), and *turn-off* (Jenson, 1969).

Resistance to learning has been addressed in many contexts including, specifically, in relation to the U.S. Board of Education's interaction with the native Alaskan Inupiats (Wexler,

2006), communicative language teaching (Little & Sanders, 1990), workplace training skills

(Illeris, 2003), workplace mandatory training contexts (Taylor, 2010), science education (Moscovici, 2003; Seiler, Tobin, & Sokolic, 2003), library instruction (Antonelli, Kempe, & Sidberry, 2000), ESL education (Alatis, 1974), reading education (Boldt, 2006), and educational administration (Janas & Boudreaux, 1997). In the adult education field, it has been examined in the context of literacy (Quigley, 1997), general teaching practices (Brookfield, 2006), learner

Figure 1. Learning engagement-resistance continuum



1. **Passive Engagement** – The learner is not resistant to the class or the content but is not actively mobilizing energy for learning in the learning context.
2. **Active Engagement** – The learner is purposefully mobilizing energy toward learning in the learning context.
3. **Passive Disengagement** – The learner is purposefully resisting and emotionally/psychologically closed to the learning activity (course or content), but is not actively mobilizing energy toward that resistance in the learning context. Resistant behaviors and cognitions are present but behaviors are typically not overt.
4. **Active Rejection** – The learner is purposefully mobilizing energy for resistance in the learning context. Resistant behaviors and cognitions are present but behaviors are typically overt.

self-direction (Hiemstra & Brockett, 1994), and critical pedagogy (Giroux, 2001). In the Communications field it has been addressed, in some form or another, by Burroughs (2007), Burroughs, Kearney, and Plax (1989), Goodboy and Bolkan (2009), McLaughlin, Cody, and Robey (1980), and Zhang (2007).

Despite this broadly-distributed attention, learning resistance as a phenomenon has not been addressed well as a broadly constructed phenomenon. This is unfortunate because in its present state, a relatively similar construct is being picked at from a multitude of directions with little or no acknowledgement or integration.

The purpose of this section is to provide a comprehensive, though not exhaustive, overview of the extant research and literature on learning resistance. To date, the work here consists of comprehensive reviews of the learning resistance literature from the fields of Education, Educational Psychology, Sociology, Communications, Anthropology, Human Resource Development, and Workplace Training & Development. Furthermore, it is addressed from motivational, psychoanalytical, cognitive, behavioristic, critical, and workplace training theoretical perspectives.

Defining Learning Resistance

Learning resistance, as a construct is very "slippery" and does not seem to "sit still in the analytic categories we develop" (Field & Olafson, 1999, p. 4). There are likely many reasons this is the case, but certainly one of the more noteworthy potential reasons is the different types of value that have been assigned to resistance. In this section, a broad array of perspectives will be examined culminating in a concise and somewhat simple working definition for the purposes of the curricular analysis offered here.

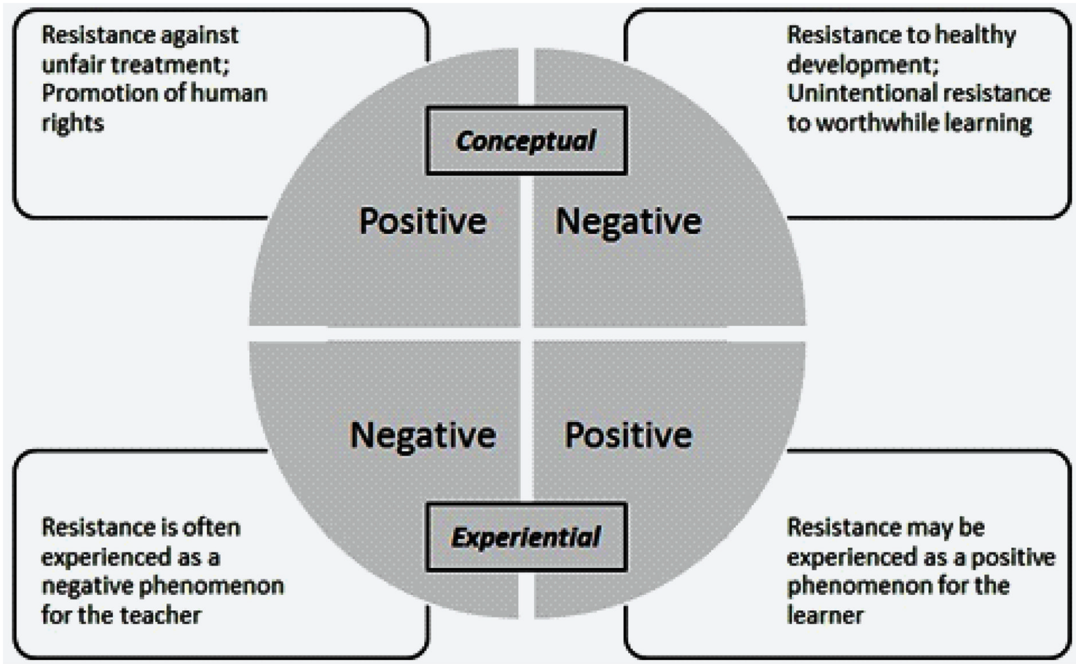
Resistance as a Negative Construct: A more traditional view of learning resistance, framed largely upon psychological and cognitive perspectives, is that resistance to learning is a negative force in learning contexts. An example of such a perspective is Caplin's (1969) reference to the resistant student as "one who fails to apply himself to the learning tasks of the school" (p. 36). Using the term *turn-off*, Jenson (1969) refers to it as "increasing inhibition of the very behaviors that promote learning" (p. 10). This view has continued to be expressed, though to a lesser extent. Long (1994) referred to it as a "force that opposes or retards," McFarland (2001) referred to it as an "endemic problem" (p. 612), and used words such as "disruptions" and "defiance" (p. 614). Also in keeping with the traditional classroom view of resistance is Henson and Gilles's (2003) description of students who have "inhibiting beliefs" and therefore "opt out of learning opportunities by removing themselves or sabotaging instruction" (p. 260).

Writing from the perspective of the college classroom and the interaction between the teacher and student methods of communication, Burroughs et al. (1989) consider resistance to be all "off-task" behavior in a classroom. Off-task, as they use it, can be seen as loosely comparable to resistance, and is the opposite of on-task behavior, which is any facilitated or permitted behavior that is a constructive part of the learning process in the classroom. It is important to note that while critical perspective definitions of "constructive" behavior almost always include resistance, to Burroughs et al, off-task seems to refer to more of a teacher-centered approach and does not highlight the positive aspects of student resistance, at least not as a primary focus. Even Brookfield (2006), who later addresses resistance in a different light from a critical theory orientation, presented learning resistance as something that often should be mitigated through teaching strategies.

Resistance as a Positive Construct: Approaching from an almost opposite perspective, others have viewed learning resistance as a positive and necessary phenomenon, and something that should, at least within certain contexts, be encouraged by the teacher. Giroux (1983, 2001) is probably the most widely known in adult education circles, but others take this view as well (e.g., Moore, 2007). Resistance in these instances involves learner resistance to the status quo and social norms of those in power. Education can be a "technology of power" (Foucault, 2001, p. 125), and as such, educational efforts should not be faced with indiscriminant acceptance. Approaching from this direction, resistance is rooted in a battle between those who are dominant and those who are dominated (Cowles, 2001; Field & Olafson, 1999; Giroux, 1983; 2001; Moore, 2007; Quigley, 1997). It should not escape notice, however, that many of those writing of resistance as a positive dynamic for the learner (i.e., resisting the status quo) have also written about the "negative" effects of learners resisting critical aspects of learning, in effect, agreeing that while resisting the status quo is a good thing, being resistant to being taught to resist the status quo might be best avoided (e.g., Brookfield, 2005).

Resistance as Both a Positive and Negative Construct: Taken together, these views form a more complex understanding of the value of learning resistance. From a conceptual standpoint, resistance can be understood as a positive phenomenon when it is engaged against a negative force

Figure 2. The value of learning resistance



(i.e., resistance of bad is good), and as a negative phenomenon when it stands in the way of positive learning experiences, and acts as a drag on learning that is beneficial for the individual and/or society. From an experiential perspective, resistance can also be viewed in a positive and negative light. For the learner, resistance can often be experienced as positive in that it relieves tension, provides emotional shelter, and often preserves identity (Illeris, 2007, 2011). For the teacher, resistance is most often experienced as negative in that it tends to make the task more difficult. Figure 2 presents this dualistic value structure.

There have been a relative few who have attempted to address resistance as a more neutral term. Canagarajah (1993) distinguished between *opposition* and *resistance*, where resistance is more radical and political in nature and opposition as a more unclear and ambiguous phenomenon. Jing (2006) used Canagarajah's definition of resistance as 'ambivalent student opposition' in her research in an effort to "broaden the sense of resistance as a relatively neutral oppositional force" (p. 97). Both Illeris (2007) and Jarvis (1992) used differentiated terms under a broader conceptual umbrella, and more recent work by Taylor (2010) has also attempted to cast a broader net. Illeris (2007) used the term Resistance Potential in a more positive way, while using the terms blocking, and defense to represent different facets of the more "negative" side of resistance. In this chapter, the term *Defensive Resistance* is used to refer to what has traditionally been viewed as the more negative side of resistance, while the term *Critical Resistance* will be used to refer the more positive aspects of resistance.

Resistance as a Unified Concept: Both sides of this coin have been examined here because they are, in many ways, a related concept. Notwithstanding, Taking into account the multiple views of learning resistance while at the same time recognizing that there is indeed significant overlap in the various conceptions, the definition provided here casts the net broadly enough to provide for the overlap without losing practical efficacy. At the most basic level, *learning resistance can be considered a state in which a learner is not open to learning in a specific learning situation as demonstrated through either active rejection or passive disengagement*.

This definition is flawed in much the same way as the proposed typology in that in attempting to be comprehensive, some of the useful nuances may have been sacrificed and, going back to Atherton's sentiment, it may "beg" a new set of questions. Despite this weakness, this broader conception of learning resistance permits a researcher to assimilate and integrate a much broader and richer array of academic and professional literature on the topic, and, perhaps more importantly, reconcile an extensive range of knowledge and apply it toward very specific ends.

Resistance Viewed from Outside the Positive Psychology Framework

It would seem that the rise of positive psychology (Seligman, 1998) and its general practice of avoiding deficit models brought with it a tendency, for better at times and perhaps worse at others, of avoiding negative terms across the board and considering them out of vogue. While there is not much, at least in the overt sense, in the literature decrying the use of the word resistance, it has been voiced often enough to the author that it bears mention here.

Constructs such as love of learning (McFarlane, 2003), learner resilience (Carr & Claxton, 2002; Quirk, Thornbery, Power, & Samuel, 2012), and learner engagement (Marks, 2000) have been addressed as more positive terms that indirectly provide understanding of learning resistance even if the term resistance was avoided in the work.

Approaching the topic from this direction has been beneficial in many ways, but to be clear, the point of view being expressed here is that the general approach of avoiding negative terms such as rejection and resistance might be advantageous in many cases, but when used exclusively, is not an adequate way to address learning resistance in the classroom.

Focusing on the learner's behavior and cognitions in a given case (i.e., resistance), is paramount to legitimizing the experiences and feelings of the learner, while generally approaching from a point of "what is going well" steps widely around the learner's point of view. Furthermore, focusing on the strengths of the learner as the primary means of mitigating resistance presupposes that any random solution is the precise fit for any particular problem (although the literature on this is couched in terms of strengths and weaknesses rather than problems and solutions). If a learner is resisting in a given learning environment because, for instance, the learning environment is too distracting, approaching this problem by addressing all of the positive aspects of human learning (i.e., which one of these things might be improved to facilitate the natural strengths of the learner) might likely be the long way around the problem. Additionally, this places the focus almost entirely on motivational *approach* goals (Schunk & Zimmerman, 2007), while completely ignoring *avoidance* goals (2007) and the specific reasons a given learner may be resisting in a particular situation.

To use the word *resistance* is to actually address what the learner is doing, for good or bad, working the problem from that end, and therefore can be considered a highly learner-centered approach. It is the author's view that to ignore the learner's reason for resisting the learning is to ignore the learner.

Categorizing Resistance

One of the few coherent attempts to bring order to the conceptions of resistance is the typology provided by Atherton (1999). Atherton grouped learning resistance into two types – *situational* and *ulterior*. Situational resistance refers to the more localized and contextualized factors that may cause a learner to resist, (i.e., classroom distractions) while ulterior resistance refers to the type of resistance brought about when an individual learner is prompted to change his or her schema about a given aspect of life. Atherton uses the word *supplantive* to describe learning that requires a significant change of viewpoint (p. 78), but this type of learning is similar to Piaget's (1951) accommodative learning, and on a grander scale, similar to the paradigm shift central to Transformational Learning theories (Illeris, 2007, actually considers Transformative Learning to be an additional level of learning distinct from accommodative learning). This typology provides a great service to those who wish to study learning resistance because it provides a framework for connecting the volumes of work directly or indirectly addressing resistance. Despite its usefulness, it fails to adequately cover all of the different angles from which resistance has been addressed in the literature.

Quigley (1997) likewise made a strong contribution to resistance scholarship when he described three types of resistance derived from his research. He wrote of three different causes of resistance – those who resist because of teachers, those who resist because of the school system, and those who resist because of boredom. A noteworthy strength of Quigley's accounting is that it was empirically rather than theoretically derived, but a limitation of his research-based typology is that it reflected a highly specific learning and learner context (literacy). Thus, while Quigley's typology also contributed to an understanding of resistance, it had a failing similar to Atherton's in that it did not account for the broad range of perspectives from which resistance has been studied.

By closely examining an extensive volume of scholarship from multiple fields addressing learning resistance, and then attempting to make sense of it as a whole, the author has come to see such an attempt at ordering the concept as the single, most effective tool for clearly understanding what has been learned about resistance. This categorization is presented here to the reader, not as an airtight conception, but as a useful frame upon which to understand what has been learned about resistance and what more might be learned.

The interdisciplinary literature provides a detailed accounting of learning resistance that can be arranged into four very broad, and potentially overlapping, categories – *Environmental*; *Cognitive-Psychological*; *Sociocultural;* and *Epistemological* resistance. These categories are based upon the general correlates (potential antecedents) of such resistance rather than the form the resistance happens to take in a given instance. This is an important distinction because resistance manifested in any particular way, in terms of behavioral and learning outcomes, could be the result of very different factors. This particular quality is shared by both Atherton's and Quigley's categories.

Caplin (1969) writes that, an "adequate understanding of resistance demands careful analysis of causes" (p. 37). This statement is as true for those viewing resistance as a negative phenomenon as it is for those holding a positive view, and the following typology can further one's understanding toward that end.

Environmental Resistance: Environmental resistance is resistance that is brought about because of factors in the environment of the learner during or near the specific learning event (localized). Examples of this would be loud and distracting classrooms or classrooms with poorly controlled temperatures. The word *localized* is used here to mean relative to the time of the learning situation. Long-term, systemic problems with the learning environment fall under the other types of learning resistance. While environmental concerns in this context would often have to do with the settings of learning, it could also include immediate life circumstances of the learner, located in close proximity to the learning situation (i.e., an argument with one's spouse just prior to the class). Environmental aspects of resistance are addressed, at least in part, by Atherton (1999) and Brookfield (2006). Environmental resistance has the distinction of the being the easiest to identify and respond to in the classroom.

Cognitive-Psychological Resistance: Cognitive-Psychological resistance is characterized by largely internal factors. It should be noted that the vital influence of the *social* aspects is not denied in this category; rather it is acknowledged and/or assumed, but not focused upon. Cognitive and/or psychological resistance is related to issues of self-efficacy (Bandura, 1986; Schunk, 1995), learned helplessness (Maier & Seligman, 1976), disinterest/boredom (e.g., via discussions of interest; Schraw, Flowerday, & Lehman, 2001; Schraw & Lehman, 2001; Shaw, Caldwell, & Kleiber, 1996), identity (Illeris, 2007, 2011; Torrance, 1949), and overconfidence or presumption (Taylor, 2010; Jarvis, 1992, respectively).

Jenson (1969) connects learner "turn-off" to a lack of readiness, which he defined in terms of both *growth readiness* and *cumulative learning theories* (Gagne, 1965, 1968). These terms and the related theories attached to them center on early childhood and are therefore somewhat limited in scope, when looking at lifelong learning. However, it might be useful to think of a *psychological or emotional readiness* rather than a developmental readiness, when considering adult learners. The author views psychological and emotional readiness as the psychological and emotional ability to be open to learning. There are many reasons why a learner might not be psychologically and emotionally open to learning such as feelings of vulnerability, low self-efficacy, anger, anxiety, and other common emotions.

An examination of the literature reveals that in recent years, cognitively-based approaches have been infrequently utilized to explain resistance within the field of adult education. Even a cursory browsing of the adult education literature reveals that the predominate focus of our field, in terms of learning resistance, has been that of critical theory and social constructionist views of learning (e.g., Giroux, 1983). The third type of learning resistance provided below tends to lean heavily on these foci.

Sociocultural Resistance: Sociocultural resistance – to borrow a term popularly attributed to Vygotskian ideas (Vygotsky, 1978) – refers to learning resistance that has as its source, social or cultural dynamics. Although the theoretical framework for critical theory is drawn from the work of philosophers such as Athusser (1971), Bourdieu (1977), Bowles and Gintes (1976), Giddens (1984), Bernstein (1977), Habermas (2003), and Foucault (2001), one of the more widely-read educational proponents of learning resistance as a vehicle of social change is Giroux (1983, 2001). Giroux's call for *radical pedagogy* continues to echo through the halls of the discipline. Going back much further, those such as Myles Horton (1998) and Paulo Freire (1996) left a strong heritage for those wishing for a more democratic society and more freedom in learning. Quigley's (1997) work mentioned earlier in this paper also falls mostly under this category, as does much of Brookfield's (2005) more recent work, and, in its own way, the work of those writing of transformative learning (i.e., Mezirow & Associates, 2000).

Epistemological Resistance: Epistemological resistance refers to learning resistance caused by a disconnect or mismatch between the learner's and teacher's conception or understanding of (a) what learning is and/or (b) what criteria should be used to evaluate truth claims. An example of both the former and the latter can be taken from a large-scale qualitative study conducted by Paulus et al., (2009) in which undergraduate university students indicated both a confusion about what exactly learning was, and also a variety of impressions about who one should use as a source of authority in competing knowledge claims. On multiple occasions students wrote in blogs that they did not learn anything new and then, almost immediately, moved on to document, in detail, a number of things they learned that they had not previously known. There was also a prevalent theme of disregarding the content the professor had provided in exchange for different information they had been provided from parents, friends, and personal experience.

This type of resistance might also exist in the workplace in cases in which the employees are using quite different criteria for evaluating truth claims than their employers and, by extension, their instructors and trainers (Salaman & Butler, 1990). If, for example, an individual believes that learning is about obtaining a physical skill, the ability to do something, and that individual is placed in a leadership class in which her or she is subjected to a lengthy instructional sequence on some form of leadership competency, the mismatch between the understanding of knowledge between the employee and employer could have significantly negative effects in terms of training efficacy.

The literature is replete with hypothesized causes of learning resistance. While many of these have been included under the specific types as provided above, a general list of those most commonly found in the literature are listed in Table 1.

There is some overlap in the proposed causes listed below, and a closer examination of the literature from which they were culled leads one to suspect that different learning contexts breed different causes of resistance.

Mitigating Learning Resistance

Of course how one chooses to deal with resistance in the classroom depends largely on how one views resistance to learning itself. For those who view it in a positive light, it is to be encouraged, facilitated, perhaps guided, but not discouraged or denied. For our purposes here, the following paragraphs focus on mitigating the negative effects of resistance to learning. This does not render the discussion of positive learning resistance provided here irrelevant because, as noted earlier, even those using critical theory approaches to engender critical awareness in learners, address learner resistance to critical awareness.

Learning Support: Moore (2007) provides six strategies to "promote learning." The first is to increase social learning experiences by promoting peer teaching and group projects. This is encouraged because such social experiences promote group construction of knowledge, allow observational learning, and encourage emulation. Second, instructional methods should be varied in ways that avoid a strictly lecture-based format, and utilize different types of media to aid in the learning process. Third, expectations for student success should also be varied to include more diverse methods of expression such as interpretation of theatrical, dance, musical, or artistic work, and/or the performance of actual work performance in real-world environment. The idea of using theatrical devices for learning has been written about before and has been applied to subjects as traditional as library education (Antonelli, Kempe, & Sidberry, 2000).

Fourth, opportunities should be provided for students to capitalize on their own personal strengths and interests. Fifth, the "overt use of sociocultural situations and methods that provide authentic contexts and enculturation into an academic disciplinary community" is encouraged. (p. 37). Finally, Moore suggests the use of course material that highlights the valuing of diverse cultures, ethnicities, and genders.

Structural Support: Bell, Morrow, and Tastsogloul (1999) view resistance as being based in structural barriers that emphasize the authoritative nature of teaching, and the submissive nature of learning as the passive reception of "objective" knowledge. Because of this, the many possible strategies for mitigating resistance to learning should address some aspect of this negative, authoritarian view of learning.

Behavioral Support: Zuna and McDougall (2004), emphasizing positive behavioral support, provide three approaches for decreasing student resistance in the classroom. They suggest that teachers use research-validated methods for shaping behavioral causes of such resistance,

Table 1. Suggested causes of learning resistance

Cause	Author
Resistance to dominant culture	Giroux, 1983, 2001; Moore, 2007; Ogbu, 1991; McNamee, Atwood, Noddings, & Taylor, 2002
Conflict between old and new learning	Salaman & Butler, 1990
Discomfort due to accommodative learning	Atherton, 1999
Cultural mismatch	Seiler, Tobin, & Sokolic, 2001
Immersion in the learning experience	Moscovici, 2003
Disliking courses, administration, and/or educational system	Atherton, 1999; Quigley, 1997
Lack of interest, disinterest, and boredom	Sun, 1995; Quigley, 1997
Low self-esteem; fear of the unknown; dislike of the teacher; irrelevancy of the material; inappropriate level of required learning	Brookfield, 2006; Quigley, 1997
Development of the personal will; differentiation from others; successful development of personal identity	Caplin, 1969; Rank, 1945; Lecky, 1945
Examination culture in school; mismatch of teacher and learner goals	Jing, 2006
Mismatch between learner's life experience and formal education	Quigley, 1997
Resistance to change study methods and habits	Dembo & Seli, 2004
Failure to "buy in" to learning objectives	Illeris, 2003
Teacher immediacy	Burroughs, Kearney, & Plax, 1989; Burroughs, 2007

utilize more efficient and desirable alternatives to achieve the same outcome that the problematic behavior has been serving, and emphasize "simple antecedent changes to the environment that often [lead] to substantial improvements in behavior" (p. 18). These authors take a decidedly behaviorist approach to mitigating resistance to learning.

Plax, Kearney, McCroskey, and Richmond (1986) have provided a very long list of Behavioral Alteration Techniques (BATs) all of which utilize either verbal control or nonverbal immediacy. Examples of these techniques are *teacher reward*, *peer reward*, *guilt*, and *normative rules*, and others. Teacher immediacy, as previously mentioned has demonstrated in empirical studies an effectiveness in reducing resistance and modifying behaviors (Burroughs, Kearney, & Plax, 1989).

Torrance (1949), writing from a psychological perspective, provided a list of 17different techniques for reducing resistance to learning behaviors and cognitions. Like the above BATs, Torrance's list is also too long to list out in paragraph form, but an example is *creating a permissive, non-blaming objective group atmosphere.*

Instructional Support: Antonelli, Kempe, and Sidberry (2000) recommend using unusual methods for teaching otherwise routine subject matter. The authors propose using "theatrical techniques" such as voice, humor, movement, costume, props, music, and rehearsal (p. 177) to teach course materials, which, in their case, was library instruction. These techniques seem to address situational resistance rather than ulterior resistance, and primarily focus on the facilitator making the class and learning experience more interesting for the learner. It is doubtful as to whether using theatrical methods would have positive effects on more systemic ulterior resistance such as resentment.

Brookfield (2006), who has written about both situational and ulterior resistance (although he did not use that terminology), advises teachers to first evaluate whether or not the learner resistance might, in fact, be justified. To mitigate resistance to learning he suggests that teachers (a) build a case for learning, (b) facilitate learning situations in which those with low confidence or low self-efficacy can experience success early on, and (c) approach all resistance with the understanding that it is a normal part of learning and that students do have the right to resist. Students cannot be forced to learn and any teacher who wants to adequately reduce resistance in his or her classroom must first dispel one-dimensional, exclusively negative views of resistance.

Raney (2003), using the term resistance in the same manner in which Illeris uses the term *resistance potential*, proposes that students learn best when active resistance (what is referred to in this chapter as critical resistance) is involved. He encourages teachers to provoke thinking from students because this thinking will cause them to experience more illumination and to learn how to think on their own. He further claims that "students [are] most likely to retain and appreciate knowledge when it is presented as a thing sought (and fought) for rather than as a morsel to be gulped blindly, baby-bird style." To accomplish this, Raney intentionally assigns reading assignments in his literature class that will disappoint and frustrate the students.

He used an example of a story that did not seem to have a "good" ending in that it did not answer questions arising from the story. The ensuing frustration and resistance on the part of the students created a large amount of conversation, and a strong desire to understand the story and why it was written the way it was.

Interdisciplinary Support: Caplin (1969) calls for an interdisciplinary team approach which would include such specialists as a psychologist, physician, school nurse, social worker, and school teacher. Despite this interdisciplinary approach, Caplin maintains that the "major burden falls upon the teacher, for it is she who usually has the earliest opportunity to identify the symptoms and make significant contribution to the child of setting in motion the action that can free him…" (pp. 38-39). He sets out the following "prescription" for mitigating in-class resistance: children are respected no matter what their level of performance; mistakes do not ever earn ridicule; students are never humiliated; response to errors and inaccuracies is the "earnest effort of the teacher and the class to overcome them;" and one child's gain is never another's loss (p. 39).

Affective Support: Illeris (2003) describes some of the difficulties that low-skilled workers have in relation to increasing their education or engaging in the learning required for a job change. He describes defense behaviors in these workers brought on by job counseling recommendations, and placement in a class, by saying that "they usually thought that the placement in which it had resulted was reasonable enough in spite of everything. However, they still experienced it as placement, and this implied humiliation and a negative attitude, which they felt deeply." The problem in this case, according to Illeris, was that the counseling in question did not continue until the worker had completely "bought into" the idea him or herself. By "placing" the individual in a class, the counselors created a situation in which the workers developed a defensive posture prior to even beginning the learning situation. Facilitating "Buy in" then, is the key to reducing this type of resistance.

Theory-Practice Issues in Curriculum Design and Instructional Practices

So where does this information on learning resistance lead the curriculum designer? It leads toward an understanding that, in a practical sense, learning is not about *acquiring* content, it is about *accepting* content. Teaching then, is not about getting people to know *how* to do something but about getting people to *agree* to actually do it on a prolonged basis. This is simply said, but to embrace this idea requires a significant paradigm shift for the educator and curriculum designer.

Taking into account the holistic nature of learning, the necessity of learner engagement, and the implications of learner resistance, the only effective teaching is teaching that acknowledges these dynamics prior to the actual teaching encounter, studiously analyzes the learner population, and designs resistance mitigation into the curriculum right along with the content. An examination of the literature would seem to indicate that this last statement is a bit non-revelatory. However, an examination of large-scale practice, particularly in the workplace, would indicate that it is, perhaps, the single most overlooked and marginalized principle in the entire practice of curriculum and instructional system design.

At the beginning of the chapter, a disjuncture was pointed out between the theory and practice of curriculum design in terms of the reality of learning resistance, as an educational dynamic. This was attributed to at least three specific factors, all of which will be addressed at length in the following pages. Chief among them is the fallacy of viewing the learner's motivation and engagement as something distinct from the learner's learning. Additionally, the mass production of education via a highly fragmented real-world ISD practice is problematic. Finally, the tendency for assessment to drive the process by which actual learning objectives are chosen in the first place creates a dynamic in which priorities become badly misaligned.

Taking all of this into consideration, the purpose of the latter half of the chapter is twofold. The purpose here is to (1) point out a naturally occurring disjuncture between the curriculum and ISD literature and the practice it seeds, and (2) outline a well-grounded but practicable way forward in course development and instruction via the introduction of some principles for analyzing learner characteristics and using that knowledge to integrate resistance-mitigation directly into the course content.

It has been previously noted that the nature of the problem addressed in this chapter is that of a theory-practice gap. While academic writing generally requires support using academic sources, the very nature of pointing out a theory-practice gap requires that one use information gleaned from years of practical experience in real-world settings. This experience is not easily cited (if citing is possible at all) and so often is left out of scholarship, and this is quite possibly one of the reasons theory-practice gaps exist in the first place. That discussion is outside the scope of this paper but it is important to note that the points made in this section are a confluence of the academic scholarship in curriculum and ISD, and decades of experience in working with institutional and organizational learning environments to address learning resistance. Those experiences have provided a great deal of revelation about the actual practice of curriculum design.

Distinctions between Motivation and Learning

In practical terms, it is fundamentally problematic to view motivation as a phenomenon distinct from human learning. Perhaps more candidly than anyone, Danish Educational Psychologist Knud Illeris has stressed the inadequacy of separating out aspects of a process as distinct objects. He further pointed out the importance of avoiding the tendencies of educational academic fields to use, as a stepping off point, one single aspect of human learning when trying to explain human learning as a whole (2002, 2007, 2011). In keeping with this he identified three overlapping and dialectic dimensions of human learning, the *Cognitive*, the *Social*, and the *Emotional* (2002). He later changed this terminology (2007) to *content*, *incentive*, and *environment*, but his original terminology has been retained here because it requires less exposition. He writes that, "…all learning involves these three dimensions, which must always be considered if an understanding or analysis of a learning situation is to be adequate" (2007, p. 25). This view is entirely consistent with notions such as Vygotsky's (1978) *dialectical development* and Bandura's (1977) *triadic reciprocation*, both foundational frameworks in educational scholarship. Likewise, on the curriculum end of things, it should not escape notice that Illeris's educational triad very closely resembles Tyler's (1949) claim that *subject matter*, *student*, and *society* must all be taken into account in the development of curriculum.

Speaking to motivation, specifically, Illeris claims that the connections between learning and motivation "…can only be separated analytically, as the motivation or drive (for or against or of any other kind) will always be an integrated part of both the learning process and the learning product…" (2003, p. 26). He further writes that:

Even when two persons apparently have learnt the same, they have not if there is a difference of any importance in their motivation. They may be able to immediately answer the same questions correctly and the like. But if learning is driven by an intrinsic motivation it is more resistant to oblivion, and the learning results may be applied in a broader scope of situations and to a bigger extent be involved in new learning, than if the motivation has been extrinsic. (p. 26)

This sort of dichotomizing, referred to in this section, is not entirely uncommon in academics and Illeris has indicated that it is connected in many ways, to the evolution of psychological science. "In my opinion, it is one of the most severe mistakes of psychological research that – in order to be 'really scientific' – it has been inclined to split apart mental constructs which operate in an integrated way" (p. 25).

Motivational theory itself, when taken together, seems to point toward a holistic view of learning. For instance, *Approach* and *Avoidance* goals (Schunk & Zimmerman, 2007) provide a framework by which all human learners are motivated in every learning situation, albeit they may be motivated *not* to learn rather than to learn.

The question must be asked then, what contribution does this tendency to separate motivation from learning make to curriculum design practices? The answer to that question is a simple one. By coming to see the two as distinct (practically, not analytically), practitioners are enabled to (a) focus more on one aspect than on the other, (b) to split responsibility for each of the two allegedly distinct constructs between various persons or divisions within the educational setting as is so commonly done in large-scale curriculum design, and (c) conveniently set aside affective elements when measurement is problematic. The latter two of these form the intersection of this problem with the other two addressed in the following paragraphs.

Curriculum designers and teachers alike cannot afford to view motivation as someone else's problem, or even as their own problem to be handled as a separate event. For instance, in the workplace, there is a common assertion that the punitive steps in place for failing to follow the policies and the procedures sufficiently serves to motivate students to learn what is taught and to do what is learned. Experience does not, however, align with this. Even in higher education it is possible to teach very solid teaching methods in a teacher training course without having even one student (teacher) agree that those methods are useful enough to actually implement.

Unfortunately, the criteria for whether or not these theories were "learned" by the students have to do with the ability of the students to articulate in some way that they are aware of the information, not that they have embraced the information.

This type of thinking is the impetus for a passive form of teaching and facilitating that fails to meet the learner where he or she is and actively work to assist that student toward engagement and openness. Of course the openness suggested here refers to an openness to learn in a given context, not openness in all cases to precisely what is being taught. Even so, it should not be forgotten that all teaching carries an agenda along with it. There is discussion in the literature regarding the ethics of adult education as it becomes enmeshed in workplace training and human resource development and management (see Hatcher & Bowles, 2006, for a discussion on this), and unquestionably there are ethical implications for what a teacher agrees to teach. However, whether it is an attempt to facilitate traditional critical thinking skills, a critical awareness of social justice, or a new company policy, teaching always involves some sort of facilitation, and facilitation by its very nature is engaged in with an end in mind. Interest, motivation, and engagement are not phenomena distinct from human learning that can be introduced at separate occasions and then be blended together into a successful learning outcome concoction.

Curriculum in a Box

The mass production of learning experiences required by very large organizations, government institutions (e.g., military; federal, state, and local governments) and to some extent, educational institutions that are more and more often constricted by accreditation and certification standards, also places a burden on the efficacy and integrity of the curricular process. To be clear, this is not to say that those who are involved in this process have any choice in the matter, nor is it to say that this type of practice cannot be done well, or in the least done more, rather than less well. It is simply to recognize that while this practice is, perhaps, unavoidable in many real-world settings, it does have the potential to lead toward certain flawed outcomes. It is the author's view that the first step in mitigating these flaws is to become deeply aware of their existence and their nature. This chapter, in part, is an effort toward that end.

The reason the mass production of curriculum presents the potential for significant problems in the learning process, is that the very effort of capturing any given content and setting it up in a way in which any given teacher, in some cases, even teachers and instructors without any subject matter knowledge, can present it for any given students, requires that one adopt a view of knowledge (and therefore also of learning and also teaching) similar to what Freire (1996) called "banking education." That is, that knowledge is some static thing that can be packaged and transmitted directly to the brain of the learner via some form of direct instruction.

Additionally, the practice of designing curriculum for very large groups of learners to be taught by a large group (over time) of somewhat generic instructors (those either pressed into service, lacking subject-matter knowledge, or lacking a passion for teaching), largely negates the entire principle of analyzing learner characteristics or learning context, or in the very least renders it more theoretical than actual. The natural division of labor that often occurs in this process requires the curriculum designer to produce a product that a different set of teachers may be teaching, and to rely on some other party to ensure that the teachers are adequately trained to teach the content. This plan may not dictate disaster but it is inherently flawed because it facilitates, and often forces a more reified division of labor that coincides with the problem of separating motivation from learning as a whole, to potentially produce a dynamic in which one group of individuals is responsible for designing the curriculum, another set of individuals is responsible for the teaching, and yet another distinct category of individuals (or organizational structures such as reward and punitive measures) is responsible for motivating the learners. The final result can be a cold, clinical collection of information which is, admittedly, very nicely organized and packaged, being fed with varying levels of skill and acumen, to a group of learners who are presumed to be pre-motivated by some feat of organizational engineering (i.e., policies, rules, punishments, and rewards). Something as integrated and holistic as human learning could have difficulty in this type of structure.

Disinclination to Teach what Cannot be Measured

This is perhaps the most significant and far-reaching problem in curriculum and ISD, both because it has severe outcomes and because it is so firmly rooted in the curriculum process itself. Posner and Rudnitsky (2006) provide a very clear evidentiary statement by saying that, "Evidence is defined as an outward sign; therefore, by definition, evidence of learning must be observable" (p. 199). They go on to say that evaluators should, "look for this evidence in observable student behaviors or observable products of student work" (p. 199).

More specifically, Dick, Carey and Carrie (2009) are quick to emphatically point out that, "…test items must correspond one to one with the performance objectives" (p. 132). This, of course, refers to criterion-referenced tests (CRT). CRT's embody a behavioristic approach to learning in that they expressly measure the ability to "perform specific competencies" (Seels & Glasgow, 1998, p. 83). In their list of steps for developing outcomes and assessments, Cennamo and Kalk (2005) finish up with "develop[ing] assessments for *each* outcome and subskill" (emphasis added) (p. 40). Verduin (1980) says this in a more general way by referring to the "key" as "specify[ing] clear, concise goals for learning and then specify[ing] some *measures* to see if the new behaviors are present after the learning experiences have taken place" (emphasis added) (p. 133).

It must be stressed that the problem here is not with the idea of measurement, in and of itself. Rather the problem arises, in practice, when the requirement for learning objectives to be behaviorally assessed creates a situation in which the assessment itself begins to determine what actually makes it onto the objective list to begin with. Posner and Rudnitsky (2006), a few pages after their strong statement on the necessity of learning evidence being observable student behavior, say, in respect to affective elements of learning, "It may not always be reasonable to expect a person who has learned an affect to supply behavioral evidence of that effect on demand" (p. 203). Dick, Carey and Carey (2009), when referring to the affective aspects of learning write that, "usually there is no direct way to measure a person's attitudes" (p. 135). Glasgow and Seels write that affective objectives are "measured by criterion items that are often voluntary and indirect" (p. 94). The debate regarding the emphasis on behavior objectives is not a new development (for a brief but informative overview, see Ornstein & Behar, 1995), but continues to be largely unresolved and, in the author's experience, almost completely divorced from actual practice. For such a prolific problem, the nature of it is quite simple. The curriculum design process, by a preponderance of the literature, promotes the creation of well-defined learning objectives, the clear connection of objectives to specific assessment measures, and the evidence of curricular and instructional effectiveness via that observable behavior of students.

This chain of expectations, when coupled with the extreme difficulty and impracticable nature of evaluating affective aspects of learning, creates a situation in which no matter what lip-service is paid to addressing the affective elements in curriculum design, the practice of curriculum design will quietly step around the affective. In essence, the mantra, perhaps not spoken quite so plainly, is to "only teach what you can assess." This, on the face of it, seems so common sense that it passes (and is reified in practice) without much notice. It is, however, in the face of real-world practice and what is known about human learning and motivation and most particularly, learner resistance, a misstep of staggering proportion. Taking into account the holistic nature of human learning, the pervasive presence and power of learning resistance, and the ultimate goal of education to bring about long-term change, the mantra should instead be "teach what you must; evaluate what you can."

This measurement factor, taking into account the tendency that separating motivation from learning has toward subsequently separating responsibilities for each, along with the tendency that the mass production of curriculum has on further establishing concrete divisions of labor, combine to produce something of a "perfect storm" for the overall process, which can often (though certainly not always) result in a series of *dis*abling and termin*ated* objectives.

Implications for Curriculum Design

Accepting, as a point of departure, that engaged learning is the only acceptable kind of learning in any educational or training context, and that engaged learning requires that learner resistance be acknowledged and addressed, certain concrete changes need to be made in the way curriculum is designed and implemented. Three of the most noteworthy will be addressed in this section, corresponding with the three dynamics addressed in the previous section.

Human Learning as a Holistic Phenomenon

First, curriculum designers must recognize that the actual content cannot be divorced from the individual learner's perception of it. That is to say that learning is situated (Lave & Wenger, 1991). Therefore, when designing curriculum, content development must occur at all times with regard for the learner's perception of it and potential resistance toward it.

Admittedly, this constructivist view of learning does not entirely mesh with much of the behaviorist curriculum and ISD models extant in the literature. There have, in recent years, been curriculum and ISD models derived from constructivist orientations (R2D2 Model) but it may be that the long history of more mechanistic models has rendered any change in practice nominal. Contributing to this was the curricular design shift in the late 1960's and early 1970's. Atkin (1971) rather strongly identified this by saying, "make no mistake; ["behaviorist objectives people"] have replaced the academicians and the general curriculum theorists…" (p. 369).

To make a significant difference in mitigating learning resistance, content must be engineered and couched in terms that are specific to the perception and situated nature of the learners to which it is to be presented. For instance, in police training, a course on tactical communications could be said to have a certain fixed domain content. However, depending on the circumstances surrounding the event, the training might be perceived by the officers in the course as punishment or reward. Furthermore, the content itself will be perceived as punitive or rewarding. How this "fixed" content is specifically shared with the officers will directly affect its acceptance by those officers.

Curriculum designers should not be permitted to engage in their craft without a comprehensive education in the philosophy and social, physiological, and psychological sciences of human learning. One's philosophy of education is the foundation of every other decision made in curriculum design whether or not that philosophy is explicit. While there are those who admit to enjoying philosophy and those who claim to eschew it, everyone possesses "one" and to possess it without fully exploring it and identifying it is, as Kegan (1994) put it, to be *had* by one's beliefs rather than to *have* them.

In much the same way, one's understanding of the social, physical, and psychological sciences always drives all the higher-level decisions, which include all aspects of the standard curricular and ISD models. Whether explicit or not; whether accurate or not; our understanding of these realities dictate all of our moves in this arena. As such, Curriculum designers should be required to have a comprehensive understanding of all of these disciplines as they relate to human learning. Again, while this may seem to be rather intuitive, it is very often not the case in real-world practice.

Since so many curricular and ISD models are based on behaviorist or neo-behaviorist frameworks, or at least in practice still bear out the effects of those frameworks, a solid understanding of human cognition and the effects of social learning could serve to balance the inherent weaknesses of the accurate but limited explanatory power of behaviorist learning models.

Of special significance, as noted in this chapter, is the need for designers to be thoroughly educated in the area of learning resistance, and more broadly, affective aspects of human learning. Rather than be the peripheral footnote they so often are (at least in practice) they need to be seen as the *driving force* of all learning. It needs to be understood that motivation and learning are inseparable and that to learn something, at least the type of learning that seems to be desired, is more than knowing something; it is accepting something. By extension, therefore, teaching is more than getting someone to know something; it is getting someone to accept something. This can sound crass when put this way, but it is important to speak frankly about it because it is the crux of a very important matter. The idea of the curriculum designer and teacher having an agenda is just a basic truth that does not conflict with even the views of social justice-oriented critical pedagogy, since at the heart of critical pedagogy is a desire for the learner to think critically, and, as an example, "….it is important that the ground be properly prepared by teachers' building the best case they can as to why critical thinking is important" (Brookfield, 2012, p. 81). Even in these cases, a teacher is trying to express not only the content of the course (critical thinking) but that the content has merit and should be embraced to some degree.

Designing and Teaching as an Integrated Whole

Second, the delivery of the content, that is, the actual teaching/training element, also cannot be divorced from the curriculum design process. Once one comes to accept that the actual content of the curriculum, presumably the most static of the parts, must be engineered with the learner's perceptions in mind, it is an easy and logical step to accept that the actual teaching of the material also cannot be a distinct and independent piece of the curriculum design process. The theoretical sound of this gains an operational clarity as soon as one examines standard practice on how instructors/trainers/teachers are selected and trained.

While there are doubtless exceptions, the author's exposure to training organizations all across the United States has revealed some very similar dynamics. Instructors are very often pressed into service either under the "other duties as assigned" clause, because of an urgent need, to provide a job for someone whose position was just eliminated, or because of some routine (but random) organizational rotation of personnel. The fact that many of these situations may arise out of well-intentioned plans or policies, does not in the least mitigate the negative affect the practice has in educational terms.

Based on the affective nature of learning and learning resistance, as a real-world dynamic, what the content is and how it is designed, cannot be effectively divorced from how it is taught. The fragmented nature of the overall curriculum and ISD process, further exacerbated by the systemic features of everyday, contemporary working life, result in a gulf between the design of the curriculum, and the actual facilitation involved in having the students learn the material. The proposed solution is to take teaching seriously and see it as more than the idle transmission of pre-packaged content to a group of passive learners who are presupposed to be naturally engaged.

To take teaching seriously, something that is difficult to do without a thorough understanding of the complexities of human learning, organizations and institutions must carefully select teachers and instructors based on merits, not the least of which is a passion for teaching and instructing. Additionally, teachers must be provided comprehensive training in how to teach, and that training must also begin with a fundamental understanding of how human beings learn. Simply put, pre-packaged materials, to include lesson plans, no matter how well done, cannot be assumed to be effective as stand-alone components in an ISD process. Not in theory; not in practice.

Using Assessment as a Subservient Tool

Of all the claims made in this chapter, it is likely that none will be received with quite so much discomfort, and perhaps outrage, than the proposition here that assessment should not be driving the curricular process. The reader should be warned, in fact, that the suggestions made here might well approach heresy (as the author was recently told), and even back as far as the very early 1970's those questioning the behavioristically-driven obsession with measurement were not kindly received. Atkin (1971) wrote that those "who have a few doubts about the effects of the tide [behavioral objectives] had better be prepared to be considered uninitiated and naïve, if not slightly addlepated and antiquarian" (p. 369).

When taking the literature as a whole, a somewhat simple pattern emerges. First, objectives should be set for the course. Second, learners' learning should be assessed to ensure that objectives are being met. Third, objectives should have a type of one-to-one correlation with assessment items or modules.

This leads to what is possibly an unintended consequence. When taking these precepts together, one arrives with a naturally emerging principle that if there is an item that does not appear on the assessment, than it should not appear in the curriculum. This is usually stated the other way around but the implication is bi-directional, to the great misfortune of educational endeavors. It is unfortunate because not every objective is easily measurable, and, to go further, it could be that, in a practical sense, some objectives might not be measureable at all. Atkin (1971) pointed out that it is a "primary flaw" to assume "that those attributes which we can measure are the elements which we consider most important" (p. 374). He goes on to say, "the behavioral analyst seems to assume that for an objective to be worthwhile, we must have methods of observing progress" (p. 374). So what works in the theoretical world might have some serious flaws in the real world. This is borne out in the literature regarding affective aspects which are at best difficult to assess (Dick, Carey, & Carey, 2009), and at worst, lacking tangible evidence (Posner & Rudnitsky, 2006).

The end result of this is that a fundamental aspect of learning (the affective domain) is given lip-service in the most well-known models, but very seldom really given any purchase in the facilitation of learning content. This might work if it were not for what a clear understanding of human learning at large, and learning resistance specifically, mandates – learning that brings about change is learning that includes comprehension *and* acceptance. Acceptance is a product of the affective domain and as such is as important as any other aspect of the entire curriculum and ISD process. Most importantly, it is a vital part of the process that is almost precluded in the practice of curriculum design and implementation because of the need to be able to assess everything that is taught. By teaching what *must* be taught and assessing what *can* be assessed, this problem can be eliminated. Atkin so aptly pointed this out by saying, "worthwhile goals come first, not our progress toward assessing progress on those goals" (1971, p. 374).

In closing this section, it is probably useful to note that this need to assess every objective, which has led to non-assessable objectives being omitted, most likely arose from an understandable but misguided attempt to bring the rules of physical science to bear on a science that is, in fact, physical *and* social *and* psychological. While the merit of scientific principles is, to many, undeniable, it does not necessarily follow that those principles can be applied to all aspects of human life with equal effect. All of the variables that need to be controlled to make curriculum and ISD, and teaching and learning, a completely scientific endeavor, simply cannot be controlled in the non-laboratory setting in which practice always is situated. Curriculum models must move away from the highly reductionist frameworks upon which they are built.

Since suggestions such as those made here are rejected often on the grounds that they herald a shift away from scientific education (a valid concern), it is perhaps a suitable conclusion to this section to include a quote from a more scientific perspective. "All that is counted does not count, and all that counts cannot be counted" (Einstein, 1879-1955, quoted in Tokuhama-Espinosa, 2011, p. 75; also cited in Patton, 2008, p. 420).

CONCLUSION

In order for effective learning to occur, teachers must facilitate learner engagement, and in order to do so, learning resistance has to be conceptually understood, acknowledged, identified, and addressed as a part of the curriculum for any given class, course, or program. To do this effectively, one must take a critical look at the theory-practice gap that exists in curriculum design practices.

The three factors discussed in the latter part of this chapter all come together to form a complex of dynamics, the confluence of which results in a lack of learner engagement in the classroom. First, motivation must be seen as an integrated and inextricable part of human learning, and the resulting confluence creates a dynamic in which all learning is both a matter of understanding content and accepting content. The acceptance part of this process is where the intersection of learning resistance, facilitation, and curriculum and ISD design exists. Effective practice demands that curriculum experts be experts of human learning, course design, and teaching and facilitation whether or not these experts will be engaging in all of these activities themselves. Learning philosophy and the physical, social, and psychological sciences of human learning are the absolute foundation, whether explicit or not, of all other curricular aspects and processes, and as such, must be studied, conceptually understood, and explicitly enumerated by all those who purport to be experts in curricular development.

Second, practitioners must acknowledge certain weaknesses inherent in the mass production of curriculum. Despite the necessity to approach curriculum design in this manner under certain conditions, the process must be seen as an integrated whole, learning must be seen as something more than the reception of static information, and the entire ISD process must be carried out with learner engagement as a primary concern.

Lastly, the difficulty in assessing affective aspects of human learning should not result in their omission, intended or unintended, in any aspects of the curriculum design process, especially in the teaching process. To make this so, there must be a willingness on the part of designers to include and even to emphasize affective objectives that may not appear in the assessment items. The messiness required here reflects the messiness of real life as opposed to the neatly ordered machinations of scientific study. This may be the most difficult to embrace, of all the changes suggested here, but is, nonetheless, the most important if curriculum practices are to be used to facilitate prolonged and meaningful human learning in organizations and institutions. Teach what must be taught, measure what can be measured. As measurement methods are improved over the years, the gap may slowly close, but in the meantime, assessment cannot and must not determine what is actually taught.

KEY TERMS AND DEFINITIONS

Learning Engagement: A willingness to mobilize the necessary energies (i.e., physical, emotional, and psychological), for learning in a given learning context.

Learning Resistance: A state in which a learner is not open to learning in a specific learning situation as demonstrated through either active rejection or passive disengagement. This includes both *behaviors* and *cognitions*.

Environmental Resistance: Resistance that is brought about because of factors in the environment of the learner during or near the specific learning event (localized). Examples of this are poor room arrangements, loud learning environments, poor instructional methods, and inter-personal issues in the immediate context.

Cognitive-Psychological Resistance: Resistance is characterized by largely internal factors such as low (or high) self-efficacy, learned helplessness, anxiety, and defense mechanisms.

Sociocultural Resistance: Resistance that has as its source, social or cultural dynamics such as issues concerning marginalization due to race, ethnicity, gender, and sexual preference.

Epistemological Resistance: Resistance caused by a disconnect or mismatch between the learner's and teacher's conception or understanding of (a) what learning is and/or (b) what criteria should be used to evaluate truth claims.

Unidirectional Learning Objectives: Needs-based learning objectives that are determined for a course and are not affected by the organization's and/or institution's capacity to accurately assess them. The underlying philosophy for unidirectional learning objectives is to "teach what must be taught, and assess what can be assessed." While attempts to measure these objectives are expedient, any shortcomings of assessment will not result in the objectives being removed from the curriculum.

Chapter 69
Quality Assurance in Transnational Education Management:
The Developmental "Global Studies" Curriculum

Gilbert Ahamer
Austrian Academy of Sciences, Austria

ABSTRACT

This chapter deals with quality assessment for interdisciplinary university curricula. As a case study, it analyses the recently established "Global Studies" (GS) developmental curriculum at Graz University, Austria. After reviewing literature on concepts of quality for curricula, key concepts for multi-disciplinarity, inter-disciplinarity, and trans-disciplinarity, approaches for their monitoring, and necessary ingredients for multi-paradigmatic inputs, processes, and outputs, this chapter applies these criteria to the ethically and globalization-oriented curriculum Global Studies at Graz University, Austria. A practical set of criteria assessing quality in curricula and in courses is identified, a list of assessment exercises that have been performed so far is provided, and assessment of academic performance and suggestions for future improvements are given. Recommendations focus on the implementation of inter-paradigmatic mutual understanding and include setting up a regular, peer-oriented discourse among all stakeholders and founders of the curriculum and the inclusion of expertise into the curricula commission. All such concrete measures shall underpin the key capability of inter-paradigmatic studies, namely to see complex phenomena as perceived by other stakeholders, friend or foe.

INTRODUCTION

The worldwide integration of higher education, curricula and their quality criteria, as well as practice in international projects and experiences in academic education didactics, suggest the necessity for transnational collaboration among universities such as clarification of success criteria and subsequently possibly even joint degrees. Higher education management involves gover-

DOI: 10.4018/978-1-4666-8246-7.ch069

nance, self-responsibility and courageous steps in quality assessment that may also be inspired by cutting-edge cases of already implemented developmental curricula that target ethical questions of globalization.

This paper has a double target:

1. Explain and analyze the necessity for Quality Assessment (QA) of curricula, especially in so-called trans-disciplinary, inter-professional and multi-paradigmatic cases such as developmental and Global Studies (GS); followed by assessment strategies proposed in literature.
2. Undertake to measure practice of GS against (1) GS curriculum, (2) international practice, (3) feedback received to date.

As a basis for writing and contextualizing, this paper dwells on both

1. A theoretical literature analysis that scanned ~1000 peer reviewed articles (making use of the Scopus literature reference system) of which ~100 were taken into consideration and ~10 considered as very suitable (among which are Aboelela et al. 2007, Brennan & Shah 2000, Lantis 2004, Fischer et al. 2011, Lattuca et al. 2004, McFadden et al. 2011, Peterson & Wittstrom 2011, Ried 2011, Spelt et al. 2009, Wagner et al. 2011)[1].
2. The concrete involvement and practical experience of the author, in co-founding and implementing the GS curriculum at Graz University and lecturing in practically all courses established specifically for GS, as well as in other inter-paradigmatic curricula.

WHY QA FOR CURRICULA?

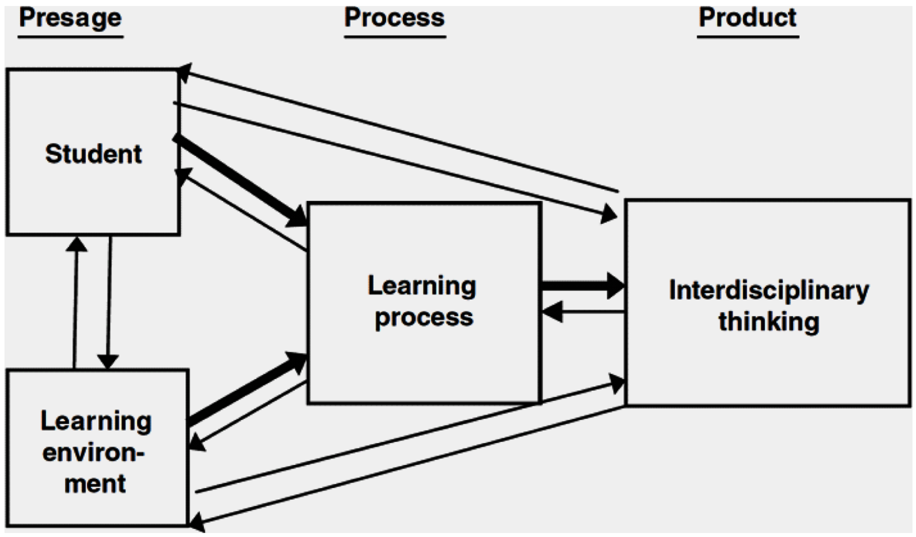
The importance of Quality Assessment (QA) during curricula development and subsequent regular quality improvement is widely debated and confirmed in literature for all modes of education (Bernhard 2011a, 2011b; 2012a, 2012b), on both national and supranational levels. On OECD level, various initiatives attempt to strengthen cross-country compatibility of education management and QA—e.g., IHME (2012), AHELO (2012), IHERD (2012)—often promoted via large international conferences.

Reeves et al. (2012) and Vilgats and Heidmets (2011) provide an overview of key developments in the past three decades. In particular, medical and health care studies already have a long tradition in QA, for which Simmons and Wagner (2009) find that "although inter-professional education and continuing inter-professional education are becoming established activities…, assessment of learners continues to be limited." The present paper, however, includes such initiatives of learner-centered assessment, e.g. undertaken by Bader and Zotter (2012).

The necessary broad scope of assessment for inter-professional education and scholarship is highlighted by Reeves (2009) who names seven key trends leading to higher quality: "conceptual clarity, quality, safety, technology, assessment of learning, faculty development, and theory". Evidently, QA is more than merely counting the impact points of lecturers or the political honors of administrators. Grossman et al. (2001) propose a collaborative model of teacher community in the workplace based on mutual respect and professional criteria-orientation: such is ultimately demanded here also, both as a general recommendation and for the case study of GS after literature and bibliometric analyses.

The mentioned extensive literature analysis of hundreds of peer-reviewed papers brought the review framework for interdisciplinary and trans - disciplinary curricula taken from Biggs (1993, 2003), and cited in Spelt et al., 2009 (Figure 1) that embraces input, process and output (from left to right) as suggested by practically all the in-depth papers analyzed. For quality learning at university, Biggs (2003) "analyzes the nature

Figure 1. Conceptual review framework for interdisciplinary curricula, also applicable to trans-disciplinary and multi-paradigmatic curricula. Source: Spelt et al. (2009, p. 368), adapted from Biggs (2003), compatible with Brennan and Shah (2000, p. 335), and closely resembling the working model suggested by Wagner et al. (2011, p. 17).



of good teaching and provides a framework for reflective practice". He" proposes the 'constructive alignment' model whereby the curriculum, teaching method assessment procedures and general institutional environment should all be in alignment with the societally desired output to promote deep learning.

Inspiringly, Figure 1 simultaneously combines the perspectives and perceptions from three different roles of co-citizens: studying, teaching/training, and working in practice (from left to right). Their collective views on higher education provide the full picture.

What is Quality in Curricula and in Higher Education?

Necessity and Effect of QA in Higher Education

A study by Brennan and Shah (2000) on QA and institutional change based on experiences from 14 countries "presents a conceptual model of institutional change in higher education implied by quality management.…" The programme for Institutional Management in Higher Education (IMHE) of the Organization for Economic Co-Operation and Development (OECD) has sponsored a project entitled 'Quality Management, Quality Assessment, and the Decision-Making Process' that considers the impact of quality assessment in terms of

- Rewards/Incentives
- Policies/Structures
- Cultures of institutions

Evidently, any successful quality management approach in higher education should not neglect to follow *all three* paths; especially the latter two institutional and corporate culture ones. A refreshingly sober and realistic outlook should provide a promising start:

Drawing on the work of the sociologist Max Weber, Finch (1997: 152-153) has drawn a distinction *between 'naked power' and 'legitimate authority' with regard to decision-making in higher education. (…) What was necessary was the conversion of naked power into legitimate authority. (…) Legitimacy in higher education is commonly thought to be achieved through adherence to values and standards which are a part of the cultures of academic disciplines (Finch 1997), i.e. a reasonably clear collective understanding between academics in a given discipline that a particular piece of work counts as good and something else as less good. (…) Thus, for Finch, the role of peer review is central to the achievement of legitimacy for quality assessment processes and the decisions reached on the basis of them. (Brennan & Shah 2000: 347).*

Brennan et al. (1994) refers:

To the 'moral' authority of peers in contrast to the 'bureaucratic' authority of quality [i.e. administrative] bodies. This is why virtually all quality bodies make peer review a central part of their assessment processes. (…) We conclude, therefore, that the introduction of external quality assessment systems in most European countries, as well as in many other parts of the world, over the past decade has been associated with a shift in the distribution of power within higher education.

The author of the present paper is very keen to emphasize the importance of peer review and a spirit of partnership, whilst at the same time being oriented on previously jointly agreed and common criteria for academic quality as well as didactics and pedagogy. This aspect of power relation analysis (Fischer & Hödl 2007) will be addressed during bibliographic analysis (see section Applying bibliographic criteria to GS).

In the same vein, Rowlands (2012) diagnoses the shifting roles and self-conceptions of university senates more towards peer review and audit-driven accountability mechanisms. On the other hand, Harvey and Williams (2010) critically analyze fifteen years of (traditional) QA in higher education: internal quality assurance with assessments of the impact of quality assurance brought improvements in learning and teaching to a varying degree:

Quality assurance has become an international concern and procedures have become increasingly standardized across national boundaries. Significantly, the consumerist approach to higher education quality that is driven by governments and senior management, has not met with enthusiasm (…) and there appears to be a strong commitment to autonomy and academic freedom. However, (…) academia is prone to inertia and compliant indifference. Ultimately, (…) it is still not clear that, even after 15 years, quality assurance systems have really enhanced higher education.

As one possible approach in this dilemma, Stensaker (2003) highlights the *structural importance of organizational change*, entitled "Trance, Transparency, and Transformation: The impact of external quality monitoring on higher education". He discusses

The impact of External Quality Monitoring (EQM) on higher education, and identifies areas in higher education where changes have taken place as a result of such external initiatives. Of special interest is the question whether quality improvement actually is the result of the many EQM systems implemented. By interpreting available data an ambiguous answer is provided, highlighting some of the typical side-effects of current EQM systems at the institutional level. The paper argues that lack of effects directly related to quality improvement should not be conceived as an EQM design error alone but as a misconception of how organizational change actually takes place. In the conclusion, it is claimed that a more dynamic view on how organizations change, highlighting the responsibility of the institutional leadership *as 'translators of meaning', may contribute to a more useful process.*

Carr et al. (2005) investigate the influence of external quality audits (EQA) on university performance and find that "evaluations have a stronger foundation when the combined effects of university governance, management initiatives and government initiatives are examined together with EQA."

QA for Global Developmental Studies: Discourse as Procedural Strategy for Quality

Curricula on global and developmental studies (Schuurman 1993; Bernstein 1973, Fischer2009) necessitate especially high levels of both disciplinary and interdisciplinary academic quality (Ahamer 2011, 2012; Ahamer et al. 2011). Given their complex fact base and epistemological landscape, such curricula require a wider range of quality criteria than do curricula of a purely disciplinary nature, given the inapplicability of any concept of "absolute truth" in multi-stakeholder and multi-perspectivistic issues in the framework of global change. Hence, global developmental studies constitute the cutting edge of academia in this respect.

A very elucidating paper on ethics and foreign policy was written by an American educator who had students discuss contemporary issues of conflict resolution (e.g. Kosovo, Iraq) while using structured debate with preparative essay writing (Lantis 2004). Gorton and Havercroft (2012) successfully use historical simulations and Socratic debates to teach political theories. Haller and Ressler (2006) studied the meanings and interrelationships of national and European identity as well as cultural identities in the face of globalization (Haller & Ressler, 2007). Osborne (2005) argues that the use of debate in a core world history course can foster both authentic learning in the discipline and progress toward intellectual and ethical maturity. In fact, academic culture in general is a culture of argumentation, and democracies are societies in which debate is central. Yet such a criteria-based culture of argumentation and peer review might be initially alien to most students and even lecturers who have grown up in a culture of personal loyalties.

Thus, any QA has to take the dialogic element of debate and discourse into account. Web based discourse in GS is described by (Ahamer 2012).

As a consequence, the concept of quality in higher education is shifted from "suitable content" (i.e. truths that can be learned) towards "suitable processes" and constructed consensus (Ahamer 2005, 2006) in multi-stakeholder issues such as global development. A didactic approach using dialogic, debate-oriented, and collaborative learning and inquiry (Becher & Trowler, 2001) shows more promise than in a purely disciplinary science.

Debate as an instrument (Doody & Condon 2012) and the power of in-class debates leads stakeholders to change their roles (Kennedy 2009). Omelicheva & Avdeyeva (2008) tested the effectiveness of traditional versus active learning methods of debate for teaching graduate students (Moody-Corbett 1996).Koklanaris et al. (2008) propose debate preparation and participation as an active, effective learning tool; Gokhale (1995) finds that collaborative learning enhances critical thinking – even in technological education. Crone (1997) used panel debates to increase student involvement in an introductory sociology class. Healey (2012), convinced by the power of debate, reflects on the potential of debates for engaging students in critical thinking about controversial geographical topics. Rocca (2010) provides an extended literature review on student participation in the college classroom.

Personal cooperation is an essential strategy: Wuchty et al. (2007) and Grossmann et al. (2001) highlight the increasing dominance of teams in the production of knowledge. Vanasupa et al. (2012) reflect on cases of faculty members' failure to collaborate as the main challenges in trans-disciplinary projects. Baba et al. (2004) studies the efficacy of globally distributed teams as vehicles for knowledge sharing. Cant and Kulik (2009) emphasized the necessary targets and ethics in university teaching when developing and implementing an ethical decision-making framework for an integrated business curriculum. For peace education and international economics, Kumpfmüller (2007, 2009) utilizes decades of professional experience in team building, continuing inter-professional education and andragogy and, after consistently excellent student feedback, was nominated by GS students for the university's lecturer prize recently (GS site 2010).

Structural Strategies for Quality in Interdisciplinary Curricula

Interdisciplinary and intercultural education needs structural and organizational transformation strategies because traditionally discipline-oriented hierarchies are not always appropriate to cope with the issues of globalization. Braun & Schubert (2007) surveyed the growth of research on inter- and multi-disciplinarity within scientific and social science papers. Spelt et al. (2009), in an intriguing paper, systematically reviewed teaching and learning in interdisciplinary higher education.

Lattuca et al. (2012) identified "eight dimensions of interdisciplinary competence that emerged from [their] extensive literature review:

1. Awareness of disciplinarity
2. Appreciation of disciplinary perspectives
3. Appreciation of non-disciplinary perspectives
4. Recognition of disciplinary limitations
5. Interdisciplinary evaluation
6. Ability to find common ground
7. Reflexivity
8. Integrative skill."

Lattuca et al. (2004: 35) ask if inter-disciplinarity promotes learning in higher education. "Constructing meaning in the classroom," they argued, "means developing multiple perspectives and demonstrated young adults' increasing capacity to contend with and choose among multiple perspectives." A very practical example, comparable with the author's edited reports on practicals in environmental systems science (USW 2012; Ahamer 2005), is that of Lattuca et al. (2004: 36), with their report on an interdisciplinary lecturer:

He presents a broad set of ideas across various disciplines and fields. During the first week of the course, he provided an overview of ecosystems and introduced questions about human nature and culture. In the next week, the discussion turned to classical economic concepts, like markets, and how these impact on the environment. Once that background was laid, the class considered problems like energy use and alternative energy, pollution of water and air, agriculture, and food supplies. The focus was on quantitative analysis and technical issues, which the instructor juxtaposed against the philosophical foundations laid in the first week of the course. In the next section of the course, students scrutinized developed and developing nations and discussed issues like sustainable development, industrialization, alternatives to industrialization, and demography. Finally, the course moved to an examination of politics, geopolitics, and policy.

The questions proposed (Lattuca et al. 2004: 36)"focus on how interdisciplinary courses and the instruction practiced by instructors in these courses might (a) forge connections to students' prior knowledge and experience; (b) assist students in developing complex understandings in particular subject areas; (c) promote the development of sophisticated views of knowledge and learning; (d) influence thinking skills; (e) build students' capacity to recognize, evaluate, and use differing (multiple) perspectives; (f) engage student interest and increase motivation; and (g) enact constructivist and active learning strategies."

Interdisciplinary strategies act as transformative change in higher education (Holley 2009). For successful reorganization, she poses "two research questions: 1) For this subset of inter-paradigmatic curricula, what change strategies are utilized by administrators to support interdisciplinary work on campus? 2) To what extent does the effort to facilitate interdisciplinary change extend across the institution?" and provides a table with answers for the following strategies (p. 337): Senior administrative support, collaborative leadership, flexible vision, faculty/staff development, and visible action.

Earlier examples of administrative reorganization at Graz University include the concept of the "interfaculty basic module" (Ressler 2007) and the successful generation of an interfaculty curriculum "Environmental Systems Sciences" (USW 2012) a decade ago; also the developmental curriculum "International Development (IE 2012; Fischer & Hödl 2007) at Vienna University. Organizational strengthening was also provided by a joint position paper on GS (2012).

Qualities in Inter-Disciplinarity

Even if it may not be necessary to consider interdisciplinarity as a target in itself, the fundamental argument is that reality as such is not limited to any of the disciplinary lenses institutionalized at universities and hence needs the critical evaluation of expert opinions (i.e. of such opinions that consider themselves to have sufficient expertise). Real-life problems are ill-structured problems without single clear answers (Lattuca et al., 2004, p. 33) but demand multiple and balancing paradigms for understanding. The more the learning paradigm advances from behaviorist to cognitive and constructivist (Ahamer, 2010), the more self-responsible learning strategies become appropriate (Lattuca et al., 2004: 35):

Reflecting on 25 years of research on college students' epistemological beliefs, Michael Paulsen and Charles Wells (1998: 367) noted that studies have consistently found that 'as students advance in their coursework and experience other aspects of the academic environment over the years of college (and graduate school), they develop more sophisticated epistemological beliefs'. Most studies of epistemological development owe a debt to William Perry (1968) who theorized that in late adolescence individuals move through several different views of knowledge; they progress from simplistic views (things are right or wrong, good or bad, true or false; knowledge comes from authorities) to multifaceted ones (there are multiple opinions and perspectives in the world).

Definitions for Varying Degrees of Inter-Disciplinarity

All too often a curriculum is called interdisciplinary when it is actually multi-disciplinary: Multiple perspectives are presented without any support for the integration of disciplinary knowledge throughout the curriculum.… In addition, curricula that aim to develop interdisciplinary thinking on a broad scale are likely to experience more difficulties than curricula that aim to develop interdisciplinary thinking on a narrow scale" (Spelt et al. 2009: 366).

Motivated by the above introduction that clearly highlights the confusion of concepts, and given the strategic importance of inter-disciplinarity that has long since gained credibility in science, we adopt suitable definitions, concepts and implementations of inter-disciplinarity in literature and practice. What is inter-disciplinarity? First is presented a clear definition of the three key concepts in growing degree of integration (Table 1).

According to Klein (2008) and Wagner et al. (2011: 15), this "most widely used schema for defining interdisciplinary research (IDR) (i.e. the three definitions in Table 1: multidisciplinary, interdisciplinary, trans-disciplinary) derives from a typology presented at the first international con-

Table 1. Definitions of key terms used in most literature: multi-, inter-, trans-disciplinarity. Sources: Wagner et al. (2011, p. 16) and Stokols et al. (2003), adapted.

Multi-	disciplinary approaches juxtapose disciplinary/professional perspectives, adding breadth and available knowledge, information, and methods. They speak as separate voices, in encyclopedic alignment, an ad hoc mix, or a mélange. Disciplinary elements retain their original identity. In short, the multidisciplinary research product is no more and no less than the simple sum of its parts
Inter-	disciplinary approaches integrate separate disciplinary data, methods, tools, concepts, and theories in order to create a holistic view or common understanding of a complex issue, question, or problem. The critical indicators of interdisciplinarity in research include evidence that the integrative synthesis is different from, and greater than, the sum of its parts.
Trans-	disciplinary approaches are comprehensive frameworks that transcend the narrow scope of disciplinary worldviews through an overarching synthesis. More recently, the term has also connoted a new mode of knowledge production that draws on expertise from a wider range of organizations, and collaborative partnerships for (social, economic, environmental)sustainability that integrate research from different disciplines with the knowledge of stakeholders in society. Here too, the transdisciplinary product is greater than the sum of its parts, though the scope of the overall effort is more comprehensive and the parts may be more diverse.

ference on interdisciplinary research and teaching in 1970." These definitions encompass a new way of knowing that grows out of shifts in:

- Epistemics
- Institutional structure
- Culture

For Klein (1996), inter-disciplinarity is *"notable for conflicting meaning"*. The author looks back on decades of tedious university experiences that indeed corroborate such theorizing.

Table 2 splits up single characteristics for the above three degrees of integration. It includes in the 3rd column the importance of the "paradigm" (i.e. thinking model) being utilized; the 4th column hints towards a spectrum of the social behavior of scientists that might range from using the same coffee machine to actually working together, and the relevance of the 5th column will become apparent when interpreting bibliometric results in section Applying bibliographic criteria to GS. The importance of true "translation" of meaning (Wolf 2011) is referred to in the last grid cell below right.

In Which Sectors Inter-Disciplinarity Emerges First: An Evolutionist View

When searching for consistent and pioneering analysis of inter-disciplinarity, clinical and health sciences assume a leading role (Larson et al. 2011; Gebbie et al. 2008; Peterson and Wittstrom 2011; Ried 2011; McFadden et al. 2011; Kurz 2003). A reason for this observation might of course be a high inclination (or rather pressure) to be innovative in this cutting-edge sector (having the highest impact journals when measuring by sheer ISI impact factors).Also, the leading role of the economic sector "medical and other health services" exhibits an ever increasing GDP share in all world regions, as displayed by the author's Global Change Data Base GCDB (Ahamer 2001; UNSTAT 2003). Figure 2 at top shows time series for the growing share of GDP generated by the medical sectors in eleven world regions.

The GCDB analyzes graphically the global techno-socio-economic trends and (to a certain degree) supports the impression that different regions might be on a similar path during economic evolution. From this perspective, evolutionary leaders are the sectors most prone to inter-disciplinarity, succeeding through high paradigmatic and epistemological interconnectedness (in Ancient Greek language: ἐπιστήμη = episteme = understanding).

Similarly, the economic sector of educational and teaching services shows an increasing trend in its contribution to overall GDP in the economies of all regions (Figure 2 at right).

Whereas in Figure 2 the GDP shares have been displayed as time series for the eleven world

Table 2. Characteristics of multidisciplinary, interdisciplinary, and transdisciplinary research. Source: Aboelela et al. (2007, p. 340).

	Participants/ Discipline	Problem Definition	Research Style	Presentation of Findings
Multidisciplinary	Two or more disciplines	Same question but different paradigm *or* different but related questions	"Parallel play" by individuals	*Separate* publications by participants from each discipline
Interdisciplinary	Two or more distinct academic fields	Described/defined in language of at least two fields, using *multiple models* or intersecting models	Drawn from more than one, with *multiple* data sources and varying analysis of same data	*Shared* publications, with language intelligible to all involved fields
Transdisciplinary	Two or more distinct academic fields	Stated in *new* language or *theory* that is *broader than any one discipline*	Fully *synthesized* methods, may result in new field	Shared publications, probably using at least some new language developed for *translation* across traditional lines

regions defined for the IPCC reports and the Global Energy Assessment (GEA 2012; Ahamer 2013),Figure 3 shows such economic sectors as a function of GDP/capita. At left in Figure 3: such a swarm of countries apparently moving in similar direction indicates that all countries in the world are increasing their efforts to provide community-related, social, and personal services, including the subsectors of medical and educational services mentioned above. At right in Figure 3: framing this service sector within all sectors of the economy shows that these community, social, and personal services grow fastest (together with financial and similar sectors in yellow); this impression is corroborated further when displaying not the shares, but the *growth rates* of these shares in Figure 4. The author's underlying concept of "blossoming evolution" is further explained in Ahamer (2008); countries are considered to move from left to right on the horizontal axes during economic evolution.

To sum up, the contribution of the health sector to overall economic output is continuously growing in all world countries and regions – as does that of the educational sector. As shown in Figure 4 at right, the growth rate of these sectors is highest in already advanced economies which can be interpreted as these activities having a high potential for further (not only economic but presumably also epistemological) strengthening of civilizational achievements and being likely to employ cutting-edge paradigms such as transdisciplinary paradigms.

Cases of Interdisciplinary Collaboration from Health Education and Other Branches

Evidently, according to literature interdisciplinary cooperation is highly necessary among various health and medical disciplines. Larson et al. (2011) build interdisciplinary research models: A didactic course prepares interdisciplinary scholars and their faculty for clinical science. Aboelela et al. (2007: 336)"reviewed 14 definitions of inter-disciplinarity, the characteristics of 42 interdisciplinary research publications from multiple fields of study" employing divergent paradigms of interdisciplinary research, positivist vs. constructivist. Pharo and Bridle (2012: 78) ask if "interdisciplinarity exists behind the façade of traditional disciplines" and require that "interdisciplinary teaching takes into account multiple ways of seeing the world" also in natural resource management teaching.

Figure 2. Time series for share of medical, dental, other health, and veterinary services (top) and educational services (bottom), two out of the approximately 40 sectors of the UN statistical data series (UNSTAT, 2003). Data incompleteness for recent years in several countries is responsible for the only seemingly decreasing trend at the right end of the curves. Source: Global Change Data Base GCDB, Ahamer (2001).

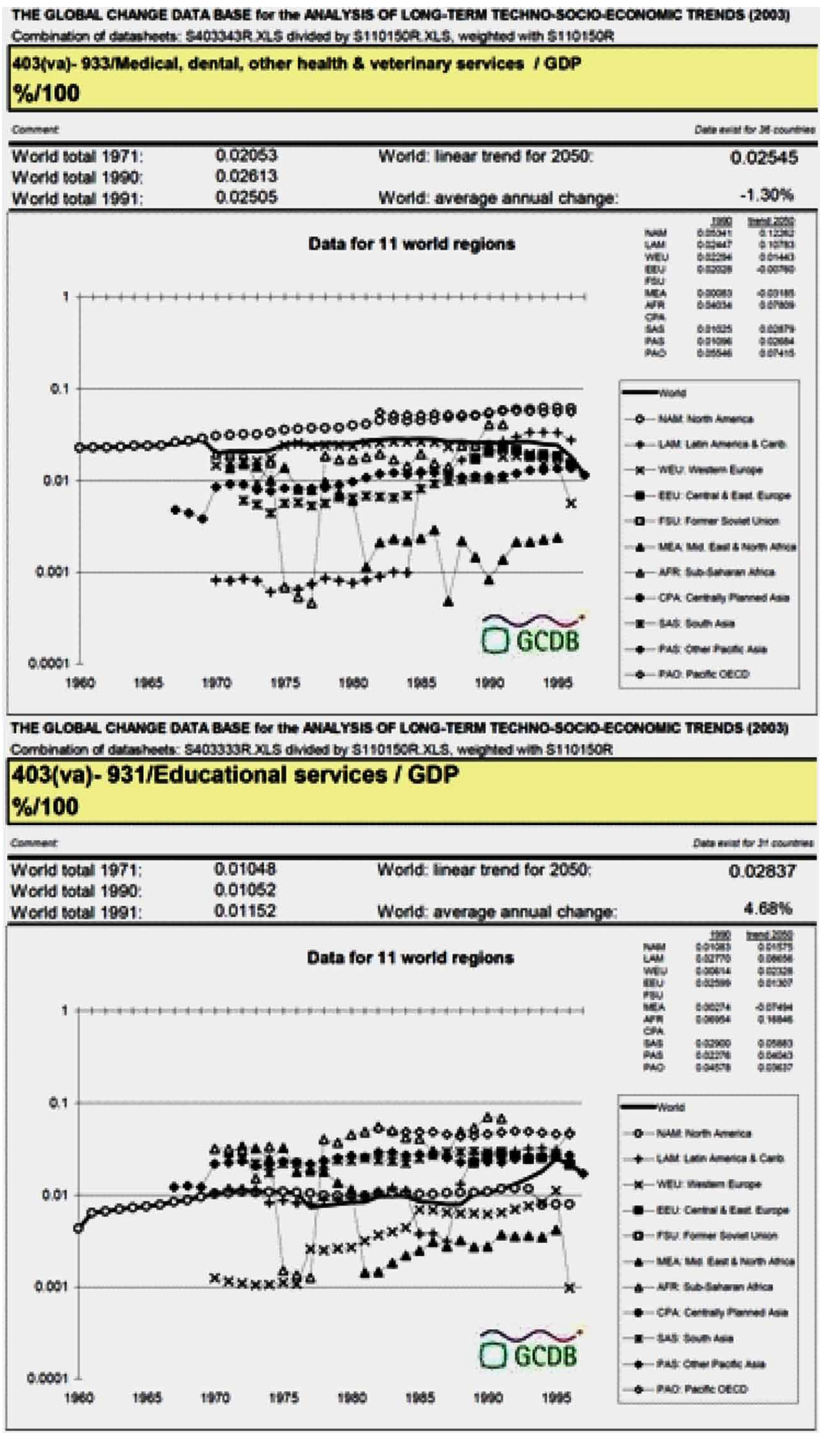


Figure 3. Display of analogous GDP shares for "community, social, and personal services" as a function of the countries' GDP/capita (a proxy for economic development). At left: for all single ~200 countries, at right for eleven world regions in pink, contrasted with the shares for the eight other economic sectors (other colors).GDP/capita values range from 10$/year at far left until 100,000$/year at far right on the horizontal axis.

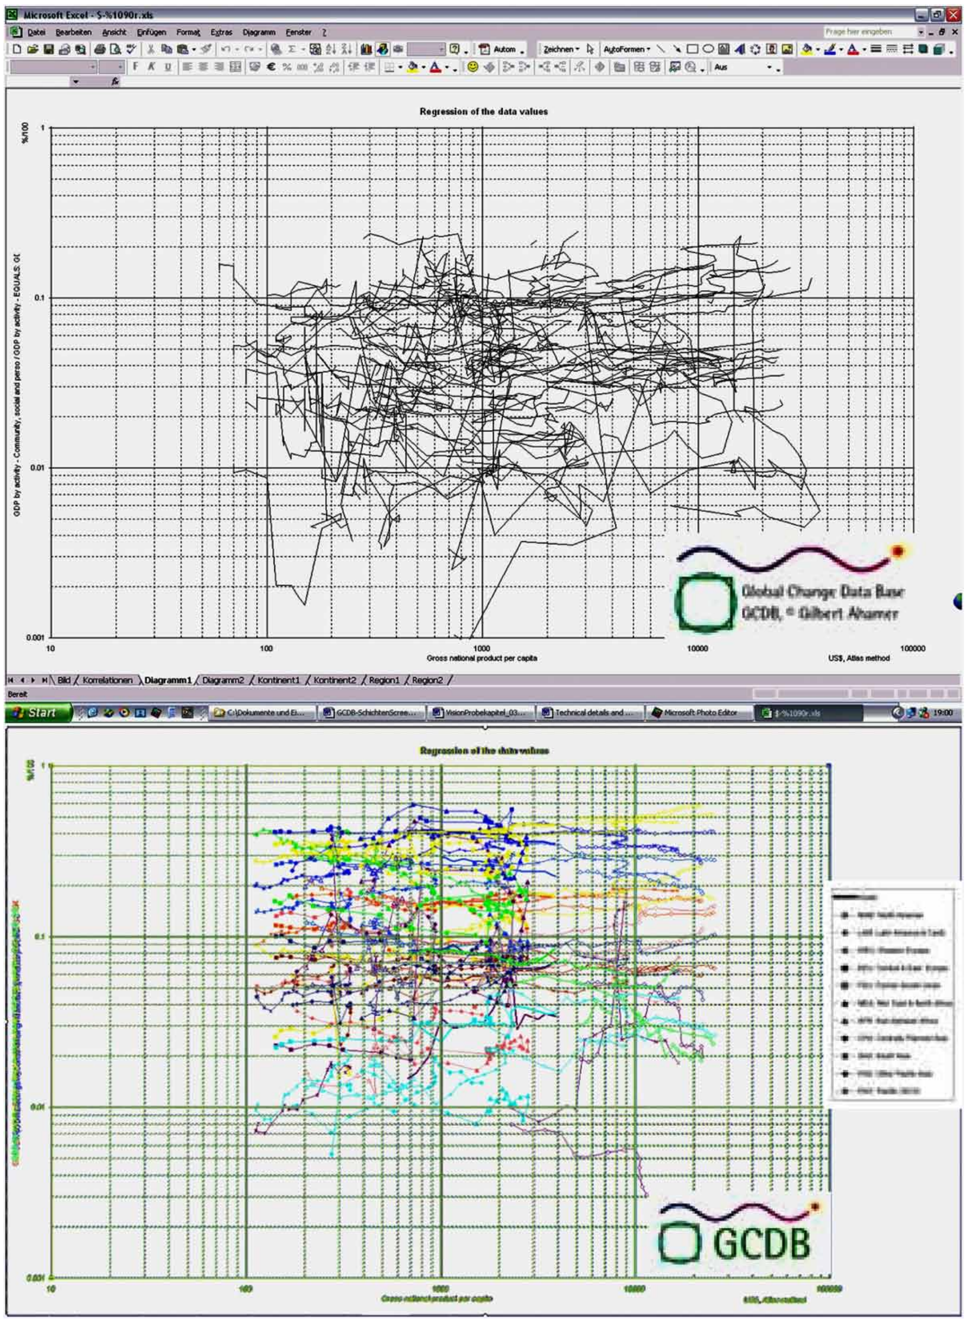

Figure 4. Annual growth rates for share of "community, social, and personal services" as a function of GDP/capita, change rates for the other sectors.

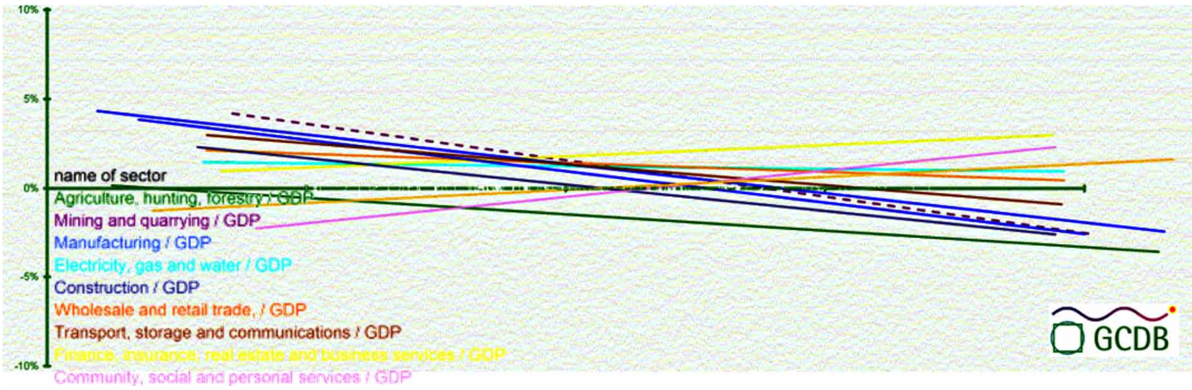


Concepts of inter-disciplinarity for Aram (2004) are *configurations of both knowledge and action*. Nissani (1997) expresses "ten cheers for interdisciplinarity" and claims that his "article presents the only self-contained, comprehensive defense of interdisciplinary knowledge and research." White (1999) uses academic topographies for a network analysis of disciplinarity among communication faculty.

Fischer et al. (2011: 341) review collaboration between the natural and social sciences:

Across disciplines, it became clear that such a community should deal with (1) difference between paradigms in the current sciences; (2) creation of skills and competences of the involved scientists; (3) scarcity of institutions sympathetic to collaborative research; and (4) the internal organization of collaborative projects.

He ranks *mutual esteem* among disciplines highly and analyzes on page 350: "*Lack of respect* may stem from scientists considering their science as the *central* way to discover the truth, and therefore *dominant* in any collaboration".

Interdisciplinary, Intercultural, and Inter-Paradigmatic Modes of Science

The following paragraphs define three "scientific modes" that add to the above, quite common, definitions. In addition to common-sense inter-disciplinarity that uses different (let us call their number "n") disciplinary lenses to look onto and to understand one specific real-world problem (at right in Figure 5, first line in Table 3, and above right in Table 4), the present paper proposes the notion of "interculturality" which shall mean here to take a standpoint of perception (i.e., not a lens) depending on one's own real-world position and involvement in the given real-world problem. An example would be to look on the Nagorno-Karabakh conflict in the Caucasus from an Armenian or Azerbaijani standpoint.

In this sense, "interculturality" means in this text an individual's ability to take several ("m") standpoints (second line in Table 3 and Table 4) that are likely to result in different weighing and assessing of single partial arguments. Other meanings of "culture" in the usual sense (e.g. Wolf 2011) remain of course untouched by the above definition.

The combination of both inter-disciplinarity ("n") and inter-culturality ("m") in the above-mentioned sense is called "inter-paradigmatic"

Figure 5. The importance of perspectives in developmental and global studies. Perspectives are world-views, symbolized by the person at right, resembling Leonardo da Vinci's human called 'Vitruvian Man.' Looking at realities is graphically symbolized by the looking angle or wedge starting out from the observer and ending at the globe which symbolizes the real-world's global change and globalization. At left: in its academic manifestation, this same entirety is symbolized by the Greek temple with six columns standing for the six modules of the "Global Studies" curriculum at Graz University having six departments; the GS logo is placed on the tympanum.

Table 3. Concise explanation of interdisciplinary, intercultural, and interparadigmatic scientific modes

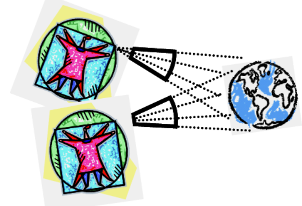
Scientific Mode as Defined Here	Explanation	Likely Substrate of Perception and Cognition
interdisciplinary ("n-fold")	The observer uses n lenses from 1 standpoint to perceive the real world.	**element**
intercultural ("m-fold")	The observer uses 1 lens from m standpoints to perceive the real world.	**interaction**
interparadigmatic ("m×n-fold")	The observer uses n lenses from m standpoints to perceive the real world.	**perspective**

Table 4. Typologies of interdisciplinary research (sources: Aboelela et al., 2007, pp. 337; combined with Pharo & Bridle, 2012, p. 67) compared to science mode definitions of interdisciplinarity, interculturality, and interparadigmatic approach (Ahamer et al., 2011, pp. 17-18)

Degree of Synthesis	Typology	Compares to Science Modes
Least: Disciplinarity	A community of scholars with their own theories, content, methods, history and culture into which members are trained and socialized such that they are able to carry out distinctive intellectual tasks and skills (Becher 1981)	Disciplinary ("1")
Informed disciplinarity	Disciplinary questions may be informed by concepts or theories from another discipline (Lattuca 2001) where they focus primarily on a single discipline but call upon other disciplines to illuminate content (Lattuca et al. 2004)	Interdisciplinary ("n")  "n" facets of viewed facts
Cross-disciplinarity	Variably defined depending on the context; often used to mean informed disciplinarity where a single discipline remains dominant (Lattuca 2001, Davies & Devlin 2007)	
Instrumental interdisciplinarity	Bridge building between fields. Problem-solving activity, does not seek synthesis or fusion of different perspectives (Klein 1996)	
Synthetic disciplinarity	Questions that link disciplines (question either belongs to both or neither disciplines) (Lattuca 2001)	
Moderate: Multidisciplinary	Coexistence of more than one discipline side by side in a way that accumulates knowledge without integration. Connection between disciplines may not be apparent. Often confused with interdisciplinarity (Petrie 1976, Spelt et al. 2009). Teams work in parallel or sequentially from their specific disciplinary base to address a common problem (Rosenfield 1992)	
Synthetic interdisciplinarity	Two or more teachers combine theories, concepts and methods from different disciplines but contributing disciplines remain clearly identifiable, revealing relatively bounded content areas and perhaps distinctive methods of inquiry (Lattuca 2001, Lattuca et al. 2004)	
Interdisciplinary	Integration of two or more disciplines that may range from simple communication of ideas to the mutual integration of organizing concepts and practices in a fairly large field (Klein 1990, Lattuca 2001, Spelt et al. 2009). Teams work jointly but still from a discipline-specific base to address a common problem (Rosenfield 1992)	
Conceptual interdisciplinarity	Explores perspectives on learning from different disciplines and involves critique of the disciplinary theories and methods (Lattuca et al. 2004). Questions without a compelling disciplinary basis (Lattuca 2001)	
Epistemological interdisciplinarity	Restructuring an earlier approach to defining a field (Klein 1996)	
Great: Transdisciplinary	The application of theories, concepts, or methods across disciplines with the intent of developing an overarching synthesis (Lattuca 2001). Focuses on dissolving disciplinary boundaries by focusing on questions that see disciplines as irrelevant. While interdisciplinarity explicitly critiques the disciplines, transdisciplinarity de-emphasizes disciplines (Lattuca 2001, Lattuca et al. 2004, Max-Neef 2005, Vilsmaier, 2011). A movement toward a coherence, unity, and simplicity of knowledge field (Klein 1996).	
Greater		Intercultural ("m")  "m" perspectives by viewing actors

continued on the following page

Table 4. Continued

<table>
<tr><th>Degree of Synthesis</th><th>Typology</th><th>Compares to Science Modes</th></tr>
<tr><td>Greatest:
Including, but beyond inter-, multi-, transdisciplinarity</td><td>
</td><td>Interparadigmatic (“n × m”)


“n” facets of viewed facts × “m” perspectives by viewing actors</td></tr>
</table>

in this text and means a “m×n” combination of both n viewing lenses and m viewing standpoints (second line in Table 3 and at the bottom of Table 4), hence the ability to use diverse paradigms and epistemologies for thinking and assessing realities. According to Lattuca et al. (2004: 35) and Perry (1968), the ability to employ various epistemologies and paradigms increases during individual biography.

As can be seen from the architecture of Figure 5 at left, the curriculum “Global Studies” (and the bundle of electives GS) endeavors to build such combined, inter-paradigmatic view of globalization and global development by including the “cultures of thinking” stemming from (“m”) different cultural positions of students and faculty with the (“n”) lenses of the disciplines history, economics, technology, sociology and culture, and international law as constituting perspectives and essential epistemologies. Figure 5 symbolically proposes the wedge of perception as a cognizable entity.

The evolution of “substrates of cognition” along the three modes is depicted in the right-most column of Table 3: elements – interactions – perspectives. Evidently, any strategy in global politics and developmental cooperation needs to deal with diverging perspectives as substrata of assessment – rather than dealing merely with sheer facts; as does, for example, physics (the author’s initial discipline).

The combined Table 4 emphasizes that the above three modes of science clearly go beyond the degrees of multi-, inter- and trans-disciplinarity that are common in literature: all these three degrees of integration across the disciplines gather within the first mode. However, intercultural thinking and inter-paradigmatic thinking include the position of the *reflective agent* within the self-referenced total of perceiving and influencing global change and globalization. The curriculum of “Global Studies” at Graz University clearly defines an *inter-paradigmatic approach* (GS 2010: 2).

Competencies for Inter-Disciplinarity

After the enlargement of the conceptual framework in the above subchapter, competencies and other requirements identified for inter-disciplinarity in literature are understood to be also applicable to an inter-paradigmatic approach.

The initial definition of inter-disciplinarity includes “the capacity to integrate knowledge and modes of thinking in two or more disciplines to produce cognitive advancement” (Spelt, et al., 2009: 366) and “builds on a performance view of understanding, meaning that individuals understand a concept when they are ready to apply it

Table 5. Core competencies for interdisciplinary research identified in a Delphi survey. Source: Larson et al. (2011, p. 39) and Gebbie et al. (2008).

Major Area	Competencies
Conducting research	• Use theories and methods from multiple disciplines in developing integrated theoretical and research frameworks. • Integrate concepts and methods from multiple disciplines in designing interdisciplinary research protocols. • Investigate hypotheses through interdisciplinary research. • Draft strategies and research proposals in partnership with scholars from other disciplines. • Author publications with scholars from other disciplines.
Communication	• Advocate interdisciplinary research in developing initiatives within a substantive area of study. • Express *respect* for the perspectives of other disciplines. • Read journals outside of his or her discipline. • *Communicate* regularly with scholars from multiple disciplines. • Share research from his or her discipline in language *meaningful* to an interdisciplinary team. • Modify his or her own work or research agenda as a result of interactions with colleagues from fields other than his or her own.
Interacting with others	• Engage colleagues from other disciplines to gain their *perspectives* on research problems. • Interact in training exercises and university lectures with scholars from other disciplines. • Attend scholarly presentations by members of other disciplines. • Collaborate *respectfully* and *equitably* with scholars from other disciplines to develop interdisciplinary research frameworks.

accurately and flexibly in novel situations" (Boix Mansilla, et al., 2000).

As a consequence of the above-mentioned requirements for the increasing levels of interdisciplinarity, Spelt et al. (2009: 366) consider "the ability to *synthesize or integrate* as a beneficial learning outcome of interdisciplinary higher education". As an example, a didactic procedure for such integration was provided by the negotiation game "Surfing Global Change" (Ahamer, 2005, 2006).

Highlighting the importance of perspectives (Table 3 right) as substrata of reasoning and cognizing, Wagner et al. (2011: 16) and Miller and Mansilla (2004) assume a "social process along four phases of increasing integration:

- **Mutual Ignorance:** Of other disciplinary perspectives.
- **Stereotyping:** That may have significant misconceptions about the other's approach
- **Perspective-Taking:** Where individuals can play the role of, sympathize with, and anticipate the other's way of thinking.
- **Merging of Perspectives:** Has been mutually revised to create a new hybrid way of thinking."

Core competencies for interdisciplinary research are listed in Table 5; it notably includes categories such as esteem and respect for other disciplines, and equitable dealing with peer scientists without considering oneself superior to others and their perspectives.

In the framework of the European Neighborhood Partnership Initiative ENPI, the author was instrumental in designing, planning and setting up several 1.2M€ projects, one of them to develop a curriculum for vocational education for agriculture in a difficult multicultural environment (Rosenzweig & Ahamer, 2009). It was particularly interesting to practically observe how respectful partnership and the principle of mutual esteem were essential for the acceptance of any future step during all phases of collaboration.

Table 6. Listing of barriers and opportunities in interdisciplinary science collaboration. Source: Fischer et al. (2001, p. 349), adapted.

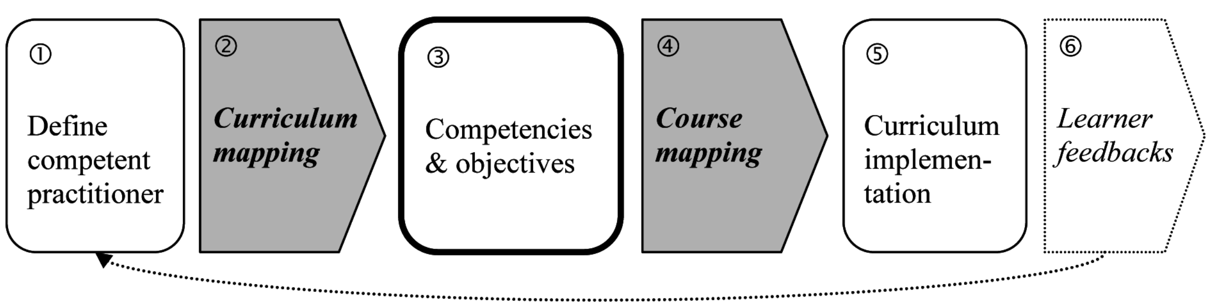
Barriers	Opportunities
Culture and Paradigms in the Sciences	
Fundamental differences between cultures of understanding in branches of science limits the relevance of approaches to be exchanged.	Complementary approaches may provide answers to problems previously outside of the scope of the field.
Make the scientific paradigms the most important aspect of research.	Make the real world goal the most important aspect of research.
Skills and Competences of Scientists	
Mutual misunderstanding of subject-specific jargon.	Select scientists with good interpersonal skills.
Lack of respect.	Select scientists willing to collaborate.
Context of the Research	
Academia is organized along disciplinary lines, making the establishment of collaboration between sciences more difficult than within disciplines.	Creation of interdisciplinary journals with high impact provides collaborative research a podium that is valued in the current evaluation criteria.
Academic institutions reward disciplinary work, and publication in high impact disciplinary journals.	
Tenure track criteria are largely organized along disciplinary lines.	
Evaluation of academic institutions and grant proposals largely follows disciplinary lines.	

Organizational Structures for Inter-Disciplinarity

According to Holley (2009: 337), universities need positive examples of transformational change linked to interdisciplinary initiatives; these can be facilitated by senior administrative support, collaborative leadership, flexible vision, staff development and visible action. Table 6 lists barriers and opportunities for such transformational change.

As a result of the above barriers and opportunities, a regular schedule of meetings among the stakeholders of an initiative such as GS is appropriate, as was implemented by the respectful open meetings of the steering committee GS in earlier years (SC GS 2010).

Figure 6. The continuous quality improvement model proposed by Ried (2011, p. 2), simplified representation along his main path of curriculum mapping and course mapping, including reassessment



How to Measure Quality in Curricula?

Given the above theoretical deliberations on criteria for inter-paradigmatic collaboration in higher education, this chapter proposes concrete methodologies. According to Bath et al. (2004), "it is suitable and indispensable to measure a practical curriculum against its original intentions". In the case of GS, these original and inalienable intentions were cooperatively defined in a peer-oriented process by Kumpfmüller (2007, 2009) and are reiterated in the general introduction of the curriculum (GS 2010: 1-2) and documented as a history of GS in Ahamer et al. (2011: 21-23).

Literature on "quality" as a concept is extremely extensive; one of the early paradigmatic narrative considerations of quality as such was the cult novel by Robert Pirsig (1974) *Zen and the Art of Motorcycle Maintenance: An Inquiry into Values*. Harvey and Green (1993) similarly provide very general criteria: "Quality can be viewed as exception, as perfection, as fitness for purpose, as value for money and as transformative". For quality assurance of (joint) Master programmes, Euro League (2010: 14) suggests to understand quality as follows:

- Quality as compliance with standards.
- Quality as fitness of purpose.
- Quality as fitness for purpose.
- Quality as customer satisfaction.
- Quality as continuous enhancement.

Such includes evaluation of curricula against needs of global real-world complexity and evaluation of the inherited course structure against the curriculum; called curriculum mapping and course mapping, respectively, in literature (Ried 2011, compare Figure 6). Uchiyama and Radin (2009) perceive curriculum mapping in higher education as a vehicle for collaboration. In an older article, English (1978) states that "the efforts of each teacher must be 'mapped', which means the real curriculum being taught in each classroom must be examined and recorded. This mapping can be done by having teachers map their own classroom curricula.... It can also be done by having observers use tools like an observer form for curricular mapping to record what is being taught in the classroom. The results of this mapping must be the beginning point for making the real curriculum fit the desired curriculum."

Cheng and Tam (1997: 24ff) present seven models of quality in education:

1. Goal and specification model
2. Resource-input model
3. Process model
4. Satisfaction model
5. Legitimacy model
6. Absence of problems model
7. Organizational learning model

Cheng (1995) emphasizes the *multidimensional concept of education quality*, which is not easily assessed by only one indicator (in similarity with management literature), as:

Education quality is the character of the set of elements in the input, process, and output of the education system that provides services that completely satisfy both internal and external strategic constituencies by meeting their explicit and implicit expectations.

Cheng and Tam (1997: 23) continue: "the difference in the *choice* of and the emphasis on indicators may *reflect the diverse interests* and expectations among the concerned constituencies and also the different management strategies". Consequently, consensus must be reached on the set of indicators, especially in such a complex case as GS. Regarding QA of Interdisciplinary Scientific Research (ISR), Wagner et al. (2011: 15) are undertaking a very comprehensive study commanded by the US National Science Foundation NSF, a review of the literature in order to consistently understand and measure interdisciplinary scientific research (IDR) and propose while "expanding the inquiry beyond quantitative measures to be inclusive along the following lines:

1. "Measurement of interdisciplinary research should recognize and incorporate *input* (consumption) and *process* value (creation) components as well as *output* (production) [compare the architecture of Figure 1 taking this into account].
2. Interdisciplinary research involves both *social and cognitive* phenomena, and both these phenomena should be reflected in any measure or assessment of interdisciplinarity [hence no limitation to cognitive measures].
3. Assessment of research outputs should be broadened *beyond* those based in *bibliometrics*, [i.e., ISI, Scopus, PoP, see later section of this chapter] while also factoring in differences in granularity and dimensions of measurement and assessment [hence include lecturing, didactics and pedagogy]."

A practical application of such measurement endeavors will be performed in the section "Applying Bibliographic Criteria to GS."

Taking a learner-centered standpoint, Gosling and D'Andrea (2001) suggest that "the quality of students' experience of higher education can more effectively be improved by combining educational development with quality assurance to create a more holistic approach."To reach better learning, van den Akker (2006, 4f) sees design research as important regarding (curriculum and course) design. He suggests interventionist, iterative, process oriented, utility oriented and theory oriented design research.

Methods for QA as a Process

Peterson et al. (2011) propose a course assessment process for curricular quality improvement and Piascik & Bird (2008) strive to create and sustain a culture of assessment. Ried (2011) suggests a model for curricular quality assessment and improvement (Figure 6); all three authors for the case of pharmaceutical education. Prager and Plewe (2009: S47) assess and evaluate GI Science curricula using the Geographic Information Science (GIS) body of knowledge while mentioning the pros and cons of being a completely regulated scientific field. They favor an outcome-based assessment of curricula founded on clear objectives: "in this approach, quality is not judged by conformance but by results". For them, the assessment of outcome sand curricular alignment can be thought of as an ongoing process that addresses four important steps (Suskie, 2004, p. 3):

1. What does the programme expect students to learn? (Desired Student Outcomes)
2. Does the programme give students sufficient opportunities to meet these expectations? (Curriculum Alignment)
3. What have students learned? (Actual Student Outcomes)
4. How can learning be improved through changes in the programme? (Programme Revision)

Such procedural architecture is still sufficiently in line with the process suggested in Figure 1. Ried (2011) discusses each component of his continuous quality improvement model, "including (1) the definition of a competent practitioner, (2) development of the core curricular competencies and course objectives, (3) students' baseline characteristics and educational attainment, (4) implementation of the curriculum, (5) data collection about the students' actual curricular performance, and (6) reassessment of the model and curricular outcomes" (simplified as flow chart in Figure 6).

Prager and Plewe (2009: S50) suggest a model with seven steps for integrated assessment and curriculum evaluation: specify mission and objectives, specify curriculum elements, review objectives and curriculum, assess student learn-

Table 7. Overview of potential sub-skills and conditions for interdisciplinary curricula. Source: Spelt et al. (2009), adapted from Biggs (2003).

Interdisciplinary thinking	Having knowledge	Knowledge of disciplines
		Knowledge of disciplinary paradigms
		Knowledge of interdisciplinarity
	Having skills	Higher-order cognitive skills
		Communication skills
Student	Personal characteristics	Curiosity
		Respect
		Openness
		Patience
		Diligence
		Self-regulation
	Prior experiences	Social
		Educational
Learning environment	Curriculum	Balance between disciplinarity and interdisciplinarity
		Disciplinary knowledge in-/outside courses on interdisciplinarity
	Teacher	Intellectual community focused on interdisciplinarity
		Expertise of teachers on interdisciplinarity
		Consensus on interdisciplinarity
		Team development
		Team teaching
	Pedagogy	Aimed at achieving interdisciplinarity
		Aimed at achieving active learning
		Aimed at achieving collaboration
	Assessment	Of students' intellectual maturation
		Of interdisciplinarity
Learning process	Pattern	Phased with gradual advancement
		Linear
		Iterative
		Milestones with encountering questions
	Learning activities	Aimed at achieving interdisciplinarity
		Aimed at achieving reflection

ing outcomes, verify alignment of objectives and curriculum, verify alignment of student outcomes with objectives and curriculum, and identify revision needs. These seven steps fit roughly into Ried's concept in Figure 6.

For the sub-process "course mapping" in Figure 6, Peterson et al. (2011: 4) propose a tentatively standardized course evaluation form for each lecturer with ten open-ended questions including a variety of perspectives:

1. **Course Policies and Procedures:** Completeness of course syllabi, use of standardized syllabi format, and compliance with policies and procedures.
2. **Course Content and Relationship to Learning Outcomes:** Content and competencies match, learning objectives are addressed.
3. **Integration within the Curriculum:** Appropriate placement within vertical integration, appropriate sequencing and horizontal integration with concurrent courses when appropriate.
4. **Skills:** Identifies that knowledge and skills are developed, practiced, and assessed.
5. **Student Assessment:** Types and number of assessments linked to learning objectives, student performance, and advancement.
6. **Course Coordinator Performance Review:** Course management skills.
7. **Summary of Individual Faculty Teaching Reviews:** Summarized from teaching evaluation forms and student instructor evaluations.
8. **Recommendations:** Specific recommendations and suggested changes for course improvement.
9. **Active Learning:** Describe active-learning techniques observed.
10. **Key Assessments and Key Artifacts:** Specific examinations or learning activities that serve as a demonstration of competency.

The implementation of the above-mentioned processes of QA (and of any sustainable QA) that is to be accepted by those involved requires a "spirit of cooperation, mutual understanding, esteem, and respectful professionalism" (Towell 2012: 107) among the greater team of assessors and assessees.

Assessable Quality Criteria

In this subchapter, the set of quality criteria assessed as most appropriate by the present paper is displayed in Table 7; its leftmost column is identical to Table 1 that has been equally recommended in this paper. These structured quality criteria are general enough to be used henceforth and practically. As an example, "communication skills" indicate the necessity of learning the language of discourse of different disciplines in order to be able to negotiate meaning, resolve epistemological differences, develop shared understanding, and communicate cognitive advancements to a broad audience (Manathunga et al. 2006; Woods 2007; Spelt et al. 2009).

As a suggestion, Table 7 can be complemented by a fourth column into which performance for the respective quality criterion is then entered.

Practical examples for curriculum development around the world:

Over the last decade, almost all European countries have established national systems for the assessment of quality in higher education. Similar developments can be found in many other parts of the world (Brennan & Shah, 2000).

Regarding developmental curricula such as GS, curriculum development in the South (earlier called 3rd world) seems no less common than in the North (earlier called 1st world).Among others, the following studies and notes pertain to Kenya, South Africa, China, Indonesia, Iran, and Latin America: SAQA (2000), Busoga (2012), Mayer et al. (2011), HigherKOS (2012), Mwinyipembe (2012), Western Cape Government (2012), Fu Jen (2012), Sumaedi et al. (2012), Monarca (2012), Havas et al. (2011), and Masembe and Nakabugo (2004). Themes pertain to students' perceived service quality, the influence of national systems of evaluation on curriculum development, the quality of curriculum evaluation in postgraduate studies, or they pertain to QA in curriculum development.

Curriculum development in the North especially seems to take place in Anglo-Saxon countries (Scottish Government 2011; Teagasc

2012; Lime 2012; UNEVOC 1993) that appear to have more of a review and discourse-oriented tradition than Central European countries might have. Wolverhampton (2012) takes advantage of inter-disciplinarity for new curricula and courses, Jordens and Zepke (2009) propose a network method for QA of curricula, Schmidt and Shaw (2008) assess quality regarding e-learning, Towell et al. (2012) create an interdisciplinary business program, Saunders-Smits and de Graaff (2012) include alumni research, Huntoon and Baltensperger (2012) educate earth science teachers.

For further quality assurance in transnational education management, clear declaration of assessment criteria, assessment procedures and a revealing of the hidden agendas of those involved (such as attempts to strengthen own institutes) will prove most useful.

QA FOR THE GS CURRICULUM

The key motto of QA in a developmental curriculum such as GS is responsibility and "accountability for educational outcomes" (Ried 2011: 8). Any assessment procedure should use "a variety of valid and reliable measures" serving as metric for quality criteria agreed in consensus. The university or "school must use the analysis of assessment measures to improve student learning and the achievement of the professional competencies", best as continuous quality improvement (p. 1).

Why GS and What is GS?

The target of the inter-paradigmatic, intercultural and interdisciplinary developmental curriculum GS was coined and formulated by the Austrian doyen in peace research, Karl Kumpfmüller (2007, 2009) and has been developed by him (Kumpfmüller & Ahamer, 2013) in cooperation with a peer-oriented "Steering Committee GS" (SC GS 2010) since 2004. The target and history of GS is extensively explained in Ahamer (2011) and Ahamer et al. (2011). The aim of GS is a professional preparation for critical and peaceful global developmental cooperation and humane management of globalization issues, for example with a strong orientation towards human rights (Benedek 1994). Since its inception, the SC GS has always comprised representatives from all schools of Graz University (in German: faculties, hence GC is an interfaculty curriculum). The author was dispatched to the SC GS to represent the interdisciplinary curriculum Environmental Systems Science and has done so since the first year of GS; this unique curriculum in the meantime belongs to a nearly founded university faculty comprising pedagogics, environmental, systems analysis and interdisciplinary studies (URBI 2012).

According to the above scheme Figure 6 of (a) curriculum mapping and (b) course mapping, the activities listed below have already been performed for GS Graz; another assessment exercise is likely to be launched by the university senate soon. The present chapter should also provide a framework for such a forthcoming assessment.

Measuring Quality in the GS Curriculum

For future QA of an inter-paradigmatic GS curriculum, the methods described by Figure 1 and Table 7 are proposed.

Until now, from the author's view the following feedback activities from the student side have been retrieved. These serve as the first examples of Quality Assurance (QA) measures already implemented to date for the Master's curriculum GS Graz:

- A reviewed paper by the student representative Bader and Zotter (2012) including their survey among all GS students after the second year of GS in 2012; and other surveys by student representatives.
- Regular evaluation of all GS courses by the university-wide online course tool UGO.

- All courses held with the cooperative online learning WebCT included evaluations.
- Students have nominated the lecturer of "economics in developing countries" for the university's prize for the best lecturer. (Lehre: Ausgezeichnet 2010)
- In the framework of GS, interdisciplinary practicals of environmental systems science were eligible and have yielded WebCT evaluations and final reports of ~200 pages.
- The didactic methodology of the Web-supported negotiation game "Surfing Global Change" utilized in these courses was published a dozen times in reviewed journals and entered into the didactic retrieval systems of the Academy of New Media and Knowledge Transfer.
- The genesis of GS Graz and its national context has been published two times. (Ahamer et al. 2011; Ahamer 2011)
- On January 15, 2012 the nationwide workshop on developmental policy was held in Graz, co-organized by the author.
- As a result of the course "Analysis of practice in GS" the participants published a collaborative article in the "Multicultural Education Technologies Journal" on two contested hydro-energy projects in Brazil and Turkey. (Duraković et al. 2012)
- The publication outlet for the 5^{th} national conference on global development three special issues of a peer reviewed journal entitled "Global Studies".
- The national university project Sustainicum (2012) on university didactics includes a description of the didactic procedures used in the "basic lecture GS" by the author, as well as other pedagogic strategies for eligible GS courses such as the interdisciplinary practical "energy revolution" ("SGC", "3x7 = 21", "jet principle").
- In coherence with the university mission statement, the foundation of a new peer reviewed online journal "Global Studies Survey" was planned and submitted (GLOSS 2007). Another SSCI journal was founded by a SC GS member: Sturge and Wolf (2008).
- As an input to the new strategic agreement among ministry and university, the author has submitted a structural proposal upon invitation to the rectorate to strategically foster GS. The proposal was supported by the curricula commission and the official students' representation (GS 2011) and has been very positively received by the rectorate; however, the text of the agreement has yet to be amended.
- Student representatives have expressed their opinion in favor of lectures on developmental economics and social and cultural geography in 2012.
- As an elective exercise, students in the basic lecture GS compared the GS curriculum against other, similar developmental curricula and submitted suggestions for the improvement of the GS curriculum.
- Amonographis planned to include student papers authored during the basic lecture GS. This could serve as a textbook for the basic GS lecture.
- Cross-national cooperation with GS curricula in Salzburg, also Vienna, Linz and with umbrella institutions such as the Mattersburg Circle for Developmental Policies (MK 2012), including a lecture for the GS curriculum in Salzburg.

The abovementioned student feedback suggests among other things (a complete list is available as an addendum to the chapter titled "Education and literature for development in responsibility – Partnership hedges globalization"):

- Increase the role of foreign languages in GS.

- Include lectures on non-neoclassical economics in GS.
- Include the introductory lecture by the founder of GS in the economics module in the regular GS curriculum.
- Arrive at true inter-disciplinarity among all lecturers, who should regularly communicate among themselves.
- Usage of learning platforms was seen positively.

Also the curricula commission (CuKo 2012) took account of some aspects of QA, based on feedback from students:

- More cohesion among the modules of the basic lecture.
- Clear definition of the perspectives adopted by lecturers.
- Clear definition of a main thread throughout the basic lecture.
- Localization of each lecturer's contribution within the greater context.
- Presentation of a meta level of GS by the GS founder.
- The unique selling proposition of GS is its multi-perspectivistic and integral analysis of the phenomena of globalization (see the inter-paradigmatic model of columns in Figure 5).

These items will be completed by achievements seen from other points of view.

Applying Bibliographic Criteria to GS

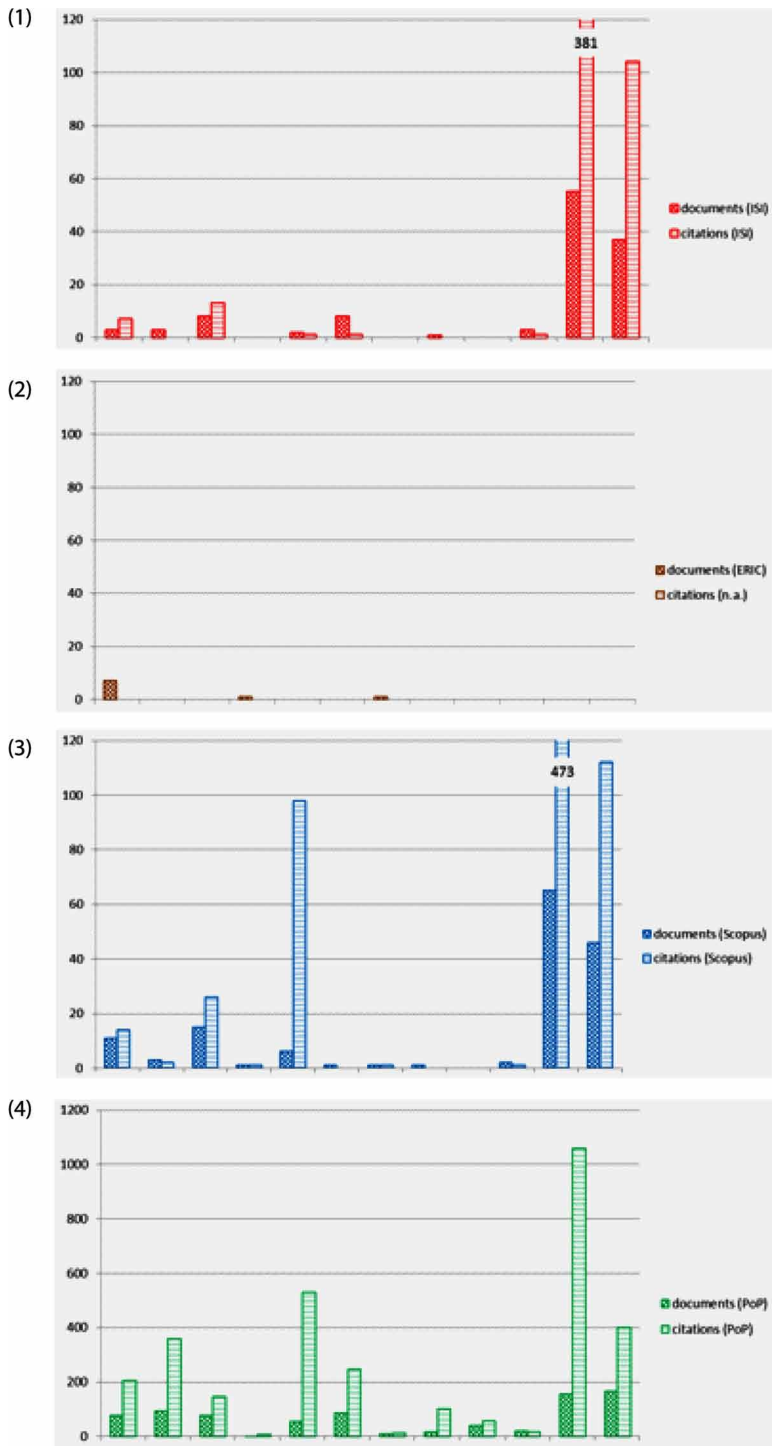
Price (1978) and Wagner et al. (2011) argue that "publication provides the function within science of correction, evaluation, and acceptance by a community. Published works are collected in journals, and a select set of journals is included in various databases such as the Web of Science (built and maintained by ISI Thomson Scientific) or Scopus (built and maintained by Elsevier)" as well as Google Scholar (analyzed by the small but powerful program tool "Publish or Perish" by Anne Harzing (2007) which makes this vast database easily usable.

These databases provide the raw material used in current bibliometric efforts to measure IDR, such as ISI Thomson "introduced by Derek de Solla Price and Eugene Garfield and adopted among others by the National Science Foundation NSFA or the OECD.… Scopus has now achieved high recognition and offers promise in that it currently indexes many thousands more source titles than the ISI databases" (Wagner et al. 2011: 18) and especially by having introduced skillfully normalized metrics such as SNIP and SJR that attempt to level out inconsistencies among citation rates among disciplines. Still, "citation measures privilege publication as the major outcome of IDR. This is one of the sharpest limitations of this approach" (Wagner et al. 2011:19) and therefore requires the use of an additional structural approach by including courses, outreach activities, press and public lectures, as is already implemented in the university's internal citation system in some criteria for professorship.

For the following analyses, some of the criteria suggested by Wagner et al. (2011) were practically applied to the twelve lectures having been active in courses planned specifically for GS in the (last available) academic year 2011-12 (including the number of weekly course hours, according to the retrieval system University Graz OnlineUGO 2012):

- Basic lecture GS (winter semester, 324.519, Basisvorlesung GS, 6)

Figure 7. Bibliometric results for twelve GS lecturers active in 2011-12 regarding retrieved documents (dark, at left) and retrieved citations (light, at right) from four different databases: ISI Thomson (first), ERIC (second), Scopus (third), and publish or perish based on Google Scholar (fourth). Vertical axes (0-120 for the first three and 1-1200 for the fourth) underline the larger sample of the latter.



- Ring lecture GS (winter semester, 324.529, Ringvorlesung GS, 2)
- Introductory lecture GS (winter semester, 324.539, Einführungs-LV GS, 2)
- Analysis of practice GS (winter semester, 324.509, Praxis-Analyse, 1)
- Analysis of practice GS (summer semester, 324.500, Praxis-Analyse, 1)
- Master seminar GS (summer semester, 324.540,Masterseminar GS, 2)

Within this list, the "basic lecture GS" at the start of the first semester in the Master's curriculum provides most of the disciplinary models on development such as history, economic history, economics, environment, society and culture, and international law (Figure 5); these should be integrated by a truly interdisciplinary lecture: such is the intention.

Figure 7 displays the results for the mentioned databases. ISI and ERIC are located in the US (reddish, above row), Scopus in the European Union (blue, below left), PoP is global and shows a tenfold load of documents (green, below right). All documents were manually counterchecked for identities and ambiguities in authorship regarding authors with similar names, if necessary single documents were read.

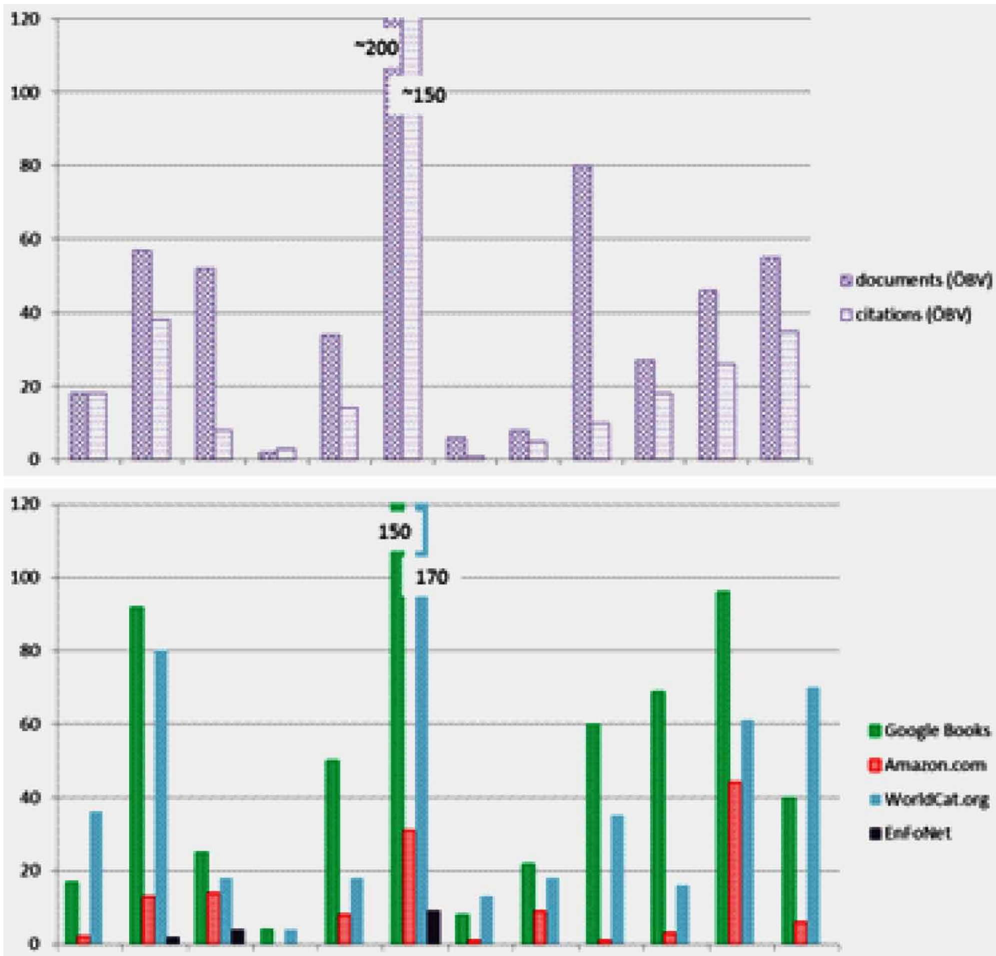
Documents Retrieved in Literature Repositories

The first two of all pictured databases (ISI rather for sciences, ERIC for educational literature) were selected identically to the categories of the monitoring system AkademIS used by the Austrian Academy of Sciences (ISI (S)SCI, ERIC; while for A&HCI on humanities no specific access seemed to be implemented).

The second row of Figure 7 provides the other databases identified by most authors and commentators in the field, such as Wagner et al. (2011), Harzing (2010), Barbour (2012), Virtual Canuck (2011). It appears that the access to ISI and Scopus is restricted to subscribed universities but the use of the other databases is free. The list of Scopus-referenced journals (~20,000) is almost twice as long as with ISI Thomson. Scopus has amended one of the most striking shortcomings of the classical ISI impact factor (equal to roughly the number of citations per number of papers) by the introduction of SNIP and SJR (Scopus 2011) for which time series can easily be compared by a very user-friendly tool, "journal analysis." In this sense, Wagner et al. (2011: 24) ask "what types of normalization (necessary to account for the different relative sizes and dynamics of science across research fields) are required to match the different units of analysis and granularity and what types of measures are best for computing the inputs, processes, and outputs of interdisciplinary research (e.g. simple counts, network measures, dynamic models, or a combination)?" According to Science Watch (2010), the disciplines "with the lowest citation thresholds observed are Social Sciences, Computer Science, and Multidisciplinary Sciences" – which does not at all favor the case of interdisciplinary or inter-paradigmatic thinking – when relying on mere bibliometrics.

Regarding the differences between single databases, Scopus shows more equilibrated scores among representatives of natural sciences, social sciences, and humanities than ISI. The program PoP based on the Google Scholar Database shows the least differences in documents between the main branches of science, notably between technology and others. These data include publications without having undergone a peer review process, as do most journals as the main means for QA. On the other hand, informal articles such as public lecture talks, conferences, and outreach activities are included here. Barrier-free or open access documents especially facilitate citation by students or low-budget countries – as can be shown by download statistics provided by some of these publishers (e.g. INTEC 2011). Also un-reviewed books from regional publishers and eulogies may increase the number of documents in PoP.

Figure 8. Documents retrieved from additional sources: Top: OBV (2012): Catalogue of Austrian libraries (draft numbers). Bottom: Google books, Amazon.com, worldcat.org, EnFoNet (all draft numbers, after manual checks for errors, without checks for double counts).



In the frequency distribution charts of Figure 7, two lecturers from another, technologically oriented university have been taken out of the regular order and placed rightmost for easier interpretation. Technical and natural sciences have higher scores in almost any citation index, non-quantitative disciplines such as history or humanities tend to have fewer citations, social and economic sciences might range in the middle. When interpreting it becomes apparent that real performance of individuals is not sufficiently well illustrated by such data. Neither is interdisciplinary competence measured suitably by sheer citation data, which favor single-disciplinary careers.

High scores in purely disciplinary metrics (such as those being referenced by ISI Thomson) do not protect against feedback from students: sustained high levels of student criticism were targeted at "unequilibriated presentation of only one out of several appropriate paradigms" (student feedback) because of its sharply limited notion of how the complex syndrome of globalization was considered. On the other hand, such lecturers often found other colleagues as insufficiently qualified. This shows that self-perception and perception by others may differ considerably – actually this is the core motivation to set up an *inter-paradigmatic world view* in any case, especially applicable for multi-paradigmatic necessity to understand globalization while slipping out of one's own conceptual and epistemological limitations.

Figure 7 above right (ERIC) shows that publications on didactics and pedagogics occur very seldom, even if teaching and training accounts for a large share of the profile of university staff. Generally, didactic skills are underappreciated in the assessment of university careers, according to the author's view.

Members of the curricula commission (CuKo) have low scores in several databases, nevertheless decisions are often made without consulting other team players who have for many years been active for GS. Compared against a subset of 11 non-retired lecturers, the 5 CuKo members had among the lowest scores of ISI documents (except one) as well as among the lowest scores of ISI citations; the same applies when using the ERIC, Scopus or PoP databases. A negative correlation becomes apparent between performance according to above bibliometrics and self-alleged importance at organizational and political levels regarding university administration and curriculum management. From the perspective of Figure 7, publishing little and being cited rarely in peer reviewed literature correlates with high locally visible honors.

However, it is also possible to draw on a more local database: The combined retrieval system of all Austrian libraries (OBV 2012) yields approximately the number of documents and citations shown in Figure 8, top. The relative distribution is markedly different when dismissing the quality criterion of "international peer review" but adding works being produced by local publishers, seemingly without peer review, historic and social sciences wins the highest scores. Because the self-perception of authors most likely uses the lenses of one's own discipline and its weighing of what is preferable (e.g., book versus journal article), it might be possible that each individual ranks high in their own assessment but colleagues from other disciplines rank much lower. Such (apparently very perspective-bound) perception may extend to disciplines, their paradigms and methods but even to individual personalities and their degree of justification in academia. As an example of bibliometrically induced personal reactions, Virtual Canuck (2011) warns that "a nice glass of scotch is sometimes necessary – either for savoring self-induced feelings of smugness or for drowning one's sorrows over the incapacity of others to recognize true genius". Readers are therefore kindly requested to consult their bar when reading this article. If ever in a casual community of loosely interacting stakeholders (e.g., team of lecturers meeting just once a year discussing timing and schedules) individuals do not engage in a deeper dialogue on the weighing factors of their implicit quality assessments (e.g., what types of result are important), a situation can arise where all individuals enter a room feeling better than their colleagues and 2 hours later they leave the room with the same self-conception. Such perceptional patterns may potentially carry on for decades.

Figure 9. From a systems analysis viewpoint, assessment exercises can be understood as a self-referential system: the assessment a(m), i.e. "how good is each author 'a' in the perception of the assessment method 'm'" is complemented by a conjugate assessment m(a), i.e. "how good is each assessment method 'm' in the perception of the author 'a.'" Such autopoietics create social dynamics that are typical for any closed systems.

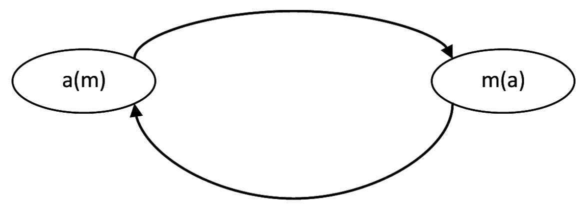


Figure 10. Hirsch's h index based on three different data bases: ISI Thomson, Scopus, and publish or perish based on Google Scholar. The h index can be computed only for such databases that provide both document numbers and citation numbers.

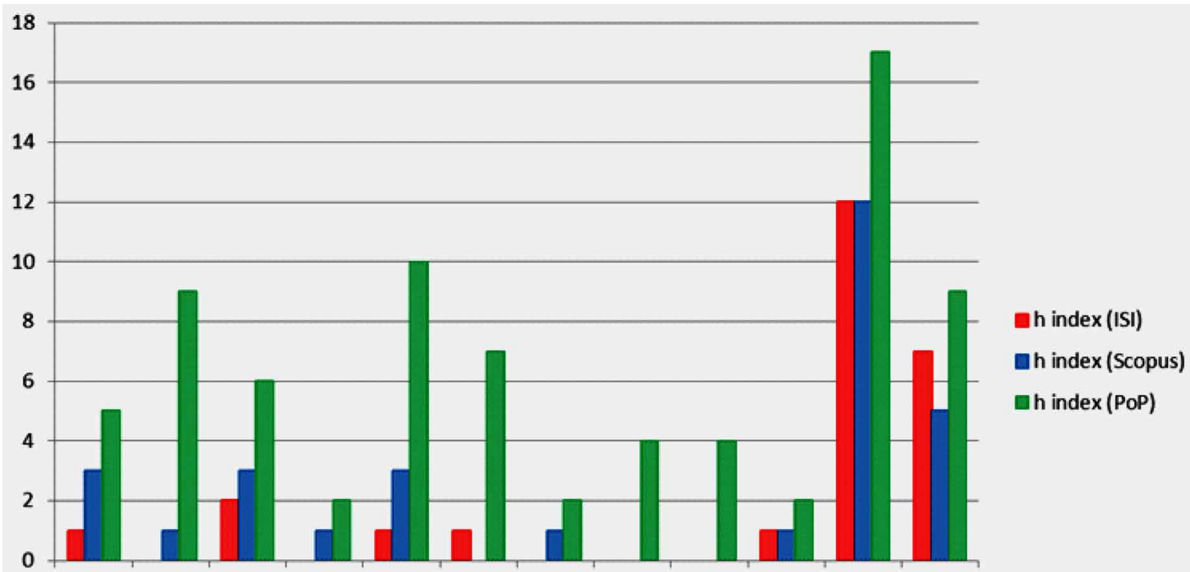
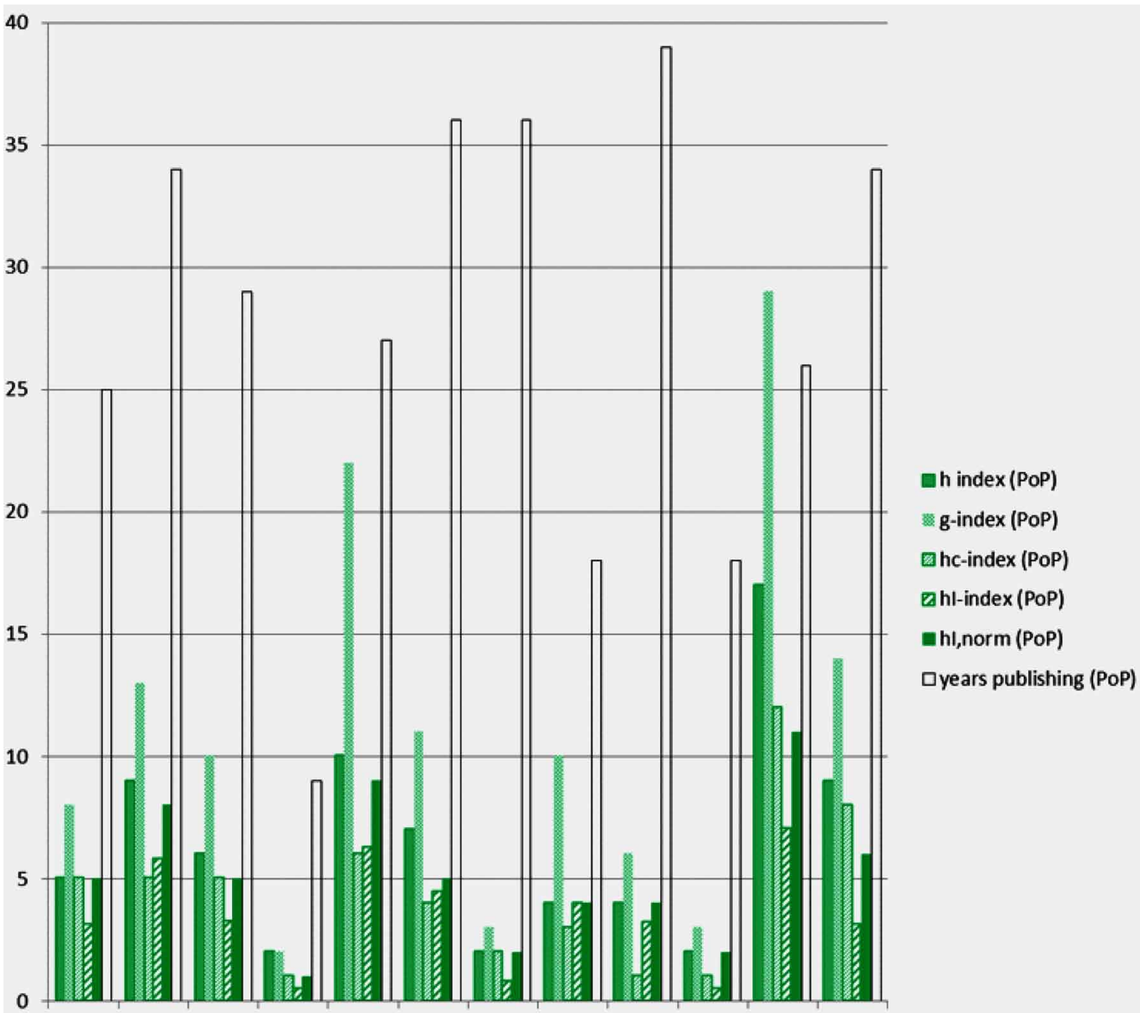


Other descriptors (Figure 8, bottom) such as retrieved documents in Google books, Amazon.com, or the recently established very comprehensive worldcat.org yield other distribution patters and correspond to other preferences in underlying conscious or unconscious assessment. The recent Austrian study on developmental research networks EnFoNet (Witjes et al. 2012 in Figure 8) has decided to use connectivity with other authors as a main criterion after a potentially subjective selection procedure of developmentally relevant pieces of work using the OBV (2012) data set.

Bluntly speaking, for each author (a) an assessment method (m) can be found where author 'a' ranks as best or second best out of the given sample of twelve. This "finding" translates the assessment exercise (or optimization exercise) "how good is each author 'a' in the perception of assessment method m" in a conjugate assessment (or optimization) exercise, namely "how good is each assessment method 'm' in the perception of the author a" (Figure 9). Such a self-referenced social procedure (in the language of social systems analysis) might produce non-linearities in optics, favor sub-optimal perception and the persistence of local sub-optima. Clearly, power relations are an important ingredient on both a local and global scale, including the power of defining success criteria. In the author's view, escape from such a closed loop pictured in Figure 9 is feasible by proactive esteem and acknowledgement of other, foreign quality definitions and quality concepts. Escape is impossible when continuously residing within one's own frame of reference for quality.

Mathematically speaking, a and m are conjugate functions producing two conjugate spaces: the a-space and the m-space. Assessors and assessees might decide to wish to live (only) in either of them – but they might also remember that in other walks of life they change their roles – this is exactly the approach of the negotiation game "Surfing Global Change" (Ahamer 2005, 2006). For design science (Dorst & Cross 2001), such conjugate spaces are known as problem space and solution space. For systems analysis (Ossimitz 2000), such structure is autopoietic and

Figure 11. Modified h indices from the tool Publish or Perish (PoP, greenish), including the number of years an author has passed since their first publication (white)

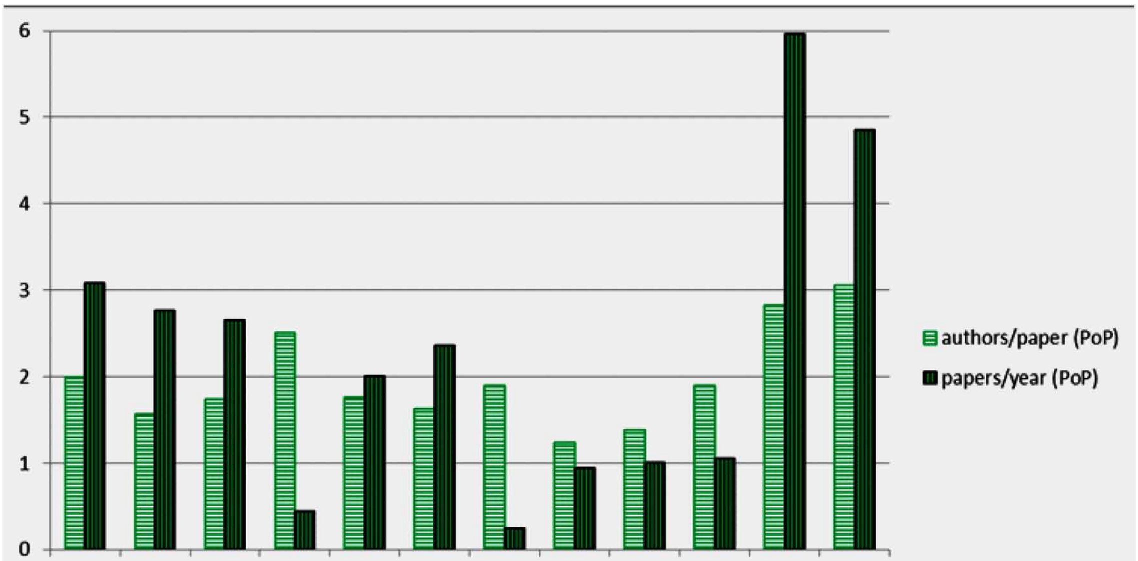


constructs itself – this might be a nice reference to pedagogic constructivism (Watzlawick, 1988). In such systems, the "construction of meaning" (e.g. of "quality") may depend on the smallest stochastic changes in initial preconditions; according to the teaching of chaos theory.

Assessment by Hirsch's h Index

As a consequence of the above-mentioned characteristics of the growing volume of databases, almost all metrics increase along the chain ISI – Scopus – PoP (Figure 7). Also, given the vast multitude of assessment methods and databases for each assessment and in order to combine authors' production with their reception, a need has arisen for a combined and dimensionless measure that takes into account both the number of documents and the number of their citations. The so-called Hirsch index or "*h index*" combines both parameters by yielding an index h if h of a scientist's papers have received at least h citations each (Figure 10). The h index aims to measure the cumulative impact of an author's output by

Figure 12. The PoP tool additionally provides the average number of authors per paper and the annual output of papers per year



looking at the amount of citation the author's work has received.

When contemplating Figure 10, naturally this h index grows markedly with the growing substrate of documents, notably along the chain ISI – Scopus – PoP (Figure 10); this is the case especially for non-technologists. Most strikingly, researchers in humanities and law might have an h index of zero or one with ISI but high h values with PoP; social scientists and economists have a middle position regarding this increase of h indices across databases; while natural scientists may even have similar h indices in all three databases, astonishingly enough, due to the thorough inclusion of their (even grey) literature in ISI Thomson. Quite naturally, the global outreach and world-wide auditorium will be very different for different outlets such as books, journal articles, presentations and informal papers. In the author's opinion, a mature scientist's profile should show assets in many such publication strategies – but should not be modest in all of them. Again, when taking an aggregated picture of all three h indices in Figure 10, 4 out of the 5 CuKo members score in the last places, their (vice-)presidents in the very last places. Strategically designing an innovative curriculum might often be considered as bringing lower honors than publishing papers – at least tacit selection criteria in force suggest this.

Several modifications of this quite telling h index have been proposed in literature and are also provided by the PoP tool (Figure 11). In order to better account for recent publications as compared to older ones, the g index was proposed (light green) but is considered as not very telling by the author; similarly the contemporary h index or h_c index (definitions, algorithms, detailed interpretations and caveats see in Harzing 2010). The individual h index or h_I index accounts for shared or multiple authorship (which might be a positive sign of team-orientation, or likewise be a deliberate strategy by authors to push their indices), as does the $h_{I,norm}$ index (preferred by the author, dark green in Figure 11)in a still more fine-grained manner. An in-depth description of all indices and their pros and cons can be found in the help function of the highly recommendable PoP program (Harzing 2007) or on Wikipedia.

Figure 13. Schematic representation of the attributes of diversity based on Stirling's (2007) conceptualization (Wagner, et al., 2011, p. 21): variety, disparity, and balance. A proxy for the variety indicator might be given through Figure 14.

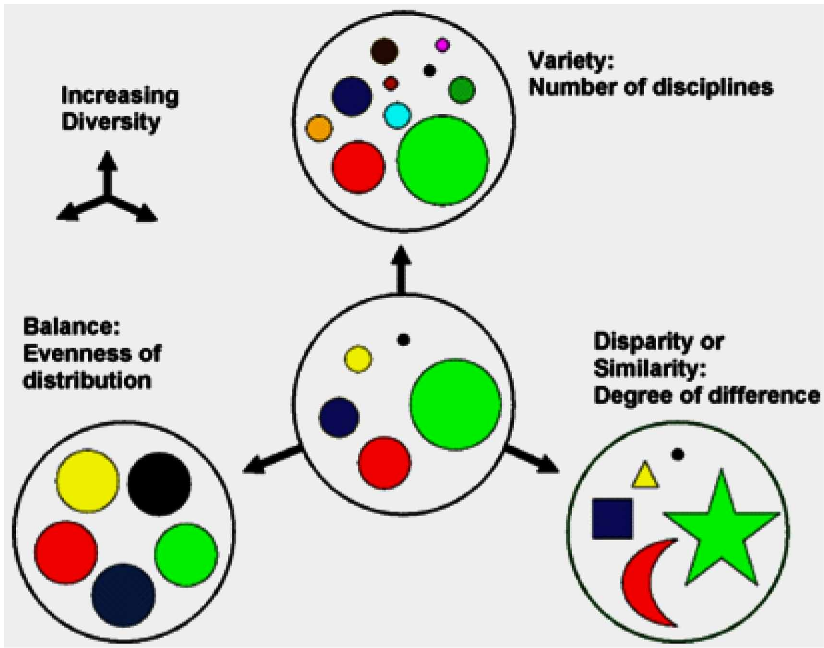


Figure 14. The pie charts from Scopus' "author analysis" tool graphically denoting the distribution of publications between different disciplines for all GS lecturers in 2011-12 ordered as in above figures. Colors are arbitrary regarding disciplines, just meaning consecutive order.

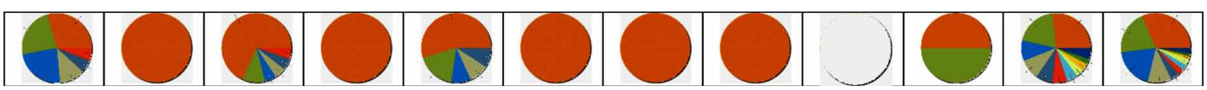

The cascade of these indices shows a strong decline for several authors in Figure 11 which might be co-determined by technical sciences having more multi-author publications than other branches of science, especially humanities. Along the chain of ISI – Scopus – PoP, the author on average scores roughly in fourth, third and fifth place, i.e. rather in the middle of the field, and hence has no personal interest in favoring one metric over another.

Figure 12 adds two variables of general interest (based on PoP data), namely authors per paper (almost 3 in technical sciences, lowest around 1.5 in humanities) and papers published per year (averaged since first publication), maybe closer to personal diligence than other parameters. Again here, 4 out of the 5 lecturing CuKo members range in the last places. At universities, career building in general need not be correlated with high scientific output; such was proven again when a call for professorship recently turned out successful for a candidate who scored far behind the leaders in science-oriented metrics but who already had personal knowledge of the respective institute.

Attempting to Measure Diversity for Inter-Disciplinarity

According to (Wagner et al. 2011: 21)who reports Stirling's (2007) conceptualization of interdisciplinary quality criteria as Figure 13, an additional criterion for inter-disciplinarity is distribution among various disciplines for which a proxy might be the pie charts provided by Scopus listed in Figure 14, again without names in order to secure anonymity. Still other criteria are: roles of (co-)editor in journals, editorial board member, participating in and managing of international projects with a developmental approach, countries worked in for different institutions in diverse roles, own academic formation in several disciplines, affiliation to and cooperation with different, inter-paradigmatically relevant institutions, lecturing in diverse subjects and diverse disciplines at diverse universities, have lived and coined multiple corporate cultures, performing outreach activities, didactic and pedagogic formation and achievement etc. – but quantitative charts are difficult to perform in these cases.

Figure 14 visualizes the multi-disciplinarity of authors by different colors: each color denotes a discipline (according to Scopus categories) in decreasing order of occurrence (orange, green, blue etc.). For the interpretation of such figures, evidently the definition, categorization, and granularity of disciplinary subdivision are highly critical for the appearing graphical impression. Also, these colors do not describe the effective interdisciplinary and inter-paradigmatic quality of the content of any single paper. In Figure 14, the lecturer with the lowest score had the highest administrative position for the GS curriculum in the given year. Sharing of power was experienced by some to be uncommon in this period. An inverse correlation between international bibliographic achievements and actual self-attributed power is apparent in this, and many similar, analyses.

In an attempt to produce impressive graphics quickly, one can always "introduce disciplinary diversity indicators to describe the heterogeneity of a bibliometric set viewed from pre-defined categories" or design "indicators of disciplinary impact by focusing on the intensity of knowledge streams between research fields" or "suggest that betweenness centrality can be used as a measure of interdisciplinarity" (Wagner et al. 2011: 21) or use spatial distances as an assessment tool (Witjes et al. 2012) without preceding in-depth analysis. However, acceptance of such exercises would be limited when assessing the deep quality of inter-paradigmatic understanding as such.

Critical Evaluation of Bibliometric Approaches

"Each approach may tell a useful story" is possibly a suitable final assessment on bibliometric attempts: Wagner et al. (2011: 25) speak up against the limitations to purely quantitative measures and metrics, but call for structural and process-oriented strategies of assessment that take into account complex, self-referential, inter-paradigmatic dynamics of what could be finally considered "academic quality": Γνῶθι σεαυτόν = know yourself – including a critical analysis about your own misconceptions about yourself.

Escape from the self-referential cycle of QA and related power attribution may quite profitably be achieved by proactive application of QA frameworks that are different from one's own; this means to exchange lenses and standpoints in an inter-paradigmatic manner (Figure 5 and Table 4). Mono-disciplinary sclerosis is undesired for such targets.

CONCLUSION AND RECOMMENDATIONS

This paper has been undertaken in order to facilitate transparent and internationally acceptable high-quality assessment to assure the quality of interdisciplinary curricula such as developmental, peace, environmental and global studies.

The literature analysis undertaken in first section of the chapter has yielded sufficient theoretical concepts on quality, inter-disciplinarity and QA methodologies for inter-paradigmatic university curricula to propose a framework for future QA: Figure 1 shows the general overview which has to take into account the input, procedure and output of higher education. Figure 6 proposes to include both curriculum mapping (against initial targets and aims) and course mapping (performance of individual lectures). Table 7 lists criteria, skills, and conditions for especially interdisciplinary curricula.

For transnational higher education it is found to be important to take on an inter-paradigmatic approach which means being able to think along conceptions of diverse stakeholders involved in the complex issues of development, global change and globalization. Such an approach practically means a collaborative and team-oriented performance of academic duties, and no reliance on administrative hierarchies.

The application of above findings for the innovative inter-disciplinary developmental curriculum "Global Studies" in section 2 includes a collection of learner-centered feedbacks and assessment procedures as well as bibliometric analysis. Documents and citations from three different bibliographic databases and derived metrics such as the h index permit quantifiable insight into the performance of lecturers which has to be complemented by social and structural information such as inter-paradigmatic competence, real-world experience from international developmental projects and didactics.

Options and limitations of bibliometrically based QA strategies were extensively discussed and changing frames of reference were recommended that span across disciplines.

The main recommendation for quality assurance in transnational higher education, especially in interdisciplinary curricula on global change and development, is professional clarity on targets that should most efficiently be monitored in a peer-oriented procedure involving assessors, lecturers, practitioners and university administration on an equal basis in a culture and atmosphere of collaboration. Limitation to discipline-oriented bibliometric metrics alone is not appropriate, as is limitations to implicit or explicit attribution of administrative or political power or financial sources in higher education. The present paper suggests that cutting-edge quality can be maintained and enhanced best in a culture of mutual esteem, respect, personal integration and orientation towards clear performance criteria previously agreed in consensus among older and younger contributors, from both the theory and practice sides of all disciplines.

KEY TERMS AND DEFINITIONS

Curriculum Assessment: Means the quality assessment of university curricula regarding the quality criteria set out in literature and in this articlechapter.

Global Change: Is seen here as the long-term change in global patterns of social, cultural, economic and environmental systemic patterns that in the present epoch may take the form of globalization, but in other epochs exhibit different change patterns.

Global Studies: Are developmental university curricula dealing with globalization, international equity and respectful development.

Globalization: Is understood here as the slow but steady change in systemic patterns of global trade, economics, culture, society and behavior; triggered among other things by easier accessibility mediated through communication technologies.

Graz University: Is Austria's second-oldest (since 1585) and second-largest (over 30,000 students) university in its second largest city of Graz (260,000 inhabitants) offering almost all important curricula in its six faculties. The latest innovation of this public generalist university is the interdisciplinary, intercultural, interparadigmatic and interfaculty Master's curriculum "Global Studies" operating since 2010.

Intercultural: Approaches combine different understandings resulting from the actors' entrenchment in different cultures and their adoption of differing values.

Interdisciplinary: Approaches combine understandings, models and views from different scientific disciplines.

Interparadigmatic: Approaches combine interdisciplinary and intercultural approaches; hence they respect both understandings stemming from different scientific disciplines and understandings from different cultural entrenchments.

ENDNOTES

1. Whereas the interesting literature review performed in the US by Spelt et al. (2009) used mostly literature bases provided by the more traditional US-based ISI Thomson retrieval system (SSCI, extended SCI, A&HCI; additionally ERIC), the present literature review used the literature base provided by more recently established Scopus.com (the European counterpart of ISI Thomson) that provides about twice as many journals, in-depth analytical tools as well as an extremely practical online option to search and directly retrieve full-texts of citing and cited literature.

This work was previously published in a Handbook of Research on Transnational Higher Education edited by Siran Mukerji and Purnendu Tripathi, pages 259-302, copyright year 2014 by Information Science Reference (an imprint of IGI Global).

Chapter 70
High School Teachers' Gender-Oriented Perceptions of Technology Integration

ABSTRACT

Within social studies, researchers note limited attention has been given to examining gender differences associated with technology integration, and have called for increased dialogue regarding gender-related technology issues (Crocco, 2006, 2008; Crocco, Cramer, & Meier, 2008; Friedman & Hicks, 2006; Marri, 2007; Mason, Manfra, & Siko, 2005; Sanders, 2006). In response, this chapter explores the gender divide in secondary teachers' perceptions of effective technology integration. Using a qualitative research design, this chapter provides insight into social studies teachers' perceptions of their pedagogical practices and technology integration. The purpose of this study is to develop an understanding of the differences in male and female teachers' use of technology to teach and support student learning. Consideration of how technology is associated with gender-sensitive pedagogical thinking and practice may address the aforementioned gap in technology usage in social studies. Patterns uncovered in data analysis suggest that gender plays a critical role in social studies technology integration. The results from this study can inform methods in which technology is integrated into future social studies classrooms, particularly in emerging areas such as online courses.

DOI: 10.4018/978-1-4666-8246-7.ch070

INTRODUCTION

Over the past two decades, the Internet has become a useful tool for social studies teachers and students. Free access to a plethora of primary and secondary sources not readily available in the classroom (Cohen & Rosenzweig, 2006; Hicks & Ewing, 2003; VanFossen &. Shiveley, 2000) and an emphasis on historical thinking (Barton, 2005; Barton & Levstik, 2004; VanSledright, 2011; Wineburg, 2001) have been central factors in rationalizing technology integration within the discipline (DeWitt, 2007; Friedman, 2006; Hicks, Doolittle, & Lee, 2004; Marri, 2005; Martin & Wineburg, 2008; Swan, & Locascio, 2008). Moreover, national efforts have encouraged technology integration with expectations for frequent and successful applications with K-12 learners (c.f. CCSS, ISTE, P21, C3, and NCSS). External factors, such as the ubiquitous personal use of technology, afforded *anywhere, anytime* access to information and constant connectivity which furthered the expectation of technology as a primary learning tool (CTIA, 2011; Cellsigns, 2010; Pew Research Center, 2011). Students of the 21st century garner information through media and electronics at a much faster and more efficient pace than previous generations. Technological advances have both created and addressed growing student needs.

As technological advances have steadily entered the field of education, the impact of technology and media have contributed to each core subject area in a unique way (Anderson, & Williams, 2012). While technology tools became pervasive in some classrooms, overall the field of social studies has lagged in this process (Swan & Hofer, 2008). The National Council for the Social Studies identifies the primary purpose of social studies education as contributing to the development of responsible citizens (NCSS, 2014). Designing an environment where students can develop into successful global citizens while honing 21st century skills can be challenging, but not impossible. A "key component is the role educational technology can have in facilitating teaching and learning in social studies" (Green, Ponder, & Donovan, 2014). For example, Internet access and gaming have been documented as increasing civic engagement and participation (Bers, 2008; Lenhart, Kahne, Middaugh, 2008; Montgomery, 2009; Perkins-Gough, 2009; VanFossen, 2006). The availability of web-based instruction and access to the Internet, historical documents, diverse perspective, political campaigning, and varying geographic locations enable online social studies educators to pair social studies curriculum with 21st century skills in a 21st century classroom. The process of how research is done in social studies classrooms has radically changed with increased technology access (Bolick, 2006). Within elementary and secondary social studies classrooms across United States the integration of technology has enabled social studies educators to seamlessly interweave the various academic disciplines examined in social studies through online interactive lessons, video, maps, photos, digital archives, and access to historical and political documents (Berson & Berson, 2013; Brush & Saye, 2009; Friedman & Heafner, 2007, 2008; Harris, Mishra, & Koehler, 2009; Heafner & Friedman, 2008; Tally & Goldenberg, 2005; Whitworth & Berson, 2003). However, access does not always imply effective integration, quality instruction, or successful student use for discipline specific learning. At a fundamental level, access does not ensure that technology integration in social studies is ubiquitous.

In order to address the diverse needs of 21st century learners, several states and school districts have developed distance education learning platforms as supplemental academic support (Barbour, 2009; Barbour & Reeves, 2009). These state-initiated platforms eventually evolved from supplemental academic supports to full public, private, and charter virtual schools. Online learning is generally classified according to the following structures: supplemental, districted based, consortium, or cyber charter school (Cavanaugh, Barbour, & Clark, 2009). Twenty-five percent of all public education students participating in distance education courses are enrolled in social studies courses (Setzer & Lewis, 2005). Despite the increasing number of students engaging in online learning in social studies, there is limited research on web-based social studies courses. Whitworth and Berson (2002) reviewed 325 academic articles on social studies education over a five-year period and found that only one percent of the articles reviewed alluded to web-based social studies classrooms and students. Current research on web-based social studies courses offers a narrow understanding on the effectiveness of online course instruction and student achievement.

Examining the concept of meaningful learning in online contexts, Kerr (2007) found that web-based social studies courses utilize a wide variety of tools and instructional approaches to guide the students' learning experiences. Studies on online learning in social studies reveal no uniform structure of methods used consistently throughout web-based courses—such as synchronous or asynchronous communication, website development organization, or course-related activities (Doering, Hughes, & Scharber, 2007; Kerr, 2007). These studies also suggest limited peer-to-peer interaction occurs in web-based classes. The varying platforms for web-based social studies education, limited collaboration, and inconclusive research, coupled with insufficient academic gains, demonstrate a need for further research into best practice concerning web-based social studies courses. The inconsistencies in learning appear to be connected to teacher factors associated with innovative praxis (Journell, 2013).

Examining two decades of U.S. educational technology policy, Culp, Honey, and Mandinach (2003) described the incongruence between visions of technology and the practice that comes to fruition. Rationales for this gap between possibilities of transformative teaching and learning as well as implementation have been sought through examination of: a) discipline differences (Koehler & Mishra, 2008; Mishra & Koehler, 2006), b) teachers' pedagogical practices (Brush & Saye, 2009; Ertmer, 2005; Manfra & Hammond, 2008-2009; Wilson & Wright, 2010; Zhao, 2004-2005), and c) teachers' efficacy and perceptions of technology (Anderson & Williams, 2012; Huang, Hood, & Yoo, 2013; Sanders, 2006; Zhao, 2007). Others contend that gender maintains a prominent role in shaping technology use (AAUW, 2010; Huang, Hood, & Yoo, 2013; Lau, & Yuen, 2010; Saglam, 2011; Shashaani, 1993); yet, this phenomenon remains outside of the realm of social studies. Within social studies, researchers note limited attention has been given to examining gender differences as associated with technology integration (Crocco, 2004, 2006, 2008; Crocco, Cramer and Meier, 2008; Marri, 2007; Mason, McGlinn, & Siko, 2005). They call for increasing the dialogue regarding gender-related technology issues (Crocco, 2006, 2008; Crocco, Cramer and Meier, 2008; Friedman & Hicks, 2006; Sanders, 2006). In response, this study explores the role of gender in secondary teachers' perceptions of effective technology integration.

Implementing a qualitative research design, this study provides insight into secondary social studies teachers' perceptions of their pedagogical practices and technology integration. Specifically, this study describes male and female high school teachers' perceptions technology use in teaching and supporting student learning of social studies. Teacher interviews with twelve tech-savvy practitioners provide descriptions of content-specific technology usage as associated with teacher attributes and characteristics. Classroom observations triangulate teacher reports and were used to affirm the teachers' sense of comfort with technology. Consideration of how technology is associated with gender-sensitive pedagogical thinking and practice may help address the aforementioned inconsistencies in technology usage in social studies. As online learning experiences increase, especially in secondary schools, the ways in which male and female teachers conceptualize technology applications can provide guidance in advancing web-based pedagogy and course design. Patterns uncovered in data analysis suggest that gender plays a critical role in social studies technology integration. Recommendations for supporting gender-oriented technology usage and furthering the role of technology in secondary social studies are provided.

BACKGROUND

Do Technology Expenditures Precipitate Change?

In 1998, technology expenditures in K-12 public schools surpassed $5.2 billion (Petersons, 1998). By fall of 2000, 95 percent of America's public schools had access to the Internet (QED, 2000). In 2009, 97 percent of teachers had one or more computers in their classrooms creating a ratio of 5.3 students for every computer (Gray, Thomas, Lewis, & Tice, 2010). Billions of dollars were poured into technology with the hope that innovative use of technology would improve our schools. In 2011, approximately $2.9 billion dollars were spent on eLearning in K-12 education (Council of Economic Advisors, 2012). The capitalistic interest in education has also led to an increase in private financial investment in online education, an initiative that has the propensity to transform learning contexts.

Investments in online education have made significant impacts. Florida led the way in the development of K-12 online education programs (Rice, 2009). Florida Virtual High School and the Virtual High School of Massachusetts were of the first schools to emerge as full virtual schools. Twenty-five states currently have virtual high schools in operation (Watson, Murin, Vashaw, Gemin, & Rapp, 2013). Twenty-nine states and Washington D.C. have statewide fulltime online schools in operation (Watson et al., 2013). In 2012, Florida began to offer full and part time online learning options to K-12 students (Molnar et al., 2013). Arizona, Florida, Kansas, Minnesota, Utah, Washington, and Wisconsin also offer a variety of fulltime and supplemental options (Molnar et al., 2013). In 2006, Michigan became the first state to require an online learning experience for graduation from the traditional education setting. Other states followed suit by recommending online learning as a necessary experience for graduation. Arizona, Florida, Georgia, Louisiana, Michigan, and Minnesota allow students who participate in online learning to select courses from various providers (Molnar et al., 2013). A total of forty-four states have reported engaging some form of online learning activities in education (Picciano & Seamen, 2007).

Notwithstanding, investments are expected to produce returns, and in education that implies an expectation of daily, fully integrative technology usage. Policy makers believe that creating abundant access to new technologies in schools will directly increase teacher use in classrooms, which ultimately leads to better teaching and learning. Yet, the presence of technology alone has not always impacted classroom learning; nor has it changed pedagogical methods (Crocco & Costigan, 2007; Levstik, 2008; VanSledright, 2011). Simply adding new technological tools to the classroom often created new platforms for traditional methods and has yet to produce the revolutionary learning environment desired by policy-makers and business leaders for ensuring success of all students (Berson & Baylta, 2004; NCES, 2010; Zhao, 2007). However, online education encapsulates a profitable return on educational expenditures and has transformed learning opportunities.

In the 2009-2010 academic year, there were approximately 1.3 million high school enrollments in distance education courses across the nation (Queen & Lewis, 2011). As of 2014, it is approximated that 250,000 students were enrolled in fulltime online schools in the United States (Molnar et al., 2014; Watson et al., 2013).

Student enrollment in virtual schools increases with grade level. Secondary students utilize online learning platforms at a higher rate than elementary students. High school students enrolled in online learning programs are engaging the following types of courses: regular education high school courses, remedial courses, advanced placement courses, and credit recovery courses (Clark, 2001). Technology industry investments have driven policy-makers to position technology as an essential learning tool (AACTE Committee on Innovation &Technology, 2008, p. 21).

How has Technology Integration Impacted Social Studies?

Technology-driven changes depend upon teachers' dispositions and skills in embracing its potential. For over a decade, research has called for educators to "take stock of what realistically needs to be done to maximize the potential of the Internet and its associated instructional technologies in our schools" (Simpson, 2001, p. 133). Given that the integration of technology varies greatly across disciplines, schools, and teachers (Anderson & Williams, 2012), exploring content-specific applications becomes important.

In 2001, White contended that successfully integrating technology in social studies classrooms was a vital issue facing social studies educators, especially with the inconsistencies that exist in technology use. As researchers have noted, reluctant and slow integration among social studies educators has been an ongoing trend (Berson, 1996; Berson & Balyta, 2004; DeWitt, 2007; Friedman, 2006; Hicks, Doolittle, & Lee; 2004; Manfra & Hammond, 2008-2009; Marri, 2005; Swan & Hicks, 2007; Swan & Hofer, 2008; VanFossen, 2001; Zhao, 2007). In many social studies classrooms, technology has not been fully integrated as a fundamental component of the curriculum, teaching, and learning (DeWitt, 2004; Friedman, 2006; Mason, 2000-2001). While social studies teachers have developed their technological skills, technology integration has yet to reach its fullest potential to improve and redefine student learning. Evidence of learning outcomes associated with technology use is scarce.

Links between pedagogical practices and technology integration are well documented in social studies literature (Friedman, 2006; Hicks, Doolittle, & Lee; 2004; Manfra & Hammond, 2008-2009; Marri, 2005; Swan & Hicks, 2007; Wilson & Wright, 2010; Zhao, 2004-2005, 2007). Only limited evidence has been documented in technology-mediated, innovative, and transformative practices (Brush & Saye, 2009; Harris, Mishra, & Koehler, 2009). Research on secondary social studies teachers' practices has indicated that those teachers who use technology, specifically the Internet, use it primarily for low-order information gathering and access to primary sources (Friedman, 2006; Hicks, Doolittle, & Lee; 2004; Marri, 2005; Vanfossen, 2001). Rarely do teachers have students engage in activities that employ technology in significant ways that harness the potential benefits of the medium to transform learning beyond traditional processes (Cuban, Kirkpatrick, & Peck, 2001; Salinas, Bellows, & Liaw, 2011; Saglam, 2011; Swan & Hofer, 2008; Whitworth & Berson, 2003; Wilson & Wright, 2010). The inconsistencies in web-based pedagogy presents further questions regarding the effectiveness of technology (Doering, Hughes, & Scharber, 2007; Kerr, 2007; Whitworth & Berson, 2003).

Cuban, Kirkpatrick, and Peck (2001), sought to understand why technology integration remained static in secondary schools, specifically social studies classrooms, as technology became pervasive in personal and social realms. The authors offered two explanations: 1) a "slow revolution", and 2) the constricting nature and structure of secondary schools. First, the "slow revolution" suggested that incremental changes over time would accumulate into a slow moving transformation. Ultimately, technology would impact schools when enough time had lapsed to integrate *societal changes mediated by the infiltration of technology in all aspects of human life. This trickle effect led researchers to contend that evidence of technology-supported, transformative learning in social studies would eventually materialize. The increased use of web-based primary sources, interactive Web 2.0 tools, and 1:1 technology initiatives could be viewed as emerging pedagogies from the "slow revolution". However, these authors anticipated fundamental limitations to this idea and contended that the rigid structure of secondary schools would inhibit or at least slow this process. The fact that social studies has lagged behind in technology integration in comparison to science or mathematics supports this thinking. As the second explanation, Cuban, Kirkpatrick and Peck suggested that high school organization prohibits teachers from collaborating with peers and having the time needed to harness skills and tools that technology affords. They recommended creative thinking about how secondary schools could be restructured to open possibilities of technology-mediated learning beyond the confines of traditional school schedules. The growth of virtual schools and the increased private investment in schools can be viewed as supporting the authors' suggestions for structural changes. While online learning and virtual schools provide different educational contexts, the majority of students are taught in traditional school settings. The structural limitations of high schools still pose challenges.*

Beyond the organization of schools, students' interests have changed. Their palpable needs to be constantly connected and socially engaged have been strong forces pushing for innovations in teaching and learning. As an educator asserted, "Whether we like it [social media] or not that is how students communicate with each other these days. They actually thrive on connecting with their peers in numerous ways" (DeWitt, 2011, para 9). TPACK initiatives have sought to inform shifting pedagogies to more effectively address students' needs (Koehler & Mishra, 2008; Harris, Mishra, & Koehler, 2009; Mishra & Koehler, 2006). Social studies researchers contend that technology is the tool by which student-centered pedagogy can be facilitated (Brush & Saye, 2009; Heafner, 2002; 2004; 2013; Manfra & Hammond, 2008-2009; Mason, Berson, Diem, Hicks, Lee, & Dralle, 2000; van Hover, Berson, Bolick, & Swan, 2006; VanFossen & Shiveley, 2000; Zhao, 2007).

What is the Relevance of Gender in Determining Technology Applications?

While student technology use appears to be equitable among male and female students in elementary grades (AAUW, 2010), a gender gap develops beginning in middle school (Mitts, 2008; Sherman, Sanders, Kwon, & Pembridge, 2009) and is exacerbated in secondary schools (Anderson & Williams, 2012; Bannert & Arbinger, 1996; Mitts, 2008; Shashaani, 1993). Technologies in schools, especially the type of applications available, are geared more towards boys than girls, and boys utilize technology more often than girls (Borg, 1999; Washburn and Miller, 2005). By the time students reach the end of high school and are deciding on higher education or a career path, girls typically have less experience with computers and technology than boys their age, and feel less confident in their abilities to *do technology*. The lack of gender role models (i.e. female adults using technology in educational settings) advance notions of inferiority and frequently leads girls away from pursuing technology fields (AAUW, 2010; Frieze, Quesenberry, Kemp, & Velazquez, 2012; Lau, & Yuen, 2010). In effect, boys and girls are socialized in school to view computers and technology as *something boys do* (Borg, 1999; Mitts, 2008; Shashanni, 1999; Washburn & Miller, 2005).

When using technology in higher education courses, gender differences are present. Huang, Hood, & Yoo (2013) conclude that males and females perceive Web 2.0 applications differently when considering the use of technologies for completing learning tasks. Females prefer using technology for designing, communicating, and socializing relevant issues, while males tend to prefer technology for utilizing, building, constructing, and programming (Frieze, Quesenberry, Kemp, & Velazquez, 2012; Mitts, 2008; Sherman, Sanders, Kwon, & Pembridge, 2009; Weber & Custer, 2005). Females gravitate toward tasks that are perceived as having some social significance, while males choose activities that require creation of an artifact. Mitts (2008) defines male-oriented outcomes as *an end in itself* (i.e. concrete, discernable product) rather than a feminine-orientation of technology as *a social process for change* (i.e. abstract, theoretical, and moral). The overemphasis on product-driven outcomes commonly present in technology applications favor male interests over the types of task structures that would promote female interest. As a result, females experience greater levels of anxiety and lower comfort levels in using technology than males. Researchers attribute these differences as an outcome of gender stereotyping, which, they note, was further emphasized through formal schooling (Frieze, Quesenberry, Kemp, & Velazquez, 2012; Mitts, 2008; Sherman, Sanders, Kwon, & Pembridge, 2009; Weber & Custer, 2005). These studies suggest that participation between genders remains unequal and is associated with differences in perceptions of skills, task orientations, and task outcomes.

Present within the literature is a belief that gender is associated with technology use (AAUW, 2010; Huang, Hood, & Yoo, 2013; Lau, & Yuen, 2010; Saglam, 2011; Shashaani, 1993). Crocco, Cramer, and Meier (2008) posited that gender is not a gap, but rather an acknowledgement of a cultural difference worthy of further examination. Males and females are drawn to different attributes of technology; thus, they do not share the same interests or ideas for how technology should be utilized. In a review of literature from four leading social studies technology journals, these authors contend that without attention to gender "as part of the effort to integrate technology into education, any gains will have only limited impact" (Crocco, Cramer and Meier, 2008, p. 30). A gap in social studies research that examines the gender divide as associated with technology integration is acknowledged among researchers (Crocco, 2004, 2006, 2008; Crocco, Cramer and Meier, 2008; Marri, 2007; Mason, Manfra, & Siko, 2005). The need for expanding the conversation regarding gender-related technology issues (Crocco, 2006, 2008; Crocco, Cramer and Meier, 2008; Friedman & Hicks, 2006; Sanders, 2006) serves as the impetus for this study.

What Is the Culture of Technology in Secondary Social Studies?

Culture is a synergistic process for change (Frieze, Quesenberry, Kemp, & Velazquez, 2012). Culture shapes its members and is shaped by members who serve as active contributors. In classrooms and online courses, teachers and students contribute to the development of the learning culture. While students are important variables, for the purpose of the chapter, we will examine the role of the teacher in defining the academic culture and the context for learning. Our rationale for this emphasis is that while research identifies many factors affecting student achievement (Zuelke, 2001), the greatest determinant of student success is the influence of teachers (Collias, Pajak, & Rigden, 2000; Lasley, Siedentop, & Yinger, 2006; Sanders & Rivers, 1996). Researchers have found that the majority of the differences in measurable student learning outcomes can be directly attributed to the teacher (Darling-Hammond, 2006; Darling-Hammond & Ball, 1997). Thus, the influence of teachers can either be positive or negative depending on various teacher characteristics.

Social studies teachers control curriculum and the context for student learning (Thornton, 2005). Their cultural attributes define gatekeeping decisions and are often limited by their own perspectives. Sunal, Christensen, and Shwery (2010) contend that teachers must recognize that they may or may not share similar cultural views with students and this is a significant issue when teaching online. Forums for discourse facilitated by technology can become platforms for deliberative discourse when awareness of culture is present; however, when differences are not acknowledged, greater isolation and inequity can result. As the use of online learning continues to expand, the ways in which teachers build a respectful and accepting classroom culture in these environments is dependent upon the collective social presence instructors are able to establish among participants (Rubin, Fernandes, Avgerinou, 2013; Shea, Bidjerano, 2012).

The culture of technology, specifically the culture of technology in secondary social studies, is one in which teachers define the manner in which technology will used by students. As with any technology, the teacher is a central determinant (Green, Ponder, & Donovan, 2014). Characteristics of the teacher (e.g. age, gender, and pedagogical beliefs), reactions to the students whom they serve (e.g. Generation X and Y), and responses to external forces (21st Century Skills, Curriculum, Standards, Technology Expenditures, Teacher Evaluations) have been documented as influences shaping technology decisions in social studies (Heafner, 2013). In a meta-analysis of social studies technology research, Green, Ponder and Donovan (2014) call for more research examining differences in teacher motivations for using (or not using) technology. These authors suggest that "exploring teacher beliefs and attitudes about the purpose and usefulness of technology…can provide insights that could inform the work of teacher educators and those responsible for teacher professional development" (Green, Ponder & Donovan, 2014, p. 580).

In this chapter, we focus on one teacher characteristic that emerged from a broader study examining teachers' reports of technology use. Of these spheres of influence, the most profound factor that emerged from an earlier study was gender. Male and female teachers projected noticeably different perceptions of technology integration and gravitated toward dissimilar uses of technology in teaching and designing student tasks. The variance of learning opportunities with technology raises the importance of examining gender as a cultural influence in defining the role technology will play in secondary social studies. Patterns that emerged from high school teacher interviews are described to shed light on why gender is an important variable that shapes the culture of technology in secondary social studies. As online learning continues to grow and reshape secondary education, those who design and teach web-based courses will impact how learning experiences are conceptualized. Noting gender differences in approaches to technology as well as gender-oriented views of meaningful technology-mediated outcomes will influence the quality and effectiveness of online education.

TEACHERS' PRECEPTIONS OF TECHNOLOGY AND REPORTED INTEGRATION

Method

Using a qualitative research design, this study presents male and female teachers' perceptions of their technology usage in high school social studies. The guiding research questions are:

- How do male and female teachers describe their use of technology to teach social studies?
- Are there differences associated with gender in teacher perceptions of technology and reported uses of technology?

We seek answers to these questions by examining male and female teachers' perspectives of technology and technology integration within high school social studies courses. The study aims to explore depth rather than breadth in order to inform understanding of gender-oriented technology applications in secondary social studies. Teacher interviews provide a deeper understanding beyond the observational level (Rubin & Rubin, 2012) and were used in conjunction with classroom observations. Interviews allowed researchers to uncover gender-specific findings from teacher motivations for using technology that would have otherwise been hidden or unseen (Tracy, 2013). As a qualitative tool, interviews enabled researchers to obtain respondents' opinions and experiences (i.e. the subjective and depth of understanding). By conducting semi-structured interviews, we embraced an inductive approach and aimed at building explanations and answers depending on what emerged from the data. Approaching the research objectives in this manner allowed us to view the data through a naturalist perspective and our findings were therefore analyzed, interpreted, and given meaning contextually (Kvale, 2012; Rubin and Rubin, 2012).

Participants

The interviewees were a purposeful sample of twelve secondary social studies teachers from five high schools in the vicinity of the researchers' location and districts that have shown efforts to effectively integrate technology, and therefore represent a sample of teachers who are assumed to be knowledgeable technology users. Researchers conducted observations in each teacher's classroom to note the manner in which technology was used and to affirm the teachers' sense of comfort with technology usage. Of the twelve teachers interviewed, seven were female, five were male, and their ages ranged from twenty to fifty years old. Participants' teaching experience included a wide scope from one year to twenty-five years with an average of ten years teaching experience for both male and female teachers. The purpose of selecting this diverse group was to explore the potential of generational differences associated with technology experiences. One of the twelve teachers worked in a private school, and the remaining participants taught in public high schools, including two teachers who were working in a magnet school program. All the schools, including the private school, were located in urban areas, (i.e. counties with a population > 50,000). Participants were given a number to preserve anonymity and to avoid gender identification. Detailed descriptions of teachers are provided in the Appendix.

Table 1. Interviewee demographics

	Private High School	Public High School	Magnet High School
Male	1	4	2
Female	0	5	0

Data Analysis

The interviewees where solicited via email with information about the project and invitations to participate. As an incentive and a show of gratitude, participants were given a gift card at the conclusion of the study. Interviews took place in a two-week period, either on the researchers' university campus or at the participant's school, depending on the availability and convenience of the participant. During this span of time, we conducted three classroom observations of each teacher. Before each interview, the researchers gave a brief introduction to the project and provided each participant the opportunity to ask questions. Each participant read and signed an informed consent document before commencing. A responsive interview model was employed to capture the depth and context required for analysis (Rubin & Rubin, 2012), and unlike normal conversation, the model included: main questions, probes, and follow up questions. It was typical for researchers to balance these inquiries throughout the interview (Rubin and Rubin, 2012). The twelve interviews varied in length and lasted between sixty and ninety minutes, due to the responsive interview model employed and the semi-structured interview format, which allowed for ad hoc probing and the freedom of the participants to add context to their answers. All interviews were recorded on a portable voice recorder, saved on a secure hard-drive, later transcribed by a graduate assistant, and coded by the research team.

To analyze the interviews, we used a grounded theory approach (Glaser & Strauss, 1967), which, similar to our interview method, allowed us to focus on patterns that emerged from the data. Our grounded theory approach integrated a multi-step, constant comparative model (Glaser & Strauss, 1967; Rubin & Rubin, 2012) to discover theory by building themes and concepts from the data as the research team read and re-read the transcripts, coded and re-coded data, and redefined codes throughout the process. The constant comparative model allowed for continual comparison between codes and concept generation, consequently leading to continual re-defining and analyzing during the coding process (Glaser & Strauss, 1967). The analysis process consisted of four stages: (1) *Comparisons*. When coding, the researchers compared examples of the same code and thereby developed abstract concepts from the observations - abstractions needed for theory development. (2) *Integration*. In the process of developing codes and comparing them to each other, the researchers developed links between the codes and sought to discover how they were interconnected. (3) *Minimization*. The grounded theory approach produced an overwhelming amount of categories, themes and codes. In order to reduce the quantity of codes and condense the material to a manageable level, researchers met to determine these levels. A meta-theme that was present in all themes emerged during these meetings. This meta-theme of gender was selected as the focus. (4) *Writing*. In the final stage, the researchers developed the theoretical framework and identified the themes as related to gender as abstracts (Glaser & Strauss, 1967). These steps guided the data analysis process in this study.

We implemented four steps in our coding process. First, all transcripts were read and open coded - coding anything seemingly relevant. Researchers did not have any developed codes before starting this process and developed the codebook while coding. The open coding process was a way of sorting and summarizing the data in order to make some preliminary sense of what was emerging (Rubin and Rubin, 2012). Due to the grounded theory approach employed in this project and the constant comparative model that followed, researchers built validity into the coding process (Kvale, 2012). Regardless, to ensure high validity the researchers open coded all twelve transcripts independently and subsequently compared codes and interpretations. If researchers coded similar statements differently, discussion about how researchers arrived at that code enabled refining of concepts and building the codebook with consensus. For the purpose of this study, only codes relating to gender-associated observations were included.

In the second stage of the coding process researchers re-visited all transcripts and continued to adjust and refine codes as relevant to study objectives. In this stage, researchers listened to audio recordings while reading transcripts to capture auditory emphasis by the interviewees. Codes were verified and additional coding occurred. In the third stage of the coding process, the themes and codes were fully developed and sub-codes were recognized. We should note that the codebook was developed to function merely as an aid in the coding process to help conceptualize and organize emerging data. Based on patterns observed, frequency counts were tallied on codes to triangulate gender differences that emerged during data analyses and coding. These frequency counts were not intended to produce a quantitative analysis, but rather to provide evidence of observable differences associated with gender. The gender-associated themes and codes that emerged from the data are discussed in the following section. Codes are presented in the Appendix.

FINDINGS AND DISCUSSION OF RESULTS

Views of Pedagogical Beliefs

A focus of the broader study was to explore teachers' pedagogical beliefs and how these are associated with teachers' descriptions of their technology use. In examining gender-oriented pedagogy, males described themselves as more constructivist teachers than female teachers. In the interview, teachers were asked to rank their pedagogical practices on a continuum of 1 (behaviorist) to 5 (constructivist). All teachers indicated a greater tendency toward constructivism. However, males reported a higher mean ranking (4.10) than female participants (3.14). These differences were examined more closely.

To explore more in-depth teacher ratings, participants were asked to describe their beliefs in detail. Data excerpts that document gender differences were noted in Table 3. Males and females described themselves as student-centered; however, males tended to focus their explanations on increasing student autonomy. In contrast, female teachers emphasized the need for behaviorist approaches to ensure that students learned the essential information and to maintain student attention. Overwhelmingly throughout the interviews, female teachers noted a need for control over the classroom environment. The manner in which they maintained this control was frequently articulated as teacher-directed instructional practices. In contrast, male participants did not express a need for behavior management or restrictive control. They were more likely to indicate greater student freedom and decision-making in how learning was structured. These comments explain mean differences in perceptions of constructivist beliefs and practices.

Table 2. Teacher self rankings of teaching philosophy

	Teaching Philosophy (1=Behaviorist to 5=Constructivist)
Average	3.54
Female Average	3.14
Male Average	4.10
F-M Difference	-0.96

Epistemological orientations were not static. Males and females alike described vacillating along the pedagogical continuum, and linked these shifts to whether or not they were using technology, the course they were teaching (e.g. Advanced Placement, an elective, a STEM/STEAM social studies course), and the composite of students in each class. A comparison of two classes as described by a young female teacher provides an example of this movement between constructivist and behaviorist methods:

#12: *I think it looks different in the classes I teach. I teach Holocaust and genocide. I also teach AP US history. For Holocaust and genocide, I feel I've been able to experiment more with student-centered and student-driven learning because there's no way, especially when we get to the genocides to teach it all. I don't know everything about the Rwandan genocide or Darfur and so I have the students doing that research, creating visual digital essays is what I call them, where they share with their classmates, and ask hard questions. In these visual digital essays, students have to incorporate music and photographs and survivor testimony and such, so I've been able to experiment with them… That class does not like me standing up and lecturing to them. It's very much learning about the*

Table 3. Male and female teacher philosophy descriptions

Male Quotes	Female Quotes
#1: *I believe in teaching students to be historians rather than teaching students to remember history.... It's very hands-on, in terms of students doing things to master historical skills and ascertaining historical content. My classes are very active. I am a facilitator not a lecturer.... It's really a workshop model and kids are working with a purpose.*	***#5:*** *It's a hard question…. student centered? I guess I figure out where I want my students to be and then I try to find activities and ways to get the content to them to meet that goal so it kind of depends on the class. Like for an AP class our goal is of course to make a certain level on the AP exam so there we're focusing on practicing and testing and getting ready for that umm whereas like a class that doesn't have an end of course test it's a little bit more informal and I get to more decide what the goals are for the students* ***#5:*** *kind of dead center in the middle* ***#5:*** *I try to balance both.*
#2: *What I have found myself falling in love with more and more, the more I teach, is the idea of trying to foster a student desire for learning. The realization that I came to about two years ago was that an authoritarian figure in front of the room is not going to in any way instill a desire to learn... by diverting some of the responsibility for learning to them but also giving them a little bit more authority in deciding how it is that they learn and how it is that they go about the classroom process, I've found that ... they enjoy the process more and therefore try harder and get more out of it.... it also becomes an educational process for me.*	***#6:*** *I'd probably go between, uh, probably about to a…closer to a 4. I would say, cause I still, because, you know social studies is such a, a challenging, um, there's just such a wide gamut of information depending on the content you're teaching. There are some things you just have to make sure the kids know, the baseline stuff and then they can do some investigation, particularly with what I teach, you know I, um, one of the several subjects that I teach is civics and economics, and so the kids, you know, I have to give them basic stuff and then I so ok now go create this or go figure out how you do this, so um, that's why I said it's, I still, I can't go to a 5 just yet, because I still have to give them little bit of pieces of the puzzle.*

history of the Holocaust through the survivors, through reflection in those survivor testimonies, looking at documents doing a lot of group and team work, and so on. I've also been able to experiment with teams and student-partners instead of just grouping them where they can choose. But, they're responsible for their own learning. They are accountable to themselves and to their teams or partners. By evaluating themselves, as well as evaluating their teammates, on their contribution to the group in creating or doing they have a vested interest in the team's overall success.

#12: *[Concerning] AP US history, I'm sad to say that this is the part where I'm probably most nervous… [Pause]… to give the students control, because I don't know how else to ensure they learn the information they need to be successful. There is so much information in the AP curriculum that I feel I need to lecture. I don't love to lecture. I try to simplify as much as possible. A lot of the students struggle getting the information from their textbook at home, so then I feel like when they come in I at least have to spend 30 minutes going through the history in a timeline for them while telling a story describing the sequence of events. This structure is teacher lead. It's me up there in front of them and that's the class where I want do better with the kids taking ownership of their learning.*

Teachers' perceptions of students and curricular content guided these pedagogical shifts. Surprisingly, females were more cognizant of this and purposeful in noting the need for pedagogical movement between traditional and student-centered methods, whereas males did not directly comment about the motives driving their pedagogical vacillation. Yet, these shifts were noticeably linked to use and nonuse of technology. For example, teacher #4, described his teaching as student-centered instruction and rated himself as a 5 (constructivist). He stated that within the last year and as a result of moving into the STEM program, "I've become more of a constructivist." He expressed:

#4: *Yeah it's STEM focused and it's all project-based. So every bit of the curriculum we create. We have a design cycle that we use for anything from a rough draft of an English paper to some kind of photography project or portfolio. Students approach every project or presentation with that design cycle thinking. It's all PBL, project based learning; so, we actually create a driving question as a group. We always begin with a question. The question is open ended question; it may not have a definitive answer, but it's got tons of answers. The kids through research, through trial and error, you know through scientific method, come up with the solution. They create something that shows us [the class and peers] that and what they've learned. Our approach is that we just give them a basis, a framework. They go from that framework and discover the rest of the content on their own. So it's learning by doing…*

Later in the interview, when asked to provide an example of when he does not use technology, he commented,

#4: *Yeah but it would be more limited, you know, what I would have access to. I have a regular civics class, civics and American government, I teach. That class is mostly 10th graders with some 11th graders who have taken it before, a repeat course. This course is not STEM so it's not project based. It's more your traditional lecture, note taking, vocabulary comprehension, and unit project type course. Maybe that's not, you know, the overall method but it [lecture] supplements the content. So, I wouldn't pull out the laptops, Mac books or whatever's available. The pc laptops or the iPads that are in the library are difficult to use. I have to rent those, check those out. When I do, students are using PowerPoint, Keynote, you know, they're using simple software like that…*

Even though he reports using technology, it is much more simplistic (i.e. traditional) and is limited in comparison to his STEM courses which embraced advanced technology applications and a more student-centered focus. This not only raises concerns about equitable access for students, but also a clear gender difference in how instructional practice is perceived.

Links between teachers' pedagogical beliefs and how they integrate technology were present. These were not gender specific, but provide evidence of technology driving pedagogical change. Constructivist, student-centered teaching seemed essential for more sophisticated technology uses. A female teacher explained how technology shaped her practice,

#6: *Well I think if we're able to integrate it [technology] successfully, and if the kids are doing what they're supposed to be doing, then they're able to really direct their learning more, because now, now that's taking into account that as a teacher I've put together the plan for them. You're going, I've given them some good instructions, they're going be able to go and find this, and it enables them to say, ok I'm going to discover this on my own, because I'm going go to this website or I'm going to ask this question and find it, … and then we can come back…*

#6: *…technology use enables constructivist learning, because it's kind of putting the learning in their hands. If I give them the set of questions or a WebQuest and they have to go find...that information, and I think it enables, it takes a lot of the big load off of me. Rather than staying there spoon-feeding information, it really puts the responsibility on them, to go and find that information...*

A few comments made during several points in the interview from a fifteen-year veteran, male teacher eloquently expressed this connection be-

Table 4. Male/female technology usage and confidence average ratings

	Immigrant (Learned to Use Technology as an Adult) or Native (Grew Up Using Technology)	Technology Confidence
Average	3.96	4.25
Female Average	3.79	4.21
Male Average	4.20	4.30
F-M Difference	-0.41	-0.09

tween technology and student-focused learning. Here are examples from the transcripts,

#9: *I would say that the current kind of movement towards really making learning more student centered lends itself well to technology because you have, they have access to so many resources and you really can set it up for them to look through content even if it's simple like a WebQuest or something like that. They can build a text book or write a chapter to a book and make it look great....*

#9: *I think technology is driving student centered learning.*

#9: *I think the philosophy is, it's [technology] not reactive but it's adaptive. I think student centered learning can be done very well through technology...*

Moreover, teacher #1 (male) suggested that a "philosophical shift" was needed before effective technology integration could be achieved. He further recommended, "The first little step of that pedagogical shift is getting them [students] comfortable with technology and really working with them on how you choose the tools you choose for each assignment. And then our second part of it, is... pushing toward a workshop model…where we're modeling work and then kids are doing work by replicating processes not just creating a product."

Gender Differences in Perceptions of Technology Usage and Confidence

During the interviews teachers were asked to rank themselves on a scale of 1 to 5 about technology usage and confidence (See Appendix). Table 4 shows the overall average, the female and male averages, and the differences between the female and male averages. Male teachers ranked themselves higher on both questions. The males perceived themselves closer to native technology users than the females, and the male teachers perceived themselves as more confident in technology usage than female teachers.

In each interview, males rated their confidence and abilities at either a four or five. Examples of highly confident and comfortable male responses follow:

#1: *[I would rate myself a] five in that I can figure out what I want do, when I want to do it. I don't have any trouble once I get technology. What I have learned is that I don't know all of the tools, which is why I rate myself a four on comfortableness or knowledge of it. Five on comfortableness because once I find a tool, I watch, then I play, and then I figure out how to use it. That's why I don't, I don't feel uncomfortable taking something I don't know and figuring out how to make it work.*

#4: *"I wouldn't say if five was a digital native I'm old enough that I can remember having to go visit people instead of sending them a text* *message. So I wouldn't say I'm a complete digital native, I have acclimated very well to the technology.*

Female ratings ranged from two to five. Variation in confidence could be associated with age differences of teachers. The presence of a generational gap among females was evident, while not present among males. Younger female teachers with teaching experience between one to six years all ranked their abilities and confidence at a four or five; while, the more experienced teachers ranged from a two to four. Table 5 provides evidence of both female differences in technological confidence as well generational gap differences.

Interestingly, even though males noted potential limitations in their skills, their ratings remained high. For example, teacher #2 who has been teaching over ten years commented,

I would rate myself as a five except for the rare moments when I complete or totally get thrown, I am when it comes time for any sort of trouble shooting, I am absolute garbage, I want it to work, I want to know how to operate it but when it comes to, the color on my smart board has been flickering the last week and I have got no idea what to do with it and if I didn't…since I don't have a competent tech director it's just that color is going to flicker kids I don't know what to do with it, I'm great with software, I am rubbish with hardware…

Similarly, an experienced female teacher of 25 years, teacher #7, rated her skills and comfort as a three, four and explained that she was,

Fairly comfortable, I feel pretty good about it [technology]. Of the reasons I feel comfortable about it, honestly, is because the relationship I have with my students is such that they love to help me. If I'm in a bind and don't know exactly, I mean like they manoeuvre around. They are much more skilled at using technology than I am. So, I'm going to; I've done my research; and I got my stuff together. I know what I'm doing, but I know if I hit a glitz, somebody that's sitting in my room can fix it. The bottom line is that my skills are nowhere near that of my students. They are very comfortable and confident in using technology.

Table 5. Examples of female confidence quotes

Less Confident	Confident:
#6: Rating of two. Some teachers …have been able to do that.... There's some software out there where kids will have a certain amount of time that they go and do a quiz or a test and they have to have it submitted by a certain deadline. Some do that, and you know, that's great if that's what you think works…I'm just not real comfortable doing that yet.	#3: I'd say a 5=five just because after during my undergraduate studies and while we were in our education program, we did a lot with technology. And then... we have the STEM program which I'm going to be working in next year. We do have a lot of technology resources in the school which includes iPads, iPhones, and netbooks. I feel, just with my generation, that I'm very much familiar with technology and I am really creative with technology. I feel very comfortable being able to pick up an iPad and do things in a classroom that some teachers would absolutely positively freak out over…
#5: I'm definitely not a super user. I'd say more of a three, kind of in the middle. Sometimes I'm more comfortable than others. The iPads are still pretty new to me. I don't have my own. So when I get them I have to teach myself how to use them with my PowerPoints and the smart boards and resources I've developed. I feel really comfortable with these now, because I've been using them for a couple of years.	#10: …not that I have necessarily used everything or that I am completely proficient in everything, but I am pretty self-reliant when it comes to learning new technologies. I have actually presented at a state conference about using technology in the classroom. So, I always feel like I'm pretty confident on that scale. Interviewer: Okay, how comfortable are you using technology? #10: probably a five Interviewer: So, you're completely comfortable… #10: Yeah. Interviewer: …with using new software and new technology? #10: Oh yeah.

While both noted weaknesses and limitations in their skills, overall, male teachers expressed a more positive perception of their technical skills and confidence in using technology.

Most notably, female teachers all reported a desire to "...do better with the use of technology in my classroom" [#12]. Every female teacher expressed sentiments that their technology usage was not at the level it should be, and articulated a desire for professional development opportunities to hone their skills for technology integration. They conveyed a need for more content-specific applications rather than generic STEM focus examples present in mandated professional development opportunities. These findings mirror gender-based research technology usage that while technology differences between males and females often do not exist, males tend to have greater efficacy in their technical skills (Anderson & Williams, 2012; Huang, Hood, & Yoo, 2013; Lau, & Yuen, 2010; Saglam, 2011; Shashaani, 1993). Furthermore, results affirm prior findings that women internalize and personally blame themselves for perceived technological inferiority (Frieze, Quesenberry, Kemp, & Velazquez, 2012; Huang, Hood, & Yoo, 2013; Mitts, 2008; Sherman, Sanders, Kwon, & Pembridge, 2009; Weber & Custer, 2005). These findings offer implications for blended or online learning. Differences in efficacy among male and female teachers could impact who is chosen to develop or deliver web-based instruction. If this becomes gender inequitable, it may perpetuate female teachers' sentiments toward technology, as well as reduce female models of advanced technology users, which has broader implications for high school and college bound girls.

Access to Technology

Teachers associated a gap between how they envisioned themselves using technology (fully constructivist and seamless integration) with the lack of access. They frequently noted that lack of access can be a barrier to more constructivist pedagogical methods. Their perceptions of the lack of accessibility were associated with specific types of hardware. Classroom observations revealed that each teacher had a computer in the classroom, and all had Internet access. The challenges described by teachers were limited advanced technology tools, specifically iPads, and the differences in longevity in having classroom technology resources (e.g. SMART Boards). The incongruence in teachers' visions of the possibilities of technology and the access to technology tools, like smartphones, was noted. A pattern that emerged was that differences in access were gender-specific. Females reported greater barriers due to access issues. One veteran female teacher noted, "I found... that it was an issue for me sometimes having access to iPads. For example, when I wanted to use it…I'd come up with a great project and unless you had it [a reservation] way out in advance you wouldn't be able to get those iPads" (#5).

Envisioned Possibilities—or Inequitable Campus Distribution?

In their descriptions of technology integration, teachers shared both their vision of the possibilities of technology as well as the practicality of classroom applications. For example, a male teacher in a general classroom [#9] commented, " I know my challenges on a daily basis to get through the curriculum and to grab the technology that I need to integrate meaningfully, sometimes it's a challenge to get it as much as I would like." (citation) These gaps between visionary goals and practical applications could be attributed to access barriers. Surprisingly, access of our sample was not gender equal. Several male and female teachers taught within the same school, but they were assigned different responsibilities (e.g. STEM, curriculum coach), which were linked to greater technology access. In one particular school, distributions of SMART Boards had occurred over several years. Within this school's social studies department, one male received the department's first Smart Board five years ago, whereas two female teachers had a SMART Board installed in their classrooms within the last two years. Furthermore, the male teacher who taught in the STEM program at this school had access to iPads. This 1:1 iPad program provided all students with individual iPads for in school and at home usage. From observations and school visits, the inequitable pattern that was present in this school also existed among other schools.

Access to Technology Tools

A female teacher who had recently moved to her current school highlighted inequalities in access across schools. She noted some schools have a computer/iPad per student and other schools must share technology resources. In contrast to the 1:1 iPad school, the teachers in this study had access only to shared computer labs or iPad carts. This teacher was a young teacher with four years of teaching experience and wanted greatly to integrate technology, as she had been able to do in her previous technology-rich teaching environment. She commented,

#10: *Anytime that I'm not using it is just, it's just access and that was something that the school I had previously been at we were 1:1, our students all had computers and we were a very technology rich environment. Now that I'm in a traditional school, um, it's {laughter}, it's sort of survival of the fittest whoever can sign up for it first, so it, limited access is the big thing.*

To equalize the playing field, in the year this study was conducted, the school districts in which these teachers work implemented a BYOT policy: *Bring Your Own Technology*. This allowed increased access for some students and teachers. The most common technology tool used under this policy was a smartphone. For teachers though, this seemed limiting since the resources were not standardized, and not all students had access to a smartphone. In addition, the wireless routers on campus, also recently installed, were inconsistently reliable. These results led us to question the rising inequalities in access among schools and within schools. Furthermore, we were concerned about the inequities for female teachers as well as the students they serve. The numbers reported in technology access studies fail to present an accurate picture of inequitable resource distribution on a national scale (NCES, 2010).

When technology was in abundance, as was the case in the 1:1 iPad STEM program, access produced results. The motive for using technology was teacher accountability and teacher evaluations. Seamless integrated technology was expected to justify county expenditures.

Interviewer: *It sounds like technology is heavily embedded in the classroom.*

Teacher #4: *In this program [STEM] it is, in my classroom yes ma'am it is and it's had to be. The county paid a ton of money to get this program here … and they thought you know we're going to give these kids the opportunity with as much technology as possible, readily available, so you know, they wanted to come in our classrooms and see it being used, they didn't want to come in and still see kids you know doing this with a notebook....*

Subject Priority as a Determinate for Technology Access

Another variable affecting teachers' access to technology was that they taught social studies. As teacher #10 observed,

#10: *I think that [access is] the big thing for social studies, and I hate to get on the political soap box here but I think in, within a school, what I said about access, is big and I know that within most schools social studies is not the priority and I think that when it comes*

> *to having access to that technology I think that math and science and English classes are going to be the ones to get the upper hand, because they're, and I hate to say this I don't think every administrator feels this way but I think at a lot of schools those are valued over social studies, and I think that has a lot to do with our access to it.*

She was not alone in this observation. Four other teachers made reference to limited access to technology as a result of the STEM subjects and Common Core courses, which were given preferential access. Regretfully, these findings support marginalization research acknowledging the subordinate role the social studies has been subjugated to in schools, and the potential ramifications at the secondary level (Fitchett & Heafner, 2010; Fitchett, Heafner, & Lambert, 2012; Heafner & Fitchett, 2012). Perhaps the silos of disciplines within the secondary environment create fundamental barriers to technology integration (Cuban, Kirkpatrick, & Peck, 2001). A possible solution to the imbalance of subject area priorities is the potential that blended and online learning afford. Given that one quarter of web-based courses are social studies (Setzer & Lewis, 2005), the opportunity for social studies teachers to utilize innovative platforms for learning that are not limited to the hardware available in schools is apparent. The school with the greatest number of participants in this study is taking strides in this direction with the experimentation of providing online social studies courses and a "power hour" for students to engage their social studies teachers with questions derived from their web-based learning.

Perceptions of Impact of Technology on Teachers' Work and Workload

Male and female teacher differences were quite noticeable in how they responded to the impact of technology on their preparation, teaching, and overall workload. To provide an overview of the wealth of information present in the teacher interviews, we attempted to visually present these differences using frequency counts of teachers' descriptions of subcategory concepts related to work perceptions of increased ease or difficulty of workload.

Perceptions That Technology Makes Work Easier

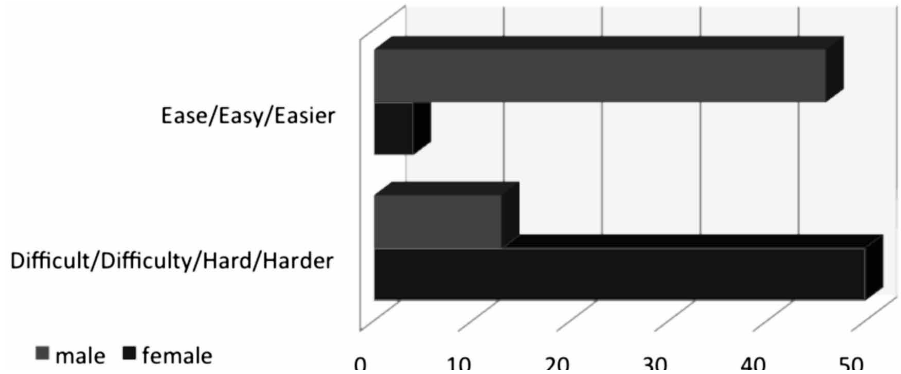
In our coding process, we had noted many occurrences of words that were associated with simplification of work (e.g. ease, easy, and easier) and words describing increased complexity as a result of technology (e.g. difficult, difficulty, hard, harder). We tabulated the frequency of males' and females' use of these words to describe how technology impacted their work. Figure 1 demonstrates the gender differences we observed in teacher interviews. Males talked the benefits of technology in an overwhelmingly positive manner. For example, Teacher #2 defined technology as "a tool or device, usually we're thinking now electronic, that makes an existing process easier or allows some sort of a new task to be accomplished" [Teacher #2]. Other male teachers echoed these sentiments when describing technology, such as:

> ***#9:*** *I would define technology as anything that helps and it doesn't have to be the student but you know in society anything that's going to help what we're trying to accomplish. If it makes something easier, simplifies a process then it's actually classified as technology.*

Male teachers also expressed a belief that the use of technology reduced their preparation time. Teacher #4 commented,

> ***#4:*** *I mean it [technology] makes my job super and simpler…*
> ***Interviewer:*** *it makes it easier?*

Figure 1. Gender differences in perceived impact of technology on teachers' work



#4: *It makes it a lot easier. I don't have to have a huge file cabinet full of worksheets. It's all at the touch of a couple of buttons.*
Interviewer: *so it doesn't intimidate you in any way*
#4: *No it doesn't intimidate me at all umm, technology no it doesn't. I mean it makes my day easier, it makes planning lessons easier.*

Teacher #8 commented,

#8: *I think it [technology], it enhances and makes it easier on me because the students know of and can find more sites, research-based sites than I'm aware of. I think it's helped because I don't have to do as much preparation. I can say, you know, within some parameters this is what I want you to find, go find it and they can do a great job of finding the information and presenting it in ways that I'm not familiar with.*
Interviewer: *OK. So it reduces some of your preparation time?*
#8: *It does because kids can to a lot more on their own.*

Perceptions That Technology Makes Work Harder

While males indicated that technology made their work easier, females conversely reported that work had become harder and more difficult as a result of increased technology usage. Perhaps an explanatory factor was the observed generational gap among females. Yet overall, females of all ages perceived technology as requiring greater preparation time. Another possible explanation was that male teachers have greater exposure to technology and many technology programs are male-oriented (Borg, 1999; Washburn & Miller, 2005). Additionally, female teachers perceived the need for greater teacher attention and monitoring when technology was utilized in the classroom. This level of awareness increased teacher supervision of students in order to reduce technology-mediated distractions and to keep students on task. For example,

#10: *I think it [technology] actually makes things… more difficult. I think a lot of people think it makes it easier. I think in a lot of ways technology can make the classroom much more stressful and more challenging. You know, when the students have access to any information, they're connected to the Internet and that opens a door for inappropriate behavior. That opens the door for students doing something that they're not supposed to do. So, I think from a classroom management perspective technology definitely increases how much you have to monitor students.*

Teacher Control

Another area in which gender differences were found was in the perceptions of teacher control. Female teachers described more concerns regarding a need for classroom control and managing student behavioral changes as a result of technology use. We present frequency counts to share visual differences in the number of times female and male teachers referred to these sub-codes.

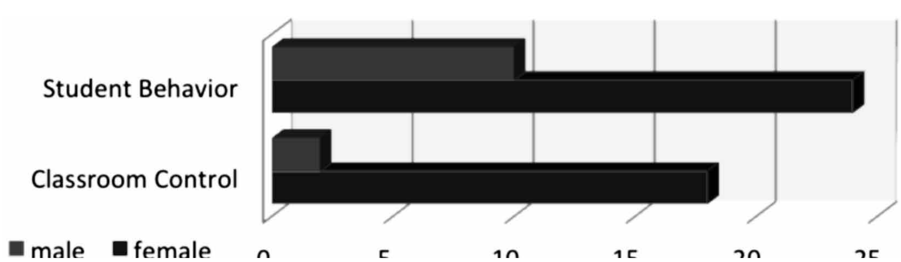
Female teachers reported a need to control the classroom, yet male teachers made little connection to control as a factor associated with technology integration (see Figure 2). Teacher control was a prominent issue that informed female teachers' decisions to teach without technology. For example,

#10: *I can even say that for myself. I have one class that just behaviorally that can't do a lot of student-centered activities because they don't have that self-control component to complete it. And, I will tell you if you look and compare these students to my other classes, they use almost zero technology on their own, because they haven't gotten over that behavior problem yet. I think that absolutely having a student-centered classroom will allow you to use any technology you want. This is unless you're in a classroom that you don't want it to be student-centered or the students can't handle that then I think that absolutely affects how much technology is being used, without a doubt.*

Generational differences among females were not present when examining classroom control. A need for control might explain a female tendency toward behaviorist pedagogies. In addition, it may be an indicator of female internalized pressure for accountability (teacher evaluations are connected to technology use) and gender roles within Western culture (Huang, Hood, & Yoo, 2013). The frequently mentioned concern for behavior issues as a deterrent to technology use was also a female phenomenon. Student behavior was consistently described in conjunction with perceptions of control.

The ability of male teachers to freely shift learning autonomy to students was not shared by female teachers. Results affirm prior findings that women internalize and personally hold themselves accountable as well as experience greater levels of workload stress (Frieze, Quesenberry, Kemp, & Velazquez, 2012; Huang, Hood, & Yoo, 2013; Sherman, Sanders, Kwon, & Pembridge, 2009). Hargreaves (1994) and Apple (2000, 2004) provide further insights into the gender roles in education and the ramifications for female teachers. Apple (2000, 2004) situates intensification in the context of the proletarianization and gender stratification of teaching. He argues that intensification of teachers' work has deskilled and undermined the professionalism of a predominately female work-

Figure 2. Gender frequencies for regarding limitations to technology



force. The findings from this study suggest very different workplace perceptions, in which female teachers experience workplace intensification that is associated with technology usage.

The need of female teachers to maintain control and to monitor student behavior when using technology, in contrast to male teachers, has the propensity to influence the manner in which teachers approach online learning. Male teachers may gravitate toward online tools that encourage more student autonomy and independence, while female teachers may instruct online courses with greater student oversight and monitoring. Given that one of the major uses of online learning currently in high schools is credit recovery (Queen & Lewis, 2011; Setzer & Lewis, 2005). We suggest that female teachers may be better suited to work with struggling students who might not have the skills needed to function independently in online learning environments.

Perceptions of Technology as a Teaching and Learning Tool

Technology and Student Engagement

The propensity for male teachers to open the social studies classroom to greater student freedom and choice is present in the frequency with which males describe the use of group work and collaboration in their technology integration. This shift of learning accountability from teachers to students was a more common description among male teachers than female teachers. As one male teacher commented,

#9: *My approach as far as learning within the classroom and technology use, it's a mixture of methods. I would say I do a lot of group work. It's very discussion oriented. I try to get the kids to think critically not only in answering writing prompts and through guided questions, but also through group discussions, which include mixed groupings like small partner groups, a few students working together, and also in whole class settings.*

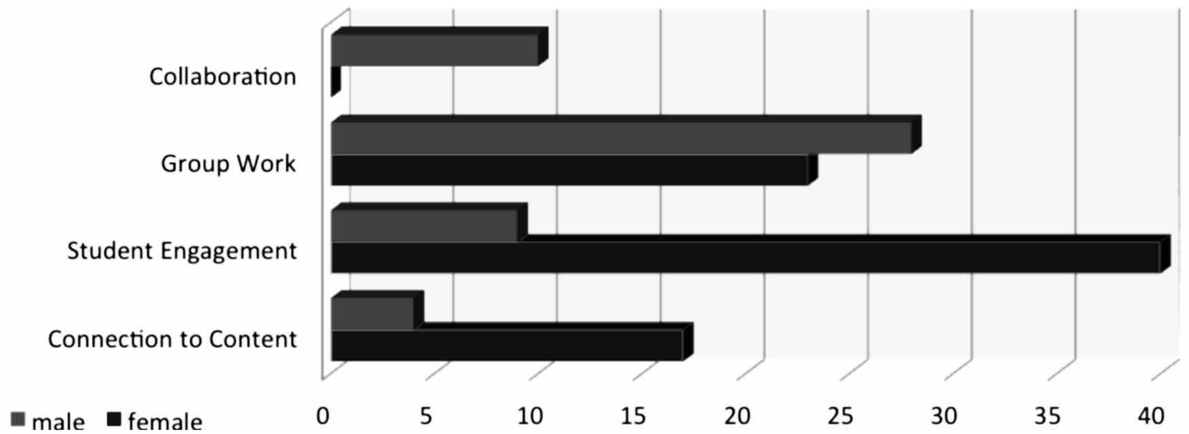
#9: *I actually have reduced the use of my smart board this year significantly....I think as far as interactive games go and so forth I've kind of turned that over to the kids because we have iPads and iPods and other portable technologies like these.*

Males provided examples of student technology uses in which students engaged in blogs, class Dojos, Twitter, digital games, Voice Thread, Toondoo, Edmodo, and other collaborative web-based tools. Technology for males was viewed as a tool for promoting interactive discourse, cooperative learning, and engagement with others as a process to support learning.

When female teachers talked about student engagement or student-centered learning, it was associated with some form of discourse. Discussion and dialogue were always described in the context of a face-to-face class activity, such as a Socratic seminar or debate, and rarely used when talking about technology tasks or classroom applications. The sheer frequency differences in how participants contextualized collaboration and discussion is surprising. While research suggests that females gravitate toward communicative technology tools (Huang, Hood, & Yoo, 2013; Mitts, 2008; Sherman, Sanders, Kwon, & Pembridge, 2009; Weber & Custer, 2005), these female teachers did not perceive technology as a tool for supporting classroom dialogue. For females, interactive exchanges were articulated as feedback loops between the teacher and students.

Research acknowledges female oriented perceptions that support affective educational experiences (AAUW, 2010; Frieze, Quesenberry, Kemp, & Velazquez, 2012). Our findings affirm this gender sensitive impact. Females viewed the role of technology as a tool to engage learners, to capture their attention, and to interact with content. As an example,

Figure 3. Purpose for using technology



#11: *I think social studies can by nature be boring, unless you just have a natural love for it. I think it really can be horribly boring especially for kids that hate it. They don't see its purpose, such as their "when am I ever going to use this" type thinking. I think you can utilize technology in so many different ways to make content seem more relevant and make what we are studying seem more real. Technology engages them in content. If anything, I use it to get their attention to focus on the content.*

Another female teacher stated,

#3: *So I'm not saying that they need to use technology to constantly entertain them, but the more creative you [teachers] are I think with technology in the classroom, the more engaged this generation stays.*

#3: *…When I use technology it's just to engage and interact with the kids…*

Furthermore, female teachers talked about technology as a medium for connecting content and making learning relevant for students. For female teachers, technology applications needed to support students in learning content, or technology tools should not be used. Female teachers articulated content connections and content learning as technology-mediated relevance. The use of visual primary sources was a strategy used to demonstrate a concept or to describe an event. For example, Teacher #6 described

#6: *[The use of technology] absolutely impacts my lesson planning, because I'm now looking more and more at things that I can get kids doing. To make the content more relevant technology becomes an important resource.*

#6: *The big thing is relevance. Relevance in social studies is important. You know, you talk about Congress to kids. Well then, get out there and research what current bills are in legislation, what topics are being deliberated, and which bills are being debated. Or if you're talking about a current genocide, go see what the United Nations is doing about it right now. Go see what some of those members are saying. It's just, content relevance. I think relevance is a big part of being able to use technology effectively.*

This female-oriented view of engagement differed greatly from male colleagues who rarely used the term *engagement* to describe technology integration motives. Male teachers described *content* as the primary driving force to initiate student interest. Male teachers also rarely justified the use of technology to create content connections. Rather, male teachers described technology as a medium for building contextual knowledge and supporting the development of background content knowledge. Many of the applications males described using included web-based visual tools, such as content videos, Geographic Information Systems (GIS), and interactive gaming. One male teacher's comment epitomizes this difference and highlights the contrast in gender perceptions:

Interviewer: *"so when you do use the technology what's the primary reason for using it in your class? Either by yourself or having the kids use it?"*
#9: *Access to information. And I use it as a pallet to demonstrate learning or build upon prior learning.*
Interviewer: *Okay, a lot of teachers have said to me that they feel the use of technology is helping them to catch the students' attention and keep them attentive basically.*
#9: *Yeah engaged*
Interviewer: *engaged, do you find that?*
#9: *Some of the applications I do but not all, I think the material, not the technology, is probably the prime determinant of what makes students interested and engaged.*

Males did not share the same vision as females regarding technology as a tool to create content relevance, nor did they see technology as a way to get students' attention. Instead, male teachers noted that the newness of technology wears off and that it no longer impacts student interest as it once did when it was new and unfamiliar. When males described the purpose of technology, they focused on student familiarity with technology as an asset to promote greater understanding of content.

#8: *…Well with students using so much more technology in their daily life, I think it's becoming more and more necessary to utilize technology from a student's standpoint because that's what they know…*
Interviewer: *So when you do use technology, whether it's the students or yourself, what's the primary reason?*
#8: *For us [students and teacher], it's a lot of research-based and some project-based learning. Creating something either to present to the class or to make something that goes along with the concept students are learning.*

Gender differences were observed in teachers' descriptions of student uses of technology as a medium for engagement and content connections. Male teachers consistently referred to technology as a tool throughout the interviews; whereas female teachers referred to technology as a means to facilitate learning and a resource to increase student motivations to learn. Gender differences in technology descriptions support existing research (Huang, Hood, & Yoo, 2013; Mitts, 2008; Sherman, Sanders, Kwon, & Pembridge, 2009; Weber & Custer, 2005). Affirming Huang, Hood, and Yoo's (2013), findings regarding web-based gender behaviors, males in our study expressed preferences for *visual* tools like videos, while females preferred to use *audio* media, such as digitally recorded speeches. The impact of gender differences in preferences for technology tools on blended learning and online course development are potentially significant. The types of web-based learning experiences offered in an online course environment might vary based on the gender of the person designing the course.

Gender-Oriented Technology-Mediated Tasks

Other gender relevant outcomes—and perhaps the most significant—were the differences in the web-based instructional tasks that teachers assigned their students. Male teachers, more often than females, described their students' technology-mediated assignments as activities that required students to demonstrate their learning by writing, presenting, building, and modeling. Female teachers articulated a need for technology task outcomes to provide students opportunities to express understanding through completing an assigned task and applying a specific technology. These gender differences align with descriptions of gender-specific activities in the literature review (Huang, Hood, & Yoo, 2013; Mitts, 2008; Sherman, Sanders, Kwon, & Pembridge, 2009; Weber & Custer, 2005). The orientation of tasks for males tended to be product-oriented and more concrete. In contrast, female teachers perceived technology assignments to be more abstract and promote social engagement.

Primary Sources and Historical Thinking

We examined teachers' discipline specific technology behaviors and found all teachers recognized the value of technology in increasing access to primary sources. Male teachers referred to information and primary source accessibility 60 times, while female teachers made similar references 65 times. Evidence that teachers are embracing the value of technology to expand content with the use of primary sources was present throughout teachers' descriptions of technology integration. Outcomes support recommendations of social studies researchers and suggest more positive findings than previously observed (Cohen & Rosenzweig, 2006; DeWitt, 2007; Friedman, 2006; Hicks, Doolittle, & Lee, 2004; Hicks & Ewing, 2003; Marri, 2005; Martin & Wineburg, 2008; Swan, & Locascio, 2008). However, the emphasis on historical thinking touted by researchers (Barton, 2005; Barton & Levstik, 2004; VanSledright, 2011; Wineburg, 2001) was not equally present in teacher descriptions of technological pedagogical and learning applications (see Figure 6). Males talked openly and with emphasis about providing learning opportunities that promoted historical thinking. While female teachers also noted primary source document analysis, they used fewer descriptions of discipline-specific learning behaviors (e.g. sourcing, analysis, and to be historians) in conjunction with technology integration. In contrast, females described technology as an important tool for promoting perspective taking and understanding of diverse perspectives (Bers, 2008; Lenhart, Kahne, Middaugh, 2008; Montgomery, 2009; Perkins-Gough, 2009; VanFossen, 2006). Males offered limited references

Figure 4. Gender frequencies in usage and descriptions of technology resources

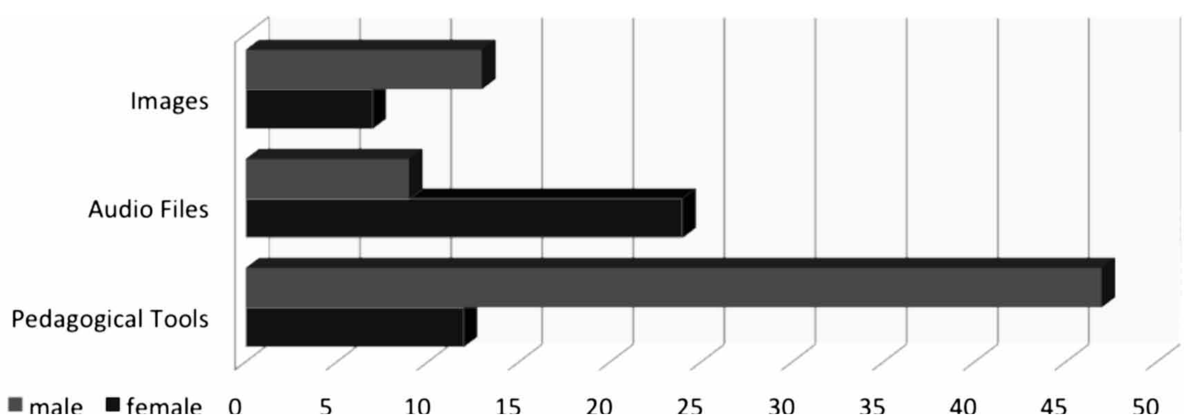


Figure 5. Gender differences in verbs used to describe evidence of student learning outcomes

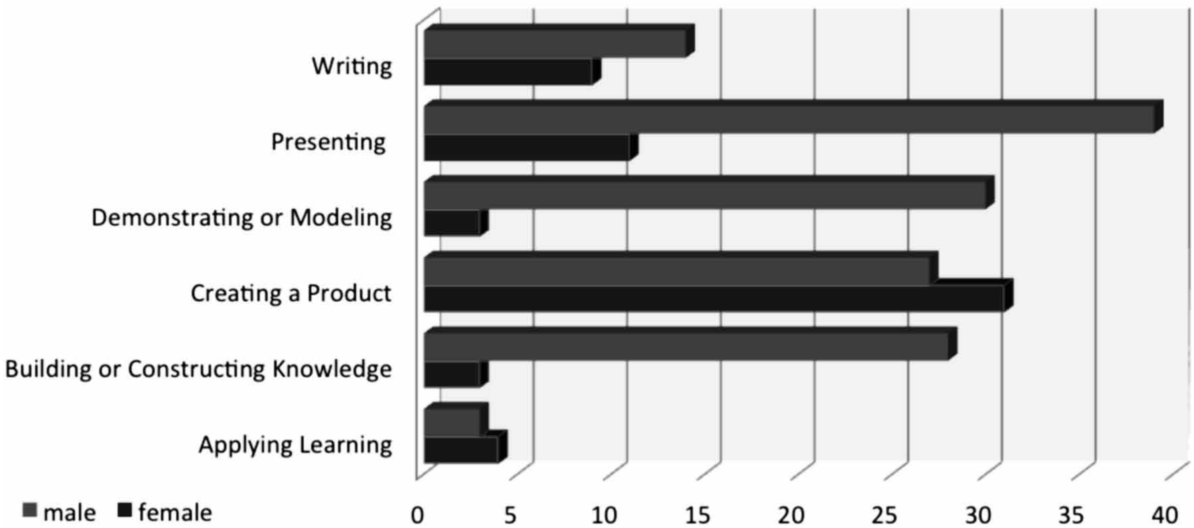
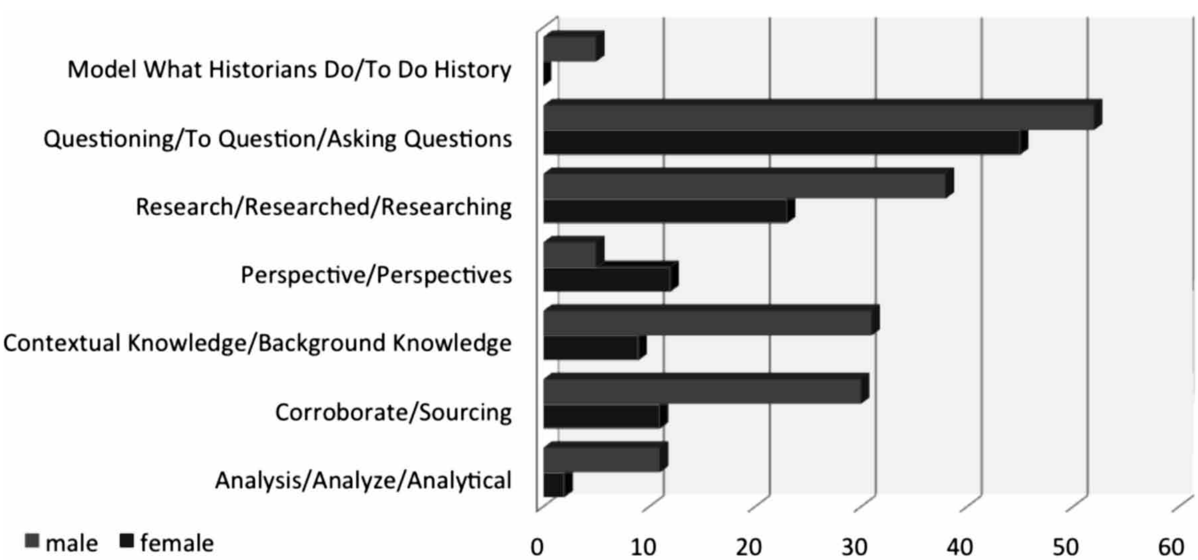


to perspective-oriented thinking. These gender differences seem to suggest gender-oriented affective and cognitive focused thinking (Bloom, Engelhart, Furst, Hill, & Krathwohl, 1956). Both approaches to technology align with the recommendations social studies researchers offer for the value technology offers in transforming learning, which will impact future developments in blended learning (Green, Ponder, & Donovan, 2014).

Figure 6. Uses to support historical thinking



Technology Tool Outcomes: Products or Processes

Males did not perceive technology as *a means to an end* (Mitts, 2008; Sherman, Sanders, Kwon, & Pembridge, 2009; Weber & Custer, 2005), which, in our study, was a documented *female* point of view. Male teachers described technology as a process for learning. Their descriptions fit more with a transformative view of learning than with a traditional approach. Affirming research, males' perceptions positioned technology as redefining the research process and increasing access to digitized sources (Bolick, 2006; Brush & Saye, 2009; Friedman & Heafner, 2007, 2008; Harris, Mishra, & Koehler, 2009; Heafner & Friedman, 2008; Tally & Goldenberg, 2005; Whitworth & Berson, 2003). In contrast, female teachers viewed the learning process outside of technology and one in which they were an integral part of student knowledge development. Relationships between students and teachers, for female teachers, were central to supporting student learning. Technology for female teachers was a tool to complete a specific task, which resulted in a measurable product. Females, in contrast to males, did not describe technology tasks involving student choice in determining the technology tools utilized. The following quotes exemplify this difference. First, a male teacher responded:

#9: *I would define technology… there's a number… I kind of look at it in two different ways because [technology is] used frequently as a means to an end for kids to research information, it replaces the need for kids to go out of the classroom and into the media center like they traditionally would do to find information and assimilate it. So technology is sort of as a reference guide. It's used frequently, umm, on the other hand, it can also be used by me as a teacher to provide them with pathways to find other information for primary sources. Students have to analyze so it can actually be very, it can be integrated into an instructive lesson times in a way. That's different than using the media center in a traditional way. Ideally also it would be provide them with the tools to create something from the material that hopefully would be evidence of some sort of synthesis of their learning.*

Second, a female teachers stated:

#10: *They [students] use technology, um, I think it's a lot more about how we use it and what product they're making with it. I mean, my peers will tell you, it's just research – just merely look at information, and they can use a textbook for that. If we're using technology, it's for, to create something.*

#10: *There needs to be a product at the end of it.*

Interviewer: *So, okay, let me just re-cap what you've said. So, you said you feel that it's a tool to make a product…*

#10: Yeah.

Interviewer: *…and you use it when it's something when you can create something, not just a source of information.*

#10: *No, not just a source of information. Students need to be able to use technology as a way to express their thinking and model their content understanding.*

This contrasting view of technology as *an end* (tool for historical/critical thinking) *to a means* (to create new pathways of thinking, perspective taking, and content relevance) rather than *a means* (process for assessing new information) *to an end* (to create a product), are distinctly different gender-sensitive points of view. Overall, all teachers view technology as a vehicle for learning, but the mode of transportation they envision looks quite different based on whether the teacher is male or female. These unique gender orientations lead to very different learning opportunities for the students enrolled in their courses. We suggest that the teacher gender differences need to be considered when designing professional development for online course instruction and blended learning. Gender differences in the purpose of technology tasks, as found in this study, can greatly impact what is included in web-based course development, how courses are organized, and what is valued online course delivery. The varying platforms for web-based social studies education, limited peer interaction, and inconclusive research combined with insufficient academic gains, demonstrate a need for further research into best practice concerning web-based social studies courses (Doering, Hughes, & Scharber, 2007; Kerr, 2007). We also argue gender-oriented technology pedagogy should be explored.

IMPLICATIONS AND SCHOLARLY SIGNIFICANCE

Outcomes of our study suggest that gender is an important factor that influences noticeably different visions for how technology should be used to teach social studies and support student learning in secondary schools. The learning opportunities these teachers provide their students vary greatly depending on gender. Furthermore, females express lower efficacy in their technology skills and comfort. They promote greater emphasis on perspective thinking and seek to make learning relevant and meaningful through technology integration. Female teachers nurture creativity, a trait valued highly among technology businesses. Female teachers have embraced the information highway as a resource for primary sources; yet, they have not reached the level of historical thinking applications males employ. Conversely, males project notions of technology as a tool to build and model learning. Descriptions of multi-dimensional media web tools permeate male visions of effective technology integration in social studies; however, the ability males have to accomplish these goals is facilitated by greater access to technology hardware. Males project higher confidence with technology, although it appears that their skills are more equivalent to females than they perceive.

Men and women view their teaching roles, as well as technology, differently; yet, both perspectives are equally important. This study supports findings from existing research (Crocco, 2008; Crocco, Cramer, & Meier, 2008; Francis, 2008). Likewise, we suggest that men and women are drawn to different attributes of technology and do not share the same interests or ideas for how technology should be utilized. Males and females gravitate to different attributes valued in social studies research. These findings counter those of Francis (2008). Crocco, Cramer, and Meier (2008) contend that without attention to gender "as part of the effort to integrate technology into education, any gains will have only limited impact" (p. 30). The implications for transformative learning mediated by technology and virtual learning experiences are significant. The online learning opportunities provided for students should embrace and tap into the gender differences in how male and female teachers perceive and utilize technology for understanding social studies. Given that most social studies teachers have been left to fend for themselves in locating and developing skills in using hardware and software, as well as honing online teaching skills (Journell, 2013), male and female teachers are likely to select very different applications, seek out different primary sources and websites, and develop lessons integrating technology or web-based courses with distinctly different learning outcomes (Doering, Hughes, & Scharber, 2007; Kerr, 2007). What we conclude from these differences is that gender should be a consideration when making technology decisions regarding access, training, professional development, and discipline-specific integration initiatives in K-12 online and blended learning.

RECOMMENDATIONS AND FUTURE RESEARCH

While we acknowledge the limitations of generalizations based on qualitative research design, there are findings from this study that deserve attention on a larger scale. We contend that future research is needed to explore the impact of these points. There are clear patterns that raise concern for researchers and they should be points of discussion in any efforts to expand technological usage in K-12 schooling. Our findings can also inform decision-making efforts to integrate more online learning and blended learning opportunities. Who designs and teaches these future blended and online virtual classes will impact what instructional experiences will look like and which learning attributes will be emphasized. Given that gender has been and continues to be a factor in shaping teaching and learning, gender must also be a consideration in blended online instructional design and virtual course delivery. Our data can be a starting point for recognizing the role of gender in online and blended learning in high school social studies.

On the basis of our study, we offer the following recommendations:

1. A concerted effort for professional development needs to include equal representation of all content areas, including social studies, and must be geared toward online and blended learning (see Journell, 2013). The teachers in this study requested discipline-specific examples of technology applications, which was a specific concern acknowledged by female teachers. However, male and female participants both noted the overemphasis on STEM subjects during technology related professional development.
2. Teachers need to be offered choices in professional development that serve both male and female technology interests, and also challenge gender-oriented perceptions. As teachers transition to new roles of online and blended learning instruction, these professional development options will be necessary to ensure the transformative and revolutionary possibilities of web-based learning are embraced.
3. Male and female teachers need the opportunity to share technology application ideas but these experiences must not be male dominated—they must also provide females with an equal voice. Mutually beneficial collaboration and online professional development learning communities (Petty, Heafner, Farinde, & Plaisance, in press) will be needed for teachers working in virtual schools. Gender dynamics will also come into play in those online environments. Acknowledging the need for gender equity is also an important consideration for online and blended learning.
4. When professional development is provided, emphasis on improving female teachers' efficacy should be included with technology training. This recommendation can greatly impact how online professional development and blended learning initiatives are designed to foster technology confidence and efficacy of female teachers.
5. Teachers should have equal access to technology, including its personal use. Providing teachers technologies such as iPads to be used at home and school is money well spent. Teachers who reported greater personal use were the teachers who rated their skills and comfort higher and perceived themselves as advanced technology users. As more virtual course and blended learning options become available, teachers will need equitable access to technology tools.
6. Time to embrace technology-driven changes, such as increased communication between students and teachers, is not currently present in the workday. Female teachers' sense of intensification was exacerbated by an inability to keep up with technology. One teacher re-

> ported a strong desire to use Twitter to create a streaming consciousness, but felt that she did not have to the time to adequately keep up with student exchanges. The female need to foster strong relationships with students created this personal expectation to respond to every post in blogs, discussion threads, Nings, and other social networking tools. Time to use technology, to learn technology, and to have students utilize technology were shortages most teachers acknowledged. Perhaps the current structure of secondary schools needs to be reconsidered to afford greater time for technology to revolutionize learning as projected decades earlier. The shift to virtual schools and more online courses will be significant in redefining the structure of secondary schools. The flexibility of time can address the challenges described. One point that must not be overlooked is that time, even in virtual teaching spaces, needs to be set aside and protected to allow teachers the opportunities to advance and hone their technology skills and expand their knowledge of digital resources.

In closing, when teachers referred to an "old school" or "very traditional" process, they were specifically describing non-technology instructional practices. Technology is undeniably impacting how social studies is taught. These teachers, both male and female, are shifting their instructional practices in order to accommodate greater technology usage. This has made the transition to constructivism a natural complement to technology integration. The move away from lecture and teacher-centered instruction, documented within the literature, is occurring because of the impact of an urgent investment in technology resources. The "slow revolution" of technology driving pedagogical change is clearly visible (Cuban, Kirkpatrick, & Peck, 2001), and we posit the next step in this evolutionary process of technology-mediated learning is the advancement of virtual and transformative learning spaces (Green, Ponder, Donovan, 2014). Social studies researchers have the opportunity to create new pathways for learning and innovative classroom practice through blended and online learning. In this process of transformation, gender should be a central consideration.

IMPLICATIONS FOR ONLINE LEARNING

Almost two-thirds of institutions of higher education surveyed in 2011 (Allen & Seaman, 2011) indicated the significance of online learning in their current and future planning. Allen and Seaman (2011) found that over six million college students were enrolled in at least one online course in the fall semester of 2010. These numbers have grown exponentially since tracking of online education enrollments began almost a decade ago. Online learning is becoming a ubiquitous experience for higher education. Given the emphasis of online learning in higher education, the natural progression in education is toward the adoption of online learning environments for K-12 settings. The emergence of virtual high schools, the requirement of an online course for high school graduation, and the push for online courses offerings in high schools are clear indicators of the forthcoming promotion of shifting learning environments (Clark, 2001; Molnar et al., 2013; Queen & Lewis, 2011; Rice, 2006; Watson et al., 2013). A total of 44 states report engaging some form of online learning activities in education (Picciano & Seamen, 2007), and 25 states have virtual high schools currently in operation (Watson et al., 2013).

With any change, there are growing pains as K-12 schools embrace online and blended learning as a way to offer large enrollment regular courses, course remediation, advanced placement courses, diverse course options, and traditionally low enrolled courses (Molnar, Huerta, Rice, Shafer, Barbour, Miron, & Horvitz, 2014). As schools seek to address shrinking budgets, online and blending learning can be very appealing options. These new school structures are not without limitations (Barbour, 2009; Barbour & Reeves, 2009; Cavanaugh, Barbour, & Clark, 2009). Learning from current technology uses, such as those presented in this chapter, can help decision makers understand the complexity that lies ahead as educators seek to revolutionize teaching and transform learning with online and blended learning platforms.

KEY TERMS AND DEFINITIONS

21st Century Skills: Technology skills deemed necessary for success in the 21st century, including critical thinking, invention, problem-solving, and multicultural collaboration.

Access to Technology: Differences in availability of technology resources such as internet, iPads, laptops, SmartBoards, apps, and other software.

Apps: Software technology applications.

Behaviorism: Teacher directed learning and instructional practices. Teacher uses of technology to convey content knowledge.

Blended Learning: Courses that use some face-to-face instruction mixed with some web-based instructional components. A flipped classroom uses a blended learning model.

Constructivism: Student centered learning and pedagogical practices. Student-oriented technologies in which students are the primary users.

Epistemology: Theoretical framework that informs pedagogical beliefs of teachers which influence instructional decision-making.

Gender Divide: the propensity of technology to attract males to the field. Preferred usage of technology by males.

Gender: Differences in male and female approaches to teaching and technology integration.

Integration: A seamless instructional process of technology mediated learning in content areas.

Online Learning: Web-based courses taught 100% in a virtual learning environment.

Secondary Social Studies: a composite discipline represented history and the social sciences. Courses taught in high school include World History, American History, U.S. History, Geography, Political Science, Civics, Government, Economics, Psychology, Sociology, and etc.

Teacher Characteristics: Attributes of teachers including teaching experience, gender, age, training, and professional development.

Technology: Classroom hardware and software, and online learning tools used by both teachers and students.

This work was previously published in Exploring the Effectiveness of Online Education in K-12 Environments edited by Tina L. Heafner, Richard Hartshorne, and Teresa Petty, pages 385-429, copyright year 2015 by Information Science Reference (an imprint of IGI Global).

APPENDIX 1

Interview Protocol

Begin with these questions:

1. How would you define your approach to teaching?
2. How would describe your teaching style on a scale of 1 to 5? 1= behaviorist (teacher directed instruction) or 5= constructivist (student centered instruction). Explain your rating.
3. How would you define technology? Provide an example.
4. How would you classify yourself on a scale of 1-5? 1= digital immigrant or 5=digital native. Please explain.
5. How comfortable are you in using technology on a scale of 1-5. 1= very unconformable or 5= very comfortable. Please explain your rating.
6. What do you think should be the role of technology in teaching? Provide an example from your teaching.
7. What do you think should be the role of technology in learning? Provide an example.
8. When you use technology what are your primary reasons for choosing to use technology? Describe a specific usage of technology.
9. When you use other instructional methods what are your primary reasons for not using technology tools?

Perceptions of technology:

- What types of technologies do you use for teaching social studies?
- How do you integrate technology into the classroom?
- Who are the primary users of technology in your social studies classes: you or your students? Explain.
- How do you define effective integration of technology in social studies?

Additional open-ended questions will be posed when appropriate. These will include questions to explore specific technology tools mentioned by teachers:

- Please describe why you chose to use this technology.
- Please describe how you use this software to teach social studies.
- What does this application of technology looks like in your classroom? Give a specific content example when you have used it.
- How do you think the use of this technology impacts your work or students' learning?
- Please describe your reasons for choosing not using this technology.

Final Questions:

1. Please define in your own words what it means to effectively integrate technology in secondary social studies classes.
2. Please feel free to add any additional comments that you may have concerning technology use in secondary social studies classes.

APPENDIX 2

Table 6. Codes from original study

Meta Theme	Theme	Code	Sub Code	Sub Code
Gender (emerged in all themes)	Workplace environment	Barriers to technology integration	Time, expertise, access, resources, discipline, testing, restrictions, professional development	Content-specific professional development, technology resources and access
	Teacher Autonomy	Perceived restraints	Teacher control (over students, technology, curriculum & pedagogy)	Independent learning Dependent learning
	Links between beliefs and technological practices	Philosophy defines technology use Technology use defines beliefs		
	Epistemological Beliefs	Behaviorist Constructivist	Mixed – middle ground	Non static practices
	Perceptions of Technology	In learning In teaching	Definitional influences	Insecurity about technology Comfort with technology
	Perceptions of Integration	Perceived benefits of technology Perceived limitations of technology	Generational differences	
	Inequalities	Technology access inequality Perceptions of students	Poverty as barrier to BYOT Disciplinary problems Advanced vs. general students	
	Applications	Types of technologies Motivations for and against technology Access levels	Teacher Use Student Use	Maintain attention of students

Table 7. Participant descriptions

Teacher Number	Teacher Characteristics	Teacher
1	**Gender:** Male **Teaches:** World History, Civics and Economics **Experience:** 6 years **Technology Type:** Very comfortable and confident in his technology abilities **Access:** Has access to iPads and uses them. His students also use smartphones and laptops in the classroom	He believes in the integration of technology in the classroom but he also states that technology should not drive the instruction. Rather the right technology should be found to supplement pedagogical decisions because technology is a tool not a pedagogical approach. He is a constructivist and designs his classroom instruction around student centered activities. He is comfortable letting go of the control in the classroom and instead he views himself as a facilitator or learning for the students.
2	**Gender:** Male **Teaches:** U.S. History, World History **Experience:** 5 years **Technology Type:** Considers himself a tech super user of sorts **Access:** His students will soon have iPads in the classroom provided to them by the school. Students have been bringing their own technology for a while.	This teacher describes himself as someone who vacillates between employing traditional teacher directed instruction methods and student centered instruction methods. He believes in giving students an increasing amount of ownership of their learning and he feels that technology is something that can aid this process. He also views technology as a tool to considerably save time when conducting research and as a tool that enables students to accomplish certain tasks otherwise not possible.
3	**Gender:** Female **Teaches:** US History **Experience:** 6 years **Technology Type:** Confident technology user, but a little conservative in her usage **Access:** She uses iPads sometimes but has a hard time accessing them. She does *not* have a smart board in her classroom but her kids have BYOT	She is a young teacher and, in my opinion, a technology native. She seems very confident and comfortable with trying new technology apps and software. However, her view on technology integration in the classroom is a little conservative in that she believes that tech can make students lazy and she therefore makes her students go to the library and use books. In addition she feels that students are best able to "think for themselves" (engage in critical thinking) without technology and she sometimes does not permit technology usage for this reason – which to me is a traditional view of technology. She states however that technology use in instruction is inevitable because students expect it and it's the only way to maintain students' interest and engagement. Technology use is also important in her opinion because it provide students with transferable skills they need for the employment market and for college. I think she integrates technology in her lessons more than she realizes.
4	**Gender:** Male **Teaches:** U.S. History, Civics and American Government **Experience:** 10 years **Technology Type:** Confident in technology use, but not a native **Access:** All his students have iPads in the classroom	He is working within a magnate school with a STEM focus and their teaching philosophy is focused on student centered instruction. He therefore considers his teaching style as constructivist, which I think was less his own doing and more a result of him working in the magnate school. He believes that technology is a supplementary tool to the learning process for example as a way of accessing information quickly and for visual aids. His students use technology *more* than he does on a daily basis. Although he has technology incorporated in his lessons, he still sometimes pursues non-technology class room instruction because he believes that sometimes technology enables students to take short cuts that are not beneficial to their learning.
5	**Gender:** Female **Teaches:** U.S. History, Social Studies **Experience:** 15 years **Technology Type:** Insecure hesitant user, not a native. **Access:** Has access to and uses the computer labs. She has access to iPads, but is a little insecure about them	She is a more traditional teacher in that she employs teacher centered instruction (lecture) in all her classes although she combines it with student centered activities. She does allow her students to use their own technology but she seems to be the main technology user in the classroom. She considers technology mostly as a tool to show visual aids or as a presenter tool. Oftentimes she feels her students are more engaged and that she "gets more out of them" when they are allowed to use technology but she also notes that she feels technology in the classroom is a distraction and she is afraid to give up the control of the learning. Although she appreciates the added value of technology, she actually considers it a burden because it adds to her workload in preparation and planning time. She also feels technology can deter students from learning standard English and can facilitate a tendency to become introverted.

continued on following page

Table 7. Continued

Teacher Number	Teacher Characteristics	Teacher
6	**Gender:** Female **Teaches:** Civics and Economics, Social Studies, U.S. History **Experience:** 15 years **Technology Type:** Fairly confident tech user but not a native **Access:** She has access problems and makes use of BYOT the most	Her teaching philosophy is a combination of teacher and student centered instruction. She feels that with the topics she teaches, the curriculum is so comprehensive that some lecture is unavoidable. She considers technology an aid to enhance learning, to look up information, and also a tool for students to express their comprehension of a topic. Technology can bring visual to the historical in a way otherwise not possible and she makes use of technology in this way to make students understand historical events better. I think she is more student centered in her approach and more of a tech user than she realizes. Although she views technology favorably, she mentions that it can be a little overwhelming and time consuming.
7	**Gender:** Female **Teaches:** All elective classes **Experience:** 25 years **Technology Type:** Not very confident in her tech skills but eager to learn more **Access:** Some access barriers to iPads etc., but her students use their own technology sometimes	Her teaching approach is student centered and she wants students to be engaged in hands on activities. However, she still believes that due to the size of the curriculum in some of her classes, she still needs to give teacher directed instruction such as lectures. She considers technology more than just a way to obtain information. Instead technology is a tool for creating something based on processing learned information and expressing it creatively. Because technology appeals to younger people, younger than her, she feels that they get excited about it and it's a tool for them to express themselves in ways that give her an insight into what her students are thinking: An insight not otherwise possible. She also considers technology a way of keeping her students attention and as a way of giving them options of how to approach a problem. It appears however that she is the main consumer of technology in the classroom, not the students.
8	**Gender:** Male **Teaches:** Social Studies, Government, Civics and Economics **Experience:** 15 **Technology Type:** He is comfortable with technology, but doesn't seem to be a super user **Access:** Some access problems but students bring their own smartphones, iPads and laptops	His teaching philosophy is based on student centered instruction and he believes in allowing his students freedom to debate and discuss. He considers technology aids as tools to enhance the learning but not tools that can replace the teacher. He states that his students use technology in the class room more than himself but when asked about this in detail he states that his students only use technology in the classroom about twice a week whereas he uses it every day. He believes that constructivist instruction style goes hand in hand with technology use however, I think he considers himself more of a tech user than he really is.
9	**Gender:** Male **Teaches:** Social Studies, U.S. History **Experience:** 15 years **Technology Type:** Confident user, but has a hard time incorporating technology into his lesson planning **Access:** He has some access problems, mostly due to a lack of planning. Kids bring their own gadgets	This teacher describes himself as a constructivist and states that his classes are a non-lecture format. He considers technology in two ways, first, as a tool for gathering information and second, as a tool used to create something with – something new that cannot be created without technology. In this way he is (theoretically at least) integrating technology into the students' learning process. It seems to me that in his classrooms, he is the main consumer of technology, not his students. He has ideals that are hard to put in practice and therefore in the end, despite his ideals, it seems his students mostly use technology to access information – not creating.
10	**Gender:** Female **Teaches:** No AP – only general level social studies, primary focus World History **Experience:** 4 years **Technology Type:** She is in my opinion a native – confident in her tech skills **Access:** some access problems, students use their smartphones	Her teaching style is mostly constructivist as she believes in student centered instruction and exploratory learning for the students, with herself as a facilitator only. She considers technology a tool for creating something in the learning process, not just a tool for gathering information, and she is weary of what she considers an over-consumption of technology (she believes in quality over quantity!). Her approach is to use technology when it's possible to create something with it and she also believes in teaching students how to appropriately use technology. She feels that technology makes the students more interested and engaged. It seems that both teacher and students are using technology in the classroom although mostly the teacher.

continued on following page

Table 7. Continued

Teacher Number	Teacher Characteristics	Teacher
11	**Gender:** Female, **Teaches:** World History, Social Studies **Experience:** 1 year of teaching experience **Technology Type:** Hesitant, but confident technology user **Access:** Has access to iPads but does not use them.	She believes in the integration of technology in theory but is insecure in integrating technology in her own classes. Planning and access are barriers for her effectively integrating technology in her classroom. With more teaching experience she will probably become more confident and better able to plan for technology use in her lessons. She does use a lot of technology in her classroom but mostly combined with teacher directed instruction. She would like to use it for more student centered activities.
12	**Gender:** Female **Teaches:** AP US history Holocaust and Genocide **Experience:** 5 years of experience **Technology Type:** Insecure, but capable technology user **Access:** Has access to iPads and uses them in her classroom	She is an able technology user however she is also an insecure and reluctant technology user because she has fear of relinquishing control of the learning process. By incorporating more technology usage in her classroom, she feels a loss of control of the learning process and she does not trust that she will be able to engage the students enough to stay interested. She also fears that if she does not give the students a lecture version of the material they need then they will not learn it (again, fear of letting go of controlling the learning process).

Chapter 71
E-Learning Training Courses on Multicultural Education:
An Example from Greece

ABSTRACT

The implementation of the blended learning model is one of the most flexible and effective ways to organize teacher training courses since it combines contact learning and distance learning. Furthermore, differentiated instruction is the solution of Modern Didactics to the teachers' needs concerning their response to the challenges of the multicultural school. In this chapter, a teacher training seminar combining cultural diversity issues with e-learning methods is presented. The participant teachers were asked to use posters illustrating human and citizenship rights issues in order to create teaching scenarios promoting Multicultural Education. Thus, they were expected both to meet the challenges of differentiated instruction and to be familiar with e-learning approaches. The study points out the significance of the practice of education when developed within e-learning environments, a method which enables the production of collective practice-based knowledge. The authors' main aim is to highlight the importance of the usage of media tools in an e-learning training course.

INTRODUCTION

Teachers differ with regard to the learning patterns they adopt, the quality of their learning and their professional development. These elements, in turn, are associated with the obvious and non-obvious learning activities teachers develop (Vermunt & Endedijk, 2011). All the aspects mentioned above have advanced due to the integration of the Web into the education system. The reason is

DOI: 10.4018/978-1-4666-8246-7.ch071

that this integration has caused a shift from centralised classroom-based education to distributed e-learning courses that can be taken anytime and anywhere (Alonso, López, Manrique & Viñes, 2005, p.234).

Teachers' beliefs, practices and attitudes, and the relationship between these factors are strongly related to the challenges teachers face at work today. With regard to the perspectives of good teaching, contemporary teachers are expected to keep up with developments related to their own skills, knowledge and pedagogy, as well as their students' learning readiness and diverse backgrounds (Vermunt & Endedijk, 2011). As a result, teacher-training practices seem to have shifted from traditional, lecture-based procedures to active, self-regulated initiatives. In addition, teachers' pedagogic role demands the ability to differentiate their instruction, to apply student-centred learning approaches, to promote meta-cognitive regulative strategies for students, to design assignments, to coach project groups and to monitor and reflect on students' learning and thinking strategies (Bakkenes, Vermunt & Wubbels, 2010). Moreover, due to the rapid development of computer science and the popularisation of the Internet, modern educational technology has enhanced education ability and efficiency, changing the traditional education model and the ways of acquiring knowledge (Palaiologou, 2006).

In this chapter, first, we provide some useful background on the educational framework in which our study was developed and implemented. Then we present the context of our study, give our perspective on the issue and support our position. Finally we refer to the conclusions of our study.

1. THEORETICAL UNDERPINNINGS

The issue of teacher education and the training programmes the teachers follow during their studies in order to become effective in multicultural classrooms, that is to be able to provide 'culturally responsive teaching' to their pupils (Gay & Howard, 2000), has been a core topic in international teaching literature (Banks, 2011). Along the same line, at the international level, especially during the last ten years, there has been an increasingly global focus on online and distance education programmes, as new innovative approaches in teacher multicultural education and training programmes.

Taking the above into consideration, the objective of this study is to set a framework for teacher-training, e-learning courses, focussing on issues of multicultural diversity. Specifically, during an e-learning, teacher-training course incorporated into a Multicultural Education project, teachers who participated were asked to create teaching scenarios in congruence with their specialisation. Posters about the issues of human and citizenship rights issues were used as an inspiring tool for the participants. The scenarios served as an arts-informed, narrative inquiry aimed at investigating the teachers' knowledge on how to exploit meaning-making resources as multicultural storytellers through media texts (Dimitriadou, Nari, & Palaiologou, 2012). In other words, story-telling was used both to inspire teachers and motivate diverse students as learners in order to maximize the potential of their critical thinking and expression of their views.

It is worth mentioning here the main characteristics of e-learning procedures as training methods for individuals whose knowledge needs to remain current and competitive (Starr, 1998). Distance learning or e-learning or long distance programmes all constitute an extension of traditional teaching with the use of ICT, 'where learning opportunities can be provided in asynchronous, self-paced formats or in synchronous virtual classes' in keeping with the needs of those being educated (Zahner, 2002, p.12; Keegan, 2001).Thus, what is achieved is the dispensation of the temporal and geographic limitations of conventional training (Zgaga, 2008), while there is a saving of time, money and teaching staff. Distance e-learning programmes should be flexible, innovative, and applicable to the needs of the learners, while their potentials range from the dispatch of texts by correspondence to sound recorded files and teleconferencing. According to Wilson and Harris (2004), the incorporation of ICT into distance e-learning programmes enhances cooperation and learning within a socio-political framework, as well as the development of critical thinking skills, reflection, self-adjustment and meta-cognition of the teachers. Cultural factors are an important dimension which should be taken into consideration in the development of software and educational platforms (Palaiologou, 2006).

Recent international studies show the importance of challenging ourselves as educators to develop a global learning programme that would contribute to multicultural and cross-cultural global education in line with core teacher education courses. An interesting example is the study conducted by Seeberg and Minick (2012, p.2), at Midwestern University in the US (MWU); the researchers used computer-mediated communication (CMC) Web 2.0 tools, including video-conferencing, 'to engage teacher candidates actively, both affectively and cognitively, in diversity and in interaction with others in global contexts by involving them in direct experiences, rather than learning "about" them'. As the researchers stated, 'at MWU students do not appear to be ideal targets for multicultural, cross-cultural global learning projects. They frequently lack multicultural experiences and the personal motivation or social need to know the other' (as above).

Needless to say, the above situation as described by our international colleagues is the same in most European teachers' preparatory and in-service education programmes (see: Palaiologou & Dietz, 2012). During the e-learning teacher-training course described here, we made an effort to cover this gap to some extent.

2. THE CONTEXT OF THE STUDY: A DISTANCE LEARNING TRAINING COURSE FOR TEACHERS AND ITS SIGNIFICANCE

During the spring term of the academic year 2011-2012, a distance learning course on differentiated instruction was held in Florina by staff members of the University of Western Macedonia, within the framework of the Educational Project 'Education for Foreign and Repatriated Students'.[1] The three co-authors have worked as trainers in the e-learning courses of this project.

A six-week training course was addressed to Primary and Secondary education school teachers of various specialisations, who were working in classes with students from diverse socio-cultural backgrounds. Amongst its main objectives was to encourage the participants to design on their own and, then, apply innovative educational strategies in their multicultural classes, combining theory and practice. Thus, the course aimed at the teachers' professional development (Chitpin, & Evers, 2005) by familiarising them with the e-learning practices. Along with other obligations, the participants were asked to design and apply teaching scenarios based on innovative educational strategies by means of ICT application in differentiated instruction.

The seminar was based on two key-concepts of the discipline of teaching: *blended e-learning* and *differentiated instruction*. On the one hand, the blended e-learning was a vehicle for the creation of flexible instructional environments. Since it combines self-paced learning, live e-learning, and face-to-face classroom learning, blended learning helps learning procedures to exceed the traditional 'chalk and talk teaching', which is usually dominated by sterilized, shallow, superficial and controlling practices. Apart from instructors and participants, faculty developers interested in helping instructors and academic administrators interested in supporting hybrid courses cooperated (Aycock, Garnham & Kaleta, 2002). It is worth mentioning that the blended leaning approach has been proved as the most efficient contemporary teaching model (Alonso et al., 2005, p. 234).

What is more, differentiated instruction is optimum since it is personalised to students' needs. Various types of differentiation can be used either separately or in combination, concerning contents, processes, products, affects and learning environments (Scalise, 2007, p. 4-5). Furthermore, computers can be considered the potential saviours of the education system, because they can be used to personalise learning: 'they design our learning according to our needs and record the progress we make' (Alonso et al., 2005, p. 218).

In the course under consideration, differentiated instruction offered the opportunity for applications in specific topics, aiming at enriching the instruction in terms of both content and methodologies. Included among the seminar modules were discussions and real examples of educational and didactic approaches that were targeted at adapting the teachers' practices to the intercultural approach. In this way, it was expected that the teachers' academic performance and self-esteem would be enhanced. Special reference was given to the fundamentals of multicultural education in multicultural settings (Palaiologou & Dietz, 2012; Palaiologou & Evangelou, 2009; Kesidou, 2004), in addition to the application of flexible teaching methods (Dimitriadou, Pougaridou & Vrantsi, 2009; Dimitriadou & Efstathiou, 2008).

It is something of a truism to say that the blended learning model has been broadly incorporated into teacher training courses, because it helps teachers develop both communicative skills and qualifications related to ICT-based learning contexts. For example, we refer to the Comenius in-service training course which took place in Benidorm, Spain (2-6 September 2013) entitled 'Building research-based MOODLE materials in Maths, Science and CLIL'. Some of the objectives of this training course were: to encourage teachers to develop skills to manage blended courses in different ICT-based learning contexts, to develop teaching materials using e-Learning tools and to increase teacher collaboration (http://itemspro.net/?page_id=411).

The significance of e-learning training courses has been commonly pointed out in the international literature for certain reasons. First, e-learning is widely perceived as a learner-friendly mode of learning, provided it offers alternative, self-paced and personalised ways of studying (O' Brien & Beetham, 2008). E-learning programmes extend traditional learning paradigms into new dynamic learning models (Liaw, Huang, & Chen., 2007), since they are designed to be studied at a distance and give participants the flexibility to work from any location using a structured and supportive framework. Instructors are willing to use e-learning environments, since they enable them to make learning more effective, efficient and appealing. Moreover, e-learning programmes also allow participants to complete their courses while keep up with their busy and complex lifestyles (Ausburn, 2004). Sharpe et al. (2006, p. 45) found that 'student response is overwhelmingly positive to the provision of online course information to supplement traditional teaching'.

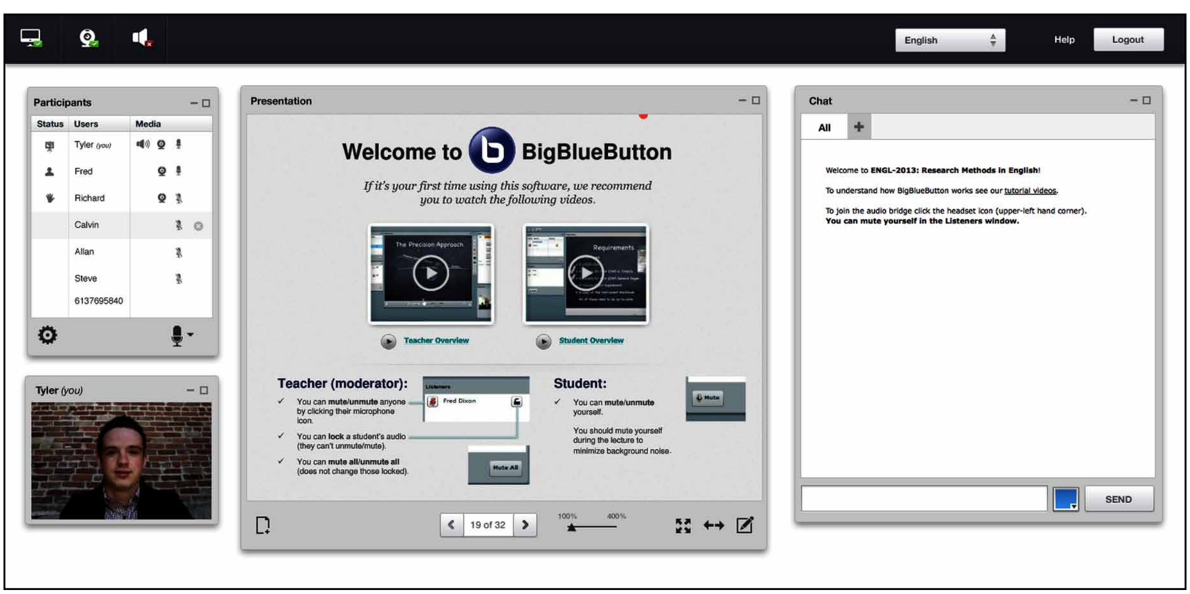
On the other hand, e-learning courses usually set barriers. To start with, a common barrier in e-learning courses is the demand for technological literacy of the learners who participate. Some learners have adequate computer-related experience, some have adequate Internet-related experience (using browsers and e-mail) rather than word processing (Liaw et al., 2007), while others have a negative attitude towards ICT. Additionally, participants expect instructors to help them when they use e-learning environments for assisted learning.

Concerning this point, some researchers claim that most students' problems with technology occur at the start of the courses, something that can be prevented by writing instructions for the students and by dedication to technology orientation and class socialisation (Aycock et al., 2002) during the first week of class. Another important negative factor that has been cited refers to the cultural barriers and the dominance of western cultures in the Internet and e-learning courses (Palaiologou, 2006). In a similar vein, not only do the people lack the technological capacity to interact with classmates and instructors; technical problems, such as poor network quality or malfunctions of digital cameras and microphones, discourage them from using e-learning tools. Collins and Berge (2000) suggest that users' technical problems can be promptly minimized by electing a simple and robust delivery technology. Also, Cho and Berge (2002) identified ten major obstacles in distance learning: technical expertise, administrative structure, evaluation/effectiveness, organisational change and quality, student support service, feeling threatened by technology, access, faculty compensation and time, as well as legal issues.

3. DESCRIPTION OF THE PLATFORM THAT WAS USED

At the beginning as well as at the end of the seminar, two face-to-face meetings took place (during the first and sixth week). Four intervening sessions were conducted by means of an open-source, web conferencing system developed primarily for distance education, called the *Big Blue Button* (http://www.bigbluebutton.org).[2] By using this system, the participants were involved in synchronous activities of distance learning through a virtual classroom, and had the opportunity to attend the instructors' lectures, to see any PDF presentations or office documents with extended whiteboard capabilities (such as a pointer, zooming and drawing),to use a microphone, to take part in a group chat which was viewed by everyone within the conference or to take part in a private chat with the instructor, as well as to communicate feelings and responses to questions or statements (Figure 1). Also, Big Blue Button offers the option of a recording feature that allows online courses to be automatically recorded and posted on the system, while every participant has access to this material.

Figure 1. Big Blue Button (new) interface



It should be noted that there is no built-in limit on the number of simultaneously active webcams.

Big Blue Button provided the environment for synchronous communication which enabled real time communication between the instructor and the teachers. The teachers had the opportunity to express their views, to contribute their experiences, to ask questions and discuss issues with their colleagues. Moreover, the interaction between the electronic (online) instructor and students was vital to avoid the isolation that can occur among participants in distance education programmes (Lewis & Al-Hamid, 2006). It is worth noting that the desired purpose can be better achieved when we use audio and video teleconferencing technologies. In some cases, these media are perceived as more 'potent' communication channels than face-to-face communication (Allen, Bourhis, Burrell, & Mabry, 2002).

In order to support the e-learning training course, the following tools and applications used contributed to the creation of an integrated e-learning environment:

- Announcement board that feeds the teachers with new information about the training course and accesses the teaching scenarios that were asked to be created in the direction of Multicultural Education.
- E-mail applications that serve as asynchronous communication among the interconnected.
- Chat applications over the Internet which offer synchronous communication with video and audio streaming in real time.
- Access to recorded files which contain the previous online courses so that every participant would be able to study part or the whole course in an asynchronous, self-paced format.

4. PARTICIPANTS' INVOLVEMENT AND INTERACTION

The participants attended four modules (thematic divisions) related to the differentiation of teaching, along the axes of: a) multimodal texts, b) concept maps, c) projects and d) scientific and technological literacy. For each module, the trainers uploaded educational material onto the platform on a weekly basis. The participants were asked to study the material, create assignments in the form of teaching scenarios for their students of various socio-cultural origins and then apply these scenarios to their classrooms. In the meantime, they used collaborative Internet resources in order to stay in touch with the trainers and be supported by the trainers' feedback and guidance. In the last face to face meeting, the participants presented these scenarios to the plenary session.

A prevailing element in such a process was the teachers' reflection concerning their task (Schön, 1983), since it not only focused on the formal knowledge of an external 'specialist' transferred to a team of teachers, but also was formulated by the teachers' experience itself, in the way they encountered it in the specific class where they taught.

The teachers' involvement in the procedures described above gave them the opportunity to collaborate with colleagues from higher education, thus taking their place in a 'learning community'. Thus it is assumed they have created knowledge that is more relevant to the practice of education than the knowledge created by research institutes (Enthoven & de Bruijn, 2010, p. 290). Moreover, they were expected to be enabled to adopt a constructivist view of learning (Terhart, 2003) in order to raise their self-esteem, as well as to promote their professional development and emancipation.

The teachers were asked to reflect on their experience twice – upon the completion of the course and in the beginning of the next school year – through questionnaires and semi-structured interviews respectively. The findings indicate that there was a positive effect both with regard to the knowledge the teachers acquired and the flexibility of the e-learning training method they followed. Moreover, when the teachers were asked to reflect on their practices five months after the end of the project, they continued to apply some of the strategies that they had learned during the blended learning course to their own classes (Nari, Dimitriadou, & Spyrtou, in press). This is an outcome which substantiates the efficiency of the course, since, according to research findings, teachers mainly report changes in their knowledge, beliefs and emotions but hardly any changes in teaching practices (Bakkenes, Vermunt, & Wubbels, 2010, p. 545).[3]

Of course, it is apparent that the role of the online instructor in the case under consideration is neither static nor one dimensional (Lewis & Abdul-Hamid, 2006). As Govindasamy (2001) maintains, teachers are responsible for finding the appropriate pedagogical method to use e-learning tools in teaching since the design of tools does not apply to pedagogical principles. As he has also asserts, unless an e-learning implementation exercise is rooted in strong pedagogical foundations, it will not be successful (op. cit.).

5. FUTURE RESEARCH DIRECTIONS

In order to improve the training practices that rely on blended learning, it is urgent that longer and more extensive teacher-training seminars throughout a wider population of teachers take place in the future. The participants' professional development could be examined in relation to factors such as learning motivation, specialty or personal characteristics of the teachers. Furthermore, more effort should be put into defining instructional processes suited to this type of teaching and not leave the ad hoc design to the instructors (Alonso et al., 2005: 218).

6. DISCUSSION AND CONCLUDING REMARKS: USING E-LEARNING TRAINING EDUCATIONAL PROCEDURES IN MULTICULTURAL SCHOOL SETTINGS

The demand for teachers' lifelong learning within e-learning training contexts, the new forms of knowledge production and the differentiated approaches to diverse students' learning have undoubtedly upgraded the quality of the participants' teaching. How did this improvement happen?

We can assume that the teachers gradually shifted from imposed, predefined teaching and learning to reflective collaboration, in accordance with the different needs of different students (Tomlinson et al., 2003). They also responded to the request for 'multiple, dynamic and malleable' literacies: they developed proficiency with the tools of technology; they put together and assigned tasks that sought emancipation, assuming ethical responsibilities towards pupils in multicultural classes. In a word, they supported social learning in favour of the 'pull' models of education, as opposed with the 'push' models, which encourage imposed, predefined and formalised teaching and learning approaches (Lankshear & Knobel, 2011, p. 24-25, p.226-229). The above characteristics are of major importance, since they create added value to e-learning possibilities: they increase the teachers' self-confidence and professional emancipation, features that can enhance their professional development.

We can also assume that the teachers made steps toward their professional development, both technically and pedagogically; the skills they developed with regard to teaching practices correspond to a kind of knowledge creation which, in turn, is expected to involve diverse students in critical thinking, creativity, and self-directing capacity, making use of their learning readiness, learning styles and multiple intelligences (Nari, Dimitriadou & Spyrtou, in press; Gardner, 1983).

In order to fulfil its mission, education needs to keep up with developments in society, science and student awareness. As Gifford (1985) previously declared almost three decades ago, *'educational reform is a sine qua non'*. Since teachers are the most appropriate people to implement innovation and change in educational practices, scientific knowledge about how teachers learn, how they differ in their learning, and how their learning can be improved are of the utmost importance (Vermunt & Endedijk, 2011). Too often, however, educational innovations have failed because the need for teacher learning has not been acknowledged. Consequently, the education systems, including the organisation and form of educational institutions and curricula, must be altered in order to keep up with the learning that occurs using computers and Web 2.0 technologies (Attwell, 2007).

In recent years, multicultural school settings have raised additional teaching needs both for teachers and students. The design and implementation of e-learning training educational systems has become an important asset, especially in multicultural educational settings, with students coming from families of different socio-cultural origins, ethnic backgrounds, or with students with special educational needs or other divergences. With the purpose of presenting a comparative approach of e-learning towards multicultural education, we shall mention in particular three similar programmes that aim to enhance students in multicultural classrooms either in the learning or the psychosocial domain. The criteria for this choice were the following two: first, to give a similar best practice example from Europe as well as from America; and second, to mention similar programmes that have been implemented recently.

Our first example is the MIH (Multicultural Interdisciplinary Handbook: tools for learning History and Geography in a multicultural perspective), a Comenius Multilateral Project which was developed from 2009 until 2011, funded with support from the European Commission. The aim of this project was to involve pupils in contributing to the creation of a sense of European citizenship, by promoting a multicultural approach to education in European schools with the support of Information and Communication Technologies and CLIL methodologies. Each partner institution organised its own teacher-training course in face-to-face or blended learning methodology and the teachers involved had the opportunity to become familiar with the materials and define their use in their classrooms, according to the different school levels and curricular programmes (Peñalvo, Zangrando, Pardo et al., 2012). Another project that supports multicultural and cross-cultural education is *Pupils On the Move* (PUMO, 2013), a European Comenius project for the development of technology-enhanced learning materials for teachers, equipping them to support pupils who have temporarily left their schools and are living with their parents in other countries. This series of online, teacher-training courses, which focus on multicultural education and intercultural pedagogy, use ICT and Web 2.0 tools in order to support learning progress in subject areas specific to their countries of origin. Amongst its main objective is to further train 300 teachers by the end of the 2014-2015 academic year.

Thirdly, we shall refer to a study that was implemented by Aragon and Kaminski (2012) entitled 'Racist Facebook Event Against Native Americans: Preservice Teachers Explore Ethical and Critical Multicultural Implications'. This was an exploratory case study which sought to analyse data from Collaborative Learning Modalities (CLM) on-line threaded discussions in order to examine preservice teachers' thinking and emotions regarding the ethical nature of a Facebook event turned away against Native Americans, and also to highlight sensitive multicultural issues addressed in the training of college students.

After taking all the above studies into consideration, we realise that in e-learning, the concept of differentiated instruction denotes a meaning which is in congruence with well-prepared traditional instruction; yet, different tools are available to help students learn and to provide information in ways most appropriate to them. Types of new media inclusion, levels of interactivity, response actions, and enhanced ability to collect data on the fly and to deliver custom content are included (Scalise, 2007). From a pedagogical point of view, it becomes quite obvious that the stronger the involvement of the learner, the better the result becomes (Kupetz & Ziegenmeyer, 2005).

KEY TERMS AND DEFINITIONS

E-Learning (Electronic Learning): Is a way of teaching and/or learning which concerns new dynamic learning models through computer and Web technologies. It encompasses Web-based learning (WBL), Internet-based training (IBT), computer-assisted instruction or computer-aided instruction (CAI), advanced distributing learning

(ADL), online learning (OL) and virtual learning environments (VLE) (known as learning platforms). It refers to instruction delivered via various electronic media such as the Internet, intranets, extranets, and hypertext/hypermedia documents. What is achieved is the dispensation from the temporal and geographic limitations of conventional training. All involved elements (technology, teachers, students of higher education, professionals who develop ICT for teaching/learning purposes, managers of institutions of higher education, stakeholders, politicians and even representatives of business) are interconnected. As a result, only if the efforts are in synergy, is the balanced development possible for the best benefit of learning.

Blended Learning: Is a formal education program which combines traditional face-to-face teaching forms along with computer-mediated, e-learning formats. Some authors use the term *hybrid* learning interchangeably when referring to courses which mix face-to-face instruction with online methods.

Intercultural/Multicultural Education: Is the development of teaching/learning procedures which take into account the socio-cultural diversity of pupils and create smooth functioning, diversity-positive, learning environments. Multicultural and intercultural education has been much discussed and researched approaches for quite some time. Multicultural education and intercultural education are often used as synonyms, while others indicate that there is a difference between the two. In the multicultural and intercultural literature it is often unclear what the concepts mean and whether they are referring to the same or different things. Often the difference in use seems mostly geographical. In Europe the preferred term is intercultural education while especially the United States but also the rest of North America, Australia and Asia use the term multicultural education (as a broader term referring to diversity). However, in Europe there are differences between countries as well. For example, in Sweden and the Netherlands intercultural education is used while in Great Britain and Finland multicultural education is the commonly used term. Interestingly multicultural and intercultural education are often used as if the terms are universally understood and referring to only one type of inclusive education. Multicultural education can take many different directions; likewise intercultural education is sometimes mostly focused on intercultural relations or intercultural competence issues. Teachers with intercultural competence are able to positively address students coming from diverse cultural environments, even if these are 'culturally invisible' in the classroom, marginalised or have difficulties in language communication and literacy practices. Moreover, teachers who are competent in intercultural education are able to manage diversity and know how to use appropriate methodological approaches: to remove prejudice, stereotypes and images of enemies from the curricula and textbooks; to emphasise the teaching context which displays not only cultural differences but also existing similarities between peoples; to introduce literary texts by authors from the country of the other; to organise common projects by students of different cultural origins in history, literature, music, etc., which facilitate contact between cultures and the acceptance of cultural similarities. Furthermore, these teachers are able to use effective curricular strategies such as simulations, advanced organisers and scaffolding-manipulation techniques, or to create teaching scenarios that may bring about the impact of inclusion. Teachers competent in intercultural education take initiatives for socially transformative education and enhance their awareness, authenticity and effectiveness while creating a classroom climate open to critical considerations of equity, social justice and human rights.

Differentiated Instruction: Addresses equal opportunities for a broad range of learners, based on the acknowledgment of their varied readiness levels, interests, and learning preferences. It refers to the teachers' tendency to overcome the technical rationalism of traditional teaching models and make modifications in order to meet the learning needs of academically diverse populations. Effective differentiation arises from consistent, reflective, and coherent efforts to address the full range of student readiness, interests, and learning profiles in the presentation of information, student practice or sense making, as well as student expression of learning. Within the frame of differentiated instruction, flexible teaching practices are used, such as: group-collaborative teaching, inquiry learning, collaborative project work, experiential learning, role-play games, brainstorming, advanced organisers, didactic exploitation of pictures, as well as procedures which promote creative thinking.

Technology Literacy: Is the ability to employ the latest technological means in order to improve day-to-day communication and social practices. Technological means refer to the different kind of "technical stuff" from conventional means such as screens, digital code, multimodal and electronic networks instead of paper, material print, distinct modes or hard-copy publishing. By facilitating these means, one is able to communicate by producing, receiving and distributing information, to solve problems by accessing and managing information and to improve learning by acquiring lifelong knowledge and skills in the new media age. As a result, someone who is familiar with ICT-based learning contexts and thus capable of using digitally mediated information, knowledge, and representations of the world is considered literate in technology.

Reflection: Is the ability of teachers to adopt an analytical approach toward their practice and take an active role in decision making, especially when facing problematic situations. Reflection is a notion strongly connected to any effort toward understanding the theory and practice of teaching and learning. Its establishment as a core ingredient of successful instruction has been viewed with regard to different aspects concerning teaching. Reflective teachers can see the correspondence between everyday actions and scientific or theoretical concepts and are able to utilise theory in order to analyse, evaluate and change their own practice. Two main types of reflection have been identified, namely 'reflection-in-action' and 'reflection-on-action'. Reflection-in-action occurs during the teaching activity, whereas reflection-on-action has a retrospective character and occurs when teachers think about their teaching experience and, making further steps, change their planning and enrich their practice with new teaching-learning ideas.

Teachers' Professional Development: Means the growth teachers attain in their profession when engaged in action learning as a continuous development of practice and when they put their 'knowing how' into words. The term denotes a procedure which is built on confidence, trust, learning and dialogue and occurs when teachers look ahead and avoid dwelling on their experiences. It corresponds to the teacher's ability to attain learning which is internally directed and presupposes sub-competences such as subject-knowledge competence, competence in planning the instruction, social competence, a good work ethic and also personal-development competence. A teacher develops professionally when she becomes aware of substantiating her teaching, sharing experiences, connecting experiences to theories, reflecting on her own practice, helping each other in a busy work situation, being aware of what is good or not in her teaching, sharing ideas, and integrating reflection in the planning of her lesson. In this sense, a teacher's professional development encompasses the teacher's readiness to take a step backward and to become aware of the fact that she has a choice whether or not to allow limiting factors to determine her behaviour. This awareness of having a choice is one of the most fundamental parameters in a teacher's professional growth, since it contributes to personal autonomy.

ENDNOTES

[1] Here, the terms 'distance' and 'e-learning' are used alternatively. The project has been planned and developed by the Aristotle University of Thessaloniki, Greece (2010-2013) (http://www.diapolis.auth.gr/index.php). The project is supported by the programme 'Education of Foreigners and Repatriated Students' funded by the National Strategic Reference Framework (NSRF) 2007-2013 and national resources. The seminar was incorporated in the Activity 'Training of Teachers and Members of the Educational Community', Sub-Activity 'Distance Learning'.

Chapter 72
Academics' Perceptions of Using Technology with Face-to-Face Teaching

Geraldine Torrisi-Steele
Griffith University, Australia

ABSTRACT

Many academics are using technology in their teaching, and universities are strongly involved in the provision of support to help academics make the most effective use of the technology. How academics perceive technology for teaching partly filters their response to the provided support. It is therefore useful to explore academics' perceptions of the use of technology in teaching. The study (N=53) reported on in this chapter provides insights into academic perceptions of teaching with technology by addressing the questions: (1) Which teaching tools (both face-to-face teaching and digital) are most popular? (2) For what purpose are the tools being used? (3) Do academics intend to extend their current use of technology with face-to-face teaching for the purposes of implementing learning strategies? and (4) Which feasibility conditions do academics perceive to be important to the realization of their intended use of technology ? The results of the study show that, for the academics in the study, face-to-face teaching is perceived as the preferred tool, especially for learning purposes such as helping students to understand concepts. The use of technology by the academics was limited to the simpler digital tools, and these were used mostly for non-learning-related purposes such as communication. However, the academics expressed the intent to increase their use of technology for improving learning in the future, and perceived feasibility conditions such as professional and technical support, teaching facilities, and especially time to be important to the realization of their intentions.

INTRODUCTION

For most academics, technology is a feature of their university teaching activities. The use of technology for teaching is strongly encouraged in universities, at an institution-wide level, for social, pedagogical and economic reasons, and thus many universities are placing significant strategic emphasis on the provision of support to assist academics to make more effective use of technology in their teaching.

DOI: 10.4018/978-1-4666-8246-7.ch072

Given that it is partly through the filter of their perceptions that academics will view, and subsequently respond to, the provided support, the present chapter seeks to shed some light on academics' perceptions of using technology in their teaching. The study (N=53) reported on in this chapter is a subset of a broader study, which aims to better understand academics' use of technology with face-to-face teaching. For the purposes of the present chapter, the focus question is "how do academics perceive the use of technology with face-to-face teaching strategies?." Pertinent to the focus question, the following more specific questions are addressed in the chapter: (1) which teaching tools (both face-to-face teaching and digital) are most popular? ', (2) 'For what purpose are the tools being used?', (3) 'Do academics intend to extend their current use of technology with face-to-face teaching for the purposes of implementing learning strategies?', and finally, (4) 'Which feasibility conditions do academics perceive to be important to the realization of their intended use of technology?'

Before describing the study and reporting on results, it is important to contextualize the study firstly, by explaining what is meant by the term 'technology' as used in the study, and then giving a brief historical perspective to highlight developments in technology, and identify underlying pedagogical mindsets.

BACKGROUND

The term 'technology' as used in the context of this chapter refers to the suite of digital technologies, both existing and emerging. The suite of technology includes laptop and desktop computers, smart mobile digital devices (phones, tablets, pens), Internet based services such as social networking tools, learning management systems, video streaming tools such as lecture capture and video conferencing, digital classroom software and so on.

The use of digital technologies for teaching has its roots in computer-based training. Computer-based training was made possible by mainframe computers in the 1960's and 70's. As the 1970's approached there arose a need to provide education to an increasing number of students. This lead to the development of the PLATO (Programmed Logic for Automated Teaching Operations) system, one of the earliest uses of digital technology for learning (Bersin, 2004). PLATO enabled access to more than 3500 hours of training materials across over 100 subject areas, and it remained in operation for more than forty years (Smith & Sherwood, 1976). Terminals were located within educational institutions. The interface used a character-based system and the only input mechanism was the keyboard. The presentation of content was limited to line drawings, graphs and color photographs, displayed on a small 22cm screen. The system's limited support for media and interaction meant that learning experiences with the PLATO system were restricted to drill and practice approaches.

The mainframe systems of the 1970's severely confined access locations because the systems were expensive and complex, and were only available for installation within larger organizations. It was the emergence of the personal computer in the 1980's that placed access to computer based learning within the reach of the general population, in their own homes, and made it possible for more educational institutions to acquire the technology. With increasing technical sophistication of the personal computer the ability to produce highly interactive and media rich computer based content became a reality in the early 1990's. It became possible to present content on a digital platform that supported the integrated use of various media (audio, video, still images, animation, text), and the capacity to support sophisticated user interactions. This mode of presenting content became known as 'interactive multimedia'. The advent of the CD-ROM, with its cheap and high storage capacity, enabled the distribution of interactive multimedia content to a wide audience.

Very soon, designers of computer-based instruction began to shift their mindset away from the idea of 'drill and practice' towards the idea that interactive multimedia could potentially facilitate deeper, more meaningful learning experiences. It was with some excitement that instructional designers and other educators explored the capacity of interactive multimedia to support multiple learning styles, and provide self-paced more individualized learning experiences. Educators speculated that interactive multimedia might not only improve learning but perhaps it could even replace instructor-led experiences (Bersin, 2004). Literature of the time was characterized by a plethora of research was investigating if technology was better than face-to-face teaching. In many cases researchers published works praising the potential of the technology to significantly enhance learning:

All of the elements will soon be in place to benefit language learners and teachers: communicatively oriented, learner-centred materials, authoring systems allowing for adaptation to individual circumstances, and truly interactive distance learning [...] interactive multimedia can empower the learner to an unprecedented degree. (Morgenstern, 1998, p. 86)

Educators saw that the potential of interactive multimedia to provide highly interactive and individualized learning experiences aligned closely with the constructivist ideals of active learning and individualized knowledge construction (based on Piaget's (1952) cognitive constructivism). Thus, cognitive constructivism became popular (and remains popular today) as a guiding philosophy for the design of interactive multimedia learning experiences. Proponents of technology for teaching and learning advocated for the use of technology based learning because with its potential to support constructivist frameworks it would be a catalyst for a paradigm shift in teaching - from instructor-centered instructivist strategies to the more student-centered constructivist approaches (Sandholtz, Ringstaff & Dwyer, 1997; Roschelle, Pea, Hoadley, Gordon, & Means, 2007; Duffy & Cunningham, 1996; Jonassen & Reeves, 1996).

The next major development in the history of technology in teaching was the arrival of the World Wide Web in the late 1990s-2001. Initially, the Web only supported basic text and graphics. The early Web offered the ability to link to other content and resources on the Web but it offered only a little more interactivity than the very early computer-based training systems. The situation rapidly changed as Internet services matured, bandwidth increased and technologies became available to support not only highly interactive, media rich experiences but also a range of communications tools for both online synchronous (same time, same place or same time, different place) and asynchronous (different time, different place) communication. Terms such as 'e-learning'- the "online access to learning resources, anywhere and anytime" (Holmes & Gardner, 2006, p. 14), and 'online learning' (sometimes used interchangeably with e-learning) were popularized and remain with us at the present time.

The capacity of the social networking tools, which accompanied the arrival of the World Wide Web, brought focus to socio-constructivism as an important base informing the design of learning experiences. Socio-constructivism holds to the cognitive constructivist principles of learner-centered learning and knowledge as construction. However, according to socio-constructivist views deep learning is achieved when learners share and question their understandings (Laurillard, 1993). Socio-constructivism stems from Vygotsky's (1978) emphasis on social learning and the power of collaboration. According to Vygotsky (1978), there exists a zone of proximal development, that is, there is a difference between what the learning can do independently and what the learner can potentially do when engaging in interaction with others (instructor of more capable peers). The role of instruction is to provide scaffolded experiences along the zone of proximal development so that the learner may advance.

Web-based communications technologies have the potential to support socio-constructivist ideals in that they provide a means of enabling students to collaborate and engage in discussion with each other and with teachers outside of on-campus contact time. Terms such as 'e-learning communities', 'e-communities', 'Web-mediated learning communities', or 'communities of practice' have become commonly used to refer to the idea that groups of individuals come together online to collaborate, discuss their learning and share learning activities for the purpose of achieving deeper learning, (Alonso, López, Manrique, & Viñes, 2005; Holmes & Gardner, 2006).

Today, the Internet and a host of associated information and communications digital technologies feature in teaching and learning contexts. The connectivity infrastructure established for the Internet now supports an array of mobile smart technologies (e.g. phones, tablets, pens) that are capable of high levels of interaction, media rich experiences and social connectivity. As a result, there is currently some focus on mobile learning. From a pedagogical perspective, the question is no longer 'is technology better than face-to-face teaching?' but rather 'How can the attributes of technology be best exploited in teaching contexts?'. Constructivism and social constructivism remain as guides for the design for the potentially complex, media rich, interactive learning experiences (Jonassen, 1994; Kramer & Schmidt, 2001; Strommen, 1999) that can be designed (Table 1).

Evidently, technology is firmly established in teaching and learning contexts. Academics may be motivated to use technology because of advantages related to pedagogy, flexibility and efficiency. The pedagogical potential of technology may be realized through instructional designs based on the constructivist approaches outlined previously. Furthermore, the presence of technology offers the opportunity for student learning experiences that might not otherwise be feasible. For example, virtual laboratories (Sancho, Corral, Rivas, a Jesu´s Gonza´lez, Cho, & Tejedor, 2006) may enable students to develop competencies that would not otherwise be possible, perhaps due to safety reasons or lack of access to sophisticated equipment. Networked technologies allow for flexibility by enabling teaching and learning to take place across time and place for both academics and students (Wang, 2007; Uğur, Akkoyunlu, & Kurbanoğlu, 2011). The capacity of using technol-

Table 1. The capacities of technology to support constructivist principles

Constructivist Principle	Capacity of Technology
Learners have different learning styles	Supports multimodal presentations which cater to different learning styles
Individual construction of knowledge	Flexible navigation is designed to enable learners to proceed at their own pace and to choose their own pathways through content
Learning through problem solving	Sophisticated interaction with content can be designed which provides opportunities for experimentation with constructive feedback. Interaction is able to be tailored to learner needs to either provide flexibility so that learners choose their own pathways through content or provide either more rigid sequences or more guidance as needed.
Authentic learning contexts; context dependent learning that mirror the natural complexity of the real world.	It is possible to construct activities that offer near authentic situations that might otherwise be impractical in reality, for example, virtual laboratories and simulations. Mobile technologies enable learning activities to take place in the field so students can undertake authentic tasks that incorporate the natural complexity of the real word.
Learning through collaboration	Asynchronous and synchronous communication and collaboration facilities enable collaboration outside constraints of location. For example, students undertaking field exercises can collaborate with peers in another location to negotiate understanding of the content found in their particular context (Jonassen, 1994).

ogy for more efficient teaching is obvious. Course materials are easier to re-use and materials can be delivered to a larger number of students (Wang, 2007) without the need for physical location to physically accommodate students and teachers.

Despite the documented potential advantages of using technology in teaching (De George-Walker & Keeffe, 2010; Garrison & Kanuka, 2004; EL-Deghaidy & Nouby, 2008; Haripersad & Naidoo, 2008;) not all academics embrace technology in teaching with the same enthusiasm or to the same extent. Some may use technology at its most basic level for reasons of convenience (for example, using a learning management system to post course announcements), whilst others may invest significant effort into developing complex, fully interactive learning designs. There is some focus in literature on identification of the barriers to adopting technology. For example, Wang (2007) found that the principal barriers to adoption included: preparation time and effort, "the challenge of instructional design with new media," the increased demands of online interaction" (p. 585). The anxiety of using technology or "being videoed when lecturing" was also impeding factors (p. 585). Ocak (2010) identified eight barriers to the adoption of technology in teaching: (1) complexity of the instruction, (2) lack of planning and organization, (3) lack of effective communication, (4) need for more time, (5) lack of institutional support, (6) changing roles, (7) difficulty of adoption to new technologies and (8) lack of electronic means.

Surveying other literature (Bagher, Marek, & Sibbald, 2007; Davis & Fill, 2007; Kistow, 2009; Stewart, Bachman, & Johnson, 2010;) concerned with barriers and facilitators of academics' use of technology for teaching brings to the fore five major factors that play an important role in facilitating or preventing use of technology in teaching: professional support, technical support, time, teaching facilities, and funding reoccur in literature in relation to facilitating academics' use of technology with face-to-face teaching

With the preceding discussion as a backdrop, attention is now directed towards adding insight into academics perceptions of the use of technology with face-to-face teaching. Prior to presentation of results and discussion the study methods are now outlined.

METHOD AND INSTRUMENTS

The study, from which the research described in this chapter is drawn, used a mixed methods approach. Following data collection via a survey a subsample of seven survey respondents were interviewed (respondents indicated their willingness to be interviewed on the survey). The survey was distributed via email and in person to academics in the Science, Environment and Engineering (SEET) group within Griffith University, Australia. A total of 53 academics responded to the survey.

In order to obtain data related to which digital tools are most used, and the purpose for which the tools are used, a matrix (Figure 1) was developed. Notice, in Figure 1, that face-to-face teaching is included in the tool list. The list of digital tools was generated from tools available on Griffith's learning management system. A consideration of the case study literature (De George-Walker & Keeffe, 2010; Sancho, Corral, Rivas, Gonzalez, & Chordi, 2006; Shen, Wang, Gao, Novak, & Tang, 2009) assisted with determining the main reasons why academics use technology together with face-to-face teaching. To complete the matrix in Figure 1, academics were asked to nominate one course they were teaching for which they made most use of technology. Academics were able to select more than one purpose of use category for each tool.

The second area of interest in the present study is the extent to which academics intend to increase their use of technology in teaching for pedagogical reasons. Data was collected using two sets of Likert scale items shown in Figure 2a and Figure 2b. To generate the items, the constructivist

philosophy is used as the foundation for strategy design, and thus some items relate to individualized learning experiences, alternative learning experiences and authentic learning activities. The seven items enabled respondents to indicate the extent to which they would like to use technology to achieve certain practice objectives in their nominated course.

To collect data related to the third of interest in the present study – feasibility conditions- a five item, seven-point Likert scale (Figure 3.0) instrument was used. The individual feasibility conditions, namely, professional support, technical support, time, teaching facilities, and funding, arose from findings of existing literature related to factors inhibiting or facilitating academics' acceptance of technology with face-to-face teaching

Figure 2. (a) Measure of academics' use of technology with face-to-face teaching for the purpose of developing learning strategies. (b) Measure of academics' intended future use of technology with face-to-face teaching for the purpose of developing learning strategies.

Indicate the extent to you use technology with face-to-face teaching to do each of the following:

RESULTS

Which Teaching Tools (Both Face-to-Face Teaching and Digital) Are Most Popular?

A count of the number of respondents using each tool yields the numbers shown in Table 2.

From Table 2 it is interesting to note that the teaching context is dominated by face-to-face teaching strategies. It is also worth noting that the simpler tools such as email and lecture capture are more commonly used than potentially more complex tools such as learning objects (which would require a greater investment of time, knowledge and effort to produce).

Table 2. The number of academics using the tools, arranged in descending order of count

Tool	Number of Academics
Face-to-face lectures	51
Email	50
Face-to-face small groups	42
lecture capture	32
You tube	30
Discussion board	29
Online assessment	28
Wikis	18

L@G Group management tool	2
Twitter	1
Interactive learning objects	1

For What Purpose Are the Tools Being Used?

Table 3 shows the tools used by at least 25% of the academics for each purpose category. Note that the first three purpose categories in Table 3 (efficiency, access to content, communication) are not directly concerned with strategies aimed at achieving learning objectives, rather they are more related to convenience. The bottom three categories, on the other hand, are related to shaping learning strategies for achieving learning objectives.

An inspection of Table 3 shows the domination of face-to-face teaching strategies. A large percentage (84.9%) of respondents use face-to-face lectures for the purpose of helping students to understand ideas. Given the high percentage of participants using face-to-face lectures for the purpose of understanding concepts, it is clear that this group of academics, at least, perceive in person delivery of content to be most suited to helping students understand ideas. Face-to-face strategies are the tool of choice across all purpose categories except for communication, in which email is the preferred method. Interestingly, most of the academics considered face-to-face lectures as being the most efficient method of delivering and accessing content – purposes that are often reported in literature as being perceived as advantages for technology in teaching.

Clearly then, the academics in the study continue to favor the use of face-to-face teaching, and it is the simpler digital tools being used. Much of the use of digital tools is for purposes of conve-

Table 3. For each purpose category, the list of tools used for that purpose by 25% or more of academics

nience such as efficiency and access to content. It is interesting to ask if this group of academics is considering extending their use of technology for learning, rather than convenience, purposes.

Do the Academics Intend to Extend Their Current Use of Technology with Face-to-Face Teaching for the Purposes of Implementing Learning Strategies?

In addressing this question a paired samples t-test was used (the paired samples t-test compares of the means of two variables and enables the researcher to determine if the difference between the means is significant).

The results of the paired samples t-test are shown in Table 4.

The paired samples t-test demonstrates a statistically significant difference between the means of current and intended future practice objectives. Thus, the academics in this group were intending to increase the use of technology with face-to-face teaching towards the creation of learning experiences. This may represent a generally favorable attitude towards the use of technology for teaching by the participants.

Having established that the participant academics generally favored increasing their use of technology for creating learning experiences, it is important to now consider the feasibility conditions which academics perceive to be most important to the realization of their future plans.

Which Feasibility Conditions do Academics Perceive to be Important to the Realization of Their Intended Use of Technology?

The means for feasibility conditions are shown in Table 5.

Recalling that the means relate to a seven-point scale, it appears that time, technical support and teaching facilities rank amongst the most important considerations. To better ascertain whether there is any statistically significant difference between each of the feasibility conditions Tukey's HSD test was able to be performed (after performing a one-way ANOVA and checking that the assumption

Professional support	5.94
Technical support	6.30
Time	6.43
Teaching facilities	6.32
Funding	5.79

of homogeneity of variances is met). The results of Tukey's HSD are shown in Table 6.

Examination of Table 6 reveals that there is a statistically significant difference (0.642) between the means for Time (6.43) and Funding (5.79) factors. It is hence reasonable to conclude Time is a more important factor than funding for the realization of future use of strategies using technology with face-to-face teaching..

DISCUSSION

The results of the present study paint a picture of a teaching context dominated by face-to-face teaching with the use of digital tools serving mostly a supplementary role or being used for purposes of convenience such as access to content or efficiency. The academics participating in the study clearly perceived the use of face-to-face teaching to be the tool of choice for achieving learning related purposes such as understanding content, practicing skills and sharing ideas. Furthermore, the use of more sophisticated digital tools such as interactive learning objects, virtual classroom tools and mobile technologies were only used by a small number of the participant academics. It seems that, as has been noted by others in literature (Collis & Van Der Wende, 2002; Graham & Robison, 2007) few academics are fully exploiting the potential of digital technologies to provide learning experiences, rather, technology is being used in a supplementary or convenience role. The results presented in this chapter add strength to the argument that professional support is needed to help academics gain the knowledge and skills necessary to exploit the attributes of technology to provide more effective learning experiences. This being said, the academics taking part in the study generally intended to increase their use of technology for the purposes of providing learning experiences. especially those that support course objectives. However, in order to realize their future intentions, it became clear that the academics perceived as important professional and technical support, facilities, funding and especially time

Table 6. Tukey's HSD results

The academics' perceptions of feasibility conditions were one area that was explored further in the open-ended interviews conducted with seven of the participants. During interviews, the time dominated the discussion of feasibility conditions. Given that it is seemingly such an important focus for the interviewed academics, key references made to time by interview participants were recorded in a table. Upon inspection of the recorded instances, it became evident that references to time could be categorized in one of four categories: Preparation, Implementation, Efficiency and Wasted time. Preparation time included time to discover possibilities and learn the skills to use technologies. Implementation time referred to the time consumed during actual use of the technology. Efficiency referred to how much time using the technology would take to achieve a teaching goal and was usually expressed as a comparison with the time it would take using other methods. 'Time' wasted referred to time lost due to technical failures. From Table 7 it can be seen that the most frequent reference made to time was in terms of preparation time.

Time for preparation was perceived as a major issue by the interviewed academics. Notably, some academics expressed a 'cost-benefit' mentality in relation to preparation time. It seems that the amount of time academics are willing to invest in preparation is related to the benefit for students in terms of improving the learning experience.

It is also important to note that other feasibility conditions such as professional support, facilities and technical support arose in the context of

Table 7. References made to time by participants (N=7) during interviews

Time Related Comment	Prepare	Implement.	Efficiency	Wasted Time
1. Having things set up online frees up a lot of my time. but once it's set up it takes less time because things are streamlined.	X			
2. Having X [blended learning advisor] there means I have more time... means I know what facilities are there.	X			
3. Discussion boards – don't use "because that means I've got to go in there and read them and that's very time consuming."		X		
4. There was help but I tried to get other staff interested but they said they didn't have time.	X			
5. I did all the background running around, I had to do all that.	X			
6. Any plans I have involve more work for me to prepare – that will require a lot of extra effort/time.	X			
7. But I knew which tool to use. I think that's the issue" "If I don't know.." it takes time to learn how to use it.	X			
8. It's all about time [to prepare].	X			
9. My time in [setting this up] this has been huge.	X			
10. I don't find time an issue for implementation just more time to learn how to use it.	X			
11. More time [to prepare].	X			
12. Time to enable me to learn what it can do.	X			
13. Again its time, if someone would come to me and say well here's all your options that'd be great.	X			
14. Time and effort relate more to finding out what's there than implementing it.	X			
15. At the moment it is such an effort just to get lectures done and out let alone anything else. Additional effort, got to have lectures done and then work on improving.	X	X		
16. Technology has 'gotten in the way' of student engagement to a certain extent, fiddling and messing around can slow you down, equipment can fail and nothing happen, so it has risks; in terms of a lecture does it really make you do more, I don't think so.				X
17. Compared to baseline – still creation of ideas and synthesis (academic part) then all this stuff you do to present it to modern standards. Does it save time NO.			X	
18. I read a paper by someone in …who was marking group discussion contributions...she said she spent over 140 hours over a semester… I was thinking about it but as soon as I read that it just turned me off that -I don't have time for that.		X		
19. Things go wrong all the time … I had to apologise to a large class – a lock up like that rips out 100's of hours.				X
20. I haven't got time to use technology with face-to-face ... if I want to use the full potential and turn it into a proper teaching system need 6 months to get up – don't have that time.	X			
21. I have a feeling I can use technology to teach and teach well, but I think it requires a terrific investment from the academic and other people – I really wonder how efficient it is.	X		X	
22. When does it [using technology] become worth it on a cost-benefit basis. Is it [technology] better than carefully planned face-to-face teaching?"			X	

discussions of time. Technical support and suitable facilities are seen as important contributors to wasting of time. Professional support is seen as mitigating the amount of time needed for development.

On the basis of the insights provided by the study two core recommendations are made:

1. *In providing professional support, institutions need to consider strategies to assist academics to exploit the attributes of technology in order to enhance (or develop new) instructional.* Although technology is being used in academic teaching, academics are not fully exploiting its potential to provide enriched learning experience. There is a need to fully explore why this is so. One possible explanation is that although academics possess the knowledge and skills to teach in more traditional face-to-face settings, they may not have the technical skills and knowledge that will enable them to fully exploit the attributes of the technology to the best advantage of the learning situation. As Mishra & Koehler (2006) propose, to effectively use technology teachers must possess technical, pedagogical and content knowledge. To facilitate the connection among technical, pedagogical and content knowledge it is important that professional development related to the use of technology for teaching should take place within a pedagogical context rather than in isolation. That is, technical training related to tool attributes and use, should be relevant to academics' pedagogical needs at the time. In this way, learning what a particular technology can do or how to use it, is perceived as knowledge required to address an issue related to teaching strategy implementation.
2. *The issue of time investment as a potential barrier to the adoption of technology for teaching must be acknowledged and strategies be put in place to address it.* Since the issue of time is linked to other feasibility conditions, possible strategies for mitigating the 'expense' of time may include: providing avenues for 'just in time' technical support (should things go wrong); academic access to instructional design advisers that are able to work with the academic on a one-one basis to help the with identification of technologies for designing learning strategies for attaining learning objectives specific to the course.

CONCLUSION

The present study has the limitations of a small sample of 53 academics, and of being institution and location specific. Furthermore, there are potentially factors not addressed in the present study that may influence academics' response to support. Despite limitations the present study has shed some light on academics' perceptions of technology for teaching. The results of the study suggest that despite technology being used by many academics for teaching, the types of digital technology being most commonly used are simple. Overall, technology is playing a relatively minor role in the creation of learning experiences. However, the participant academics expressed the intention to extend their use of technology for the purposes of creating learning experiences, especially to meet course objectives. This outcome suggests that the academics have a generally positive perception of the application of technology for the purposes of teaching and learning. Given that the academics placed considerable importance on factors such as technical and professional support, facilities, funding and time it becomes important to consider the extent of impact these feasibility factors are having on the extent to which academics are using technology for teaching. Of the feasibility conditions, time emerged as being most important, and the interview data suggested that other feasibility conditions are integrated with the availability of time.

The study reported in this chapter has served to reinforce the importance of providing institutional support for facilitating academics' more effective use of technology for teaching and learning, and the importance of implementing strategies to reduce the 'time cost' of developing and implementing teaching strategies that are enriched by the use of technology.

KEY TERMS AND DEFINITIONS

Cognitive Constructivism: A set of beliefs about teaching and learning stemming from the work of Piaget (1952). The learner is viewed as an active participant in their own knowledge building process, and the teacher as a facilitator of that active knowledge building process. Constructivist views espouse to the idea of learner-centered teaching.

Computer-Based Training: Presenting content on a computer and using 'drill and practice' approach to learning. Typically computer-based training includes simple interactivity such as multiple-choice exercises.

Interactivity: In the context of using computers or other digital devices, interactivity requires input from the user that triggers an output response from computer system. For example, the user submits an answer to a multiple choice quiz by clicking the selected answer (input), the system responds (output) with an image of either a tick for a correct answer or 'x' for incorrect answer. Interactivity may relate to either controlling movement through the content (pace or pathway), or to interaction with the content itself (e.g., manipulate a component in a simulation to see the result).

Socio-Constructivism: A set of beliefs about teaching and learning stems from Vygotsky's (1978) work on social learning and the power of collaboration. Deep learning is achieved when learners share and question their understandings.

Technology: Refers to the suite of digital technologies, both existing and emerging. The suite includes laptop and desktop computers, smart mobile digital devices (phones, tablets, pens), Internet based services such as social networking tools, learning management.

Zone of Proximal Development: According to Vygotsky (1978), there exists a zone of proximal development, that is, there is a difference between what the learning can do independently and what the learner can potentially do when engaging in interaction with others (instructor of more capable peers). The role of instruction is to provide scaffolded experiences along the zone of proximal development so that the learner may advance.

Chapter 73
Multicultural Considerations for Curriculum Developers of Online Courses

Beth Sargent
California State University, USA

Cynthia Gautreau
California State University, USA

Kristin Stang
California State University, USA

ABSTRACT

Grounded in the dimensional model of national culture, the purpose of this literature review was to investigate (a) the cultural impact of globalization on online instruction (in particular Eastern and Western beliefs and values), (b) the knowledge needed by curriculum developers (i.e., instructional designers and online instructors) to create multicultural appropriate content, (c) the identification of appropriate design strategies to promote cultural inclusion; and (d) cultural and functional priorities in the global workplace. Findings from the review of pertinent literature were used to create six guidelines appropriate for curriculum developers who design content for multicultural audiences. These guidelines are intended for online curriculum developers as they design coursework using multicultural design strategies.

INTRODUCTION

Globalization impacts today's multicultural society. The need for different cultures to effectively communicate and to cooperate in diverse settings is commonplace. There is a growing demand for effective design of online learning, as noted by Allen and Seaman (2014) the number of students enrolled in online courses has grown to 7.1 million. Enrollment in online courses indicates that 33.5 percent of high education students are enrolled in at least one online course. Research focusing on the impact of globalization in multicultural learning environments offers a range of effective practices (Alessi & Trollip, 2000; Beamer & Varner, 2001; Vatrapu, 2008). Curriculum

DOI: 10.4018/978-1-4666-8246-7.ch073

developers of online courses (i.e., instructional designers (ID) and online instructors) should be aware of their own cultural biases and use sound judgment when designing instructional content (Alessi & Trollip, 2000). A lack of knowledge about the cultural needs of audiences encumbers the design process (Vatrapu, 2008).

This research addresses the five dimensions of national culture as defined by Hofstede, Hofstede, and Minkow (2005). Particular attention is given to each dimension to demonstrate the connection to curriculum development in online courses. After the dimensions are discussed, multicultural design strategies and cultural inclusion in online learning are detailed. The researchers then provide a list of six recommendations and implications for future research based up on the literature synthesis and review. For the purposes of this work, an online course is defined as a course taught through a learning management system. This course is one that does not require face-to-face meetings by students and faculty. All instruction, either synchronous or asynchronous, occurs in the online learning format.

DIMENSIONAL MODEL OF NATIONAL CULTURE

In the dimensional model of national culture, cultures are divided into five dimensions: power distance, individualism versus collectivism, masculinity versus femininity, uncertainty avoidance, and long term orientation versus short-term orientation (Hofstede et al., 2005). As defined by Hofstede et al. (2005), power distance refers to social hierarchy and an individual's perceived place among the hierarchy. Collectivism is related to group dynamics and belonging to a group. In contrast, individualism refers to an individual or immediate family identity. Masculinity relates to success through the attainment of money and power, whereas femininity is related to caring and the quality of life. Uncertainty avoidance is the way people feel about changes and innovation, and the avoidance of new or unfamiliar situations. Dimension five, long-term orientation, is when societies place value on the future. In contrast short-term orientation is when value is placed on the past and present.

These cultural dimensions may be of importance to online course development. Subsequently, the foci are applied as the theoretical foundation for this literature review and the multicultural course design recommendations that follow.

CULTURAL IMPACT OF GLOBALIZATION ON COURSE DESIGN

Curriculum developers face unique challenges when attempting to design courses addressing multicultural audience needs and promoting cultural sensitivity. Several researchers investigated the contrast between Eastern and Western cultures (Ellsworth, 1994; Hofstede et al., 2005; Imada & Ellsworth, 2011; Kim, Pan, & Park, 1998; Nisbett, Peng, Choi, & Norenzayan, 2001; Perkins, 2008; Walsham, 2002; Yang, 1993). Respect between cultures was emphasized by Walsham (2002), who noted the need to understand, to feel empathy, and to show respect in an outwardly manner. Walsham (2002) believed empathy and understanding would create a copacetic environment where multiple cultures could work together. In contrast to Hofstede et al.'s (2005) belief in a national culture, Walsham (2002) noted many national cultures are heterogeneous encompassing various religious, social, and racial backgrounds. In determining the importance structure analysis had on cultural heterogeneity, Walsham (2002) described the viewing of cultures as homogenous as unimportant and "one should be looking for a measure of systemness or homogeneity within particular social groupings," (p. 375). Although various heterogeneous cultures exist, it is important to address the differences when designing courses for online instruction. Exploring power distance and culturally sensitive design options is the first dimension that we address.

DIMENSION ONE: POWER DISTANCE AND CULTURALLY SENSITIVE DESIGN CONSIDERATIONS

A curriculum developer's level of cultural knowledge influences the overall course design. Understanding Hofstede et al.'s (2005) *dimension of power distance* among cultures influences a curriculum developer's design and activity choices. *Power distance* refers to the hierarchy of social status and what one perceives as his or her place in society. Online participants whose culture is collective may perceive synchronous discussions and online discussion boards as problematic and therefore participate less than the instructor expects. Since participation is required, Vatrapu (2008) suggested alternatives to discussion board collaborations that typically occur in online courses, such as the use of embedded messages and the facilitation of both individual and collective communications. Research suggests curriculum developers should provide a range of communication options to ensure multicultural needs are addressed (Reiser & Dempsey, 2007; Rogers, Graham, & Mayes, 2007; Vatrapu, 2008).

Information related to multicultural design of online courses may often be difficult to locate and apply. Rogers et al. (2007) discussed a lack of research and difficulties in finding best practices when online course developers design content for multicultural audiences. Furthermore, Rogers et al. (2007) stressed that curriculum developers should demonstrate a strong desire to find materials related to cultural needs and understand to support participants.

Cultural Context

Curriculum developers ought to recognize the cultural needs of audiences when designing online courses. Reiser and Dempsey (2007) noted different cultural context promotes the development of global education to address multicultural audiences' needs. Internationalization is the removal of cultural context. Localization refers to the inclusion of local cultural features customized to fit the cultural needs of an audience (Reiser & Dempsey, 2007). Modifications to cultural context by internationalization or localization can be used to effectively meet cultural needs while addressing the multicultural audiences of online courses (Alessi & Trollip, 2000; Reiser & Dempsey, 2007).

Researchers have explored the fundamental thinking differences between Eastern and Western cultures (Imada & Ellsworth, 2011; Nisbett et al., 2001; Yang, 1993). Nisbett et al. (2001) explored the notable differences between Eastern and Western thinking and cultures and believed Easterners think holistically and Westerners think analytically. As a curriculum developer, it is important to understand and address the multifaceted views of participants. Imada and Ellsworth (2011) analyzed the "cultural differences in appraisal and corresponding emotion" (p. 329). In particular, the relationship between events and the interpretation of the events with Japanese and American participants were explored by these authors as they identified differences in what was attributed to collective thought processes (i.e., Japanese) and individual thought processes (i.e., American). Imada and Ellsworth (2011) found individualistic thinkers "attributed success to themselves" (p. 330) and collective thinkers generally linked success to luck or to outside factors. Conversely the authors believed collective thinkers associated failure with shame and individualistic thinkers were angered by their failures (Imada & Ellsworth, 2011).

To further support the depth of difference between Asian and American cultures, Yang, (1993) emphasized the difficulty Asian (i.e., Chinese and Japanese) participants may experience when adjusting to mainstream America. Yang (1993), like Nisbett et al. (2001), cited the differences in thinking between the cultures and recognized that generally Asian culture taught collectivism whereas American culture taught individualism. Furthermore, Yang (1993) noted the differences in language and recognized Asian languages typically use fewer words and Western languages emphasize eloquence. Yang (1993) iterated the importance of communicating Eastern and Western value differences when developing curriculum.

Yang (1993) described collectives as "for the purpose of maximizing (the) individual's well-being and advancement" (p.4) in Western culture and explained in Eastern culture, individuals do things to better the collective. The difference noted is in Western culture, the collective subordinates to better the individual, and in Eastern culture the individual subordinates to better the collective.

High and Low Context Cultures

Kim et al. (1998) studied the validity of Hall's (1976) theory of high context (HC) and low context (LC) between cultures. Kim et al. (1998) explained in HC culture countries people are more deeply involved with one another than in LC culture countries. High context culture countries also have more of a social hierarchy than LC culture countries and the people are more reserved and self-contained. Communication in HC culture countries tends to be personal, simple, and with deep or implied meaning. Low context culture countries, on the other hand, tend to be more individualized and not deeply involved, rather more distanced. In LC culture countries social hierarchy is less important and communication is more impersonal and exact, (Kim et al., 1998).

Curriculum developers may benefit from considering high context and low context differences among cultures (Hall, 1976; Kim et al., 1998; Perkins, 2008). In a high context culture, such as Western Culture, communication is a deeply involved and idiomatic change occurs within the culture (Hofstede et al., 2005; Perkins, 2008). Communication tends to be personal, and simple with deep or implied meaning. Drawing on the needs of a high context culture, curriculum developers may draw on characteristics and design content that is designed to be simple, straightforward and direct. Provide specific instructions and a detailed grading rubric for the various activities and provide examples to supply high context cultures with implicit details. Create a social environment where individuals may freely express their ideas within a group and receive feedback.

In contrast, in a low context culture (i.e., Eastern Cultures), communication tends to be more individualized and not deeply involved (Hofstede et al., 2005). In this type of culture, the curriculum developer may opt for a less social environment and communicate individually with participants. Group based activities would be kept to a minimum to ensure that the needs of the individual are addressed. In low context countries, social hierarchy is more important and communication tends to be more impersonal and exact, and the resulting impact is the people may tend to be more reserved and self-contained. Based on the social hierarchy curriculum designers would limit the use of discussion board forums and opt for individual assignments where participants express their opinions in a private exchange with instructors.

Language Differences

The differences in languages between Eastern and Western cultures impact online communication. Rogers et al. (2007) discussed challenges curriculum developers faced when designing for multicultural audiences. The authors' researched cultural and learning expectations and language differences, noting there was a need to have "a deeper understanding of cultural expectations, especially when working cross-culturally" (p. 204). Rogers et al. (2007) also found curriculum developers are often faced with adversity and challenges that require analysis and evaluation in order to design better cross-cultural instruction, especially when language differences exist.

Similar to Rogers et al. (2007), Yang (1993) noted Asian languages typically use fewer words to express ideas than do Western languages. Yang (1993) expressed differences in thinking between Eastern and Western cultures and explained the differences on several levels including: beliefs and ways of life, competition, individualism, relationships, and cooperation. Furthermore, Yang (1993) revealed the importance of communicating Eastern and Western value differences when developing curriculum and suggested when teaching speech communication cultural ideas and beliefs should be addressed.

Morse (2003) explored online asynchronous learning through the use of high and low cultural context and learning. Morse's findings suggested high context participants were obstructed by technology and "communication norms implicit in their culture" (p. 51) and language differences were extremely important to the understanding of online training (Morse, 2003).

Website Design Considerations

Website design is one area where high and low context communication is a concern. Usunier and Roulin (2010) explored high versus low context communications and the implications on website design. They found when designing in a low context communication style it was "easier to find, use colors and graphics more effectively, make navigation more user-friendly, contain more corporate and product information cues, and offer more contract-and relationship-related content than websites from high context communication countries" (Usunier & Roulin, 2010, p. 189). Usunier and Roulin (2010) noted low context websites provided a better way of communicating to a global audience because contextual cues are not a priority.

Alessi and Trollip (2000) discussed methods of control and recommended when designing any application interface, the designer should keep it simple. This information is relevant to online course designers, as ease of access should be a priority consideration for the target audience. The authors specified three "user-friendly" (p. 53) types of controls; buttons, menus, and hyperlinks (Alessi & Trollip, 2000). When using buttons, the authors recommended designers use a small number of buttons and they be used for "local controls" (p. 53) not "global controls" (p. 54). A final recommendation when using buttons was to ensure visual confirmation was included to inform the user the button had been clicked (Alessi & Trollip, 2000). The next control was through the use of menus; "full-screen menus, hidden menus, and frame menus" (p. 54). Designers of online courses are geared for multicultural audiences and require ease of navigation should note course design considerations. The next dimension explored is individualism and collectivism, a pertinent consideration for curriculum developers.

DIMENSION TWO: INDIVIDUALISM AND COLLECTIVISM ADDRESSED

The second component of the dimensional model of national cultures (Hofstede et al., 2005) is individual and collectivism. The differences between individualism and collectivism are important for curriculum developers to understand in the design process. A curriculum developer has many options to consider when creating group and individual activities in an online course. Collectivism will influence group dynamics and the overall contributions of each group member. Collectivism is defined as group dynamics, where, in exchange for loyalty the group will care for individual members (Hofstede et al., 2005). In general, Eastern cultural thinking is holistic, and collectivism is taught and appreciated as part of the culture (Hofstede et al., 2005; Imada & Ellsworth, 2011; Nisbett et al., 2001). Collective thinkers tend to attribute success to luck or to outside factors. Many curriculum developers include a self-evaluation component to group projects, asking individuals to rank their contributions and their group members' contributions to the project. When integrating self-evaluation instruments curriculum, developers should use detailed and specific checklists to ensure participants clearly indicate their contributions. Yang (1993) asserts in Eastern culture, individuals act to improve the collective, and the main purpose is to support the collective culture.

Hofstede et al. (2005) defined individualism as the opposite of collectivism. Individuals are expected to care for only themselves and their immediate families. In contrast to Eastern culture, typically Western culture is analytical and individualism is encouraged (Imada & Ellsworth, 2011; Yang, 1993). Imada and Ellsworth (2011) found individualistic thinkers "attributed success to themselves" (p. 330). As noted in the previous example, the integration of group self-evaluation instruments may be proactive when designing instruction for a multicultural audience. The self-evaluation instrument would permit users to define their specific contributions to the group project and earn credit for their work. One characteristic of individualism in Western culture is the collective subordinates are used to better the individual. Another issue contributing to cultural differences, and relevant to curriculum developers, is the variations among masculinity and femininity in cultures.

DIMENSION THREE: MASCULINITY VERSUS FEMININITY

The third dimension of the dimensional model of national cultures (Hofstede et al., 2005) is masculinity and femininity in cultures. Hofstede et al. (2005) viewed gender from a national perspective and found countries to be either masculine or feminine. Countries such as Norway and Sweden were deemed feminine while countries such as Japan and the U.S. were seen as masculine. The feminine countries were considered modest while the masculine countries were assertive. This carried over into the perspectives of the people in each of these countries where someone from a masculine country might see a lack of self-adulation as underselling oneself and someone from a feminine country would see self-adulation as bragging about oneself.

Hofstede et al. (2005) noted gender differences are only partly influenced by biological makeup and women can behave in masculine ways and men can behave in feminine ways. The distinction between masculine and feminine was stated as masculine being more concerned with earning high pay, getting recognition for their endeavors, opportunities for advancement, and having challenging work; feminine was distinguished by propensities towards managing copacetic work relationships, cooperating with others, enjoying pleasant living areas, and job security. Hofstede et al. (2005) contended that while individuals can possess both masculine and feminine traits, country cultures are either predominately one or the other. As noted by Hando and Ahern (2012) the masculine and feminine of cultures may extend to the online course platform and based on the cultural traits individuals may prefer to work with like genders. This should be a consideration for curriculum developers when designing group activities. Expanding on the traits of cultures, the next dimension explored is that of uncertainty avoidance issues.

DIMENSION FOUR: ADDRESSING UNCERTAINTY AVOIDANCE ISSUES

Curriculum developers should select activities and designs sympathetic to the target audience. As noted by Hofstede et al. (2005) *uncertainty avoidance* may be a hindrance for multicultural audiences and present challenges to curriculum developers because of lack of knowledge about cultural needs. However, in a multicultural situation, a blended methodologies approach benefits the cultural needs of the group. Although, researchers noticed appropriate multicultural design may be difficult to master because cultures perceive content and activities differently (Beamer & Varner, 2001;Vatrapu, 2008; Yang, 1993).

Another factor to consider when designing for a multicultural audience is cultural inclusion. Oosthuizen (2004) explained the importance of communication in marketing to global communities and believed effective communication would have to be empathetic and relevant to the target audience, which included local language. Hanvey (1976) recognized people have different perspectives and referred to this as "perspective consciousness", (p. 5). The author suggested cross-cultural awareness are attained by overcoming the cultural influences learned from childhood; in other words, the ability to think beyond that which one knows and understand the perspectives of others. Hanvey (1976) noted the need to select activities and methods that are sympathetic to the culture addressed and further, he explained that in a multicultural setting a blended methodology may be necessary. Another area pertinent to cultural needs and relevant to the instructional design process is that of long term versus short-term orientations.

DIMENSION FIVE: LONG-TERM VERSUS SHORT-TERM ORIENTATION

Hofstede et al. (2005) defined Long Term Orientation (LTO) as a fostering of future ideas and trends as they relate to perseverance and thrift. The definition of Short Term Orientation (STO) was the opposite and it held the past and present and values steeped in tradition as important. Using the Chinese Value Survey (CVS) some of the key differences between LTO and STO cultures were quick results versus sustained, slow results; concern with social status versus willingness to subordinate; and humility is for women versus humility is for men and women (Hofstede et al., 2005, p. 243).

Implications in education were determined by an analysis of the Trends in International Mathematics and Science Study (TIMSS) in which Hofstede et al. (2005) discovered a correlation between high math skills and Eastern countries. Specifically LTO-CVS countries possessed strength in solving problems and were explicit rather than ambiguous. The emphasis is placed on what works rather than on why it is effective. To this extent practical consideration in curriculum development and implementation should be part of the instructional process and design. Based on the literature review findings and the detailed information provided pertaining to the dimensions of national culture, as researchers, we assert that numerous multicultural design strategies promote cultural inclusion. The following section addresses the strategies that may be integrated by curriculum developers to effectively promote the inclusion of culture in online courses.

MULTICULTURAL DESIGN STRATEGIES TO PROMOTE CULTURAL INCLUSION

Several researchers detail specific strategies that may promote cultural inclusion in online course development. King, Gulick, and Avery (2010) explored the differences between diversity training and diversity education and took those practices they thought were the best to create a set of best practices for each vocation. The authors found themes that included a needs assessment, the context in which the training would take place, and development of successful programs. Successful programs were those that allowed for the transfer of knowledge into the work place and also those that benefited the learner (King et al., 2010). The authors then discovered several themes pertaining to best practices in diversity education including: "developing awareness and understanding of differences through self-evaluation, feedback, and active learning" (King et al., 2010, p. 895). The authors' final conclusion was that by "bridging the divide" between the two disciplines future considerations for each approach would allow for more effective diversity training and education in corporations and schools (King et al., 2010).

Rasmussen, Nichols, and Ferguson (2003) discussed the implementation of multiculturalism in education and training. The authors viewed the need for multiculturalism as critical in today's global online community and offered a training model on which to build eLearning programs. The model was based on the web-based instructional design (WBID) model developed by Davidson-Shivers and Rasmussen (2006) and based upon well-established online pedagogical principles. The methods included in the model were orientation, content, conclusion, interaction, and motivation. Orientation included the course description, syllabus, and requirements, content included a variety of ways to encourage interaction and motivate learners, and conclusion entailed a review and assessment of the course (Rasmussen et al., 2003).

Cultural competency and distance training through the use of television were discussed by Ancis (2001). Ancis (2001) pointed out the challenges and potential worth of using this medium in an online environment. Some of the challenges included one-way video where instructors could not observe student's behavior and student isolation was impeded by geographic location. Technology also played a role in the challenges of offering televised learning because relying upon it meant both the source generating the instruction and the source receiving the instruction needed to support communication efforts (Ancis, 2001).

One potential worth of using televised learning was viewed as the element of *humanizing*. Ancis (2001) explained humanizing as the process of creating an environment that made students feel comfortable in a diverse environment. This allowed the instructors to embrace the opportunity to educate students from all over the world. By setting ground rules, Ancis (2001) paved the way for successful active and interactive learning where students were encouraged to send photos and other forms of media in which to engage each other in a collaborative process.

A mobile learning (m-learning) and sociocultural study was conducted by Male and Patterson (2011) to research "how culturally aware convergence developments in mobile technology" (p. 331) could be used to help improve online learning between two continents. The authors discussed interface design as it pertained to both the device and application levels and emphasized the use of interface design on mobile devices. Using the "cultural pedagogy theory" (p. 333), Male and Patterson (2011) proposed a macro and micro social cultural method where the macro was the approach from a national perspective and the micro was the approach from the individual perspective. This allowed the authors to adopt Korat's (2001) "individualism and collectivism approach" and place emphasis on the learner (Male & Patterson, 2011, p. 333).

From the technology perspective the authors concentrated on infrastructure and application. The authors explained infrastructure as a means of supporting the application deployment and technology and the application as the medium through which the learners engage in learning. Male and Patterson (2011) used specific socio-cultural views, including, "the culture-aware-pedagogy view, the pedagogy-aware view, the indigenous knowledge domain view, (and) the learner profile view" (p. 336). The authors then applied these views and suggested several technical specifications such as enhancing the use of the mobile device by having the ability to connect to a larger "display device" or by connecting to an "advanced audio device" (p. 338). Male and Patterson (2011) continued with learner interaction suggestions such as engaging students through "ease of navigation and acceptable response times" (p. 340). Learner interaction is a key element in the design process. Curriculum developers who are designing content for a multicultural audience are responsible for understanding the cultural needs of the target audience.

KNOWLEDGE ABOUT CULTURE IN THE DESIGN PROCESS

Curriculum developers should be knowledgeable of cultural customs, traditions, and protocol to create an online course that is culturally sensitive and meets the needs of a global audience (Reiser & Dempsey, 2007). Rasmussen et al. (2003) discussed the implementation of multiculturalism in online instruction and considered it as critical in today's global online curriculum development. Knowledge and awareness of culture must be learned by the curriculum designers and must be implemented during the design process (Beamer & Varner, 2001). Furthermore, Beamer and Varner (2001) stressed that curriculum designers need to understand the rationale for various cultural concepts as well as appropriate or inappropriate acts. Understanding the underlying meaning associated with actions and individual perception based on culture is crucial. Reiser and Dempsey (2007) pointed out different cultural context can help trainers develop global training. One method of understanding the culture is a needs assessment of the multicultural audience. This was a common theme in the literature.

Needs Assessment

The recommendation to use a needs assessment to identify the culturally related needs of the target audience is another prominent theme in literature. King et al. (2010) stressed that among the best practices of online instruction, a needs assessment is prominent and should be included to create a successful program. The inclusion of a needs assessment informs the curriculum developer of the specific cultural and academic needs of the target audience (Rossett & Sheldon, 2001). Likewise, Flowers (2001) emphasized the need to evaluate, and re-evaluate the needs of the audience to create a positive learning environment that evolves to meet the specific targeted needs.

Addressing Cultural Differences in Design

Unique differences exist among Eastern and Western cultures that impact the design process. One method of addressing cultural differences is through establishment of Netiquette guidelines (Shea, 1994) for communications that are culturally sensitive. As noted by Tedre, Kamppuri, and Kommers (2006) and Preece (2004), a global society requires cultural differences in communication be identified and a mutually agreed upon code of conduct be established. Research suggests curriculum developers consider using guidelines consistent with the culture of the target audience.

RECOMMENDATIONS

Based on this review of the literature, we offer the following six guidelines for curriculum developers who are designing online courses for multicultural audiences:

1. Incorporate multicultural elements into the design and development process with special emphasis on high-context and low-context concerns related to language (Kim et al., 1998; Hall, 1976; Hofstede et al., 2005);
2. Conduct a needs assessment of your audience to determine the presence of collectivism and individualism (Hofstede et al., 2005, King et al., 2010; Rasmussen et al., 2003). The information collected during the needs assessment will provide information about how your audience thinks and feels, their culture, and their values. Analyze the pre-assessment and include learning activities addressing the multicultural needs of the target audience;
3. Respect cultural differences by integrating blended learning methodologies into the online course (Rasmussen et al., 2003). Plan activities that are multicultural and include a range of options; consider adding group and individual projects, and research-based assignments;
4. Make informed decisions about the design of the online course (Reiser & Dempsey, 2007). Ensure the website or multimedia learning object's navigation is consistent, easy to use, and colors used are culturally sensitive (Usunier & Roulin, 2010);
5. Encourage and support multicultural conversations as part of the online course. The suggested standard emphasizes that culturally relevant Netiquette (Preece, 2004; Shea, 1994; Tedre et al., 2006) is followed during online discussions and communication exchanges;
6. Reflect on the planning, using the Multicultural Design Considerations for Curriculum Developers (see Table 1) as a guideline. Consider each question and ensure the development of course content and design respects a multicultural perspective.

The Multicultural Design Considerations for Curriculum Developers presented in Table 1 were designed based on a review of literature. The purposes of the questions are to provide a multicultural design framework for curriculum developers. The overarching multicultural topics include acknowledgement of cultures, design methods, diversity and respect, inclusion of multiculturalism, and empathy considerations. The sets of questions are designed for curriculum developers of online courses and are intended as guiding questions the curriculum developer may use as they reflect on the needs of multicultural audiences. Each question listed in Table 1 represents content revealed in the literature review and reflective of the five dimensions of national culture as defined by Hofstede et al. (2005).

The first set of questions relates to dimension one *power distance* and acknowledges the need to create culturally sensitive designs. Cultural considerations of the target audience should be taken into account by the curriculum developer. The second set of design questions highlights key design methods. This is reflective of the differences between *individualism and collectivism* the second of the five dimensions of national culture. A curriculum developer selects from numerous design options when creating group and individual activities in online courses. The third set of design questions focus on *masculinity and femininity* in cultures (Hofstede et al., 2005). As curriculum developers, the need to communicate diversity and respect of cultures is critical. Including a multicultural perspective that addresses specific demands as revealed through a needs assessment is a high priority in the design process. The fourth set of questions corresponds to inclusion of culturally

Table 1. Multicultural design considerations for curriculum developers

Design Considerations	Guiding Questions for Curriculum Developers
Acknowledge Cultures	Did you complete a needs assessment to identify cultural priorities including collectivism and individualism? Did you identify the cultural backgrounds and characteristics of the target audience? Did you include culturally relevant activities as identified in the needs assessment?
Design Methods	Did you clearly describe the course to orient the target audience? Did you create content that is engaging and motivating to the target audience?
Diversity and Respect	Did you include multicultural perspectives in the design of the course? Did you implement new strategies and course materials based on specific cultural needs?
Include Culturally Sensitive Design Aspects	Did you provide options for communication to address multicultural needs such as high and low context? Did you include culturally appropriate Netiquette guidelines? Did you consider course design elements such as navigational control and use of color that meet a multicultural audience?
Empathy Considerations	Did you consider the cultural needs of the audience? Are future trends or past traditions more important? Is immediate gratification or are slow sustained results sought after by the learners? Did you include a plan to address the learners' needs? Are practical considerations taken into account?

sensitive design aspects and addresses Hofstede et al.'s (2005) *uncertainty avoidance* dimension of national culture. The questions focus on high and low context as well as design elements. The fifth set reinforces empathy considerations reflective of *long and short-term orientation* (Hofstede et al., 2005). The questions include cultural perspectives steeped in tradition and future trends. Online curriculum developers need to consider the learner's expectations based on their points of view and provide practical applications in their learning plans and experiences.

CONCLUSION

The availability of resources and reference guides for curriculum developers is limited (Reiser & Dempsey, 2007; Rogers et al., 2007; Weisinger & Trauth, 2002). An extensive review of current literature on the topic of multicultural design for online courses revealed that a comprehensive resource was not readily available to instructional designers. Further, guiding questions that promoted multicultural design aspects were not found in a review of literature. This review of the literature revealed suggestions identified to improve multicultural design practices and prompted the authors to create a list of guiding questions that encompassed the multicultural design elements reveals in the literature.

Additionally, research should be done specifically related to the needs of curriculum developers who design content for multicultural audiences. The need for a multicultural assessment with questions designed to reveal cultural biases and beliefs would benefit both the instructors and learners. Furthermore, the creation of a multicultural design guide deliberately intended for curriculum developers reinforcing design principles would be of interest for future research and practice.

Chapter 74
Intercultural Communication and Sustainable Leadership:
The Case of a Joint Master Course

Nelly Kostoulas-Makrakis
University of Crete, Greece

ABSTRACT

The environmental, economic, and social crises we are increasingly confronted with locally and globally, including climate change, ozone depletion, biodiversity loss, and also economic and social issues, such as poverty, social inequalities, violation of human rights, gender inequalities, loss of indigenous knowledge, etc. call for changes in the ways we think, work, and act. In this context, a course dealing with intercultural communication and sustainable leadership that is part of a M.Sc. programme on ICT in Education for Sustainable Development has been developed and is studied in this chapter. The course puts emphasis on the most urgent and critical social, environmental, and economic challenges facing the world and explores how leaders from education, business, government and civil society are responding to global/local sustainability challenges. In particular, it elaborates on the nature of sustainability leadership and how it can contribute to transformational change. It does this by locating sustainability within the leadership literature and presenting a model of sustainability leadership that integrates three complementary types of leadership, namely: distributed; entrepreneurial and transformational. The course also examines the importance of sustainable leadership practices within organisations (e.g. schools, business, NGOs, public) and assess the potential benefits if institutions are more actively engaged in sustainable leadership practices. It explores how intercultural communication can contribute to positive change for sustainability and discusses that new theoretical frameworks are needed to better understand effective transformational leadership. It also elaborates how cultural orientations and intercultural communication competence affect the full range leadership framework and transformational leadership dimensions. This course is delivered through a Virtual Learning Management System (VLMS) based on Moodle open LMS.

DOI: 10.4018/978-1-4666-8246-7.ch074

ORGANISATIONAL BACKGROUND

Education at all levels, but especially higher education bears its own responsibility for these crises, as through the education system all sorts of professionals and leaders who take decisions at all levels in public and private sectors, are educated. Corcoran and Wals (2004) observe that "[t]he scope and range of the negative impacts of university educated people on the natural systems that sustain Earth are unprecedented" (p. 3). All these have highlighted the important role leaders across all societal sectors can play and the urgency to develop a cadre of leaders equipped with the skills and competences to move society towards a more sustainable direction. This raises the question: what does this mean for those in leadership positions? The term of sustainable leadership represents a shift to capture and merge contemporary unsustainable leadership with the urgent global pressure for sustainable development through education. Unlike earlier descriptions of leadership which emphasised personal characteristics and capacities, sustainable leadership is often represented as a concept and a strategy with foundational principles drawn from sustainable development conceptions (Hargreaves & Fink, 2003, 2004; Fullan, 2005). Academics can lead efforts to develop transformative intellectuals and sustainable leadership ready to confront the critical issues and foster opportunities for sustainable development.

While many nations around the world have embraced the need for education to achieve sustainability, only limited progress has been made on any level. Some of the more prevalent challenges are: a lack of or inadequately trained professionals to provide inspired ESD; disciplinary boundaries between subject areas persist as well as lack of educational leadership to support transformative pedagogies to address sustainability. Our state of the art reviews on Master degree programmes in the field of ESD showed that the great majority (Makrakis & Kostoulas-Makrakis, 2012a):

- Focused on the environmental pillar of sustainable development, neglecting the other three pillars (social, cultural and economic);
- Did not exploit the potential of ICTs in addressing sustainability issues, especially Web 2 technologies and use of open education resources (learning objects) available in the Web; and
- Employed techno-centric approaches, meaning that curriculum is developed by experts without the end-users inputs.

There was thus need of Master programmes that are participatory, holistic, interdisciplinary and contextual, making use of ICTs both as learning pedagogies and means of delivering at a distance or through a blended mode. The course on "Intercultural Communication and Sustainable Leadership" is one of the 12 courses offered in a joint M.Sc. programme on ICT in Education for Sustainable Development. It is an interdisciplinary program that focuses on developing competency and skill on Education for Sustainable Development enabled through ICTs. The program presents a range of theoretical and practical concepts and contexts of education for sustainable development enabled through ICTs and draws from a wide range of teaching/learning methodologies. The overriding aims of the joint M.Sc. programme are:

- To enhance knowledge for informed decision and policy-making on education for sustainable development issues;
- To enhance critical, analytical and integrative skills for developing ICT-enabled ESD curricula and training programmes; and
- To produce professional experts on ICT-enabled ESD having the capacity to become reflective practitioners and agents of change, locally as well as globally.

In particular, the "Intercultural Communication and Sustainable Leadership" course explores an interesting confluence of two current topics: intercultural communication and ESD leadership. Students in this course engage in a critical assessment of intercultural communication theories and applications with the explicit goal of addressing issues of sustainable leadership. The course examines key factors in green and distributed leadership models and strategies and draws attention to the importance of transformational leadership in connection to intercultural communication competence. Emphasis is given on issues of culture and power, the relationship of language (both verbal and non-verbal) and culture, the relationship between culture and strategies of negotiation, as well as differing perspectives of conflict and ways of managing intercultural conflict.

Through experience, action and critical reflection (Elliott, 2010; Tilbury, 2011), students are to collaboratively explore: 1) social entrepreneurship as leadership that facilitates societal transformation; 2) the role of ICT in facilitating leadership and transformational ESD; 3) the attributes of effective sustainable leadership and 4) the choice of communication strategies needed within different cultural contexts and how intercultural communication affects transformational leadership. The overriding goal of this course is to equip participants with the skills and knowledge to function as transformative educators and ESD leaders. The specific course objectives are as follows:

- To explore and gain understanding of cultural self-awareness, other culture awareness, and the interactive dynamics between the two in the context of sustainable leadership.
- To understand how communication processes differ among cultures; identify the challenges from these differences and learn ways to creatively address them.
- To acquire knowledge, skills and attitudes that increase intercultural competence for shared, distributed and transformative leadership.

By the completion of the course students will be able to:

- Know about different verbal and nonverbal communication behaviors and their implications for sustainable leadership.
- Compare and contrast verbal and nonverbal communication styles and patterns of various cultures and their impact on sustainable leadership.
- Describe and critically assess own cultural heritage/identities and how these influence their communication and sustainability thinking.
- Identify, describe and explain how the cultural, microcultural, environmental, perceptual, and socio-relational contexts affect intercultural communication and sustainable leadership.
- Identify intercultural ethical principles/standards and apply them to intercultural communication cases and sustainable leadership.
- Explain how theories related to intercultural communication can influence sustainable leadership.
- Describe the components of intercultural competence and its impact on distributed and transformative leadership.
- Distinguish and discuss whether a distributed leadership model may be an appropriate alternate frame of sustainable leadership.
- Describe how shared leadership is developed within a school or a local authority to support ESD.
- Discuss the relationship between transformational leadership and the intercultural communication competence frame.
- Define and discuss “green leadership” at the individual, organisational, entrepreneurial and political level.

SETTING THE STAGE

Who is Involved in the Design and Development of the M.Sc. Programme?

The UNESCO Chair of ICT in Education for Sustainable Development (http://www.edc.uoc.gr/unescochair/) established at the University of Crete in cooperation with the RCE Crete (http://www.edc.uoc.gr/unescochair/rcecrete/) took the initiative to form a consortium of seven European Universities with considerable experiences in the fields of ICT and ESD to propose a project entitled "ICT-enabled Education for Sustainable Development" to the European Commission for funding. This project aimed to develop a joint Master degree (deployed on an advanced virtual platform) in ICT in ESD offered in English. This project was approved by the European Commission and was financially supported (Project Number: 510212-LLP-1-2010-1-GR-ERASMUS-EVC and agreement number 2010-3494/001-001). In the course of its design and development, a participatory design was adopted that included prospective students, curriculum designers, ESD experts, technologists, instructional designers, Web designers, etc.

Challenges Identified

The challenges identified in the process of design and development of the M.Sc. course can be categorised in five key domains: 1) the curriculum philosophy to be adopted; 2) the virtual learning and course delivery platform; 3) sustainable leadership discourse challenges; 4) the instructional design and teaching methodology adopted and 5) the overcoming of various barriers for the implementation of a joint Masters program. Some key challenges reflecting the above domains were:

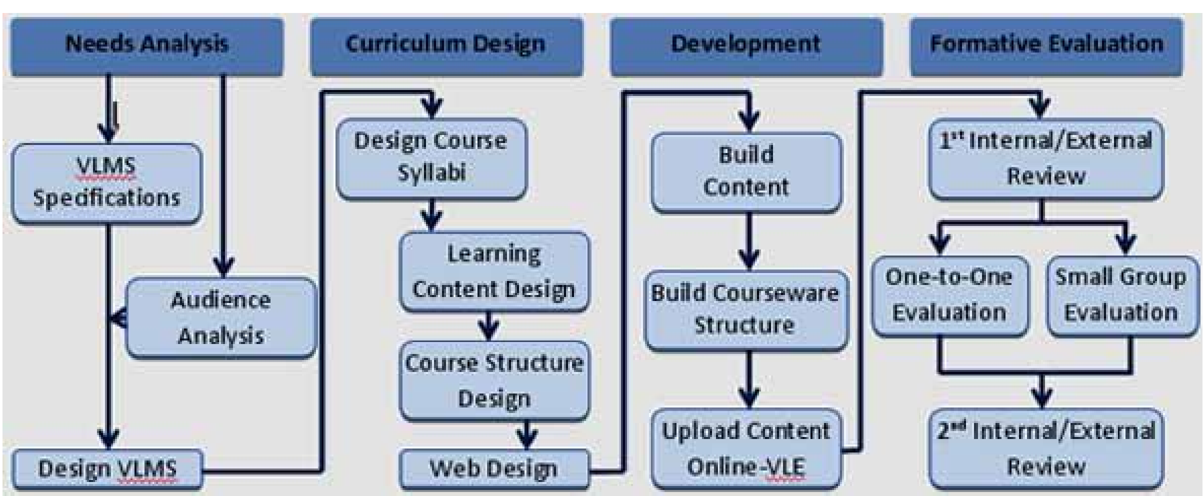
- New theoretical frameworks are needed to better understand effective sustainable leadership in different cultural domains.
- Social institutions need to generate innovative ideas and solutions on institutional change and mechanisms and processes for advancing sustainable leadership, taking into account current and future sustainability problems.
- There is a lack of or inadequately trained professionals to provide inspired sustainable leadership.
- Disciplinary boundaries between subject areas persist as well as lack of educational leadership to support transformative pedagogies to address sustainability.
- There is need to review and renew curriculum and teaching methods to support learning that articulates with, and critically engages with new forms of knowledge, inter-disciplinarity, and hands-on and minds-on learning.
- Curriculum innovations and methodologies for meaningful teaching and learning in a changing knowledge environment are needed.
- The current environmental, social and economic crises highlight the urgency to develop sustainable leaders.
- Systemic, holistic thinking and understanding of current and future sustainability challenges are imperative.
- There is need to rethink the dominated model of "doing business as usual" and consider the role to play in building more sustainable futures.

CASE DESCRIPTION

Methodology

This Masters programme was designed and interpreted in a four-stage process**:** 1) design of course syllabi; 2) learning content design; 3) course structure design and 4) Web design. These processes provided the foundation for the course modules development exemplified in the development phase. A critical decision was made for the structure of the course curriculum which merged vertical and horizontal modes of course curriculum design. The vertical integration ensures continuity and structures the content in sequence from core to more complex and to specified streams. This provides a clear picture to learning, as students are able to understand how the content is developed and organised in the course. The vertical integration also assumes that the discrete courses may combine content from two or more subject domains. The horizontal integration brings about more breadth of curricular contents of different disciplinary areas and knowledge domains, especially through an interdisciplinary approach within the course areas. In this sense, transformative learning cut across all the four competences (learning to know, learning to do, learning to live together, learning to be) as formulated by UNESCO (1996) as well as across the fifth competence that was added later on that of learning to transform oneself and society (cf. Black 1999). Horizontally, the courses were built conceptually upon five main themes: Sustainability Theory; Educational Research; ESD pedagogy; Educational Policy and Leadership; and Information & Communication Technology (ICT). The emphases were on: 1) inter/cross-disciplinary content by merging concepts from the main themes and 2) multidisciplinary content by integrating multiple teaching methods and learning technologies. In this context, ICTs and ESD form the integrating "backbone" across all course contents. The design of the online curriculum components departed from the students' needs that were contingent on the needs analysis processes. As seen in Figure 1, this model consists of five design phases– needs analysis, curriculum design, development, formative evaluation and implementation– each of which has its own design processes. These phases, although, placed sequentially, in practice, they are considered to function interactively (Makrakis & Kostoulas-Makrakis, 2012a).

Figure 1. A model for designing course design and development



Needs Analysis

This first phase, *Needs Analysis*, was concerned with gathering, analyzing, and summarizing information necessary to build the Virtual Learning Management System (VLMS). This phase was consisted of three design processes: VLMS specifications; audience analysis and VLMS design. The VLMS specifications process provided various design activities involved such as enrolment, maintenance of student records, academic profiles, scheduling of units, etc. Audience analysis process concerned analyzing audience characteristics, such as age, cultural and educational background, knowledge related to topic, ICT literacy and access to technology. In our case, based on comparative analysis of various LMS platforms, Moodle 2.0 was adopted as the basic LMS platform upon which we designed our VLMS. Moodle is one of the most user-friendly and flexible open source courseware products available. It has excellent documentation, strong support for security and administration, and is evolving towards Instructional Management Systems/Shareable Content Object Reference Model (IMS/SCORM) standards with platform (Apache, PHP, and MySQL). The key to Moodle is that it is developed with both pedagogy and technology in mind. Moodle can also be supported by Mahara, which was found to be suitable as an e-portfolio.

In the process the VLMS design a semi-structured questionnaire was delivered to a purposeful sample (N=37) of prospective students to elicit various types of information such as learning styles and profiles, previous experiences with e-learning tools, learning needs, ICT literacy, technology use etc. Small group discussions were also carried out to enable people to talk and share ideas and experiences. The information gleaned from the needs analysis helped us to define educational goals, which were stated as specific learning outcomes in the phase of curriculum design and development. In other words, this phase functioned as the foundation on which we developed course syllabi and course modules. In general, prospective students to this joint Master degree have a rather good ICT literacy, able to handle online tools with minimal guidance. All of them used productive tools (e.g. presentation software) and especially communication tools such as e-mail and discussion forums, facebook and blogs. On such uses they can be classified as very skilled. Very few were identified to have some experience with Learning Management Systems such as Moodle (classified as weak skilled). Although the great majority had no experience in online courses, it seemed that they could handle such a mode of instruction without problems. All the informants were from the participating institutions, so there was not any indication concerning the profile of non-EU prospective students, especially from less economically developed countries. This was of particular importance, as due to the lack of good networking infrastructures this might affect the access and use of the online tools integrated into the Virtual Learning Environments. Validation methods were used before, during and after developing a VLMS. The first was carried out during the user needs analysis, which provided the source for identifying the main categories for presenting the use and functionality of the VLMS as a platform for organising and delivering the Master Degree programme. Validation during the process was concerned with the specifications in designing the Virtual Learning Management System. Finally, validation after assessment was applied after designing the VLMS. All these processes were carried out using the design team as testers. Involvement of prospective students was applied during the integration of course syllabi and course modules into the VLMS. The validation process was also expert-based involving four experts of which the three of them were involved in the design of the VLMS. The final validation was applied when the content modules were integrated, involving a number of prospective users, experts and prospective e-tutors.

Curriculum Analysis, Design, and Development

Curriculum analysis and design was guided through a model that departs from Habermas (1971) theory on knowledge-constitutive interests and communicative theories based on three human interests. A technical interest is an interest to control, predict and manage the environment deeply-rooted on modes of inquiry, curriculum and pedagogy in the "empirical-analytic" or positivist sciences. Practical interest rooted in the interpretive-hermeneutic sciences is an interest of mutual and self-understanding. Finally, the emancipatory interest is an interest of critical self-reflection, leading to empowerment, praxis and emancipation. The praxis model of curriculum theory and practice makes an explicit commitment to true emancipatory potential of merging technology and knowledge. Each of the three knowledge-constitutive interests is expressed in a particular scientific or scholarly paradigm, and directly or indirectly affects curriculum design, perceived education roles, teaching methods and pedagogy (Table 1).

In a transmissive virtual classroom model, driven by a technical interest, the focus is on linear pedagogies and pre-specified curriculum goals and content, which may lead both educators and learners to overlook the dynamic learning online interactions enabled by ICTs. The e-tutor is placed at the center of the learning process and is expected to transmit to students a prescribed subject (curriculum as product). Virtual lecturing and demonstration are the primary instructional methods. It is a virtual classroom in which students are to approach their learning working independently. They are also expected to neglect their personal interests, experiences and needs. The perceived role of education is that of replication of existing social, cultural and economic structures.

In contrast, the transactive virtual classroom driven by a practical interest focuses on flexibility, negotiation, active sharing and learning (curriculum as process). In other words, the questions of "what to teach?," "what to learn?" and even "how to learn?" are not predetermined but are open to intersubjective treatment. In this sense, the curriculum "is not simply a set of plans to be implemented, but rather is constituted through an active process in which planning, acting and evaluating are all reciprocally related and integrated into the process" (Grundy 1987, p. 115). In such a virtual model of online education, the e-tutor's role is one of a guide whose primary task lies in motivating and engaging students in the learning process. To accomplish this, the e-tutor creates problem-solving opportunities for students that are often based upon student experience. The perceived role of education as Sterling (2001) sets out what could/should be:

Table 1. Habermas' three knowledge interests and their effects

Type of Knowledge/ Human Interest	Perceived Role of Education	Virtual Teaching & Learning	Curriculum Perspectives	Pedagogy
Technical (prediction; causality; instrumentality)	Reproduction/ socialization/ Vocationalization roles	Transmissive Lecturing	Product oriented	Behavioral/ cognitive Linear
Practical (Understanding; intersubjective)	Liberal role	Transactive	Process oriented	Constructivism
Emancipatory (critical reflection)	Tranformative role	Transformative	Praxis oriented	Critical pedagogy

- To replicate society, culture and citizenship – a socialisation function
- To train for employment – a vocational function
- To develop the individual – a liberal humanist function
- To encourage a fairer society and a better world – a transformative function

The last role is seen by Sterling (2001) as central to achieve a more sustainable educational system. The first two roles mirror ideologies adherent to curriculum as product, the third, curriculum as process and the fourth curriculum as praxis. In a transformative virtual classroom model, driven by emancipatory interest the focus is placed on empowerment, critical consciousness and reflection (praxis). Students can transform their frames of reference through critical reflection of their assumed assumptions concerning interpretations, beliefs and habits of mind or points of view (e.g. Mezirow, 2000).

A critical decision was made for the structure of the course curriculum. It was structured by merging vertical and horizontal modes of course curriculum design. The vertical integration represented continuity and structured the content in sequence from core to more complex and special. This provided a clear picture to learning, as students are able to understand how the knowledge is developed and organised in the course. In addition, it can help students to learn concepts and principles, to develop cognitive skills, and to develop attitudes and values that will be important to them in the working world. The horizontal integration brings about more breadth of curricular contents of different disciplinary areas and knowledge domains. Horizontally, the courses were built conceptually upon five main themes: Sustainability Theory; Educational Research; ESD pedagogy; Educational Policy and Leadership; and Information & Communication Technology (ICT). The emphases were on: 1) cross-disciplinary content by merging concepts from the main themes and 2) multidisciplinary by integrating multiple teaching methods and learning technologies. In this context, ICTs and ESD form the integrating "backbone" across all course contents.

The study programme consists of three main parts: 1) core or foundational courses; 2) optional courses and 3) written thesis. In the first part, students are required to take the required courses which are designed to help them develop a broad understanding of ICT- enabled education for sustainable development as well as to prepare them for more specialized courses. In the second part, students can choose three out of six courses taking into consideration their personal, academic and specialized orientations. This part of the programme gives students the opportunity to learn skills in areas such as reorienting formal education for sustainability, curriculum design for sustainability education, educational planning and policy for sustainability as well as climate change education. The third part is devoted to the implementation and completion of the M.Sc. Thesis (Table 2).

The Master's programme consists of 12 courses, of which nine must be taken and is designed for a period of four semesters (two years) for full time students and a maximum of 10 semesters (five years) for part-time students offered through a virtual learning environment platform. The academic year is divided into two semesters of 14 weeks each, giving in total 60 ECTS credits (the European Credit Transfer System). These ECTS credits cover the relative amount of study related performances in which the workload of one year amounts to 1500 real hours. This workload includes synchronous and/or asynchronous modes of communication, case studies, self-study, assignments etc. To graduate, the student must acquire 120 ECTS credits: 90 credits (9 courses) from course work, and 30 credits from thesis work (Table 3).

Table 2. Course allocation to semesters

		Type	Course Code/Title	ECTS		Type	Course Code/Title	ECTS
Year 1	Semester 1	R	Sustainability Theory, Systems Thinking and Transformative Change	10	Semester 2	R	Appropriate Technology, Active Citizenship and Education for Sustainable Development	10
		R	Approaches to Educational Research for Sustainable Development	10		R	Action Research and Participatory Action Research for Sustainable Development	10
		R	ESD Pedagogy and ICT	10		R	ICT, Instructional/Learning Design and Education for Sustainable Development	10
				30				30
Year 2	Semester 3	E	Elective 1		Semester 4	R	Dissertation	30
		E	Elective 2	10				
		E	Elective 3	10				
				30				30
Part-time study is also possible. The modular nature of the courses and the mode of delivery (e-learning) allow the students to complete the program at their own pace. It is expected that part time students will complete the programme up to five years.								

Infrastructure and Instructional Design Analysis

The International MSc on ICT in ESD programme is designed to be delivered online through the V-campus Virtual Learning Environment (VLE) which is a Moodle-based Learning Management System. The content or curriculum integrates reflective and problem-based learning and provides tools and services that allow for virtual collaboration and virtual peer mentoring amongst learners and e-tutors. Student-to-instructor and student-to-student communication is highly interactive. Learners engage in a series of online activities within the thematic area of ICT in ESD through the use of various virtual learning tools. Students are presented with opportunities for self-paced learning, group learning, reflective learning and participatory learning.

Each course of the proposed MSc has been allocated 10 ECTS credits, which equates to 250 hours of work for the learner. Learner activities and workload have been divided into four areas: (1) directed learning online, (2) dynamic interaction online, (3) assessment, and (4) independent learning. Given that courses are 14 weeks long, then an average learner will be engaged in '*Directed Learning Online'*, which involves reviewing pre-designed online content by themselves for up to 2.5 hours per week; in '*Dynamic Interaction Online'* or 'live' interaction with their peers and/or the e-tutor for about 1.5 hour per week; and in preparation for '*Assessment*' by themselves or with peers for 7 hours per week. An additional 7 hours per week is allowed for '*Independent Learning'* or reading beyond the course. The Table 4 below provides detailed information on students' workload in a course of the programme.

Each course such as the one on "Intercultural Communication and Sustainable Leadership" consists of a number of modules. More specifically, this course consists of seven modules:

1. Sustainability challenges and leadership responses.
2. Sustainable leadership for transformative change.
3. Sustainable leadership and intercultural communication.

*Table 3. List of programme courses**

A/A	Course Type	Course Code	Course Title	Teaching Hours per Week**			ECTS
				Directed Learning Online	Dynamic Interaction Online	Laboratory	
1	Required		Sustainability Theory, Systems Thinking and Transformative Change	2.5	1.5	0	10
2	Required		Approaches to Educational Research for Sustainable Development	2.5	1.5	0	10
3	Required		ESD Pedagogy and ICT	2.5	1.5	0	10
4	Required		Appropriate Technology, Active Citizenship and Education for Sustainable Development	2.5	1.5	0	10
5	Required		Action Research and Participatory Action Research for Sustainable Development	2.5	1.5	0	10
6	Required		ICT, Instructional/Learning Design and Education for Sustainable Development	2.5	1.5	0	10
7	Elective		Educational Policy and Planning for Sustainable Schooling	2.5	1.5	0	10
8	Elective		ICT, Climate Change and Geo-spatial Tools	2.5	1.5	0	10
9	Elective		Bio-cultural Diversity and Education for Sustainable Development	2.5	1.5	0	10
10	Elective		e-Learning, Virtual Worlds and Education for Sustainable Development	2.5	1.5	0	10
11	Elective		Teaching to Live Sustainably through the Earth Charter	2.5	1.5	0	10
12	Elective		Intercultural Communication and Sustainable Leadership	2.5	1.5	0	10
13	Required		Thesis	N/A	N/A	0	30

*Due to the fact the course will be delivered online, the table has been amended to refer to teaching hours instead of teaching periods.
**All modules are fully compliant with the ECTS system and include 250 hours of coursework for students.
Duration (in min.) of a teaching period: N/A
Teaching Weeks per semester: 14

4. Distributed leadership as sustainable leadership.
5. Social entrepreneurship as sustainable leadership.
6. Transformational leadership as sustainable leadership.
7. Developing and implementing a sustainable leadership plan enabled by ICTs.

These modules are divided into units, and their content and related activities will reflect on how sustainable leadership should be driven in the three sectors (governance, civil society and private sector) across different cultures. Learning content was based on an instructional design process for curriculum development which involved a systematic approach to establishing modules goals and objectives, selecting educational strategies to meet goals and objectives, the use of media and technology as well as designing learning activities for the online environment. Course structure process was based on breaking-up the course content into manageable and meaningful modules and units, taking into consideration the weekly topics designed in the course syllabus. An example of a course modules template is provided in Figure 2.

Table 4. ECTS credit workload breakdown for a Course

N	Workload Type	Description	Examples	Workload
1	Directed Learning Online	Time required by learners to read or to view 'static' (permanent) online content. This content introduces the key concepts and contexts for the course; maximum time allowable 2.5 hours per week.	Time required to read or view: (a) reading/ s[1], (b) online presentations[2] (in Powerpoint or Pressie), (c) podcasts[3], (d) online Videos[4], (e) online Simulations	36 hours (or approx. 2.5 hrs each week for 14 weeks)
2	Dynamic Online Interaction	Time required by learners to interact, either individually or in groups, in online activities, that do **NOT** directly contribute to assessment. The online interaction gives learners opportunities to discuss, critique and query their understanding of the key concepts introduced each week.	Time required to interact in: (a) tutorial with peers/ e-Tutor in online classroom or forums, (b) discussion groups in Moodle, (c) microblogs (i.e. Twitter), (d) social networking (i.e. Facebook).	20 hours (or approx. 1.5 hr each week for 14 weeks)
3	Assessment	Time required by learners to complete the continuous assessments and/ or summative assessments.	1. Time required to interact in online activities that directly contribute to the completion of assessment, such as: (a) group interaction in Wikis, (b) weekly submissions of Online reflective journals/ diaries, (c) individual submission of weekly blogs/ video blogs 2. Time required to complete off-line activities that directly contribute to completion of assignment such as completion of essays/ multimedia artefacts/ e-portfolios etc. 3. Time required to interact within a teaching, clinical, community or other work-based setting that is necessary in the completion of participatory multimedia artefacts, e-portfolio or other forms of assessment.	100 hours (or approx. 7 hrs each week for 14 weeks)
4	Independent Learning	Time required by learners to read additional publications within the field (engagement in reading beyond the core content outlined in 1 above).	Time required by learners to search for and read (or view) additional resources: (a) Journal articles/ key texts in specific discipline, (b) online videos/ Podcasts of theorists within the field.	100 hours (or approx. 7 hrs each week for 14 weeks)
			TOTAL	**256 Hours**

[1] Note: Core Readings (such as a journal article or book chapter) will take no longer than 60-90 minutes to read each week.
[2] Note: Powerpoint Presentations will be recorded with a voice-over. Presentations will be no longer than 15 minutes in length; longer presentations will be split into two or three parts.
[3] Note: Podcasts will each be 3-5 minutes in length.
[4] Note: Online Videos will each be no longer than 15 minutes in length.

The units for the course "Intercultural Communication and Sustainable Leadership" have been developed as follows:

Unit 1.1: The "business as usual case" for responding to sustainability
Unit 1.2: Leadership perspectives, practices and types
Unit 1.3: Deconstructing dominant concepts of leadership
Unit 1.4: Alternative conceptions of leadership
Unit 2.1: Change and transformation: The leadership mission
Unit 2.2: The hallmarks of sustainable leadership
Unit 2.3: Viewing the world through a sustainable leadership lens

Figure 2. The template of the course modules design

	Explanation
Module 2	

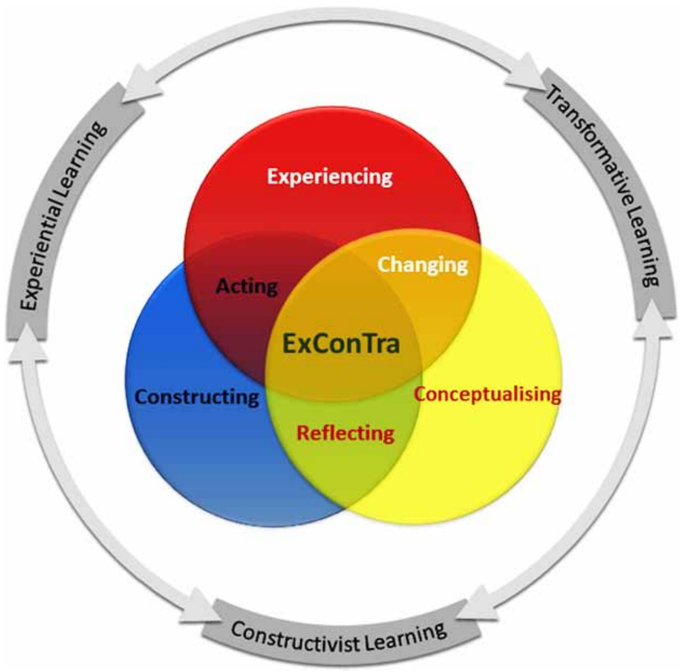
Unit 2.4: Competences and models of sustainable leadership
Unit 3.1: The communication competence frame in sustainable leadership
Unit 3.2: Sustainable leadership in different cultures
Unit 3.3: Behaviour changes via marketing, role models, champions, education and advocacy
Unit 4.1: Distributed leadership: the why, what, and how
Unit 4.2: The impact of distributed leadership on sustainability
Unit 4.3: Implementing a distributed leadership perspective
Unit 5.1: Social entrepreneurial leadership: the why, what, and how
Unit 5.2: The impact of social entrepreneurial leadership on sustainability
Unit 5.3: Implementing a social entrepreneurial leadership perspective
Unit 6.1: Social transformational leadership: the why, what, and how
Unit 6.2: The impact of transformational leadership on sustainability
Unit 6.3: Implementing a transformational leadership perspective
Unit 7.1: Models for developing a strategic plan for sustainability
Unit 7.2: Strategic planning and implementation as a system approach

In trying to bring together the main principles of the constructivist and tranformative learning theories, assuming that experiential learning is crossing the two (e.g. Kolb & Kolb, 2005; Makrakis & Kostoulas-Makrakis, 2012b) have conceptualised a construct abbreviated as ExConTra, that corresponds to Experiential learning, Constructivist learning and Transformative learning depicted in Figure 3. This model provided guidance for developing and implementing the M.Sc. course curriculum.

Examples of how ExConTra learning paradigm can be implemented in online course design include the following:

- Using Web-based authoring tools and scripting languages to develop learner-centred and self-instructional modules.
- Providing Web-based resources using hypermedia and multimedia links to support

Figure 3. The ExConTra learning model



students' experiential, constructivist and transformative learning activities.

- Providing links to online databases, experts, virtual laboratories and knowledge repositories dealing with sustainable development issues.
- Providing Web-based distributed learning activities that allow learners to brainstorm ideas, negotiate, reflect, peer critique, debate, construct knowledge, and develop action competences.
- Providing synchronous and asynchronous communication tools that help the knowledge construction process through self/group critical reflection.
- Incorporating learning principles and strategies that include active learning, collaboration, and cooperation.
- Engaging students in the application of knowledge through: inquiry-based learning; problem-based learning; higher order thinking; inter/cross disciplinary learning; and authentic learning.

CHALLENGES PAST AND PRESENT FACING THE ORGANIZATION

It is essential that universities make considerable innovative efforts: 1) to improve their own "sustainability profile" by developing "learning environments" conducive to ESD supported by ICTs and 2) to develop new open and flexible postgraduate programmes that respond to the increased needs of those who want to play a key role in moving forward the issue of ESD. Recalling the challenges identified in the process of design and development of the international joint M.Sc. program presented in an earlier section in this chapter, the following assumptions can be made. First, this program is expected to contribute in tackling the identified lack of or inadequately trained professionals in the field of ESD and sustainable leadership. Second, as the course curriculum design was driven by interdisciplinary approaches, the courses developed merge concepts from various other subjects and in this way it contributes to narrowing the disciplinary boundaries. This has also affected the teaching and learning methods adopted to support learning that articulates with, and critically engages with new forms of knowledge, inter-disciplinarity, hands-on and minds-on learning. However, the challenge to bring all the initial partner universities into the exploitation of the joint M.Sc. program faced various obstacles that mostly relate to internal administrative concerns. Indeed, one of the main concerns revealed in a EUA (2006) review on Joint Masters degrees was the often weak anchoring of Joint Masters programs within their network institutions. This is explained by the fact that such programmes are mostly initiated and linked to committed individuals, while the institution as an "outsider" has often provided difficulties to endorse the programme. Another important finding in that review was the incompatibility of the national mandate of Quality Assurance agencies with the transnational nature of joint degrees.

However, an increasing number of institutions endorse joint degrees bringing together institutions and scholars from all continents working and developing various pedagogical and technological tools that will be adapted in different social, economic and cultural contexts. Offering a joint programme and academic degree should have significant advantages both for partner institutions, the European Higher education Area and internationally. It promotes virtual student and staff mobility which add value to a new dimension of mobility that is envisaged to give rise to scientific and pedagogical development, intercultural understanding and knowledge sharing. It brings together a European and international team of researchers, experts and educators. Another challenge concerned the qualifications of the staff to be involved in teaching courses offered online. Indeed, with a growing number of courses and degrees offered through the Internet, there is a considerable interest in preparing instructors to teach online.

SOLUTIONS AND RECOMMENDATIONS

In terms of solutions, a major effort was exerted in systematizing and organizing curricular contents in order to ensure that the curricular components were aligned with the learning activities, the curriculum objectives and competencies to promote. There were also efforts to bring consensus with respect to various organisational and administrative issues, including coordination of courses and the re-allocation of students from the coordinating institution to the partner institutions where they are attending courses.

Beyond the academic qualifications, staff either as course coordinators or e-tutors must be certified and/or having experience in teaching online. In particular, course coordinators should preferably come from the partners' institutions and be highly qualified in the field of course coordinating and be experienced in online teaching methodologies. To tackle the issue of qualified staff an e-tutors toolkit was developed that was implemented with the initial participation of more than 35 prospective e-tutors nominated by the partner universities. The e-tutors toolkit is a self-development manual based on ICTeESD materials/tools and Open Education Resources supported by facilitators to assist participants make the shift from face-to-face forms of teaching and learning to online learning. The e-tutors' training carried out in a period of three months online reflected the philosophy adopted in the ICT-enabled ESD program. In particular, the e-tutors' course focused closely to the competencies required by participants in their roles as online tutors. An integrated approach was employed that merged theoretical and practical aspects of online pedagogy taught via individual and group tasks. At the end, 60 percent of those

Figure 4. The e-tutors Toolkit

started succeeded to fulfil the requirements for certification. (see Figure 4)

FUTURE DIRECTIONS INCLUDING RESEARCH

As the M.Sc. programme will be implemented in the coming academic year, it remains to see the international response to this new subject offered in post-graduate education. Higher Education has been identified globally as a critical agent in furthering sustainable development in society; particularly towards strengthening transformative practices associated with intercultural communication and sustainable development leadership. It is important to integrate and further elaborate the tryptich of transformational-transactional-transmissive leadership across cultures and in line with the three Habermasian human interests. As the notion of leadership and its dimensions in the context of sustainability has been raised more recently, it seems interesting to address the contribution of leadership activities to sustainable development in a more comprehensive way. It would be of particular interest to assess business as usual (technical) and distributed leadership (practical) approaches to leadership, and their critical approaches– perhaps what can be term transformational approaches- a typology in line with Habermasian critical theory.

CONCLUSION

The international joint M.Sc. programme and its courses are delivered online through the V-campus Virtual Learning Environment (VLE) which is a Moodle-based Learning Management System (http://iceeed.v-campusedc.uoc.gr). The content/curriculum integrates reflective/problem-based learning and provides tools and services that allow for virtual collaboration and virtual peer mentoring amongst learners and e-tutors. Student-to-instructor and student-to-student communication is highly interactive. Learners engage in a series of online activities within the thematic area of ICT-enabled ESD through the use of various virtual learning tools and open education resources. Students are presented with opportunities for self-paced learning, group learning, reflective learning and participatory learning.

Using a participatory curriculum development approach ensures that all the groups and individuals who have a real interest in the program are actively involved in some way in the project during various stages. In this way, prospective students, instructional designers, content experts, critical readers and prospective e-tutors were involved in the course curriculum development. Through this approach contextualised teaching and learning becomes more feasible, as these people bring their experiences that are context dependent, and contribute with different forms and sources of expertise. Such an approach is also conducive to the 'process' and 'praxis' curriculum approach that is characterized by the recognition of empowerment, emancipation, knowledge construction, meaning making, and negotiation. The program of study (curriculum) developed focused on a learning paradigm that merges three theories of learning, namely: experiential learning, constructivist learning and transformative learning (ExConTra). This learning paradigm allows both learners and facilitators to take advantage of ICT tools and the World Wide Web on making connections and making meaning in the learning process. The ExConTra learning paradigm is also based on an interdisciplinary approach addressing the four pillars (environment, society, culture and economy) of sustainable development and makes use of an online course design methodology that uses four phases: needs analysis, curriculum design, development and formative evaluation. The programme makes use of ICTs in three ways: a) providing opportunities to target groups for reflective practice; b) using open source ICT tools and ESD-related learning objects available in the Web; and c) using ICTs to develop interactive, interdisciplinary and cross-disciplinary ESD learning activities.

Chapter 75
Improve Collaboration Skills Using Cyber-Enabled Learning Environment

Yujian Fu
Alabama A&M University, USA

ABSTRACT

Collaborative learning methods have been widely applied in online learning environments to increase the effectiveness of the STEM programs. However, simply grouping students and assigning them projects and homework does not guarantee that they will get effective learning outcomes and improve their collaboration skills. This chapter shows that students can improve their learning outcomes and non-technical skills (e.g. collaboration and communication skills) through the cyber-enabled learning environment. The data was collected mainly from software engineering and object-oriented design classes of both graduates and undergraduates. The authors apply a blended version of education techniques by taking advantage of online environment and classroom teaching. Based on the study, the authors show that students can improve their collaboration and communication skills as well as other learning outcomes through the blended version of learning environment.

INTRODUCTION

Collaborative learning methods have been widely applied in online learning environment to increase the effectiveness of STEM programs. However, purely application of the online learning environment may not work well for students to improve both technical and non-technical skills (such as collaboration and communication skills). First, simply grouping students and assigning projects and homework do not guarantee that they will get effective learning outcome. Second, existing instructor-centered learning environment in many online courses does not offer sufficient scope for students to work collaboratively. To prepare students for their future information technology careers, it is necessary to foster collaboration and communication skills that are needed in the industry.

In addition, it is widely noticed that software engineering professionals working in industry are generally unsatisfied with the level of real-world

DOI: 10.4018/978-1-4666-8246-7.ch075

preparedness possessed by recent university graduates entering the workforce (Cummings & Betsy, 2007; Callahan & Pedigo, 2002). Their frustration is understandable – in order for these graduates to be productive in an industrial setting, organizations that hire them must supplement their university education with extensive on-the-job training and preparation that provide them with the skills and knowledge they lack (Conn, 2002). The root of the problem seems to lie in the way software engineering is typically taught: theories and concepts are presented in a series of lectures, and students are required to complete a small, toy project in an attempt to put this newfound knowledge into practice. Thus, the student graduated has little demonstrated capability in solving problems of large scale systems or dealing with critical issues and is lack of adequate skills of collaboration, communication in the teamwork environment.

Having observed similar situations in Alabama A&M University in the past years, we have developed a framework using the blackboard learning system to encourage students to engage with online activities. This framework is intentionally designed to support student online activity so that they could actively interact with teaching content and collaborate and communicate with others. Another feature of this methodology is the development of reusable learning objects. A learning object is a learning unit that contains an objective, a learning activity and assessment, which represent a set of reusable and self-contained digital resources. The baseline data collection in software engineering course at Alabama A&M University started in Spring 2008. The framework has been applied and validated since 2010 and has been improved in 2012. The measurement of the method was done in several ways – a pre-test and post-semester survey, a student interview, an alumni survey. The data was analyzed based on the satisfaction rate regarding to the course objectives. The survey questions are grouped by four categories regarding to the course objectives and program goals: background (including majors, minors, working experience), programming skills, project topics (information systems, embedded systems, security, government project, industrial project), and difficulty level (ranking from 1 to 5). In this chapter, we focus our analysis of the questions that are related to collaboration and communication skills.

In order to provide a meaningful context for students to learn and work collaboratively, this study is conducted in the software engineering and object oriented programming courses. We updated the current technology-based learning strategy as the background theory that supports this framework. Technology based teaching strategies utilizing Internet technology could provide remarkable educational opportunities for the 21st century learners. In our study, the upgraded technology-based learning (UTBL) includes communication devices other than just Internet based teaching. The communication devices used in this framework are robots, mobile devices (such as Android tablets, iPhone), social media and networks. These devices can be used for demo, example and project implementation, group discussion and peer communication during and after classroom time. Through synthesizing cyber enabled learning environment with technology-based teaching, the framework can dramatically motivate students and improve their learning outcomes.

THE DEFINITION OF COLLABORATION AND TEAMWORK

One of the main characteristics of our graduates considered by industry is the capability to work in team. Teamwork is not a new term and has been aware of by educators and employers for decades. In our study, we have considered the following capabilities and skills in teamwork: collaboration, communication, self-management, and leadership. Due to the limited space, in this chapter, we will focus on describing two skills – collaboration and communication.

In the dictionary, *collaboration* is defined as a style of working with each other to conduct a task and to achieve shared goals. In Wikipedia, it is defined as "a recursive process where two or more people or organizations work together to realize the shared goals." In education, *collaboration* means "two or more co-equal individual voluntarily brings their knowledge and experience together by interacting toward a common goal in the best interest of students for the betterment of their education success. Students achieve team building and communication skills meeting many curricular standards. Students have the ability to practice real-world communication experiences. Students gain leadership through collaboration and empowers peer to peer learning" (Wikipedia).

It is widely accepted that graduates should not only be technically competent but also be skilled in communication and teamwork. They should have certain social skills and be equipped with global awareness, self-managed and self-learning skills, which are important in their life time. However it is much less clear how these "soft skills" could be best developed in their undergraduate and even graduate studies. McLoughlin and Luca (2000) suggested that pedagogy needs to change from transmissive, didactic approaches to transformative, student-centered approaches. In this study, the framework that is developed focuses on student's role instead of instructor's role. To achieve this goal, we implemented the framework in a context of project-based unit involving individual and group study format under an online learning environment.

This framework improves student achievement in two folds. First, it is a technology driven strategy. The power of digital instruction has been widely noticed. For example, digital instruction supports personalized learning through various vehicles. As instructions are required to align with college- and career-ready standards, digital learning can become increasingly student-centered and market-driven, individually tailored to provide the variety of paths and paces students need to achieve ambitious goals, and informed by adaptable technology and assessment data. The potential of digital instruction is enormous: In its next generation, it will likely become increasingly emotionally connective for students and provide them and their teachers with enhanced diagnostics and instructional roadmaps. These improvements will enable the consistent instructional differentiation and high standards for students' learning advancement that today typifies only the most excellent teachers and schools, while saving teachers' time so they could engage in other aspects of teaching.

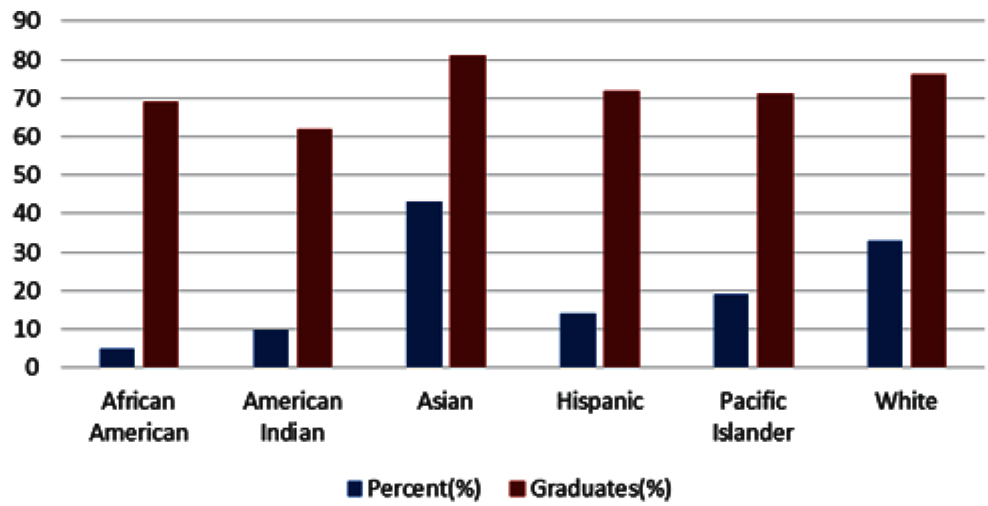
The second benefit comes in the integrated approach's capacity to let institutions reach more students with excellent teachers who could ensure that students achieve their ambitious, personally fulfilling goals. This level of growth is essential for closing achievement gaps and helping average students leap ahead to higher standards. In the future, when technology makes the basics of learning available to all students globally, complex aspects of excellent teaching will become even more important: guiding students' selection of ambitious and engaging work, fostering student motivation, addressing the myriad learning barriers, and cultivating higher-order thinking.

BACKGROUND AND RATIONALE

Our country's success in the increasingly technology-driven and globalized economy will depend on how we prepare today's learners and students for tomorrow's job markets, for personal fulfillment and for civic engagement in an interconnected world.

For this reason, it is important to set clear, ambitious goals for institutional education to generate high student growth and develop students' higher-order thinking skills. But goals alone will not set our students up for success. Students' learning needs are shaped by family supports and personal characteristics, such as past achieve-

Figure 1. Graduation and college-ready rates: Data retrieved from ACT (2013)



ment, self-motivation, learning preferences, time management, and emotional stability. Even the best one-size-fits-all teaching methods do not meet the diverse needs that teachers encounter in classrooms. Our nation's educational challenge, then, is to maintain ambitious goals for all while helping each student find a path to meet them.

There is a moral and economic imperative to change the way instructors teach and students learn in the United States. All children graduated from high school should be ready for college and career, possessing the deeper learning skills they need in order to compete in today's rapidly changing economy. These skills include not only mastery of core content but also the ability to think critically, solve complex problems, work collaboratively, communicate effectively, be self-directed, and incorporate feedback (Alliance, 2011). Too many low-income students are still not developing the skills they need to succeed in modern life. Nationwide, only 72 percent of students earn a high school diploma. In the class of 2011, more than 1 million students dropped out before graduation. Among minority students, only 58 percent of Hispanic, 57 percent of African American, and 54 percent of American Indian and Alaska Native students in the United States graduate with a regular diploma, compared to 77 percent of white students and 83 percent of Asian Americans (Editorial, 2010).

Similarly, in Figure 1, data collected from ACT (2013) explicitly shows that college readiness rates for most of races are around or lower than 50%. Specifically, African-American students have 5% college-readiness rate and 68% graduate rate. These numbers are astonishing to today's educators, especially for college education. It is highly desired for our researcher to find an efficient way to motivate students and encourage them to pursue and accomplish the college study and to prepare for the future workforce.

The rise of digital learning presents a unique opportunity to meet the aforementioned challenge. It has unprecedented potential to help underprepared students achieve ambitious goals by enabling personalized paths to learning success. Even in the digital age, the vast majority of U.S. students will probably attend brick-and-mortar schools. Many parents need to have their children stay at school while they work, because our schools act as connective fabric for the communities. As a result, most students will experience digital learning as part of blended learning: a combination of digital instruction and in-person teaching.

In this chapter, we explain how the proposed learning framework can succeed by bringing interesting projects with the best available technology to students under the guidance of instructor, motivating students and improving their collaboration and communication skills. When the instructors use the high quality project-based learning under cyber enabled learning environment, they can realize the great potential to dramatically improve student learning outcomes and non-technology skills.

DIMENSIONS OF TEAMWORK EDUCATION

This section discusses the key dimensions of teamwork education in the development, implementation and assessment of project-based, team-oriented framework in the cyber enabled learning environment. The dimensions of teamwork education include project-based learning (PBL), technology based learning (TBL), participants, content, project, and assessment.

Project Based Learning (PBL)

The selected study is carried on in two courses: software engineering and object oriented programming and design. Software engineering class aims at conveying the fundamental concepts, design methodologies, validation and verification techniques for a software life cycle. Object oriented programming and design class aims at the advanced level of object oriented programming concepts, such as inheritance, method call, polymorphism and their relationship with design concepts. Both classes are concept oriented with a lot of design notations; students need to master and apply the design approaches to the real world applications. At the very beginning year of teaching both classes at Alabama A&M University, we found two dilemmas from students:

- **Group A:** Students struggle with the understanding of concepts. This situation will hinder the students to have further capability of applying the concepts.
- **Group B:** Students have hard time to implement and apply the design methodology to concrete problems, which usually are just some toy systems with minimum design. This situation happens to those students who even have a better understanding of notations and concepts and have demonstrated a very good grade in the quizzes and homework.

The author collected some student data with the consideration of age and background to make sure these students are at the similar level. The data includes the courses students registered, their current GPA, their final course grade, their background knowledge regarding to the software engineering, and the grades of some related courses. After analyzing the data, we have the following findings:

- In Group A, about 11% students maintain good GPA (above 3.0) and good grade in other courses;
- In Group B about 69% students maintain good GPA (above 3.0) and good grade in other courses.

To understand this situation, a simple survey with interview is offered to students in both classes. From student response, we have the following findings:

- Students are more interested in some new applications and realistic problems instead of the questions given in the classes.
- Students are looking for the connection between the design concepts and applications but have hard time to link them together.

Some student comments are "I feel it is interesting, but after a while, it is getting boring…," and "there are too many concepts, and I don't have time to study… I do not have notes…" From the data analysis and survey findings, we identified a key issue for student learning–motivation. Students need to be interested in the topic. Regarding to this issues, we started implementing project-based learning with cyber enabled environment in both classes to help students keep up and maintain their interests.

Project-based learning could improve and broaden the competence of computer science students. Through this learning approach, students could

- Understand the role of theoretical and real-world discipline-specific knowledge in a multi-disciplinary, collaborative, and project-centered platform;
- Recognize the relationship of the software engineering concepts to the enterprise context and the key role of this context in computer science decision;
- Learn how to work in a team manner and lead multiple roles to design, develop, manage, and maintain high quality large scale software intensive systems, effectively and economically.

Technology Based Learning Strategy

Internet is the most fluent technology in this century. It is one of the most popular applications in human history. Of course, several other technologies such as networking and protocol (WAN and LAN techniques), memory, Web page design, are the key supporting technologies for the development and booming of Internet. Besides Internet, mobile applications and robotics are all the latest emerging technology that currently flew into the classroom. Accordingly, today's technology based teaching is not limited to Internet. There are other new emerging technologies that have effects on the traditional teaching strategies. The definition of technology based learning (TBL) is changing from installing digital technology in classroom teaching to ad hoc multiple techniques and to a new cyber learning environment. One of the key ideas behind the new era of teaching is to motivate students and improve the teaching qualities of educators and instructors.

First and foremost, our technology-based learning as the education strategy includes various electronic technologies, such as Internet, intranets, satellite broadcasts, audio and video tape, video and audio conferencing, Internet conferencing, chat rooms, e-bulletin boards, Webcasts, computer-based instruction, and CD-ROM (ASTD, 2005). TBL also encompasses related terms, such as online learning and Web-based technology that occur via the Internet, and computer-based learning that is restricted to learning using computers. E-learning is synonymous with TBL and has largely replaced it in scholarship and industry as an alternative term. Therefore, this chapter uses these terms interchangeably. Distance learning sometimes is also referred as technology-delivered learning. However, it is worth to note that there is a difference between distance learning and TBL. TBL includes methodologies where instructors and learners are in the same room and instruction is computer-based, but there is no *distance* involved. On the other hand, TBL is more narrowly defined in that it does not include text-based learning and courses are conducted via written correspondence that would be covered by either distance learning or technology-delivered learning. Furthermore, technology-enhanced learning describes a methodology in which technology plays a subordinate role and serves to enrich a traditional face-to-face classroom. On earth, both TBL and digital learning aim at improving students' learning outcome through increasing their motivation and curiosity.

Participant

The students are required to self-group themselves based on willingness without instructor's interaction at the beginning of class. For the senior design class, this could be an easy process, because students are mostly acquainted with each other. Students have the choices to select one term project from the list given in the Blackboard. At the same time, students of the same group that have no interest in any of project in the list can propose a new project by their own. The proposal will be evaluated and approved by the instructor. By doing so, we want to ensure that the project students are working on is the one that are most interesting to them.

Content

The ultimate goal of the framework is to improve students' learning outcome through cyber enable learning environment with the context of project based learning and team oriented platform. Through this type of learning, students will understand

- The fundamental concepts and design methodologies regarding to the context;
- How to apply design methodologies on real world systems;
- How information technology and collaboration skills could support their teamwork and help them achieve the learning outcomes.

Project

The projects students working on are multi-disciplinary that require knowledge of software system design, programming language, system configuration and/or computer science theories. The students in a group are required to analyze the project, assign tasks and roles to team members, and setup timelines of the project. The project requires necessary documentations that contain design models, analysis, implementation, and validation through the software life cycle. During the project period, students will learn

- Software design and development methodologies and object oriented programming skills;
- Problem solving skills for both predictable issues and unexpected issues;
- Communication skills through face-to-face teamwork and multimedia social networking in the cyber learning environment;
- Collaboration skills through team meeting and multimedia social networking in the cyber learning environment;
- Using online materials provided in Internet and Blackboard learning systems;
- Leadership skills through collaborations and management.

Assessment

It is hard to evaluate non-technical skills using traditional assessment methods. In addition, teamwork in a digital learning environment is posing new assessment challenges. Current studies of university courses in which technology is a key component tend to focus on the technology part – specifically, on media selection and media effects. Neither of these issues addresses the individual learner (Walther, 1997). In software engineering education, project-based learning under the cyber enabled learning environment focus on determining how to design and build assessment within the perspective of cognitive and situated learning theory. If traditional assessment methods have limited value in evaluating a collaborative, multidisciplinary, geographically distributed team of students, they are ineffective in the measuring of student knowledge and collaboration skills.

All the aforementioned dimensions encompass various concepts, theories, strategies, and tactics that pertain to the motivation to learn

(Keller, 1987a). They represent the major idea of the integration approach, which is the synthesis of PBL, TBL with the cyber enabled learning environment. They also provide the basis for the feature of this integration approach, which is the systematic design process that assists instructors in creating motivational tactics that match student characteristics and needs (Keller, 1987b).

As mentioned before, it is important for educators to prepare our college graduates with more skills than just knowledge. The proposed framework carries the following features – self-organized, simple, and easy-to-implement. In the following sections, we will discuss our framework upon the above dimensions.

DESIGN FRAMEWORK PROCESS

The overall idea of the framework is to increase student satisfaction to the content of both technology and nontechnology outcomes. Satisfaction of learners refers to the positive feelings about one's accomplishments and learning experiences. It means that students receive recognition and evidence of success that support their intrinsic feelings of satisfaction and they believe they have been treated fairly. This study is to show that students will demonstrate a high level of satisfaction through the learning process using this framework.

The framework contains a six-phase design process for the development of motivational systems in the work and learning settings (Figure 2). The first two phases – design & development and distribution – are the foundation of the tower, which include the basic components of the process and indicate the further evaluation and overall analysis of the process. These two phases produce information about the status quo and provide the basis for analyzing gaps and their causes. The middle two phases are engagement and implementation. These two phases focus on students' understanding of instructions. In other words, students should know what they need to do through the process of engagement. Implementation is the key component to apply the approach. This is the step to observe results. The last two phases are analysis and evaluation. Based on previous phases, the project's data is collected and analyzed, learning objectives are assessed, and future improvement is identified. These steps are more critical and analytical for the purpose of selecting solutions that best fit time, resources, and other constraining factors in the situation.

Design and Development

In our approach, it is best to work on specifically defined problems. Design starts with problem domain analysis. The domain will specify scope of the application. The content concentration will specify the concept inventory and related problems. At this initial phase, students should note the key concepts to learn and understand the problems to solve. The time frame and assignments are also necessary to be clarified in this phase. The development of problems and design of teaching strategies are well defined in this phase. The use of cyber enabled learning environment should also be clarified. Often, people will try to deal with other issues of how to improve motivation by adopting a global solution, such as a new set of curriculum materials or an entirely new approach to teaching. This approach may be successful for a while, but after the novelty wears off, the old motivational problems tend to re-emerge.

After choosing a specific problem to solve, the primary task in the design & development phase is to brainstorm possible solutions. At this point, all potential solutions should be listed without considering their presumed feasibility. The goal, as in any brainstorming process, is to produce as many ideas as possible. In addition, students need to define the ideal solution without constraints. Each problem and ideal solution

Figure 2. The design process

might be constructed from several specific suggestions utilizing the facilities of cyber enabled learning environment in various degrees. We also encourage students and instructors to use mobile and digital facilities if they have. At this stage, we do not worry about cost, organizational policies, or other constraints that might inhibit the discovery of an ideal solution.

Once the most feasible tactics are chosen and documented properly, the instructor needs to help students integrate them into the framework as an organizational structure with proper grading points. This step upgrades the previous step from encouraging restraintless envision to an ideal and possible solution. At this time, a best possible solution needs to be created by combining ideas and applying several selection criteria pertaining to expense, policy, acceptability, and proportionality.

Distribution

Design & Development provide support for all further activities. At this stage, learners will have a nutrition foundation that is full of digital and technical surroundings. The distributions mainly focus on the dissemination of the bipartite documents to all learners through two ways – digital and traditional ways. Digital distribution involves all possible synchronous and asynchronous methods, broadcasting style and multimedia style vehicles. For example, to distribute documents that do not need feedback, broadcast would be the most efficient way. To distribute documents that need to collect data, synchronous and asynchronous are necessary. In addition, in this phase, students can follow the document and employ the application. Other activities in this phase include documentation plan preparation, media development, developmental reviews, and implementation. As with any effective system development activity, it is important to have motivational tactics and strategies well integrated with other components. For example, tactics such as case studies at the beginning of a class can be a total waste of time if they do not meet specific needs of the audience.

These design & development and distribution phases are comprehensive, interleaving and time-consuming due to two limitations. First, it requires the motivational designer to have quite a bit of knowledge of the different factors represented by the three categories. Second, in reality, various situations where serious challenges always occur and unexpected cases appear frequently are hardly to handle. In some cases, it is highly critical to maximize the effectiveness and performance of a lesson or a course. The full six-phase can be the best approach to follow. But, in many situations these conditions are not met. With teachers or instructional designers, who have little or no formal knowledge of motivational concepts and principles, it would be good to have a simpler model. Such a model has been created and tested in several cyber-related learning environments.

Engagement

It is a challenge issue to engage students in the systematic design process. Two main factors are necessary to consider – level of students and degree of engagement. Engagement activities are varied with the class. Freshmen may be dramatically different from junior and seniors. Sophomore may be different from freshmen. Engagement is a typical issue and highly relevant to student motivations. Degree of engagement is related with the class, student motivation, and learning approach. In this framework, we use this as a separate phase because of our experience. We found that engagement of students can increase student curiosity and motivation, which will results in high quality of product. Otherwise, it is completely opposite. There are two difficulties in determining the degree of engagement since it is a fully subjective topic. First, there is no baseline for engagement. It is hard to find the symptom of non-engagement at the initial or on-going stage of the project. Second, there is no measurement for the degree of engagement. Right now, no research work has been published to evaluate and assess student engagement in an activity.

There are two main styles of integrations – classroom integration and cyber enabled engagement. In the digital learning era, how to engage students through current advanced technology remains a challenge. During lectures, materials and supplements are available online, shifting instructor-centered learning to student-centered learning. This requires students to be more reliable and sustainable during the learning process. Thus the engagement is between students and computers, students and learning environment. The question raised is how to design a cyber enabled learning environment that is interactive with and interesting to students. Many researchers have done some work to solve this problem. For example, WReSTT (Clarke et al., 2012) and its updated version WReSTT-CyLE are Web-based repository and cyber enabled learning environment to teach software testing.

"Students want to engage in technology, especially if it's socially based, whether it's with teachers, students, other schools, or experts around the world," says Julie Evans, CEO of Project Tomorrow. "But they want social interaction that is school-oriented, about serious topics and not the personal 'dramas' of Facebook." (Susan, 2011)

Implementation

After any systematic design process, the framework needs to be applied by the learning systems that involve students and instructors with multiple roles and responsibilities. In this case, motivation is resolved in the framework and combined with the instructors' development design from the beginning phase. Students are able to identify system characteristics and/or gaps which lead to their objectives. In this phase, there are two difficulties in determining the degree and nature of a problem. From our experience, the first and typical problem is that the applications students have chosen could not be realized, at least from the learner's side; and in some cases, the instructor is not aware of this situation. From the pedagogy point of view this is due to the insufficient documents of instruction. From the psychology point of view, this is due to the immature of learners' psycho-experience. The pre-seeing of this situation and tactically handling it is important for the framework to continue function. Students who do not have and cannot get the skills required to perform satisfactorily will not be able to learn quickly thus cannot succeed to a satisfactory degree. They will develop low expectations for success, or even feelings of helplessness, and will be demotivated as evidenced by lowered levels of effort and performance.

Analysis

As with any systematic approach, the integration framework needs a process of analysis by collecting necessary data and information regarding to the project goal and objectives. The purpose of analysis lies in two aspects – for the assessment of the project, and for the resolution of the problems occurred during project execution.

There are several scientific methods that can be used to analyze the data once the project is evaluated. Without analysis, the evaluation results are meaningless. Usually, analysis is a little difficult and ad hoc. The method changes with the problems and domains. In addition, the problem lies in the nature of the project and is relevant to the project characteristics. Objectively, it is the data that carries the efficiency of content, domain, class, time, numbers of population, and ethnicity. Subjectively, it is varied with motivation, curiosity, maturity, performance and other psychology factors. It follows a curvilinear relationship with objective factors and subjective factors. As objective factors increase, subjective factors decrease to an optimal point. When one analyzes the data of a problem, it is desirable to include as many factors as possible in order to reduce the bias.

Comparable problems occur in other categories of the framework and require tactics to modify learner results into a more productive range. In conducting motivational analysis, it is important to identify the nature of technology gaps in these terms, and to realize that the problems might be different by subgroups or by individuals. It is also important to identify the presence of any positive factors.

Evaluation

Any approach needs a scientific evaluation to assess the results and effectiveness. There are two main groups of evaluation – summative and formative evaluation. This proposed framework has been used by the author in the past five years. A large amount of data has been collected including statistical data, surveys and assessment results. In the following section, we will present some non-technology activities that are implemented at Alabama A&M University using the proposed framework.

APPLICATION OF FRAMEWORK

Our application of the framework is implemented in the software engineering and object-oriented programming classes of Alabama A&M University starting 2008. The application of the framework does not have a comprehensive tool that includes all cyber learning environments. Thus, we utilized the existing available resources: Blackboard + Email + Yahoo Messenger/Google Talk. The Blackboard is updated with several integrated features to facilitate instructors to use. For example, students are automatically enrolled in the courses that are assigned to the instructor in the Blackboard. The Blackboard has included assessment process for quizzes, exam, homework and reports. In addition, it can realize social communications by using grouping and creating discussion forum.

The only weak point for Blackboard is video conference. Blackboard could support multimedia, such as video and audio. However, if the file size is getting bigger, it will be hard for learners to download the video. In addition, you cannot create videos using tools provided in Blackboard. The instructor has to find other ways to solve this problem. In the followings, we will describe how to implement the framework in our courses.

Step 1: Design and Development

Our approach was implemented in two classes at both undergraduate and graduate level. For the design & development, the difference is mainly in the courses, but not in the classification of students. The Software engineering courses offered at Alabama A&M University mainly focuses on software process, project management, design model, quality assurance. Object oriented programming & design course is offered to both undergraduates and graduates. The author implemented this approach at the graduate level course, which covers the principles of object oriented design and programming languages, object oriented design methodology (UML), advanced modeling and analysis.

We chose the application problems in the software intensive systems that include four categories – information systems (GUI design), mobile systems (iPhone, Android apps), robotics systems, and networking. In each category, one to three projects is carefully designed with short description of user requirement. The covered knowledge units are slightly different from category to category. The common knowledge for students is programming, software design and development. The projects aim at improving students' problem solving skills through sequence steps in a software development cycle.

Step 2: Distribution

All projects are distributed in three levels of documents – problem domain selection, project topics regarding to categories, and self-designed projects. The students are instructed to read through the documents in a top-down way from first level to third level. For each problem domain, a short description and sample project areas are listed. Several links of the existing student class projects are referred. After the first level of reading, students get the main ideas of each domain and they could connect them with their own background knowledge and skills. The tasks given to students are to evaluate themselves and find out their interest. After the first level of reading, most students can go through level 2 and select proper topics. To increase collaboration, the topic selection process must be done through a group discussion. The final topic will be reported online by the group coordinator.

Through this study, we found that the group discussion reduced a lot of collaboration problems that might occur later. Certainly, it cannot reduce all of problems, but we found that it completely reduce the problems regarding to project topics and domain areas, which we had in the first year.

Step 3: Engagement

Engagement, defined as "student-faculty interaction, peer-to-peer collaboration and active learning..." (Chen, Gonyea, & Kuh, 2008), has been positively related to the quality of the learning experience. Social learning or learning as part of a group is an important way to help students gain experience in collaboration and develop important skills of critical thinking, self-reflection, and co-construction of knowledge. Email has been a popular way for people to communicate. It has been used as one of the main communication techniques in author's classes. In this study, we adopted three ways of engagement: discussion board, social media, and announcement.

To encourage a broad discussion with participants and learners, the instructor created groups of discussion forums in Blackboard. Students can share information with colleagues and discuss some questions regarding to class contents and projects. The data collected from 2009 does not show a fully involvement of discussion forum in Blackboard. Since 2010, firmware is utilized and added to the class teaching. Several robotics and high level robots are bought and designed for student project. Some group members had problems with software and environment setup. Through the board discussion, some successful stories were shared to help other students with similar problems.

Collaboration can be done in a specified group or within or outside of the class. Cyber enabled learning environment encourages students to share various types of information with their classmates, increases peer discussion and communication, and helps students in learning of the context in multiple aspects. Synchronous discussion is a key method of student collaboration and communication because of its efficiency in sharing ideas. Students are also encouraged to use social media to communicate, such as Google Talk, Yahoo Messenger, Twitter and Facebook. We expect students to provide the log file and archive for the class record.

Announcement provides a unidirectional way of communication. Only instructor is allowed to create and send announcements to students through Blackboard. The information passed will motivate students to participate in activities and get involved in projects. For example, once a local industrial conference info was passed to students and some students attended the conference, participated in discussions, presented their projects, and built network connections. One student came from the conference commented "it is a great experience… He (she talked to a person in the conference) is very interested in my project …" Because of this experience, she had been diligently working on her robot project during the remaining four weeks and solved one hard problem by herself.

Table 1. Number of students participated in the study

	Control Group	Study Group	Number of Projects
Spring 2008	9	10	2
Fall 2008		9	3
Spring 2009	10	11	3
Fall 2009		10	3
Spring 2010	14	11	3
Fall 2010		10	3
Spring 2011	17	12	4
Fall 2011		7	3
Spring 2012	13	9	3
Fall 2012		5	2
Spring 2013	21		0

Step 4: Implementation

As discussed in the first step, this approach was implemented in two classes at both undergraduate and graduate level. Software engineering topics are offered for both graduates and undergraduates and object oriented programming & design is offer for graduates. During the implementation, to reduce the bias, we implemented one class as study group and another class as control group. The class content, homework, quizzes and exams are all the same. The participated student number is shown in Table 1.

Among all projects, robotics projects are the most favorite and were selected by 87% of students. Other projects are purely information system design.

Step 5: Analysis and Assessment

Data was gathered from two classes from Spring 2008 to Spring 2013. The collaborative work has

Table 2. Distribution of student grading results (control group)

Questions	A	B	C	Below C
Definition	75%	15%	10%	0%
Programming concepts	55%	35%	5%	5%
Design concepts	25%	50%	15%	10%
Programming skills	30%	40%	20%	10%
UML syntax	30%	50%	15%	5%
Design model	28%	44%	23%	5%
Result analysis	12%	21%	43%	24%

demonstrated more efficient learning results in the concepts, such as UML diagrams, system design model, and analysis. However, it shows that students of study group are not good at understanding and mastering of definitions and terminologies. In contrast, the control group students are good at definition and concepts, but lack of the skills of system design. Students learning outcome is evaluated by homework, exams, and quizzes. We categorize the questions into several groups: definition, programming concepts, design concepts, programming skills, UML syntax, design model, and result analysis. The grading results of control group and study group are listed in Table 2 and Table 3, respectively

There is a slight difference in student grades between the control group and study group (shown in Tables 2 & 3). A factor could be that study group implemented collaborative team project and students in this group are evaluated by the items that do not reflect their behavior and contributions to the project. Regarding to this issue, we increased assessment for the collaboration evaluation.

Collaboration skills are evaluated based on learning outcomes and some other non-score features. The group projects were assigned a cumulative grade based on the collaborative group process (a series of documents), the final product (group paper, project demo and project presentation), and peer-and-self evaluations of the collaborative work.

Through the above assessment process of collaborative work, we saw some differences among students in the same project. After carefully analyzing the data and assessment results, we found that students who are involved in the group project but do not contribute well will have poor peer evaluations and perform poorly in the exam and quizzes. These groups of students are the main factor to lower the outcome of project-based learning.

Table 3. Distribution of student grading results (study group)

Questions	A	B	C	Below C
Definition	85%	10%	5%	0%
Programming concepts	45%	35%	10%	10%
Design concepts	45%	35%	15%	5%
Programming skills	35%	35%	20%	10%
UML syntax	35%	50%	10%	5%
Design model	35%	45%	15%	5%
Result analysis	21%	32%	43%	4%

In the end of semester survey, many students responded that they like this class. For example, one student commented "the project (robot) is very interesting, and it really helps me to understand programming concepts and software design model." Regarding to group project and collaboration skills, some students commented "Group project is fun, I like group discussion and meetings, a lot of ideas come (during meeting). … Leading a group is not simple but tricky, (I) like work with people."

Cyber enable learning environment provides a suitable platform for students to learn and study class content in digital style. Some student commented that "online discussion is good and helpful for our project. Information in blackboard is really helpful and saves us a lot of time." A student who disliked team work at the beginning of the semester commented "online learning helps the teamwork, with this I can get a lot of my work done (faster), now, I like work in a team."

Discussion

In Alabama A&M University, we have implemented this framework and found that cyber enabled learning environment combined with project based learning strategy can improve student collaboration skills, motivate student as well as improve their learning outcomes. Our data may be different from other institutions. However, because of the large amount of minority students (African American students) in Alabama A&M University, we believe our survey results are representatives of other institutions that have similar student populations.

Students were excited for every step of their improvement. In 2009, some students gave the following evaluations for this class: "I like the videos (in the blackboard), it helps me a lot, esp. when I missed some lectures." and "(Materials in blackboard) is helpful for our group discussion, whenever we have some issues, just go to the blackboard, either send message to discussion forum, or send an email to professor, or look at lectures and supplements. It helps our collaboration and team work."

In 2011, robotics project is introduced in this framework. More than 50% students chose the robot project. Before the end of the semester, two students have told the instructor that they got internships from a company after they presented their robot project during the interview. Some students commented "(using blackboard for class teaching is) very good for me, the project (robot) is very interesting, love it!"

CONCLUSION

It is the digital era now and it is the time to adopt cyber enabled learning environment technique to support student learning and improve student skills. Cyber enabled learning environment not only supports gaining knowledge, but is also an important platform for improving the non-technological skills. The world is shifting from hard copy documents to electronic versions. It is the time to make our classroom green – paperless. However, without well thought-out design of classes and context, skill training cannot be achieved in a passive electronic platform. A well design of teaching framework can widely extend the benefit of cyber enabled learning environment. Project-based learning framework presented in this chapter provides a solid foundation for student-centered learning. In addition, this framework can be easily extend to other courses in STEM areas especially for the courses that require more credit hours, because this framework focuses on improving student learning and student engagement in a collaborative, crosscutting process and can be implemented effectively.

KEY TERMS AND DEFINITIONS

Cyber Enabled Learning: A teaching environment, where information technology is used as the infrastructure.

Collaboration Skills: Skills that require players to work together to achieve certain goals.

Project Based Learning: A learning approach that involves students to solve a complicated problem.

STEM Programs: Science, Technology, engineering, and mathematics programs.

Technology Based Learning Strategy: Using technology to assist students to achieve their learning objectives.

Chapter 76
Artful Learning:
Holistic Curriculum Development for Mind, Body, Heart, and Spirit

Randee Lipson Lawrence
National Louis University, USA

ABSTRACT

This chapter begins with a critique of traditional models of curriculum development as overly rigid, fragmented, and disconnected from the true nature of the learner. Holistic learning is described as engaging the mind, body, heart, and spirit of the learner in relationship to the learning environment. Holistic learning is earth-centered, participatory, and inclusive of the cultural context of the learners. These various learning domains and their relationship to curriculum are discussed, including the application of learning from indigenous communities. Several examples of arts-based and creative learning activities are offered along with holistic ways of developing learning objectives and assessing learning.

INTRODUCTION

The typical curriculum in adult and higher education is based on the acquisition of knowledge, primarily fostering the rational or analytic abilities of the learners to the exclusion of other ways of knowing. Traditional schooling privileges propositional or cognitive epistemologies. We are taught by listening to lectures, reading scholarly writing and engaging in rational discourse. While these ways of learning are valid, they draw on only a part of our human potential, as we are whole, thinking, feeling and sensing human beings. To be fully human, according to Greene (1995) requires accessing our imagination and seeing beyond what is, to what could be. The role of imagination "is to awaken, to disclose the ordinarily unseen, unheard and unexpected." (p. 28). The intent of this chapter is to describe a holistic, spiritual and imaginal approach to developing curriculum that engages all of who we are.

Integrating affective, somatic and spiritual dimensions along with the cognitive into our curriculum through artistic expression (visual art, drama, music, storytelling and poetry) engages multiple intelligences (Gardner, 2006) freeing learners to fully participate in the learning process and to explore meaningful relationships between the subject and the self, and the self with others, which often leads to lasting change or transforma-

DOI: 10.4018/978-1-4666-8246-7.ch076

tion. Students who are willing to risk stepping out of their comfort zone to embrace these alternative ways of learning tend to discover that they have reawakened an aspect themselves that was there all along but had been dormant. Intentionally inviting creative expression into class activities and assignments makes space for holistic learning to occur.

In 1926, Eduard Lindeman wrote: "*Education is life* – not merely preparation for an unknown kind of future living. Consequently all static concepts of education which relegate the learning process to the period of youth are abandoned. The whole of life is learning, therefore education can have no endings." (Lindeman, 1926, pp. 4-5). If as Lindeman passionately declared, the whole of life is learning, then we must consider the ways in which learning occurs as an integrated whole.

Understanding Holistic Education

Miller (2007) sees holistic education as incorporating the principles of balance, inclusion and connection. It maintains a balance of individual and collaborative learning, the content and pedagogy of the curriculum, factual knowledge and imagination, rational and intuitive knowledge and quantitative and qualitative assessment. Miller is not suggesting we get rid of our traditional rational curriculum but that we balance it with the intuitive, the embodied and the spiritual. Inclusion does not see the curriculum as something that is given to the student but rather something that is created with the learner. Connection focuses on relationships between the different ways of knowing, relationships between the learner and the larger community, relationships with the earth and the learner's relationship with his or her soul. Miller (2006, p. 3) also describes "timeless learning" which is much more than learning facts. It is a type of deep powerful learning that touches our soul. It is embodied, connected, integrated, soulful, participatory, mysterious and unexplainable. Miller believes this learning can also be transformative as it "can lead to profound change in the individual" (p. 8)

In 1990, eighty international holistic educators gathered at a conference in Chicago and drafted the statement *Education 2000: A Holistic Perspective*. This vision statement was created as a critique of public education at that time. Holistic education was seen as including the following components and purposes (Flake, 1993):

- Deepening relationships to self, family, community, the planet and the cosmos.
- Balancing learning for economic gain with learning necessary for responsible action.
- Respecting individuality by eliminating uniform assessment.
- Focusing on experiential learning.
- Honoring multiple ways of knowing including the spiritual domain.
- De-emphasizing the role of teacher as technician
- Promoting freedom of inquiry and expression
- Teaching for participatory democracy and social justice.
- Educating for global citizenship.
- Promoting earth literacy. Recognizing the interdependence of all beings.
- Nourishing the health of the spirit

According to Collister (2010, p. 52) "Holistic education is not a curriculum or methodology. It is a set of assumptions that recognizes that humans seek meaning, not just facts or skills." Holistic learning activities are embodied, experiential and make use of aesthetic activities that engage the senses.

Heron (1996, p. 104) advances a "holistic epistemology" which incorporates four kinds of knowledge including experiential (through direct encounter), presentational (intuitive and imaginal), propositional (theoretical and conceptual) and practical. "In my view those modes of knowing are grounded in each other and emerge from each other." (Heron, 1996, p. 105)

Myles Horton (1990) believed that education was by nature holistic but our formal educational systems with their emphasis on discrete disciplines has compartmentalized it..

Instead of thinking that you put the pieces together that will add up to a whole, I think you have to start with the premise that they're already all together and you try to keep them from destroying life by segmenting it, overorganizing it and dehumanizing it. (p. 130)

The Case for a Holistic Curriculum

It's a beautiful sunny day in May and I'm sitting on the lawn behind my high school eating lunch. In just three weeks I will be graduating. I don't realize how much my life is about to change. Today, however am I completely focused in the moment. I walk away from the noisy crowd of students to sit alone by a creek. I lie down on the grass and close my eyes, feeling the warmth of the sun and the gentle breezes. I listen to the flow of the stream and the chirping of birds. Suddenly I experience a sensation of connectedness to everything around me, a complete feeling of wellbeing, what some would call a spiritual moment. I write:

The world is mine today
the sun, the sky, the river,
and the trees
all a part of me. . . .
i listen to the chirping of the birds
and the flowing of the river and i
no longer need words to feel complete.

This sensation of wholeness, of being one with the universe was completely paradoxical to what I'd experienced in school with its focus on discrete disciplines, mandated curricula, standardized and non-standardized testing. Even today, educational programs are out of balance. Miller (2006, 2007) in his argument for a holistic way of learning describes the fragmentation of our society. We pollute our earth because we see ourselves as separate from nature. Busy lifestyles often cut us off from community and even our own families. We disconnect our heads from our hearts and our bodies. Our educational systems are fragmented by dividing knowledge into discreet units and lesson plans. We overemphasize the rational and cognitive and focus primarily on mastering technique to the exclusion of the imaginal, intuitive and communal forms of knowing. Miller (2007) calls for a holistic curriculum that "attempts to bring education into alignment with the fundamental realities of nature." (p. 3) He goes on to say that "the rational mind, which focuses on analysis, cannot fully grasp the wholeness of existence." (p. 20) He advocates the cultivation of our intuitive sensibilities to support a more holistic way of learning.

Holistic education can also be viewed from a critical perspective. Traditional education sometimes perpetuates racism and sexism, what Freire (1970) called the *Pedagogy of the Oppressed*. Holistic models which honor multiple voices and multiple cultural perspectives can disrupt this cycle.

Cranton (2008) believes that our traditional systems of education with their institutional requirements for behavioral objectives, structured syllabi and grading policies "stifles, oppresses and suffocates the soul." (p. 127) She does turn this rather depressing imagery around as she believes the "soul is resilient" (p. 125) and meaningful teaching can emerge through the inclusion of creative and arts-based teaching practices.

Collister (2010) dedicates his book *A Journey in Search of Wholeness and Meaning*, to those who have been marginalized by mainstream education. He uses the word marginalization to include anyone who has experienced a disconnection with the dominant ideology and advocates for an earth-based, holistic education that is practiced in Eastern and indigenous cultural traditions. Slattery (2006) also noted that "Curriculum development programs in the past have tended to ignore issues of race, gender and ethnicity because curriculum was seen as something that reflected an objectively knowable structure that existed 'out there' ….simply waiting to be discovered and memorized." (p. 178) He advocates a post-modern philosophy of curriculum development that disrupts master narratives of "disembodied learning, homogenized curriculum guides and disconnected objective goals" (p. 178). There is no such thing as a one size fits all curriculum. Even a curriculum that uses creative educational strategies cannot be assumed to fit all learners at all times. The cultural orientation of the learners as well as their individual learning styles needs to be considered.

A Sense of Place and Space

A holistic curriculum does not only address what type of education takes place; it is also concerned with the where of education. The physical environment plays a large role in the learning experience. Interior buildings without natural light or with harsh fluorescent lighting can have a negative effect on the quality of the experience. Extremes of hot or cold distract the learners and often diminish their experience.

Furthermore, holistic education considers the individual in relationship to the world in which he or she resides. Therefore, as Collister, (2010, p. 75) proclaims:

It is impossible to separate the person from their environment . . . One cannot consider the individual without considering the relationships that the individual has with the earth. and ultimately the affect those relationships have on the balance and harmony of the universe.

Holistic learning includes a variety of learning activities including those that are experiential and embodied. Therefore it is important to have moveable furniture and enough space to move chairs and tables into a variety of configurations or even off to the side into order to allow room for movement. Some holistic learning activities work best outside of the classroom where field trips or observing nature serve to enhance the learning process. The growing emphasis on service learning, for example places learners outside of the classroom walls and into the community.

Circle Consciousness

In the 1980's I taught non-credit courses for a local community college. The classes were held evenings in various high school buildings. The first thing I did was to rearrange the chairs from rows facing a teacher's desk at the front to the room to a circle. I wanted my classes to be interactive and it is difficult for students to talk to one another if they are looking at the backs of each other's heads.

Christina Baldwin (1994) teaches a form of circle consciousness as a way of creating shared community in organizations. The circle is actually an ancient tradition where people gathered around fires to keep warm and share stories. Baldwin's circles are founded upon shared leadership, mutual responsibility and spirituality. In holistic classrooms students often sit in a circle. The teacher sits around the circle with the students, not separate or apart. Sherman Stanage, one of my doctoral professors for example would sit on the circle, but always off center to the front of the room to signify that he was a co-learner with the students. The idea of the circle goes beyond the physical arrangement of furniture however. In a circle, all voices are equally valid and everyone contributes to the whole. The space inside the circle is open for shared knowledge to enter and change form as all ideas are considered. In my classes, I introduce Baldwin's concept of "holding up the rim" (1994, p. 234). We hold up the rim for each other when someone is struggling or needs help from the community.

Regnier (1992) cited in Slattery (2006, p. 218) discussed applications for the "sacred circle" which come from Canadian Native traditions. The sacred circle includes the "physical, emotional, spiritual, and intellectual dimensions of personal development. Through this model, students are encouraged to view themselves as a whole person who can become self-determining."

Brookfield (1995) uses the example of the circle as a taken for granted assumption of good democratic teaching. Critically reflecting on this assumption, we realize that the circle can actually be oppressive for some students who feel vulnerable and exposed in this environment. It may also go against certain cultural norms for some students such as the Columbian student I had, who was self-conscious about his English. He was quite uncomfortable in the circle. Similarly, Palmer (2004) cautions that some circles may be unsafe. A community of trust needs to be established where disclosure is invited but not mandated.

While physical circles may not be appropriate for all groups at all times, the circle, as a symbol of a perfect whole with no beginning and no end can be seen as a metaphor for a holistic curriculum that honors the whole person and all learning domains. A holistic curriculum is neither fixed nor static. It is a dynamic space that is open to change and being changed over and over again. The participants in the circle are responsible for the well being of the whole.

Synergistic Wholes

A common understanding of the word "synergy" is the whole is greater than the sum of its parts. Therefore it seems quite paradoxical to break up a discussion of holistic educational curriculum into its component parts. This text however is linear so in order to understand the parts, this section will discuss each component individually. The reader is then invited to tear out each section and braid them together like strands of DNA. As cognitive learning is already privileged in mainstream education, it will not be the focus of this discussion. Spiritual, affective and embodied knowledge will be discussed as well as lessons from indigenous traditions from Native America and Africa which both include Earth-based dimensions.

Encountering the Sacred

It is my second trip to New Mexico and I am visiting a small shrine in the Sangre de Cristo Mountains northeast of Santa Fe called " El Santuario de Chimayo." The church, which was built in 1814, is known as "Lourdes of America" and is a place where people come for miracle healings. I am not Catholic and quite skeptical that the blind can suddenly have their sight restored or that people in wheelchairs leave on foot from this sacred place. Nonetheless, it is a beautiful old building in lovely rural mountain town so I decide to visit. I am immediately taken by the architecture of the beautiful adobe church and begin taking lots of photos. As soon as I enter the building however, I feel something shift in me. I feel a deep sense of reverence and awe. My whole body is tingling and I am close to tears. I did not expect to have this reaction. As I take in the candles and religious artifacts, I instinctively put my camera away. Though photos are allowed it feels wrong, almost sacrilegious. I walk slowly through the building continuing to feel this profound sense of awe. The depth of my response surprises me. I knew this was a sacred place but did not know it would feel sacred to me in this way.

The sacred or spirituality in teaching takes on many forms and is described in many ways including presence, inspiration, and awe, and is practiced through ritual, meditation and connections with the unconscious. O'Sullivan (2005, p. 76) declared, "If humans are going to survive on this planet, we need new connections to each other and to the natural world." He believes that we are in need of radical transformation and that education must be reformed into order for this to happen. He further explains that transformation comes about "as a result of depth encounters with the sacred." (p. 69)

Presence: Senge, Scharmer, Jaworski and Flowers (2004) discuss organizational change through presence or the art of being present. Influenced by the Buddhist concept of non-attachment they talk about "letting go and letting come" p. 98. In order for new energy and new learning to occur we must let go of our assumptions about what we think we know and surrender control of the outcome. This act of "presencing" (p. 104) opens a door to the mysterious and unexpected.

Kornelsen (2006) explored teaching with presence that he describes as a teacher allowing the students to see him or herself as an authentic human being by sharing personal stories and not hiding behind a façade. Being present is also about learning to live with ambiguity and chaos without the need to control it. In our classes, we use the mantra "trust the process." The students gradually accept that it is okay not to know everything at once and that if they practice patience the process will unfold. Hart (2000, p. 147) describes trust as "faith in nonrational postreflective ways of knowing" that "builds a bridge between the known and the unknown and then allows us to temporarily cross into this other world where inspiration exists." Kornelsen (2006) suggests that the teacher must also trust the process. In a holistic classroom this may mean letting go of a pre-planned agenda and being spontaneous in order to allow for more meaningful or inspirational learning to occur.

Inspiration: Hart (2000, p. 33) describes inspiration as "the poet in the process of learning, the prophet beholding the voice of God, the artist hearing the Muse, and the 'ordinary' person becoming only for a moment, extraordinary." Inspiration often comes unexpectedly where one feels a deep sense of connectedness to self and the transcendent other such as in my experience at the Sanctuaro. There is a heightened awareness or a shift in consciousness where one is more open to learning from unexpected sources. This is an embodied, spiritual experience that cannot adequately be expressed in words. According to Kates (2005, p. 201) "The soul speaks to us through intuition and inspiration." Hart (2000) suggests that inspiration may be an opening in our conscious awareness to knowledge that existed all along but had been hidden from us.

Holistic educators can engender inspirational learning by giving space and attention to what Tisdell (2003) called "shimmering moments" or ahas when the learners suddenly make connections to the content in deep and meaningful ways. According to Hart (2000, p. 49) "An inspiration comes to fruition when it is embodied." This often happens through creative and artistic process such as painting, poetry, or music that taps into extrarational ways of knowing. These inspirational learning activities are discussed in detail later in this chapter.

A.W.E: Educator and theologian Matthew Fox (2006) believes our educational systems are in crisis and even more so, our existence as a species is endangered. He advocates a form of pedagogy called Ancestral Wisdom Education or teaching with awe. "Awe opens the door in our souls, our hearts and minds. Awe is bigger than we are-like the sacred is bigger than we are and so it pulls us out of ourselves, it touches on transcendence." (p. 51) Fox believes there is much to learn from the wisdom of our ancestors, in particular their stories of overcoming racial, gender and religious oppression. He suggests that perhaps starting with developing curriculum is the wrong approach. We need to first get to know our learners, motivate them and then develop curriculum later. We need to reinvent education by teaching compassion, justice and sustainability and *refiring* passion and awe through ceremony, celebration and ritual.

The word "awesome" is so overused these days as to be rendered meaningless. What if we were to reclaim the word awesome and provide education that is truly awe inspiring and filled with mystery? "We can plan the curriculum, study the course, pursue the best teacher or the most suitable college, but often our most profound engagement with knowledge is mystery" (Snowber, 2005, p. 218)

Miller (2005) believes that the spiritual element must be attended to in a holistic curriculum. While progressive and humanistic approaches to education attempt to be holistic, according to Miller they lack this spiritual connection. In the same volume, Kates (2005) talks about creativity in the classroom as soul work. "We express our soul's knowing through aesthetic processes: writing, painting, music, dance and other expressive arts." (p. 198)

Spiritual Practices

It is possible to bring spiritual practices into the curriculum without labeling them as such. Tolliver and Tisdell (2006) suggest designing learning activities that foster openness and authenticity and engage multiple ways of knowing. Ritual and symbol are ways of engaging the spirit. This section looks at meditation, centering and dreamwork as ways to bring spirit into the holistic classroom.

Meditation: Some educators (Nozawa, 2005; Denton, 2005; Miller, 2000; Fox, 2006; Tisdell, 2000) use meditation in their classroom as a holistic and spiritual practice. Meditation is a way of slowing down and bringing awareness into the present moment. This practice can be especially useful with learners who come to class after a stressful day of work or family responsibilities. It helps them to settle in and gradually let go of the day's events. Nozawa (2005, p. 226) describes meditation as "a radical openness in which the individual does not try to control what is happening." "Through meditation we can bring more attention to the experience of our being interconnected with the whole." (p. 224) While meditation is traditionally seen as sitting quietly with eyes closed it can also be experienced through walking, body movement and through certain forms of artwork. One of my colleagues turns off the lights and has a candle burning when his students enter the classroom. He plays quiet flute music as they get settled and transition into the classroom environment. (C. Mealman, personal conversation, August 2013).

Centering: Lawrence and Dirkx (2010) described centering as a process of helping students leave behind the busyness of their lives and bring their focus into the classroom. Guided meditation or visualization is one form of centering. Other forms include looking at a piece of art, listening to music or reading poetry and then reflecting on the meaning it has for the students. Centering activities are holistic because they engage the learners' heart, body, mind and especially their spirit. They create a bridge between the learner and the learning activities so they are usually connected to the course content. For example, in a class on transformative learning I might bring in a film clip from Alice in Wonderland where Alice who has shrunk to three inches tall encounters the caterpillar. This leads to a discussion of the kinds of disorientation people often feel during transformative moments.

Centering is especially effective in online classes where learners don't have the benefit of a shared physical environment to help them focus. I post the images or poems and ask for their impressions. Sometime the students are asked to bring something to the centering process. For example they might post lyrics to a song or describe or post images of a particular artifact that is meaningful to them.

Dreamwork and the Unconscious: Holistic learning includes learning that comes from unexpected sources including our unconscious. Unconscious knowledge often surfaces in symbolic ways through our dreams. Dreamwork however is rarely considered in educational curriculums because dreams are not taken seriously or seen as meaningful or because teachers do not feel qualified to work with dreams (Miller, 2000). Dreams are a way of bringing our unconscious knowledge to the surface so we can take a look at it. As dreams are expressed in symbol and metaphor the knowledge is not immediately obvious. "As the mind explores the symbol it is lead to ideas that lie beyond the grasp of reason." (Jung, 1964, p. 4) Delving into the meaning of dreams in groups can help us look deeper into the meaning of messages embedded in our dreams and use them for learning.

In indigenous cultures dreams are considered an important source of knowledge that may not be able to be accessed in other ways. "Denying the spiritual and psychological importance of dreaming, and not honoring its place in the educative process, leads to stunting an elemental process of human learning." (Cajete, 1994, p. 144)

Lawrence (2009) described dreamwork as a process of working with our intuitive knowledge. In dreams there are no filters or judgments so ideas we might dismiss as silly or irrelevant in our waking life have a chance to break through. If we pay attention to this knowledge it can be a valuable source of learning. Furthermore, "When we take seriously the responsibility of developing a more conscious relationship with the unconscious dimensions of our being, we enter into a profoundly transformative, life-changing process." (Dirkx, 2006, p. 19)

Pedagogy of the Heart

Emotions exist. No matter how hard we try to keep the curriculum on a strictly intellectual level, students are continually having emotional reactions as they engage with the material. Dirkx (2006) believes that rather than ignore the emotions we can use them as an educational tool as emotions often "give voice to unconscious personal meaning of their learning experiences" (p. 16). He suggests that we can use the language of imagination to understand and work with our emotions. We can also design a curriculum that intentionally engages the affective domain.

A curriculum that is holistic engages the heart of the student. We tend to retain knowledge more readily when it taps into our emotions. Denton (2005) describes a "pedagogy of compassion." She often shares personal stories from her own experience to encourage students to open their hearts. She uses meditation, poetic symbolism, image and metaphor to help students to access their heart center.

As emotions are often difficult to express in words, a variety of artistic process can be woven into a curriculum to engage the affective domain. These processes which will be discussed later in this chapter, include the student as witness such as watching a dramatic performance or looking at artwork as well as experiential activities that involve the students in the creation of art such as painting, drawing, poetry writing or improvisational theatre.

Embodied Learning

As the holistic curriculum engages our heart and spirit, it also engages our body. In most of my formal school experience, my only awareness of my body came from the backaches I got from sitting all day in uncomfortable chairs. However, as Collister (2010, p. 83) reminds us:

"Holistic ways of knowing are embodied. They are rooted in the *experience of Doing*. *Doing* allows a sensual experience rather than an intellectual one." As previously discussed (Lawrence, 2012) bodies hold knowledge and wisdom that may not be part of our conscious awareness. Facilitating embodied activities in the classroom can be a way to surface this knowledge.

Holistic embodied learning often takes place outside of the classroom walls. In the first semester of our doctoral program we take our students through a one day course at Outdoor Wisconsin Leadership School (OWLS). The course consists of a series of physical challenges that promote team building for students who are part of a three year cohort group. In the morning, the activities focus on group decision making and cooperation such as getting adults of various ages, shapes and sizes through the holes of a giant spider web made of ropes without touching the rope. In the afternoon, we climb to a 40 foot high ropes course where there are a number of obstacles that challenge us physically, emotionally and mentally. While we are hooked into harnesses and supported by a belay team, for many, the experience seems fearful and overwhelming. Nevertheless, most complete the course, which culminates in a zip line to the ground. What results is an embodied experience that stays with the students throughout their program. Later when the thought of completing a dissertation seems daunting, they remember their ropes experience, or rather their body remembers it and they realize that this is just another obstacle and they have the wherewithal to do it. As in any embodied experience, the learning is in the processing and reflection on the experience. Howden (2012, p.50) suggests that groups who have participated in this shared experience answer three questions. "What?" (What occurred), "So What?" (What does it mean?) and "Now what?" (How can they connect what they learned to future situations).

Embodied learning can also enter the curriculum in the form of dance or theatre improvisation. Snowber (2012) believes that dance is our "birthright." (p. 53) Babies dance in the womb and small children dance spontaneously all of the time. We learn to suppress this natural urge as we are made to learn sitting down. In bringing dance into educational settings we recover "a visceral language that has the capacity to connect body, mind, heart and soul, and imaginative thinking." (p. 54)

Sometimes just getting up and moving can deepen our conceptual leaning. For example, in one class we were looking at the intersections of privilege and oppression. A racially and ethnically diverse group of students were asked to stand up and take a position on an invisible line across the room. The right side of the room represented privilege and the left side, oppression. As I called out different identifiers such as race, religion, gender, age, sexual orientation, education etc. people moved to different places along the line. Not only could we literally see that everyone was privileged and oppressed in different ways; we felt it in our bodies. A particularly poignant moment was when considering religious privilege and oppression; the one Muslim student in class took a position outside the door. A lively discussion followed that was not soon forgotten.

Lessons from Indigenous Traditions

While western education relies primarily on rational/cognitive ways of knowing, indigenous cultures are more naturally holistic as education is not seen as separate from life.

This section discusses holistic education from traditional African and Native American cultural perspectives.

Learning from Traditional African Education

According to Omolewa (2007) traditional African education "is based on practical common sense, on teachings and experience and is holistic- it cannot be compartmentalized and cannot be separated from the people who are involved in it because essentially it is a way of life." (p. 596) Omolewa goes on to describe how in a holistic learning approach "the learner is liberated from the authoritarianism of the teacher, the curriculum and the institution. The learner, through this approach is free to develop self-discipline, engage in self-directed learning and self-fulfillment." (p. 606) In African traditions, knowledge is connected to the culture of the people, religion, myths and folklore as well as practical experience and is stored in their memories and the memories of ancestors. Africans rely heavily on oral traditions and knowledge is often transmitted through stories, music dance, and ritual. (Omolewa, 2007) For example, many Africans believe in the power of myths to help them understand their history and culture and how things came into being. "Myths serve as a language depicting truths or realities for which history does not provide a full explanation." (p. 599)

The Afrocentric learning paradigm (Asante, 1987) has relevance here. Asante felt the need for teaching Africans in a way that was consistent with African identity and values in order to preserve a culture that was becoming increasingly marginalized. Botswana educator Ntseane (2011) believes that education should be "culturally sensitive" (p. 307) informed by the Afrocentric values of spirituality, a collective worldview and community empowerment. Spirituality for Africans includes the interconnectedness of all things including animals and ancestral spirits. A collective worldview means that knowledge is seen as residing in the community rather than the individual therefore community participation in decision making is crucial. Community empowerment refers to social change, which comes from knowledge sharing through "the myths, stories and proverbs that bind them and others as a people." (Ntseane, 2011, p. 318)

Curriculum developers and educators can learn a lot from these traditions. Omolewa (2007) stresses the importance of starting with "local knowledge" (p. 606) or what the students already know. Connecting new knowledge to current experiential knowledge has traditionally been a part of informal adult education (Horton, 1990) but less so in the formal classroom. Omolewa (2007) also advocates the use of indigenous stories as an educational strategy. Community elders may be invited in as storytellers and educators. Stories may be told in performative ways through music, and dance

Learning from Native Indian Traditions

Many of the characteristics of indigenous wisdom from Native Indians are similar to those of African traditions including interconnectedness with nature and the ancestors, the infusion of spirituality into everything, collectivism as a way of life, the use of ritual and ceremony and the transmission of knowledge through storytelling and the arts. (Collister, 2010; Orr, 2000; Cajete, 1994).

When I first discovered Cajete's (1994) inspirational book *Look to the Mountain: An Ecology of Indigenous Education* I thought he was speaking directly to me. Cajete critiques mainstream American education was being too focused on objectivity as the dominant paradigm to the exclusion of "relational reality" (p. 20) so ingrained in Indian cultures. He describes a holistic, relational educational process that includes "communal relationships, artistic and mythical dimensions, ritual and ceremony, sacred ecology, psychological and spiritual orientations" (p. 20) of an indigenous culture. According to Deloria (1999) this holistic way of learning cannot coexist with more linear forms of thinking.

The Lakota have a saying *Mitakuye Oyasin* that translates to "all my relations." A nature-centered philosophy underlies indigenous education, as living in harmony and balance with all of earth's creatures and nonliving entities is considered crucial. Learning takes place through careful observation of the plant and animal world and applying this knowledge to life. This Earth-centered view of education is echoed by Miller (2000) who recognizes the interdependence of all of life and the need for an ecologically conscious curriculum which focuses on environmental sustainability.

Cajete (1994) believes that education is about learning to become fully human. This is a spiritual journey. "Indigenous education at its innermost core is education about the life and nature of the spirit that moves us. Spirituality evolves from exploring and coming to know and experience the nature of the living energy moving in each of us." (p. 42) Learning also occurs through tapping into the wisdom of ancestors.

Art making is central to indigenous education. In indigenous tradition there is no separation between artists and non-artists as everyone engages in some form of the arts. Art is considered to be "an expression of life. . . Art is a way of seeing, of being, and of becoming." (Cajete, 1994, p.153) The arts are also a part of the ceremonies and rituals that characterize the native people such as the creation of artifacts or talisman used in religious ceremonies, however it is the process of creating art rather than the product that is important. Much learning occurs through the transformation of raw materials into something tangible. The origin of the materials is also important. For example, creating a traditional drum involves making a wooden frame and stretching an animal skin, usually a deer across the frame. The spirits of the animal and the tree that were sacrificed to make the drum are honored.

Cajete (1994) offers 23 axioms for indigenous learning, most of which are applicable to all learning situations. Among these are paying attention to the natural world, learning by doing (experiential learning), examining taken for granted assumptions, incorporating ritual and the arts into the teaching/learning environment and the use of storytelling. Orr (2000) adds educational strategies such as interviewing elders to learn traditional native wisdom, story circles and the use of the talking stick. I've used the talking stick in my classes at times when the topic was particularly sensitive or when certain individuals tended to be dominating class discussions. We sit in a circle without tables in front of us so it is not possible to be distracted by the temptation of wireless Internet. We pass around a stick, stone or some other object and only the person who holds the talking piece is allowed to speak. One chooses to speak or passes to the next person. The result is to slow down the conversation and learn to really listen. It often puts students in a reflective mode "allowing wisdom to approach rather than seeking answers to self-generated questions." (Deloria, 1999, p. 130) Clearly, holistic ways of learning are not new as indigenous cultures have been practicing them for centuries. Today's students at all levels can benefit by these holistic practices.

Creativity, Imagination, and the Mythopoetic

A holistic curriculum depends on creativity and imagination. In this section we look into the world of imagination as well as the mythopoetic.

Imagination

Willis (2008) drawing on Hillman, described the imaginal as imagining oneself in a new role "Imaginistic processes refers to way in which people become aware of images in their psych that carry great meaning for them"(Willis, 2008, p. 247)

Maxine Greene is well known for her work on the role of the arts and imagination in education. Her book *Releasing the Imagination* (1995) with chapter titles such as *Creating Possibilities*, *Imagination, Breakthroughs and the Unexpected, and Social Vision and the Dance of Life,* speaks to the power of creating change through imagining what could be different. According to Greene (p. 14) "teaching and learning are matters of breaking through barriers- of expectation, of boredom, of predefinition." For Greene, imagination is a way to move us from complacency to action, from hopelessness to hope. Through imagination on the part of both the teachers and learners, the curriculum can shift from one of cultural reproduction and knowledge transmission to one that is meaningful and relevant to the learners' needs. The arts are a powerful tool in an imaginative holistic curriculum. Harrell (2011) for example uses provocative images and poetry to explore social issues like racism and poverty with her students.

Mythopoesis

Curriculum theorist Macdonald (1981), drawing on philosopher Paul Ricouer's notion of *mythopoetic imagination* identified this as a third methodology useful in curriculum development along with science (technical /rational) and critical theory (emancipatory). Macdonald defined mytho-poetic imagination as "the use of insight, visualization and imagination . . . It is a search for meaning and a sense of unity and well-being." (p. 134) These ideas are further developed by Leonard and Willis and their colleagues in the book *Pedagogies of the Imagination* (2008). Davison (2008, p. 53) uses the term "productive confusion" suggesting that letting go of the science of predictability and certainty and living in the chaos opens us up to new create possibilities. "

To have wisdom in teaching is also to develop and to transfer an imaginal capacity for social and personal transformation. This is a mythopoetic capacity, a mobilization of mythic energy that sustains and communicates creative judgment, empathetic perception and moral inquiry (Davison, 2008, p. 59)

Dirkx (2008) stresses the value of the mythopoetic perspective in working with students who are often engaged in "self-formation" or "soul work." "Soul work represents a hard, emotional, messy, uncertain, ambiguous, and ill-structured process, with no pat strategies, methods of specific models to guide the way" (p. 66) Mythopoetic imagination offers an alternative to developing curriculum when the learning cannot be quantified or objectified which I would argue is most of our learning.

Prosser (2008) argues for a holistic or mythopoetic way of teaching from a critical theory perspective. Critical pedagogy, which disrupts dominant ideologies of how power is distributed and used, is often described through a political lens, as a rational process. Yet, these power struggles are often highly emotional and need to be addressed through affective and embodied processes. "If critical theory is to reinvigorate and redesign pedagogy, it must consider how the complex person can empower that reform through head, heart and hands." (p. 220)

So what would a mythopoetic curriculum look like? Willis (2008) suggests engaging in expressive processes that help learners to vicariously experience other ways of being through fiction and film and poetry. This is followed by a reflective process because "ruminative time is needed for the mythopoetic process to grow and deepen" (p. 261). The following sections elaborate on some of these expressive processes.

Artful Learning

By now you've discovered that the arts are an essential tool in a holistic curriculum. The arts engage our minds, our bodies, our hearts, our spirits and our imagination. They are an integral part of indigenous traditions. Yet, the arts still remain on the margins of most educational programs (Lawrence, 2005). Art and music are taught as discrete courses and are the first to be cut when budgets are tight. In a holistic curriculum that is multidisciplinary, the arts are infused throughout the coursework. Slattery, (2006, p. 243) described a "postmodern curriculum" where the arts or aesthetic are "the heart and soul of teaching, pedagogy and human growth." Similarly, Fox (2006, p. 112) sees the arts as central to the curriculum for all students. For Fox, it is as much about the student creating art, as it is about what happens to the artist in the process.

Entering into the relationship between colour, canvas, light, and the painter; between clay and the sculptor; between the body and the dancer; . . . all of this is an essential part of an awe-based educational curriculum, one what will culminate in wisdom.

The arts can help us to see, understand and make sense of our own experience (Greene, 1995).

As Jelaluddin Rumi- 13th century mystic poet understood, there are times when words are just not adequate to express what we know.

Out beyond ideas of wrongdoing
and rightdoing there is a field.

I'll meet you there.
When the soul lies down in that grass
the world is too full to talk about.
Ideas, language and even the phrase each other
Doesn't make any sense"

As Collister (2010, p. 79) relates: "The use of aesthetics, recognizes the holarchical nature of all existence, connecting the whole person with their community, their place, the Earth, and the universe through embodiment, spirituality, and cosmology." Davis-Manigaulte, Yorks and Kasl (2006, p. 27) use the term "expressive ways of knowing" to describe holistic learning that taps into the learners' intuition and imagination. They discuss how the use of artwork and ritual in the classroom helps groups to become more cohesive. As students share their creative work and their stories other students are able to make connections to their own experiences that may not have otherwise surfaced.

Many educators are reluctant to use these expressive forms in their classrooms as they feel uncomfortable and unnatural (Lawrence, 2005). For some learners, engaging in art is risky business. They learned at a young age that art was reserved for those with special talents. Davis-Manigaulte, Yorks, and Kasl (2006) stress the importance of the educator participating in the holistic learning activities along with the students. This not only allows the teacher to empathize with the students, it provides opportunities for transformation for both the learner and educator.

Selkrig and Bottrell (2009) developed an arts-based curriculum for pre-service teachers in Australia. They strongly emphasize the need for teachers to "get their hands dirty" (p. 400) and model artmaking for their students. Selkrig and Bottrell also recognized the uneasiness that many of their students initially feel when they are asked to engage in artistic activities. They guide them through some less risky collective projects at the beginning of the program, followed by a reflective session where they acknowledge and confront their discomfort. I've found that sometimes just recognizing that students may be uncomfortable with engaging in art activities and allowing them to voice their feelings breaks down barriers where they become more open to trying these different forms of expression. In the rest of this section, I provide examples of ways in which the arts can be infused into the curriculum including, theatre, poetry, photography, storytelling, fiction and film, and the visual arts.

Theatre

Theatre can enter into the curriculum in many ways including role-playing, improvisation, reader's theatre and popular theatre. Theatre engages multiple learning domains, especially the affective and embodied dimensions or as Elm and Taylor (2010, p. 129) refer to as "gut –level learning." Elm and Taylor experimented with performing plays at management conferences that presented the audience with controversial or ethical issues in business. A discussion of the issues followed. The audience had emotional and visceral reactions to the issues that may not have surfaced if they just read or heard about them through a lecture and they engaged in a lively and productive dialogue.

Cueva (2007) used reader's theatre as part of a cancer education program with Alaska Natives. Participants read written scripts out loud where fictional characters discussed their experiences dealing with cancer. She found that just the act of saying the words out loud were freeing as talking about the illness directly had been a taboo subject in the village.

Meyer (2010) has been working to transform the workplace to a "playspace." She facilitates improvisational activities in the classroom and in the workplace that could include anything from making people aware of where they hold the tension in their bodies to acting out potential solutions to organizational problems. These types of activities engage one's whole self in the learning process, which enhances creativity.

I involve students in exercises from Augusto Boal's *Theatre of the Oppressed* (1992), inviting them to get into their bodies to better understand the concept of oppression. For example, after a series of warm-up activities to get people comfortable with their bodies, I might ask them to think of a time when they were made to feel oppressed, misunderstood or treated poorly by others and then to feel that oppression in their bodies and strike a pose that depicts that moment. As we look around at one another we can see the pain reflected our bodies. This activity often opens up channels to begin to discuss what had been undiscussable. We can also act out alternatives to accepting the oppressive behavior in our bodies, which can be quite liberating. As one might imagine, activities like these may bring up strong emotions. Dirkx (2001, p. 66) views emotions as "messengers of the soul." Emotions connect the self with the outer world and can lead to profound shifts in our awareness by making the unconscious conscious which according to Dirkx can lead to transformative learning.

In a previous publication (Butterwick & Lawrence, 2009) we shared examples of using popular theatre to share stories of uncomfortable situations such as racism and gay bashing. Embodying the stories gave people a language of expression when words were just too painful. Forum theatre (Boal, 1992) is another approach that works well in the curriculum. In forum theatre the audience is referred to as "spect-actors" as there is no separation between actors and audience. The "actors" improvise a scenario that is troubling or problematic and try to work out solutions. At anytime, an audience member can yell "stop" and replace the protagonist (oppressed) and try out different strategies until a resolution is reached.

Poetry

The reading of poetry can be can be an exciting way for learners to engage in and make sense of what they are learning as Wright et al. (2010) discovered. As Sullivan (Lawrence & Sullivan, 2005) suggests, the "reader enters that lived experience and arrives at an understanding that is potentially both visceral and intellectual." The writing of poetry is yet another level of engagement. Sullivan uses poetic expression to help students learn about data gathering in research. She asks students to identity key life experiences and to make a list of "data" in their memory using their five senses. They tap into their visual memory to identify colors, textures and shapes. Their auditory memory surfaces sounds, their tactile memory brings up textures etc. They then take this data and write a poem. I've used a version of this activity in my classes where I also include emotional data. The depth of their poems created in a very short period of time is surprising and delightful. Poetry like other forms of creative writing "decompresses stored emotional experiences in order to make sense of them in new ways" (Kates, 2005, p. 198)

Photography

Photography is gaining popularity as a research technique through photo-voice where the researcher takes photographs as data, or photo-elicitation where research participants are asked to take photos. Photography also has a place in the holistic classroom. As we've heard, "a picture is worth a thousand words." We tell our stories through the subject matter we select. Armstrong (2005) uses a method called "autophotography" which blends photography with autobiography. He has his students take photos of their world and then critically reflect on the meaning of the images to them. The images are in shared in class and the group raises critical questions to help further elicit meaning from the images. Not only is the learning deepened for the individual sharing his or her images, the knowledge is social constructed by the entire group. According to Armstrong (2005, p. 42), "When stories of people's lives are delivered as art they are more powerful (life-changing) for the presenter as much as for the listener."

While some people use photography to document what is, the photograph, as an artifact is never neutral but rather an example of constructed reality. What is emphasized and what is omitted has a lot to say about the reality of the photographer. Parsons (2011) who uses photography as a class activity in teaching for social justice, asks his students to consider how the subject of their photograph constructs their view of the *other*. "The photographer must consider the constructedness of the photographic text *in relation to* the Other. The photographer must confront his or her own colonizing gaze." (p. 86)

The photos we create say a lot about who we are and how we see the world. Lawrence and Cranton (2009) use photography both literally and metaphorically to teach about how we can look at the world or ideas from multiple perspectives. Some examples include taking multiple photos of the same subject from different angles, viewing images from the perspective of a bird, mouse or ant, looking at reflections in water, windows or snow, or creating images to convey particular feelings. One exercise I have found particularly revealing is to ask students to remove the labels of things and only focus on lines or curves or particular shapes. For example, one might look at a park bench from the side and see the arcs and curves. When we normally look at a bench we tell ourselves that it is a bench and we don't really see its properties or how it might be different than other benches. This leads to a discussion of labels and stereotypes that prevent us from seeing the uniqueness of people. I also use photographic techniques in teaching beginning researchers how to be careful observers. We spend time (usually in an outdoor setting) looking at things through multiple lenses, from very close and detailed to further away where the context of the object is revealed. The hands-on, embodied experiential nature of photography often stays with the learner much longer than book learning.

Story

Stories and storytelling are an integral part of a holistic curriculum. I approach the teaching of adult development and learning through life history as my students are all adults who have gone through various developmental stages and learning process. Looking at one's own life experience in relationship to theoretical knowledge makes it real. They also learn from sharing their stories, as classes tend to be diverse in age, race, ethnicity and work experience.

As described above, stories are central to indigenous education and have a prominent place in informal adult education. Horton (1990) believed strongly in the power of adults' experiences. His mission was to show them that their experience had value and could help them in figuring out solutions to problems. As Collister (2010) noted, stories affect the spirit. "They engage our emotions and touch our souls" (p. 78) We tell our stories in many ways, orally, through artwork, poetry, drama and dance. As these ways of learning are discussed individually, I won't elaborate on them here.

Film and Fiction

In addition to telling our own stories, we can learn from the stories of others. Fictional characters depicted in novels and in film often help to draw out our own experiential learning. For example, in a master's class on adult learning I assigned *Dancing on the Edge of the Roof* by Sheila Williams. The main character, Juanita is a 42 year old African American woman living in Columbus, Ohio. She has a dead-end job as a nurse's aid, three adult "deadbeat" children who constantly make demands of her and a series of bad relationships with men. Juanita is also barely literate. One day she finds a box of old romance novels left behind by a patient. She teaches herself to read through these novels and literally runs away from her life, taking the first bus out of town. Throughout the book Juanita is confronted with a series of new and sometimes frightening experiences. All of the students can relate to Juanita's experience, if not from a personal level, they have had students like Juanita.

We can also learn from the experiences of others that may be very different from our own. When I was in the 9th grade I had a social studies teacher who decided to depart from the traditional curriculum that consisted of reading boring texts and spitting out dates and facts on a test. We read Dick Gregory's *Nigger* to learn about racism and Joseph Heller's *Catch 22* to better understand the atrocities of war. The rich discussions that accompanied the readings helped me to connect to the subject in ways the textbooks never could. Social studies shifted from my least favorite to my most favorite subject. Greene (1995, p. 98) echoes my sentiments about this experience:

It is not that I learned anything altogether new; moreover, I was made to see what I had not particularly wanted to see. But once seen, it moved me to summon energies as never before to create meanings, to effect connections, to bring some vital order into existence.

Cranton often uses novels in her classes. She believes that reading about fictional characters can be transformative for the reader as we see ourselves in these characters. "Stories promote transformative learning by help us to see and articulate our values, beliefs and experiences. They help us to question those values and imagine alternatives." (Cranton, 2009, p. 83) As Jarvis (2006) pointed out, reading a novel is not a universal experience for all readers. Meaning making happens as an interaction between the writer and reader so the meanings constructed by each reader may not be the same. This underscores the value of using the novels as part of the curriculum. Group discussion can bring out various meanings and new learning can be co-constructed.

Film, even more so than novels, draw us into the experience of the characters as the director bring us into their world through visualization, music and dialogue. We cannot assume however that merely having our learners view films will lead to learning. One has to be ready and willing to embrace these other worlds and at least consider what they have to say. According to Greene (1995, p. 101) "they [films] render worlds that are entered only when imagination is released and beholders are ready to lend these words their lives."

Related to film and fiction, Beyerbach (2011) invites her students to bring in examples from pop culture media that are disturbing. With the creation of You Tube we are now bombarded with these examples. She uses these media clips to examine how issues of power and oppression are perpetuated.

When selecting novels and films for a class it is important to select material that represents a variety of cultural perspectives. On the one hand it is important to be inclusive so that the stories are reflective of the population of the students. On the other hand we tend to get stuck in our own ethnocentric point of view so being exposed to very different perspectives can often shake us out of our comfort zone, opening us up to new ways of thinking and seeing the world. Inviting the students to choose novels and films helps to broaden the scope even more and is more indicative of participatory education.

Visual Arts

The visual arts engage mind, body, heart and spirit. In a holistic curriculum, one can tap into these various learning domains through both creating and witnessing art. One of my colleagues (C. Mealman, personal conversation, August 2013) likes to bring in paintings related to the subjects he is teaching. For example, in a class on adult development he might bring in a painting depicting women in different life stages. The painting becomes a catalyst for discussion as it provokes emotion and students share connections from prior experience.

Students might also engage in drawing, painting, sculpture or collage. Larsen (2007) gives her students a lump of clay and asks them to work with it with their eyes closed without attempting to create anything in particular. Without the visual connection, the students find that they are less judgmental about their own work and free to just allow themselves to create. Clay is also a playful activity many associate with childhood. Cueva, Kuhnley, and Cueva (2012) used clay in a cancer education program with Alaska natives. They used the clay to create images of cancer and cancer prevention. They also used it to express their immediate emotions. As cancer is a difficult subject to talk about, the clay created an outlet for expression and a catalyst for conversation. While cancer is difficult to talk about, HIV/AIDS is taboo in many communities. Collins (2012) reported on several educators who are using art activities, as a tool to reduce the stigma and prejudice around HIV/AIDS, opening up channels for healthy communication.

The above sections described just a few examples of how the arts can be used in a holistic curriculum. There are many more. See for example Chapter 9 in Hoggan, Simpson and Stuckey (2009). The possibilities are limited only by one's imagination.

Holistic Learning Objectives and Evaluation Strategies

In most institutions of higher learning there are norms and expectations for creating learning objectives, designing activities to meet those objectives and employing assessment tools to measure whether learning has taken place. Many schools are moving toward standardized syllabi and assessment measures regardless of the course content. In a holistic learning curriculum these traditional methods are largely irrelevant. What then is the holistic educator to do? We need new methods of evaluation that depart from behaviorism, competency based education, and one size fits all rubrics.

Kucukaydin and Cranton (2012) suggest that the very nature of adult education as a participatory process goes against the grain of traditional practices of lesson planning and grading policies. They argue that "good teaching" needs to be subversive, that is, resisting the dominant curriculum development processes and involving learners in co-developing the course. They further suggest that when teachers maintain absolute control over the curriculum they reproduce the dominant hegemonic power structures of society.

Objectives

Learning objectives are a fact of life in most institutions. Often objectives are the first items that are developed as part of a course design and must be scrutinized by curriculum committees even before the course becomes a part of the curriculum. Learning need not be quantifiable. Holistic learning objectives are concerned not only with what knowledge the learner will gain as a result of the course but can also be experiential, affective and even spiritual.

In a holistic classroom, learners are often involved in creating objectives for the course. Even when objectives must be created by the instructor to meet institutional requirements, these objectives do not have to be written in stone. I often ask the students to critique the objectives and modify them if necessary and to create new objectives that are relevant to what they want to learn.

Assessment

And what of assessment? A curriculum that is soulful, transformative and participatory is more difficult to assess. It cannot be measured in traditional ways. I have found it is helpful to give students choices in assignments. When students are given choices, completing an assignment is not seen as a necessary requirement to earn a grade but something that has meaning to them. When I was a doctoral student I took a course on critical pedagogy with Phyllis Cunningham. It was an accelerated course that met over a six week period during the summer. The course requirements were to read three books and write a critical review of each. After the first two book reviews I grew tired of writing papers and asked Phyllis if there were an alternative to completing the assignment. She asked me what I would suggest. As I learn best experientially I asked her if she could recommend someone who is an exemplary practitioner of critical pedagogy that I could observe in action. Phyllis introduced me to Susan House, a former welder who was doing workplace education. I was fascinated with Susan's hands-on methods of teaching basic skills to adults. Two decades later I cannot remember the names of the books we read for the course but I'll always remember what I learned from Susan.

I often encourage students to use artistic expression in completing assignments to demonstrate learning. I always offer several options including the option to create their own assignment, as creativity cannot be mandated. Those who are fearful of getting their hands into art materials may choose to read a novel or watch a film and analyze it according to the course content. I find it fascinating that students usually come up with alternatives that I could not think up in my wildest imagination. Students create quilts, jewelry and sculpture. They incorporate, music, dance and performance. For example, my doctoral students were asked to create a visual representation of how they were integrating research with theory and practice. One woman brought "research Barbie" which was a Barbie doll sitting on a lawn chair completely wrapped up in recording tape. She talked about how the doll represented the overwhelming feeling of getting wrapped up in the data while trying to sort it out and make sense. Another student brought in a box of Lincoln Logs. He explained that his way of meaning making was collaborative so he invited members of his cohort group to help construct something out of the Lincoln Logs and to add material of their own. A display formed and began to change shape over the course of the week as individuals added plastic animals, photos and natural artifacts.

The projects the students choose are often grounded in their culture or positionality. An African American student who had spent considerable time in Africa created performance art complete with drums, African artifacts, and call and response. A Polish student wrote a folk song and performed it in her native language. A Palestinian woman wrote a provocative poem about being racially profiled after 911 and a white gay man wrote a poem about the pain of living in two worlds and the conflicts about being in the closet as homophobic men made assumptions that he was one of them. These types of projects help us to hear students' voices in multi-modal ways (Sanford & Mimick, 2012)

Grading

Many teachers are reluctant to assign these creative expressions, as they are not sure how to evaluate them. How do you assign a grade to someone's creative work? I remember submitting some of my poetry as a high school junior in English class. The assignment was returned to me with a grade of B-. My sixteen year-old heart was crushed. I had shared my innermost feelings with a teacher and all they were worth was a B-! The anxiety around earning good grades often gets in the way of students pouring their whole selves into more holistically based assignments. I was advisor to a Master's student working on an independent inquiry project. I encouraged her to think about other ways of expression than writing a traditional research paper. This particular student chose to create a Website. In our advising session she kept asking me what I wanted her to do to get an "A." Finally I told her "you will get you're A. Now let's get down to the business of doing the work."

The removal of the pressure to earn a good grade was freeing to this student and she went on to do exemplary work.

Kucukaydin and Cranton (2012) insist on self-grading for their students as it shifts the power dynamic from the teacher to the learner. It is also freeing for the teacher. Who are we after all to tell as student that their journal, poetry or artwork is good, bad or worth a B-?

Holistic Learning and Criticality

As you can imagine, designing and facilitating holistic learning is not easy. The institutions in which many of us work are constrained by rules, requirements and standards for accountability. Furthermore, many students are so steeped in the hegemonic forces that govern most classrooms that they actively resist participation in curriculum decision making and learning activities that engage their creativity. Holistic education is not synonymous with criticality. Brookfield (2005) describes critical pedagogy as a democratic practice of challenging the dominant ideology, unmaking power relations, contesting hegemony and overcoming alienation. It is possible to teach in holistic and creative ways that are not particularly critical. It is also possible to teach in ways that are critical but not necessarily holistic, however as described by Prosser (2008) above, critical teaching cannot neglect the role of emotions and the body as we are always having affective and visceral responses to serious issues. This chapter described an approach to holistic education that challenged educators and learners to rethink education as a "Pedagogy of Hope" (Freire, 1992). Without hope and the ability to imagine a better world, what do we have left?

CONCLUSION AND FUTURE DIRECTIONS

This chapter looked at holistic models of curriculum that are artful, embodied, experiential, and attend to the heart and spirit of the learner. These methods (or actually non-methods) of developing curriculum can no longer rely on the ubiquitous behavioral objectives, technical rationality and standardized assessments that characterize most universities. To consider the future of curriculum development we must spiral back to the past. We need to look beyond liberal and vocational models of education and consider the needs of the whole learner. We also need to look beyond our North American and European ways of knowing and consider what can be learned from indigenous cultures that have viewed education as a holistic process from the beginning. Given the current situation of climate change and the deterioration of our natural resources we can no longer afford to educate human beings as if they were separate from the Earth.

In learning from the past we must also look back to Lindeman (1926, 1961, p. 7) who said "Authoritative teaching, examinations which preclude original thinking, rigid pedagogical formulae—all of these have no place in adult education." Lindeman believed there was no separation between learning and life. And life itself is holistic.

KEY TERMS AND DEFINITIONS

Arts-Based Curriculum: A curriculum that infuses the arts into mainstream courses at all levels.

A.W. E.: Matthew Fox's (2006) acronym for ancestral wisdom education, an approach to education reform that honors the teachings of the ancestors, nurtures wisdom rather than knowledge and educates through compassion, creativity and critical consciousness.

Centering: A process of letting go of outside distractions and bring the total self into focus. Examples of centering activities include: meditation, guided visualization and reflection on various art forms.

Earth-Centered Education: Educational curriculum that recognizes human beings in relationship to the Earth, not separate from it.

Holistic Epistemology: John Heron's (1996) description of four kinds of interrelated knowledge that are outcomes of co-operative inquiry including; experiential, presentational, propositional and practical knowledge.

Indigenous Wisdom: Organic or local knowledge that comes from direct experience in one's environment as opposed to learning in formal education.

Mythopoetic Curriculum: A curriculum that relies on imaginal knowing "linked to the way humans imagine the real world. Imaginal knowing moves the heart, holds the imagination, finds the fit between self-stories, public myths, and the content of cultural knowledge." (Leonard and Willis, 2008).

Section 6
Emerging Trends

This section highlights research potential within the field of Curriculum Design and Classroom Management while exploring uncharted areas of study for the advancement of the discipline. Introducing this section are chapters that set the stage for future research directions and topical suggestions for continued debate, centering on the new venues and forums for discussion. A pair of chapters on the usability and effectiveness research makes up the middle of the section of the final 10 chapters, and the book concludes with a look ahead into the future of the Curriculum Design and Classroom Management field, with "Trends of Blended Learning in K-12 Schools: Challenges and Possibilities." In all, this text will serve as a vital resource to practitioners and academics interested in the best practices and applications of the burgeoning field of Curriculum Design and Classroom Management.

Chapter 77
Preparing to Teach with Flipped Classroom in Teacher Preparation Programs

Beverly B. Ray
Idaho State University, USA

Angiline Powell
University of Memphis, USA

ABSTRACT

The chapter outlines best practices in the use of Flipped Classroom to promote active and meaningful learning in higher education, specifically preservice teacher preparation courses. The theoretical foundation supporting the use of Flipped Classroom is reviewed as well as issues related to its use. Recommendations as to how to integrate Flipped Classroom are examined as well. Linkage to the goals of teacher preparation programs are made to assure the reader's understanding of the recommendations that follow.

INTRODUCTION

Assuring the classroom success of the teachers we prepare is the central goal of all teacher educators. Criticism of the ways teacher educators prepare preservice teachers comes from policy makers, business leaders, and K-12 educators as well as students. The criticism of preservice teachers' effective use of technology is also of particular concern since preservice teachers may experience difficulties translating course work into effective technology practice (Watson, Blakeley, & Abbot, 1998). This disconnect between course work and the development of effective technology practice often occurs when preservice teachers do not fully understand the principles of teaching and learning with technology, many of which are hard to "integrate" without first-hand experience. Often we fail to prepare preservice teachers for classroom success using technology and other authentic methods of learning, such as inquiry and problem-based learning (Darling-Hammond & Bransford; 2005; Kagan, 1992). This is particularly problematic in a time when many K12 educators face tremendous pressure to adapt their teaching to

DOI: 10.4018/978-1-4666-8246-7.ch077

online or blended learning environments (Dexter & Riedel, 2003; Niess, 2005).

The result of this technology disconnect, compounded by other pivotal challenges faced by novice teachers, can be seen in the research documenting high attrition rates during the teacher induction years (Darling-Hammond, 2003; Moore Johnson, & The Project on the Next Generation of Teachers, 2004; Shen, 2003). As preservice teacher educators, we strive to model authentic and meaningful learning strategies for our students. In fact, modeling ways of teaching with technology is important in helping preservice learners figure out how best to use technology to support learning (Chickering & Ehrmann, 1996; Rogers, 2004). Consequently, we believe that use of Flipped Classroom is an effective use of technology that shows great promise (Bergmann, & Sams, 2012, Brunsell, & Horejsi, 2013) for teacher preparation and should be used within teacher preparation programs.

Flipped Classroom is a reversal of traditional modes of classroom based teaching and homework. Outside of class students access online videos or instructional DVDs. In class, students focus on understanding and applying content from previously viewed videos. This is done via group or individual problem solving activities, discussions, and/or other learner centered activities that promote critical thinking and reasoning (Garrison & Kanuka, 2004; Lage, Platt, & Treglia, 2000; So & Brush, 2008; Strayer, 2012). The teacher's role is to guide and facilitate that understanding (Butrymowicz, 2012). Since we want to bridge the technological divide with our students we propose using Flipped Classrooms in order to help preservice learners develop the knowledge, skills, and dispositions needed to succeed as technological users and innovators. While Flipped Classroom is most associated with the use of online resources (i.e., videos), it can be used without Internet access assuming videos are loaded onto DVDs or other storage devices that do not require internet access. Viewing videos on DVD addresses some of the equity issues associated with the "digital divide" and ongoing concerns related to reliable internet access for many learners (Valadez & Duran, 2007).

THEORETICAL FOUNDATION

The theoretical foundation supporting the use of Flipped Classroom in teacher preparation programs is grounded in an understanding of the social and intellectual learning environment. In this environment learners actively engage knowledge in ways that act as catalysts for deep and meaningful learning (Noddings, 2005; Piaget & Inhelder, 1969). Flipped Classroom is also grounded in a consideration and respect for individual and diverse learning needs. Using Flipped Classroom allows teacher educators to motivate and guide learners to specific understanding even as they model use of an innovative method of teaching with technology that will prove meaningful and appropriate for their future practice.

Constructivism and Flipped Classroom

Constructivists contend learning is an intellectual process in which the learner forms or constructs new knowledge by combining new ideas with those acquired during previous learning experiences (Schunk, 2011). The depth of what is understood is affected by previous knowledge and interests (Bruner, 1993; Piaget & Inhelder, 1969). The use of Flipped Classroom in teacher preparation programs provides a modern instructional model for how to engage learners' natural curiosity, increasing their interests in teaching and effectively building new conceptual constructs using technology. By using Flipped Classroom, preservice learners see, hear, and experience something new or unique via out of class video study. Linking the new learning experience from the Flipped Classroom videos to previous knowledge or understanding, learners can then use class time to interpret that new experience based on what is already known, supporting the essence of constructivism.

Flipped Classroom supports another tenet of constructivism, that the learner is responsible for their own learning. As the learner views the video portion of a flipped lesson, they can continuously assess their understanding of concepts. While in the classroom, the learner further engages or interacts with those same concepts and receives the opportunity to demonstrate understanding as well as to clarify misconceptions.

Social Cognition and Flipped Classroom

Social Cognitive theory is grounded in a process of immediate feedback on work, as well as just-in-time support from teachers and peers. It is also grounded in an understanding that learners can learn by observing, including observing modeled behaviors. Bandura also noted the need for learners to demonstrate understanding and to share that understanding with others. For example, some teachers have adopted use of peer instruction and the jigsaw method of learning as a result of Bandura's recommendations (Bandura, 1977). Because learners can view the videos together, work in teams in or out of class, and learn through teaching one another via peer tutoring, social learning theory can be used to validate use of Flipped Classroom in teacher preparation programs.

RESEARCH SUPPORTING THE USE OF FLIPPED CLASSROOM

Even though many of the claims made about the efficacy of Flipped Classroom as learning tools are not yet fully research supported, an emergent research base suggests that mindful use of Flipped Classroom can support authentic and other meaningful learning experiences, content learning, motivation to learn, and some positive socialization skills, such as cooperation within real or virtual groups (Baker, 2000; Collins, de Boer, & van der Veen, 2001; Gannod, Burge & Helmick, 2008; Lage, Platt, & Treglia, 2000; Strayer 2012). Flipped Classroom possesses the potential to promote learning across all age and academic levels (Flumerfelt & Green, 2013). In order to support preservice teachers and their effective use of technology in the classroom, we propose integration of this effective technology is an essential component of teacher preparation course work. A number of researchers noted that the likelihood of transfer into K-12 practice increases when preservice students see technology modeled and practiced in preparation classes when compared to students whose exposure occurs within a stand-alone technology methods course (Halpin, 1999; Niess, 2005; Snider, 2003; Topp, 1995; Zimmerman, 1989).

SUGGESTIONS FOR USING FLIPPED CLASSROOM

At present, few teacher educators are using Flipped Classroom. In fact, many may never use Flipped Classroom, preferring a continued reliance on more familiar, teacher-directed methods of instruction (Cuban, 1986; Eggen & Kauchak, 2007; Rogers, 2004). Yet learning theory and a small, emergent research base support the effectiveness of Flipped Classroom along with other student centered technology methods (Chickering & Ehrmann, 1996; Schunk, 2011). By addressing issues related to the use of Flipped Classroom, our intent is to inspire readers to see its potential and to offer insight to assure success when using Flipped Classroom as a learner centered instructional tool.

To assist those efforts, we examine the challenges faced by those seeking to integrate the use of Flipped Classroom into traditional teacher preparation programs. In this section challenges are identified and addressed to provide the reader with an action plan for the successful integration of Flipped Classroom into teacher preparation courses.

Planning for Instruction

Early attempts at Flipped Classroom were built on a traditional lecture model which may not work for all preservice learners (Kumar, 2010; Lowry, 1999). However, it is possible to use a more constructivist approach that more fully integrates the examination of problems and issues from practice. For example, instead of simply having students view and take self-directed notes from a pre-recorded lecture, teacher educators should include learner-centered tasks to complete before, during, and after viewing an interactive lecture. This approach should be used when viewing a video demonstrating how to effectively apply a particular skill, such as deep questioning or, perhaps, a specific behavior management skill that the learner first sees modeled via video before practicing in class or in a clinical setting. In these ways and others we move beyond a limited lecture based approach to learning to one that is more fully supported by learning theory.

Additionally, a focused and contextual approach to teacher preparation requires the use of interactive and problem-based methods, such as role plays/simulations, integrated writing assignments, inquiry, reflection, discussion, and clinical activities that allow learners to actively participate in the learning process beyond simply viewing assigned videos (Kumar, 2010; Schunk, 2011). The purpose of such diverse activities is to allow preservice learners to construct and apply new or refined understandings based on content and pedagogical knowledge along with highly effective learning strategies (VanSledright, 2002). In teacher preparation programs, strategically selected or produced videos can serve as exemplars, or models, for discussion of what is meant by effective teaching. Use of Flipped Classroom serves as a catalyst for this kind of learning environment and is conducive to a constructivist and problem-based learning environment (Strayer, 2012). In order to maximize the effectiveness of the Flipped experience, it is critical that teacher educators guide and continually assess the process for preservice students before, during, and after viewing out of class videos. Doing so assures the foundation of new knowledge is based on a correct understanding of the concepts or other information contained within assigned videos.

Subject Matter Concerns

Many teacher education pedagogy and content and standards can be addressed through the use of Flipped Classroom, but it is particularly effective in allowing students to observe and explore complex topics interactively, including moral issues that cannot be easily accomplished using more traditional (i.e., passive) methods of instruction. Preservice students need to examine and understand the complexities of the profession and the tensions and conflicts that come into play as teachers, children, parents, and other educational stakeholders interact with one another (Noddings, 2005). This global understanding of education includes issues of diversity and social justice, classroom management, assessment, and other critical attributes of the profession. Additionally, preservice students need to understand the responsibilities of the profession and how those responsibilities are reflected across the profession. Because education is often grounded in social issues, teacher educators should prepare to examine those issues from multiple personal and historical perspectives. Video can capture and document these kind of events bringing with it opportunities for authentic and meaningful discussion of these kinds of issues. When using videos such as these, teacher educators should also prepare to implement many of the same strategies used when teaching about current and controversial issues (Engle & Ochoa, 1988; Hess, 2009). For example, when using problem-based learning, encourage preservice learners to break away from the video at identified points to consider and reflect on issues of practice. When doing so it is important to include time in class to richly debrief, reflect upon, and make connections between what was experienced and learned during the video experience and in class discussion to instructional objectives and program standards (Larson & Keiper, 2011).

Assuring Learner Success

Addressing the purpose for the use of Flipped Classroom at the beginning of the course (or before implementing a Flipped lesson) provides a foundation that pays dividends in the form of participant buy-in, a necessary disposition for the most effective use of the Flipped Classroom (Coulter & Ray, 2009; Holbrook, & Dupont, 2010). However, even when provided explanations of the organization of the course, the purpose of the videos, and the requirement for appropriate technology, some preservice students may not fully appreciate the importance of the videos to their academic success. Others will experience frustration with the videos that may impact their learning. In fact, because of limited time, interest, access to technology or other factors, some may attempt to circumvent the content of the videos and attempt to acquire the information in other ways rather than from viewing the assigned videos (Coulter & Ray, 2009). Others may never attempt to view assigned videos assuming that their contents will be made apparent during class discussions and/or lecture sessions. Therefore, to avoid re-teaching the contents of the videos we suggest instructors set aside time at the beginning of the course to discuss the importance of the video's contents to successful completion of the class. Coulter and Ray (2009) suggested having students sign a statement acknowledging their responsibilities when accessing and viewing the assigned videos as one way to address this type of concern.

Aligning Learning across the Flipped Classroom Experience

Both the face-to-face in class sessions and the videos must align so that one transitions into and coherently supports the other. Without this clear alignment of learning students may struggle to see how assigned videos relate to the learning goals of the course (Ginns & Ellis, 2007). When the out of class video and face-to-face portions of the learning experience are not carefully aligned, research demonstrates that technology, including video, can become a barrier for learning as students choose whether and to what extent to invest in the learning goals of the classroom (Buerck, Malstrom & Peppers, 2003; Coulter & Ray, 2009; Elen & Clarebout, 2001).

Adapting Constructivist Instructional Strategies to Flipped Classroom

Teacher educators play a pivotal role as guides, facilitators, and discussants when Flipped Classroom is used as instructional tools. Their role often is to combat or prevent the emergence of misconceptions among learners by using highly focused and contextual approaches to learning (VanSledright, 2002). As guides, facilitators, and discussants, they can use a variety of student centered instructional approaches, including the strategies discussed here.

Engaged Inquiry: Use of Flipped Classroom can promote key attributes of inquiry learning, including problem solving and discovery learning (Larson & Keiper, 2011). In particular, Flipped Classroom can promote student-directed investigations into the issues and problems that confront educators and practice. Flipped Classroom allows learners to think like the very professionals working to resolve these issues. As they think like professionals engaged in solving the issue presented in assigned videos, they engage in a process of questioning, analyzing, drawing conclusions, and making recommendations and/or taking action within their own emerging practice that mirrors the real world process followed by educators and others involved in solving real life teaching and learning issues (Gallagher, Shers, Stepien & Workman, 1995). In this manner, Flipped Classroom can function as a method of engaged inquiry even as its use acts as a catalyst for awareness, self-efficacy and agency, including the confidence, will, and ability to try out new skills or propose solutions to solve real classroom problems.

Problem-Based Learning: Problem-based learning (PBL) originated in the medical field and spread to many other areas, including education. It is aligned with both cognitivism and constructivism where emphasis is placed on learners and how they learn. When implementing PBL in the classroom there are three major components a) problem-driven learning, b) self-directed learning, and c) collaborative learning. This problem driven learning approach becomes authentic when it is student initiated and student driven by real-world needs occurring within their emerging practice. The self-directed nature of this learning changes the traditional teacher lead lecture into one where the instructor first models the problem solving strategies for students, for example within a video, and then asks students to apply that model to their own reasoning and critical thinking about issues from practice. In this way PBL is indicative of the process followed by adaptive expert teachers in the field. Like many other constructivist-supported methods, collaboration within PBL is characterized by students working in small groups to increase and deepen content knowledge (Hung, 2011).

Discussion and Debate: Flipped Classroom also can promote reflection and dialogue on many levels, including intrapersonal reflection as the learner seeks to draw pedagogical, ethical, moral or other conclusions based on the contents of the video portion of the Flipped experience. The evidence provided during the process combined with study of related content, peer-to-peer discussion, and/or whole group discussion draws the learner's attention to key teacher education content and learning goals. Opportunities for multiple types of discussions are useful for learning, particularly "when the objective is to acquire greater conceptual understanding or multiple sides of a topic" (Schunk, 2011, p. 271).

Flipped Classroom also allows for the use of debate as learners view background information via videos before presenting issues from practice, including controversial and/or moral dilemmas, all of which are useful topics for classroom debate. While debates require more preparation than discussion sessions, the format of Flipped Classroom provides ample content-rich source materials for use in setting up a debate session. Specifically, videos provided by online sites, such as Edutopia (See a sampling of useful teacher education videos from Edutopia in Appendix A, Table 1), can work well when used as a catalyst for debate or discussion.

Reflective Learning: With guidance from teacher educators and associated curriculum and assessments, Flipped Classroom can support the creation of an environment of thoughtful learning wherein the learner must take into account not only new but multiple perspectives, including current educational perspectives and subject matter and pedagogical knowledge along with his or her own moral framework. Teacher educators can use Flipped Classroom to encourage preservice students to reflect in action and to reflect on actions, including the actions of others, once an assigned video is viewed. In this way, Flipped Classroom can promote or reinforce within willing learners a disposition to reflect on and take action (i.e., requiring the disposition and qualities of efficacy and agency) to improve their practice, key attributes and competencies that are not easily taught using traditional or commonly used instructional practices (e.g., lecture, assigned readings, or other assessments that rely on closed-ended questions, etc.).

Cooperative Learning: Cooperative strategies have a long history in education, including teacher preparation (Marzano, Pikering, & Pollock, 2001). Using Flipped Classroom, teacher educators can model and promote positive interdependence among learners who must view videos together and/or discuss them first in small groups, helping group members to identify key points as they hone interpersonal communication skills, before moving into larger or whole group discussion of video topics. Flipped Classroom can also promote individual accountability within groups if, for example, a series of videos are assigned individually to group members to view and then share with their assigned group. For example, a jigsaw approach to viewing and sharing contents can make individual students responsible for their own learning even as they assume responsibility for the learning of others in their group. It also allows them to learn how to integrate technology into the Jigsaw approach and then draw conclusions about the effectiveness of that approach.

Assessing Learning

Use of Flipped Classroom results in many of the same assessment concerns any teacher educator has when using traditional or constructivist instructional strategies. For example, teacher educators should plan ways to allow students to demonstrate learning via either performance-based or product-based rubrics and assessments that include opportunities for rich classroom discussions, time to debrief an activity, and use of written reflective products (such as a KWL or an interactive notebook), that allow students to not only demonstrate understanding that goes beyond simple recall of facts, but also document higher order thinking, including dispositional items (Larson & Keiper, 2011; Stiggins, Arter, Chappuis, & Chappuis, 2007).

The use of Flipped Classroom to promote learning does not happen without effort. Introducing preservice teachers and other learners to the Flipped Classroom learning process is no different than introducing them to any other means of learning. Flipped Classroom must align with specific standards or course objectives if its use is to have a chance of promoting targeted learning goals. Methods of assessing learning when using Flipped Classroom can be perceived as complicated by those unfamiliar with the format or the use of video as an instructional tool, but in fact follow many of the principles of what we know about how people learn (Bransford & Schwartz, 1999). As with any knowledge, skill, or disposition that the learner must acquire, learning using Flipped Classroom must align with specific goals (See the alignment chart linking selected Edutopia videos to CAEP Teacher Preparation Standards provided in Appendix A, Table 1). Furthermore, purposeful steps must be taken to encourage learners to develop the habit of engaging in an activity such as this if it is ever to become generalized beyond a single teacher preparation course as a reliable method of learning.

Varied assessments are useful as well. The actual process of accessing the video viewing experience or assessing time on task with each video should remain secondary goals, but could be assessed if deemed a critical part of the learning goals for the course (Larson & Keiper, 2011). While a variety of assessment strategies are recommended, a few examples are provided to guide the reader's own thinking:

Example One

A set of basic questions we might have students consider for any assigned video could include the following questions:

- What do I know already about the concepts addressed in this video?
- What do I need to find out while watching this video?
- What is one important idea or concept that I have learned from the video already?

- What key piece of information do I want to be sure is addressed during our upcoming in class discussion of this video?
- What did I learn from viewing this video?
- How can I apply that knowledge to further my understanding of this topic?

In answering this basic set of questions, pre-service students are challenged to consider their previous knowledge of the topic and to plan what they should do with the knowledge acquired from the assigned video (Redfield & Rousseau, 1981). These questions can be addressed in writing via the use of interactive journal entries (Teachers' Curriculum Institute, 2013) and/or by filling out an instructor provided advanced organizer (Ausubel, 1968), such as a modified KWL organizer based on spiraled questions, such as those presented above (Hershberger, Zembal-Saul, & Starr, 2006; Ogle, 1998).

Example Two

Promoting reflection and meta-reflection are critical attributes of any teacher education program (Schon, 1983). Metacognition, or thinking about thinking (Ellis, 2001), serves as a "critical revisiting of the learning process" (Georghiades, 2004, p. 171). Metacognition occurs when a learner is aware of or understands how they learn and are aware that they are in the process of learning (Mayer, 2011). Use of approaches that support the examination of the beliefs that emerge from practice or from thinking about practice promote the development of more flexible and intentional approaches to effective teaching and learning (Sockman & Sharma, 2008). What follows is a basic set of meta-reflective questions that pre-service students could use to assist their thinking about the importance of assigned videos:

- As you watched the video, how did you decide what information was important?
- What have you learned about (the assigned topic) from this video?
- How did you decide what information in the video was not important?
- What connections have you made between the video's contents and your practice (or topics examined in class)?
- What statements in the video did you agree with or like?
- What statements, if any, in the video did you disagree with or dislike?
- What statements concern you or contradicted your previous understanding?
- Which information in the video is more important than other parts?
- Where within your emerging teaching practice can you use what you learned from the video?
- Is there another way you could use that same information to support learning?

Like the first example, questions such as these could be used as writing prompts for an interactive journal. Or they could be used to guide small group or whole group classroom discussion.

SUGGESTIONS FOR SUCCESSFULLY USING AND CREATING VISUAL MEDIA

Scaffolding Learning

Given what we know about effective media instruction, learning using visual media should be scaffolded by the teacher educator in order to assure that the intended learning occurs (Hall, Stark, Hilgers, & Chang, 2004; Kline, Stewart, & Murphy, 2006). Use of a viewing guide containing information about what the learner should do or look for while viewing the assigned video (pre, interim, and post viewing) is critical to scaffolding the experience and promoting meaningful learning. Ideally, viewing guides should prepare the learner not only for the contents of the video, but also notify them of what information or reflections they should bring with them into the classroom setting (e.g. discussion topics) and how that information is important to the goals of the individual lesson, lecture, and/or the goals of the course. Students should also know how much time they are expected to spend viewing and reflecting on each assigned videos. A sample viewing guide is provided in Appendix B.

Selecting and Creating Visual Media for Use with Flipped Classroom

A fundamental principal of Flipped Classroom is that learners view and learn from a single or small set of visual media. Often this visual media takes the form of teacher created videos or videocasts. Other times teachers elect to use carefully selected videos or video segments from reliable online (or off-line) education providers. Whether or not videos are written and produced by the teacher educator, it remains necessary that the learner know how to derive meaning and/or interpret the contents of the videos viewed. Success in this regard requires an understanding of how visual media (including film, television, news broadcasts, web and videocasts, etc.) functions as a tool for learning (Sharp et al., 1995). Because it is a medium infrequently used in preservice learning, it also requires a basic understanding of how to interact with and derive understanding from visual messages (i.e., media literacy). However, since most videos function using a culturally familiar narrative device, it is often possible for preservice learners to transfer an understanding of how to learn from other narrative devices (i.e., oral lecture and/or written textbook passages) to the visual medium used within Flipped Classroom. Despite this common narrative experience, transfer of that skill is not always automatic even for those who are technologically advanced. Assumptions in this regard may lead to frustration and/or misunderstandings about what is important within each video assigned, as many learners are more familiar with *passive seeing* rather than active watching, analyzing, and decoding of visual media.

Selecting and Aligning Videos to Course Goals

When selecting a video for use by preservice teachers, the teacher educator begins by determining whether the video is accurate and produced by a reliable and expert source. Beyond those two critical steps, teacher educators should also consider issues of video length and clarity. Traditional teacher preparation classes can range from 50 minutes to nearly three hours. Though it is rare to lecture the entire time teacher educators might be tempted to record or assign verbatim a lengthy video lecture and have the class view this video at home as a part of their homework assignment. However, this is not the most effective way of using video for learning. Instead, shorter videos, each with a specific topic or concept addressed (Strasburger, Wilson, & Jordan, 2009) should be selected—or scripted and then recorded.

Scripting and Creating Your Own Videos

Written transcripts are helpful for several important reasons. First, a transcript is helpful in locating and reviewing information. Additionally, providing a transcript is not only an critical component for universal design, but it also is time effective for the instructor when the goal is the production of quality videos. Second, the only access for video viewing for some preservice students continues to be campus computer labs, and audio can disturb other students. Recording extemporaneously versus recording using a guiding transcript or reading from a transcript when voicing over slides or other images promotes rehearsal and mindful consideration of the most important concepts which leads to more effective instruction. Speaking without written prompts can require multiple attempts at recording before achieving a cohesive narrative, thus consuming valuable instructional time. In addition, scripted presentations tend to be better organized and contain fewer verbal fillers (i.e., "ums" or "ahs") (Coulter & Ray, 2009).

A number of options are available for creating videos, but when the instructor's time and motivation to continue using Flipped Classroom are considerations, we recommend using the simplest method available. For example, voicing over *PowerPoint*™ presentations using the narration feature within the software remains a viable option for the novice Flipped Classroom user. Since most teacher educators are familiar with *PowerPoint*™ it will not require excessive amounts of time or technical support. Additionally, the use of *PowerPoint*™ enables the incorporation of previous written guiding notes and concepts of universal design (Center for Universal Design, 2008) to meet the needs of the learners. Finally, any computer with *PowerPoint*™ software and a high-speed internet connection can be used to create and publish simple videos. A next step in achieving mastery of Flipped Classroom might involve translating files into streaming video and placing them on a server that can be accessed by preservice students. Besides easier access, this can be a better option since *PowerPoint* videocasts (files), once created and published as streaming video, cannot be altered by any person other than the producer or copyright holder. The downside to this method is that some universities still have limited server space and are reluctant to allocate space for extensive publication of videos. However, given the number of free or inexpensive cloud hosting services now available, teacher educators can choose to host their video off campus on a third party site, such as *YouTube*. *YouTube* channels can be password protected, invitation only sites or they can be set for public viewing. Either choice gives instructors control over access to what for many may be proprietary videos (Coulter & Ray, 2009).

Another step towards mastery of video production might involve use of *Animoto*, *iMovie*, *GoAnimate,* and/or *Slide Rocket* to create videos for use. Also, many universities provide and support instructors and students' use of *Tegrity* or other lecture capture software programs that can be used to make video recordings for student use. In additional to producing basic video, programs such as *Tegrity* allow viewers to search within a video, bookmark selected scenes, and insert typed note at key points in a video recording. Many of these programs also allow viewers to send messages to peers or the instructor from exact points of interest in a video, thus providing concrete opportunities for clarification of misunderstanding, questioning, discussion, reflection, and collaborative learning.

Other practical suggestions to assure continued use of Flipped Classroom include reducing the size of video files to facilitate faster downloads, saving files using multiple versions or file types, and burning the videos to DVD for those requiring alternative viewing methods (Coulter & Ray, 2009). This kind of a flexible approach to access is particularly useful for students using older computers and/or located in areas with poor quality Internet access.

INSTRUCTOR AND LEARNER MOTIVATION TO USE FLIPPED CLASSROOM

Willingness to try or use new technology is directly related to preservice teachers' perceptions of technology (Albion, 2001; Becker, 2000; Ertmer, 2005; Niederhauser & Lindstrom, 2007; Palak & Walls, 2009; Rogers, 2004). There are several research-based findings concerning preservice teachers and their use and perceptions of technology. Anxiety *with* and resistance *to* technology can result without proper support (Becker, 2000; Ertmer, 2005; Budin, 1999). Teachers fear that using technology comes at a sacrifice from content. Resistance to change has a serious impact on willingness to try new technologies (Rogers, 2004). Heinich (2011) reported traditional educational delivery persists in many classrooms because some teachers structure instruction based on their needs rather than that of their learners. More problematic is that instruction based on teachers' needs can become entrenched during the preservice years (Niederhauser & Lindstrom, 2007). Consequently, willingness, or intent to use technology, is an important consideration in educational settings because some evidence suggests that teachers' personalities and resistance to change can present barriers to the adoption of technology interventions (Fabry & Higgs, 1997; Lehman, 1994; Overbay, Patterson, & Grable, 2009).

After an extensive review of the literature on teacher change, Ertmer and Ottenbreit-Leftwich (2010) argued that in spite of the rapid expansion of technology for learning within educational settings, many teachers persist in not using technological tools and/or not using them appropriately (i.e., in ways that will increase student achievement). However, Reiser and Dempsey (2012) offer an explanation for this behavior that is important to consider. That is, that while teachers are expected to be technology adopters and implementers, they are not often introduced to technology in ways that support successful adoption. There is a need for active discussion centered on bridging the gap between current implementation and desired optimal implementation. Because technology such as Flipped Classroom enables teachers to "package learning opportunities in an increasing number of alternative ways so as to best meet the varying needs of different students" (Buzzetto-More & Sweat-Guy, 2007, p. 5), the role and intentions of the teacher are key. Consequently, Flipped Classroom may have the capacity to change preservice teachers' intentions regarding the use of technology for learning. Therefore, issues related to teachers' attitudes and intentions toward the use of Flipped Classroom in education are important to address within teacher preparation programs. Research in this regard is needed.

Limitations of Flipped Classroom

Despite the on-going hype and high expectations for learning associated with Flipped Classroom, we still do not know whether it will prove to be research supported. Even though some teachers are reporting noticeable improvements in both their students' grades and their attitudes toward learning, some students likely will not thrive in Flipped Classroom settings (Butrymowicz, 2012). As with any other methods used in teacher preparation programs, Flipped Classroom should not be the only method of instruction used, not even in blended learning environments. Because many preservice learners, particularly in geographically remote or isolated locations, still do not have reliable or fast internet connections, teacher educators should plan alternative ways of learning for those students to fall back on if or when technology access is limited or non- existent (Butrymowicz, 2012). Because it is often difficult for teachers to provide meaningful instruction for technologically savvy students, the issue of whether Flipped Classroom promotes student learning, including preservice learning and whether the method can be used in a classroom environment geared toward pedagogical concerns should be carefully researched as well.

CONCLUSION

This chapter is intended to assist teacher educators and others to create positive learning environments using Flipped Classroom. These environments can support learning even as they serve as models of best practices when using technology to support learning. In particular, a meaningful and authentic learning environment that can support preservice teachers' acquisition of key knowledge, skill, and/

or dispositional learning can be created using Flipped Classroom.

We write this because we believe that Flipped Classroom can be appropriately used in preservice teacher preparation programs. We note, however, that technology for technology's sake is not appropriate. Therefore, we offer ways of thinking about Flipped Classroom and ways of doing (or implementing) Flipped Classroom into instruction that can provide guidance to those considering its use for the first time. The ways of doing highlighted in this chapter are reflective of theory and emerging research.

The audience for this chapter includes preservice educators and specialized inservice teacher trainers. However, interest in the chapter is also shaped nationally and internationally by an emerging interest in whether and to what extent Flipped Classroom can be used as a positive learning tool. This interest in Flipped Classroom is an outgrowth of a society that is fully integrating technology into everyday experiences (Bergmann, & Sams, 2012). Teacher preparation programs should be no exception and, in fact, must be part of this process. Furthermore, as today's technology savvy youth move into the teacher workforce, it becomes more likely that technologies, such as Flipped Classroom, will be embraced by many.

KEY TERMS AND DEFINITIONS

CAEP Standards: A set of national standards developed by the Council for the Accreditation of Educator Preparation (CAEP) to guide the preparation of teachers in the United States.

Constructivist Learning: A method or philosophy of learning that promotes meaningful student centered learning via the use of multiple resources and data sources.

Flipped Classroom: A technology based method of learning that reverses instruction moving homework or more learner-centered activities into class time even as it moves traditional instruction (i.e., lectures) out of the class into the homework slot using videos or other audiovisual means.

Preservice: A term used to describe beginning teacher educators, particular those enrolled in Teacher Preparation Programs.

This work was previously published in Promoting Active Learning through the Flipped Classroom Model edited by Jared Keengwe, Grace Onchwari, and James N. Oigara, pages 1-22, copyright year 2014 by Information Science Reference (an imprint of IGI Global).

APPENDIX B: SAMPLE VIEWING GUIDE

Project-Based Learning (PBL): Viewing and Implementation Guide

Directions: We will be examining PBL for the next two weeks. As a part of this activity we will used a Flipped Classroom model to assist our efforts. As such, it is your responsibility to view and reflect in writing about the contents of each of the assigned videos (2) and the online reading (1). Written reflections should appear in your reflective journal and that journal must be brought to class each day. The prompts coupled with your written reflections will serve as the foundation for our course discussion on PBL. Be prepared to share your written thoughts and to discuss PBL during each in class meeting on PBL. Once we have discussed PBL, you will work in your assigned group to develop an age appropriate PBL activity for use with K-3 learners. After those in class presentations, we will engage in a process of summative reflection on PBL before moving to our next course topic.

PBL and the process of implementing PBL into your teaching is supported by the following *CAEP Standard: 1.4*

Step 1: Homework in Advance of Tuesday's Class

Video 1: Project Based Learning from Start to Finish
Source: Edutopia
URL: http://www.edutopia.org/stw-project-based-learning-best-practices-new-tech-video
Length: 8:01 minutes
Before Viewing

1. Define Project Based Learning (PBL)
2. Based on your current understanding of PBL, what do you think is its value for learning?

While Viewing

1. Consider how your understanding of PBL is evolving as you view the contents of the video. What one point about PBL made in the view do you find worthy of serious consideration?
2. What point (quote) from one learner do you find most compelling?

After Viewing: Consider and be ready to discuss these questions in class on Tuesday:

1. Look back at your original definition of PBL and update this definition based on what you learned from the contents of the video. How did it change? How did it stay the same?
2. Why is it important to use learners' prior knowledge to "hook" them into the content of the PBL activity?
3. How did the teachers work together to assure learning?
4. How successful were they in aligning PBL to state standards?
5. How would you begin the process of implementing PBL into your teaching?
6. What do you need to know to assure your success with PBL?
7. How successful might PBL with younger learners (K-3)?
8. How did you decide what information contained in the video was important?
9. What connections have you made between the video's contents and your practice?
10. Where in your teaching could you use what you learned from the video?

Reading 1: A Step-by-Step Guide to the Best Projects

Source: Edutopia
URL: http://www.edutopia.org/stw-project-based-learning-best-practices-new-tech-video
Length: NA
Before Reading

1. List the steps you think are involved in planning, implementing and assessing a lesson using PBL.

While Reading

1. Consider the steps and assess, in the moment, your level of comfort placing a **X** on the continuum in the spot that best reflects your comfort level with PBL.

Very Uncomfortable Very Comfortable
0______________________________1_____________________________2

After Viewing: Consider these questions as they will serve as the foundation for the in class discussion of PBL.

1. What are the strengths of PBL?
2. What are the limitations?
3. What strength do you bring to PBL?
4. What strength might you need to master to assure your success with PBL
5. Consider again, this question from earlier: How successful might PBL with younger learners (K-3)? Place an **X** on the spot on the continuum that best reflects your position.

Unsuccessful Successful
0____________________________1_____________________________2

Step 2: In Class Discussion of PBL on Tuesday

Bring reflective journals to class and be prepared to deeply discuss PBL during class. NOTE: Questions from this guide will serve as starting points for out discussion.

Step 3: Homework for Thursday's Class

Video 2: Five-Year-Olds Pilot Their Own Project-Based Learning
Source: http://www.edutopia.org/kindergarten-project-based-learning-video
Length: 9:01 minutes
Before Viewing

1. What special steps might a teacher need to consider before using PBL with young (K-3) children?
2. How realistic do you think long term PBL projects might be for very young children?

While Viewing

1. What themes from K-3 standards might make successful PBL topics?
2. What management issues emerge that a teacher would want to anticipate and plan for when planning to use PBL?

After Viewing

1. Looking back at your earlier self-assessments of comfort and success, go back and place a check (√) on the spot you now think best reflects your understanding.

2. How did your perspectives change? What factor(s) caused you to change (or fail to change) your perspective about PBL?
3. Identify a list of possible management issues to plan for when developing a PBL activity with the assigned age group (K-3).
4. What statements concern you or contradicted previous understanding of PBL?
5. Where in your teaching could you use what you learned from the video?

Step 4: In Class Follow Up Discussion for Thursday's Class

Bring updated reflective journals to class and be prepared to participate in further discussion of PBL focusing on its use with K-3 learners.

Step 5: Group Activity for Thursday's Class (2 Class Periods, Plus out of Class Group Meetings)

1. Identify a guiding theme or guiding question based on one K-3 learning standard and then identify one appropriate to PBL activity to develop and model for your peers based on this work.
2. What prior knowledge is required of the learner?
3. Develop, rehearse, revise, and them implement (model) the activity for your peers in this class.
4. Be sure to build/develop all materials needed for successful implementation.
5. Present/model your PBL activity for the entire group.
6. Post finalized material in Moodle for peer feedback and instructor grading.

Step 6: Post-Implementation Questions for Final Class on PBL

1. What did you learn about PBL from the group activities developed and modeled in class?
2. As you plan for future PBL activities, what specific management, developmental, and/or academic issues do you now know need to consider?
3. What part of the development and modeling of your group's PBL activity was the most successful? Why?
4. What part might you improve if you were to teach the lesson again?
5. What advice would you give to a novice teacher considering PBL for the first time?

Summative Questions

1. What have you learned about PBL from all the materials and activities?
2. What connections have you made to your teaching practice?
3. Is there another way you could use that same information to support learning?
4. What about PBL continues to concerns you and/or contradicts your previous understanding?
5. Which information about PBL is more important to you than other parts?
6. How useful for learning did you find the Flipped Classroom model? To what extend do you think the Flipped Model supported your learning? What other way(s) might you have preferred to learn this information?

Chapter 78
Innovations in Blended-Learning:
Promoting Proficiency in Reading Comprehension among Students with Dyslexia

Edith Gotesman
Ashkelon Academic College, Israel

Miri Krisi
Ashkelon Academic College, Israel

ABSTRACT

This research was born out of a necessity to accommodate students with learning disabilities who study English for Academic Purposes (EAP) at the Ashkelon Academic College in Israel. It was aimed at examining whether a convergence of traditional teaching and computer technology complemented by e-learning could assist students with Learning Disabilities (LD) to bypass their initial disadvantages when it came to studying English. Groups of LD students selected for study were given five regular and two guided reading tests to explore whether the use of blended learning improved the reading comprehension abilities of students in the sample group.

INTRODUCTION

At Ashkelon College, we are moving from a teacher-centered to a learner-focused system of education. New developments in learning and technology provide opportunities for creating well-designed meaningful learning environments for diverse learners including learners with disabilities. With the advent of computer based education and online learning methodologies and technologies, providers of education are combining teaching methods to fulfill the needs of their learners. Academic institutions now increasingly make use of the internet and digital technologies to deliver instruction and training. Many instructors are encouraged to design courses in which students can benefit from blended learning, a relatively new educational practice which integrates

DOI: 10.4018/978-1-4666-8246-7.ch078

classroom face-to-face learning experiences with online learning experiences (Garrison & Kanuka, 2004). Transformation of learning environments in higher education settings for an increasingly electronic world is critical to ensure that the benefits are fully realized (Williams, 2002). Universities and other institutions of higher education are required to "provide for a larger and more diverse cross-section of the population, to cater for emerging patterns on educational involvement which facilitate lifelong learning and to include technology-based practices in the curriculum'' (Hicks, Reid, & George, 2001, p. 143)

Despite the gaining acceptance of blended learning in higher education (Bliuc, Goodyear, & Ellis, 2007), blended leaning is often a neglected pedagogical strategy for teaching students with learning disabilities. The reasons for the lack of use may vary from teachers who are unaware of the options for using blended learning in their courses, to teachers who are familiar with this method of teaching, but might feel threatened by change and the use of new technologies. Thus far, no studies were conducted examining the blended learning experiences of students with learning disabilities, and its contribution to successful learning.

In this study, the use of blended learning emerged out of the necessity to accommodate students with learning disabilities who study English for Academic Purposes (EAP) in higher education. We would like to share our experience in the field by discussing the practical use of blended learning with this particular group of students. For these students, frontal teaching and the use of assistive technologies (AT) were combined with e-learning in order to assist them read in English. The policy at Ashkelon College is that students with learning disabilities are entitled to a reader. This policy is advantageous during exams and while working at home. However, during the lessons which are not specifically suited to the needs of the LD students, they are unable to benefit from a reader. Instead, LD students have to cope with the reading of the text by themselves, which makes the task almost impossible. Often times they become frustrated at their lack of success and lose motivation. The purpose of the current study was to examine the use of blended learning for teaching English to LD students, and its contribution to successful learning.

In the following sections, we will elaborate on the issue of teaching English in higher education settings, in particular in Israel. Moreover, we will present literature related to teaching English to LD students in higher education using assistive technologies, e-learning modalities, and blended learning techniques. Finally, we will share how these techniques were used to teach English to LD students and the effect these pedagogical strategies had on our students at Ashkelon Academic College.

BACKGROUND

Teaching English for Academic Purposes in Higher Education

In the world of globalization, reading academic texts in English is a basic requirement of higher education. English is important both for college or university entry and for graduation. English is a very important subject especially for students in non-English speaking countries. Thus, as part of the academic requirements in Israel, all college and university students have to master academic vocabulary and reach an advanced level of exemption in reading comprehension in order to graduate.

This exemption level is achieved either through psychometric exams or through enrollment in different levels of English courses based on their entrance level of English. Students who did not reach exemption level prior to their admission to college or university take English courses at different levels, from beginners to advanced levels, provided at the institutions of higher education so that they can meet the requirements. The aim of these courses is to assist students in reaching a proper level of text comprehension in English through the teaching of reading strategies and familiarizing students with extended academic vocabulary.

Students identified as having learning disabilities such as dyslexia often struggle to attain literacy in English. These students are required to meet the same requirements in English as students without learning disabilities. At Ashkelon Academic College, English instructors searched for the best method for helping LD students meet the necessary requirements without the feeling of failure or frustration that often accompanies these students during the course. We reasoned that as they had been unable to learn English using the traditional teaching methods, the use of Assistive Technologies combined with e-learning could facilitate their understanding of texts in English and also lead to their becoming autonomous learners.

PROFICIENCY IN READING

Dyslexia and the Use of Assistive Technologies

Dyslexia is defined as a specific functional failure to acquire the age-appropriate reading skills in otherwise normally developing children (Curtin, Manis & Siedenberg, 2001). Thus, individuals with dyslexia exhibit difficulties in acquiring reading and writing skills at the level expected at a particular age. It is evident when accurate and fluent word reading, spelling and writing develop very incompletely or with great difficulty (Siegel & Smythe, 2004). Within the context of our study, it should be noted that reading and writing skills include comprehension as well and not only word recognition and decoding.

Students with dyslexia often find reading texts extremely difficult in their mother tongue, a difficulty that is exacerbated in attempts to read texts in a foreign language such as English. The aim of Ashkelon college English program is to assist students with dyslexia and other language-related difficulties in learning to read English fluently and be able to cope with the different academic texts provided in the exemption courses. After using different teaching strategies, we came to the conclusion that assistive technology, specifically text-to-speech programs, might be more appropriate for achieving these goals.

The use of assistive technology (AT) has been shown to be effective in many areas, including education. Research has shown that the integration of computer technologies into education is uniquely beneficial to students with special needs, on both the academic and the socio emotional levels, especially for students with learning disabilities (LD) who experience deficiencies in basic academic skills as well as social difficulties through their development (Raskind, Margalit, & Higgins, 2006). Nowadays, many computer programs have features that meet the needs of students with LD. Information and communication technologies support writing, spelling, planning, organizing, editing, and calculation in such a way that users feel more able to express their opinions and their needs. Technological developments have highlighted the potential of assistive technologies for special needs populations (Heiman & Olenik-Shemesh, 2012).

Definition and Types of Assistive Technologies

The term assistive technology (AT) is defined as "any item, piece of equipment, or product system, whether acquired commercially, modified, or customized, that is used to increase, maintain, or improve functional capabilities of individuals with disabilities" (Individuals with Disabilities Education Improvement Act, 2004, sec. 602). According to Raskind and Higgins (1998), assistive technology referred to any technology used to bridge the gap between the person's abilities and the demands of the environment, which can compensate for their specific deficits. Lewis

Table 1. Matching AT to students' specific needs

Student's Individual Need	Assistive Technology
Decoding (sounding out words) Reading comprehension	Text-to-speech programs
Handwriting Directionality	Speech-to-text programs
Expressing words in written form	Word processors Word prediction programs
Encoding (spelling)	Proofreading programs Spell checkers
Organization	Outlining/brainstorming programs

(1998) added that the ease of technology usage can promote students' ability to overcome barriers regarding academic difficulties.

AT covers a wide range of software which helps students read, write, organize information and spell. Table 1 presents the ways in which AT can be used to meet the specific needs of students with disabilities.

Research on Assistive Technology and Learning Disabilities

The use of technology has been shown to be effective in a wide range of content areas (Ashton, 2005; Edyburn, 2004; Okolo, Cavalier, Ferretti, & MacArthur, 2000). Research indicates that use of Assistive Technology (AT) can contribute to strengthening students' skills in decoding, comprehending and reading with fluency (Elkind, Cohen & Murray 1993; Higgins & Raskind, 2000), word recognition, reading comprehension, spelling and reading strategies (Raskind & Higgins, 1999), spelling (Dalton, Winbury, & Morocco, 1990), organizing, reading and synthesizing information (Anderson, Inman, Knox-Quinn, & Homey, 1996, Anderson, Inman, Knox-Quinn, & Szymanski, 1999), proofreading (Raskind & Higgins, 1995) and writing (Raskind & Higgins, 1995). While the use of AT has many benefits, it is essential that an instructor is able to select the most appropriate technology that matches their students' needs.

Selecting the Appropriate Technology and Matching it to Students' Individual Needs: Raskind and Higgins (1998) claim that selecting the appropriate technology for an individual with a learning disability requires careful analysis of the interplay between the individual, the specific tasks or functions to be performed, the specific technology and the specific context of interaction. Figure 1 shows the interplay between the individual who requires assistive technology, the context in which it is used - at home for homework, at school for class assignments or in the library - and the type of technology.

Each individual should have access to the type of technology that best complements his or her needs. The chosen type of assistive technology could help an individual with a learning disability to function at a level that is appropriate to their level of intelligence. Table 2 presents various types of AT that correspond to the type of learning difficulty: difficulty in reading, writing, planning and organizing material, spelling and word prediction.

Text-to-Speech Programs: Individuals with learning disabilities such as dyslexia, who have difficulty in decoding and understanding written text, may be able to comprehend printed content better when it is read out loud. These individuals

Figure 1. The interplay of individual, task, context and technology (Source: Raskind, 2006)

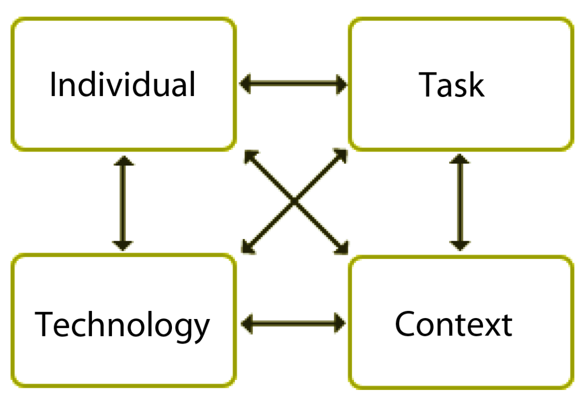

Table 2. AT according to types of difficulty/impairment

Type of Difficulty	At to Consider	Internet Site
Reading	ReadPlease Natural Reader TextAloud TextAssist Kurtzweil Read&Write	www.readplease.com www.naturalreader.com www.textaloud.com www.textassist.com www.kurzweiledu.com http://www.texthelp.com
Writing	DragonNaturally Speaking Intellitalk	www.nuance.com/naturallyspeaking www.intellitools.com
Planning and organization	Inspiration	www.inspiration.com
Spelling and word prediction	WordQ Predictor Pro	www.wordq.com www.readingmadeez.com/products/PredictorPro.html

may have substantial gains in reading scores and comprehension when the text is read aloud for them. Text-to-speech programs allow the electronic text to be synchronized with audio in order to help people with reading difficulties. These reading programs are very useful not only for students with dyslexia. They are also valuable for visually impaired students who can use one of the software features in order to enlarge font, change background and/or listen to the text uploaded to the screen of the reader.

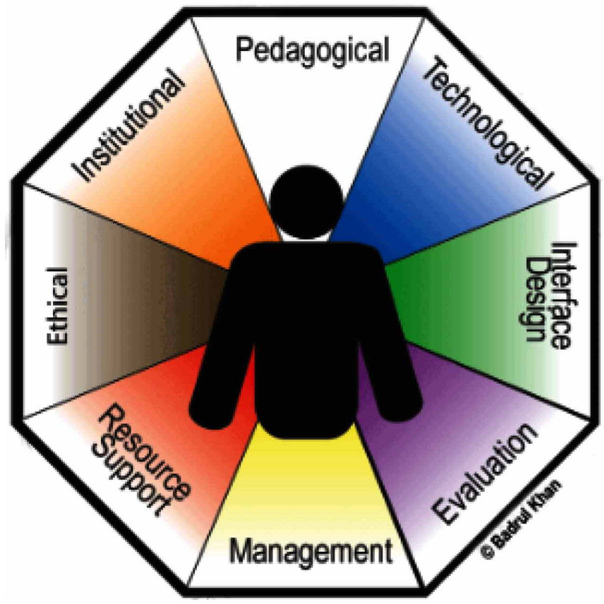
At Ashkelon Academic College our choice for text-to-speech software was TextAloud. This reading program provides multi-modal reading, which means that the text- to-speech is combined with word-by-word highlighting, thus reading a digital text out loud. Students can adjust the reading rate and the font size according to their individual needs. The software provides options for voice type. One of its advantages over other text-to-speech programs is that it can turn text files into audio files. LD students at Ashkelon College use TextAloud to listen to articles both in class while working on assignments and at home when preparing their homework. TextAloud offers AT&T voices, which sound less artificial and are better understood by students.

E-Learning

Most institutions of higher education make use of advanced technologies to improve their distance teaching. E-learning (studying via the Internet) can be viewed as an innovative approach for delivering well-designed, learner-centered, interactive and facilitated learning environment to anyone, anyplace, anytime, by utilizing the attributes and resources of various digital technologies along with other forms of learning materials suited for open and distributed learning environment (Kahn, 2001).

Studies show that with regards to academic aspects, e-learning provides pedagogical and technological alternatives to face-to-face tutorial meetings for students who are unable to attend the group meetings or for students with various disabilities (Heiman & Olenik-Shemesh, 2012). E-learning provides constant academic updates as well as online discussion forums, allowing the learner to reflect prior to responding to a message, and therefore it usually enables a better analytic response (Harasim, 1990). E-learning often includes additional enrichment learning resources, links to databases, Internet sites and multimedia materials that are related to the course of study.

Figure 2. Kahn's octagonal framework



The theoretical framework for our special course at Ashkelon Academic College is based on Khan's e-learning framework 'The Octagonal Framework' (http://asianvu.com/bk/framework/).

According to Khan (2005), a variety of factors are required to be addressed in order to create a meaningful learning environment, many of which are interrelated and interdependent. Since the learning requirements and preferences of each learner tend to vary, it is essential to use a blend of learning approaches and teaching strategies in order to cater for their needs. Placing the learner at the center of Kahn's framework, we identified the critical issues of the learning environment for our particular group of students and adopted the teaching philosophy which best suits the needs of our students: blended learning.

Blended Learning

Today's students are increasingly more diverse than ever before. Incoming undergraduates are in many cases more technologically proficient than their faculty (Dziuban, Hartman & Moskal, 2004). A relatively innovative trend emerging in higher education is the blending of text-based asynchronous Internet technology with face-to-face learning—often referred to as simply blended learning (Garrison & Kanuka, 2004). Bonk and Graham (2005) state in their Handbook of Blended Learning that "The widespread adoption and availability of digital learning technologies has led to increased levels of integration of computer mediated instructional elements into the traditional F2F (face to face) learning experience" (p. 27).

There are a number of potential advantages to blended learning that are emerging. Some of these revolve around accessibility, pedagogical effectiveness, and course interaction. An additional benefit is an increase in interaction over what students and faculty typically perceive in face-to-face courses, and the end result is a learning environment where students can be actively engaged, potentially learning more than in a traditional on campus classroom (Wingard, 2004).

Blended learning represents a shift in educational strategy. It is an educational method that combines the benefits of e-learning, computer technology and the conventional face-to-face teaching methods in order to optimize the teaching and learning process. It intends to take the best of both worlds. Students take advantage of teacher-driven presentation and selection of relevant content, benefit from social interaction, live instruction and immediate feedback. Blended learning supports personalized learning, thoughtful reflection, and differentiate instruction from student to student across a diverse group of learners. Thus, blended learning offers a pedagogical approach that combines the effectiveness and socialization opportunities of the classroom with the technologically enhanced active learning possibilities of the online environment (Dziuban, Hartman & Moskal, 2004).

THE PILOT PROJECT STUDY

Rationale, Problems and Solutions

Pupils with learning disabilities become college students with learning disabilities. In order to meet the needs of students with learning disabilities attending institutions of higher education, these institutions offer various accommodations for students who have been diagnosed as having a disability. Assessment is the key determining factor in deciding whether a student will benefit from a text-to-speech output accommodation. A student who has difficulty decoding multisyllabic words, loses his or her place on the page, or has difficulty comprehending printed text, may benefit from text-to-speech output. The diagnosis is conducted by a certified diagnostician specializing in learning disabilities.

Our college offers LD students enrolled in the EAP program the opportunity to complete their English requirements. Students formally diagnosed as learning-disabled are offered the following accommodations:

1. A modified version of the text: the original text of the article to be studied is edited and rearranged in a different way in a manner that simplifies accessibility to answers. Each group of paragraphs is followed by the set of questions that refer to them. This format helps LD students better focus on their assignment.
2. Time extension.
3. Use of TextAloud program, a text-to-speech software which reads the text of the article and the related questions.

Aim of the Project

The pilot study aimed at examining whether employing blended learning could facilitate the understanding of English texts by LD students and improve their reading comprehension abilities thus leading to their becoming autonomous learners.

Methodology: We used a quantitative experimental research. The experimental study was conducted throughout the academic year of 2010-2011. The stages of the study included a pre-test, intervention and a post-test design. The t-tests, comparing the average scores of the first and final exams of the students in the control group to those of the students in the special group, were statistically analyzed and discussed. In addition, observations of the students in the respective classes were conducted during the academic year, and a follow-up interview with students from both sample and control groups were conducted at the end of the course.

During the observations, notes were taken as to the use of the software by the students in the sample group, the interactions of the LD students in both the specialized and regular classes with the instructors as well as other students, as well as the students' participation in the lesson. The end-of-year interview included questions regarding the student's perceptions, feelings and overall sense of accomplishment at the end of the course.

Two groups of LD students participated in the pilot study. All the students took five exams during the academic year. The t-tests compared the average scores of the first and final exams of the students in the control group to those of the students in the special group. The sample group consisted of 20 students enrolled in the special course for LD students, and the control group consisted of 7 LD students who were entitled to the same accommodations, but chose not to be part of the special course. The special course is designed for LD students. The course includes the same materials, reading strategies and academic vocabulary as those used in the regular EAP courses. However, the specialized English course for LD students differs from the regular courses in that the lesson takes place in a computer lab, where each student sits in front of a computer and uses TextAloud in order to read the materials used during the lesson.

In the study, each group of participants undertook five reading comprehension exams during the annual course. The exams varied in terms of level of difficulty, length of the text and vocabulary. Students took the first exam at the beginning of the course, and the last exam was the final exemption test at the end of the course. The first group of twenty students, who were part of the special course, used TextAloud for class assignments on a regular basis. In order to be able to practice the material taught in class and complete homework assignments by using the reading software, the teaching and learning process was supplemented by e-learning. LD students had access to the learning materials and the TextAloud program online. They in fact experienced blended learning: face-to-face teaching in the computer lab, use of AT and e-learning. The teaching methodology used incorporated frontal teaching – the instructor taught his students traditionally, using books and board, supplemented by the use of assistive technology – students put on their headphones and individually listened to the text and questions read aloud by TextAloud. Thus, every lesson began with a traditional mode of instruction in which the instructor provided explanations of the material taught. The students' independent learning followed in the second part of the lesson. They put on their headphones and used TextAloud in order to listen to the text of the article and related questions. The instructor role is to supervise, answer questions, to provide immediate feedback and technical assistance.

The software assisted LD students decode the text by reading aloud the text copied into the program window. The program's features allowed each student to choose the preferred "natural voice" of a male or female reader, to adjust the speed and pitch of the reading, as well as go back and forth in the text as needed. Students were able to concentrate better as they listened to the text through their headphones. The students worked at their own pace, and greatly appreciated the option of reading speed adjustment. At home students accessed the college site and used the reading software in order to complete their assignments. In the past, students would download the trial version of TextAloud from the Internet site and work at home, but the artificial computer voices that the free trial version offers were not clear enough. The solution was to work online from home. Students virtually connected to the desktop of the college main computer by using their username and password. In this way they could use the college purchased version of TextAloud and listen to the text being read by more natural voices.

The second group included seven LD students who took part in the regular courses, and did not have access to a computer during the regular lessons. Thus, they experienced only the traditional method of face-to-face teaching. These students made use of TextAloud only during in-class and the final exams.

Findings

The results of the 5 exams of all 27 participants were statistically analyzed.

Table 3 presents the means and standard deviations of the scores on the exams of the students in the specialized class. The results point to a significant improvement in the students' scores over time $F(4,76) = 11.6, p < 0.01, \eta^2 = 0.38$. A subsequent Bonferroni test indicates a significant difference in student English test scores from the second to the third exams and the last exam.

In addition, a comparison between the results of the LD students in the specialized class to the results of LD students in the regular classes indicates that although both groups showed a gradual improvement in exam scores, students who attended the specialized class appeared to achieve greater improvements. That is, while no significant differences between groups are found in the scores on the first exam (t (28) =-0.207, p=0.84), significant differences are found in the scores on the exemption exam given at the end of the course (t (28) =1.5, p=0.144) (see Table 4).

CONCLUSION AND RECOMMENDATIONS FOR FURTHER RESEARCH

The pilot study aimed at examining whether employing blended learning could facilitate the understanding of English texts of LD students and improve their reading comprehension abilities thus leading to their becoming autonomous learners. Overall, the results point toward a tendency of

Table 3. Mean ± Standard Deviations of exam scores of LD students in specialized class

	M (N=20)	SD (N=20)
2nd exam	53.60	13.869

Table 4. Comparison in means of 1st and final exam

Exam	Dyslexic Students in the Special Course	Dyslexic Students in Regular Courses
1st exam	53.7 (14.98)	55 (13.13)
Exemption exam	75.96 (16.5)	63.6 (26.5)

improvement for both LD groups, those who used the technology and were enrolled in the blended English learning course and those who did not. Nevertheless, while both groups benefited from participating in the course as shown by their improvement in reading English academic texts, those students who took part in the specialized course were able to make greater progress. It appears that the use of blended learning including the use of assistive technology and e-learning best suited the students' needs, and provided the necessary tools to supplement the face-to-face teaching. The use of the computer for reading texts in class helped students to understand the lesson better

Thus, while students in the sample group benefited from TextAloud, which assisted them in bypassing their reading disability, the LD students in the regular class had to rely mainly on the instructor's help during the lesson for reading and comprehending the texts. This, in turn, put them at a disadvantage since the instructor's attention focused on the majority of regular students rather than the LD student. Students' access to TextAloud at home assisted them in doing homework assignments on their own. This enabled them to practice the various strategies and new vocabulary taught in class. LD students who attended the regular classes did not have access to the text-to-speech program from home. Consequently, completing their homework assignments was much more difficult, often leading to frustration and neglect to complete their assignments.

When asked about their experiences with blended learning, most students in the sample group expressed satisfaction with the level of instruction as well as the multitude of teaching media, stating that the use of AT and e-learning greatly contributed to their accomplishments in the course. More importantly, students claimed that their ability to "handle texts on their own" had also helped in boosting up their self-esteem, proving their ability to succeed in the academic studies despite reading difficulties. Hence, it appears that employing blended learning as the teaching strategy increased students' participation in the lesson and helped them be better prepared to reading articles in their individual field of study. Moreover, participating in the specialized course provided students with the opportunity to learn, apply, develop, maintain and generalize new reading strategies, leading to improvements in their reading fluency. This resulted in better grades.

An interesting observation regarding the use of the program is worth noting. It appears that students vary in the way in which they related to the software. While some students made constant use of the software and could not do without the reader, others used it only when they encountered difficult words they were unable to read by themselves. Students from both the sample and control groups acknowledged the advantages of the reader over the tapes they had used in high school: easier movement in the text, possibility to enlarge fonts, arrange text according to individual preferences, adjust the speed/pace of reading, choose the voice of the reader (male or female) which best suited their needs. The fact that students were able to use the reader by working online from home did, in fact, contribute to their success. Students realized that the software could not only help them read in order to understand the texts studied during the course. It could become handy whenever they have to read. After graduation from colleges or universities, students start their own career. Since their reading disability does not disappear, they will be able to benefit from the assistance of screen readers later in life.

Nonetheless, some caveats should be mentioned that future implementation of AT and e-learning should take into consideration. Some students pointed to the lack of inflection and intonation of the reading program, which slightly impaired their understanding. They would rather listen to human voices, to a real person sitting across them and reading to them. In addition, instructors observed that some students found it hard to multitask while working individually during the lesson.

In addition, a follow-up research on a larger population of LD students and a longer period of time is needed. We consider using more varied research tools by adding in-depth interviews and case studies in order to observe individual variation. Research carried out thus far on e-readers indicates that, as is often the conclusion in educational research, individual variation merits greater attention than mere examination of group means (Hecker et al., 2002). The effectiveness of e-readers appears to be highly dependent on individual student traits.

The present study shed some light as to the contribution of blended learning in improving the reading comprehension of LD students. It appears that blended learning provided LD students with the appropriate learning environment and the necessary tools for maintaining an open and flexible learning environment. Educators should not hesitate to integrate technology features into instruction for students who struggle with academic tasks. These approaches can support learning by building literacy, language skills and independence.

KEY TERMS AND DEFINITIONS

Assistive Technology: Any item, piece of equipment, or product system, whether acquired commercially, modified, or customized, that is used to increase, maintain, or improve functional capabilities of individuals with disabilities.

Blended Learning: An educational method that combines the benefits of e-learning, computer technology and the conventional face-to-face teaching methods in order to optimize the teaching and learning process.

Dyslexia: A specific functional failure to acquire the age-appropriate reading skills in otherwise normally developing children.

E-Learning: Studying via Internet.

EAP: English for academic purposes.

LD Students: Students with learning disabilities.

Text-to-Speech Programs: Computer programs that use a form of speech synthesis that converts text into spoken voice output.

Chapter 79
The Ever-Evolving Educator: Examining K-12 Online Teachers in the United States

Jean Larson
Arizona State University, USA

Leanna Archambault
Arizona State University, USA

ABSTRACT

This chapter reviews the current research on the educational, training, and demographic characteristics of those involved in teaching K-12 online. Although very few colleges of education incorporate any aspect of teaching online into their curricula, the existing online teacher preparation programs are discussed. Past and ongoing research reveals a dramatic disconnect between: (a) the rapidly expanding expectations for and implementation of online education at the K-12 levels and (b) the surprisingly limited extent to which teachers are actually being educated, trained, and otherwise prepared to function in this challenging new educational environment. The implications for teacher education programs and current K-12 virtual schools are clear. Effective online teaching techniques must be defined, empirically proven, and efficiently implemented by both future and current K-12 online teachers.

INTRODUCTION

Online education at the K-12 level is in the early stage of an exponential growth pattern that will ultimately result in an entirely new educational paradigm (Miller & Ribble, 2010). The need for highly-qualified, classroom teachers has always been critical, but now such teachers must also be trained to meet the challenges of conveying knowledge to students that are separated from the teacher in space and time (Charania, 2010). This new category of teachers must be capable of (a) transferring knowledge without face-to-face contact, (b) designing and developing course content in a technology-based environment and (c) delivering content in a way that will both engage the remote student and assure that the content is actually learned. Unfortunately, there is a significant disconnect between the growing expectations for online education and the training

DOI: 10.4018/978-1-4666-8246-7.ch079

of teachers expected to teach in this uniquely different environment. While some form of online learning is now available in every state (Watson, Murin, Vashaw, Gemin, & Rapp, 2011), only a small minority of current K-12 online teachers have actually received formal training on how to teach online during the course of their teacher education program (Archambault, 2011; Dawley, Rice, & Hinks, 2010). The current status of online K-12 education must be viewed against a background of teacher training that includes very little, if any, relevant instruction pertaining to teaching in an online environment.

This chapter will present and discuss the following topics:

1. An introduction to online teacher quality and preparation;
2. The characteristics of K-12 online teachers based on current research;
3. Programmatic online teacher preparation efforts, both at the pre-service and in-service levels; and,
4. Implications and recommendations for teacher education programs.

BACKGROUND

Current Status of K-12 Online and Blended Learning

During the 2012-2013 school year, 31 states had at least one fully-online, statewide school (Watson, Murin, Vashaw, Gemin, & Rapp, 2012). Enrollment in K-12 courses offered by online schools has increased from 50,000 course enrollments in 2000 (Clark, 2001) to over 2 million course enrollments in 2009 (Patrick & Dawley, 2009). Watson et al. (2012) report that about 5% of all K-12 students in the United States are enrolled in at least one online class. Queen, Lewis and Coopersmith (2011) found that 55% of public school districts were offering some form of online experience for their students during the 2009-2010 school year. Among these schools, 74% reported an interest in expanding the online opportunities being offered in the following years (Queen, Lewis, & Coopersmith, 2011).

There are many reasons for the increasing number of K-12 students who attend school online, including, for example, the ability to work at one's own pace and to take courses that are otherwise unavailable. As of 2010, Advanced Placement (AP) or International Baccalaureate (IB) courses in common subjects were offered in fewer than 34% of public school districts (Lee, Edwards, Menson, & Rawls, 2011). Advanced courses as well as credit recovery are two of the most common reasons that school districts have made online offerings available to students (Lee et al., 2011).

Online programs have evolved over the past two decades through the independent efforts of geographically and politically separated administrative entities. Different formats have been experimentally implemented in the presentation of different subjects, using different technologies at different grade levels. This lack of any common or centralized development has lead to the adoption and use of different terms for the same or closely similar concepts in online learning. Only recently has there been a trend toward more unified and shared terminology and identification of the basic formats by which K-12 content is delivered, in whole or part, through the Internet.

As defined by Clark (2001), a "virtual school" is "an educational organization that offers K-12 courses through Internet or Web-based methods" (p. 1). According to Watson et al. (2012), one of the fastest growing educational formats is "blended learning," a combination of face-to-face learning with online learning. The structures of blended learning models are themselves evolving to include different elements of communication and different proportions of face-to-face and digital delivery.

Online programs are also being categorized on the basis of the administrative structure by which the underlying program is sponsored, funded, or controlled. For example, an online program may be administered by a school district, some form of a state-level entity, a consortium of schools or school districts, or a post-secondary institution.

With the accelerating growth in online or virtual schooling at the K-12 level, there is a corresponding need for qualified, K-12 online teachers (Charania, 2010; Kennedy & Archambault, 2012b). Independent of the *content* being offered through online courses, the skills needed to effectively convey knowledge in an online environment include, but go substantially beyond, those skills learned in traditional, teacher education programs designed solely for face-to-face instruction (Barbour, 2012b). Interestingly, the vast majority of current research relating to online education is focused on the student and not the teacher. Very few teacher education programs include courses or training designed for the specific preparation of online teachers (Barbour, Siko, Gross, & Waddell, 2012). Furthermore, little is known about the relevant education and training of those currently teaching K-12 online students in the United States (Archambault, 2011). This lack of information, coupled with limited research on effective practices for teaching K-12 students online suggests a troubling disconnect between the rapid expansion of online course offerings and the training of teachers in the design, preparation, and delivery of such courses.

Definition of Terms

Overview

The extensive volume of literature pertaining to online learning and its relation to traditional and other forms of learning has produced a vast array of terms with divergent and sometimes inconsistent meanings and applications. This inconsistency makes it difficult to understand and compare important studies. A meaningful statement on the status of online education can be obscured through inconsistent terminology. For purposes of this chapter, an attempt was made to normalize and simplify definitions currently used in research, including the definitions developed by the Innosight Institute (Staker & Horn, 2012) and *Keeping Pace with K-12 Online & Blended Learning* (Watson et al., 2012). These normalized definitions are presented in the following section.

There are three fundamental forms of learning that can be described and defined as (a) face-to-face learning, (b) online learning and (c) blended learning. Their definitional relation to one another is depicted in Figure 1.

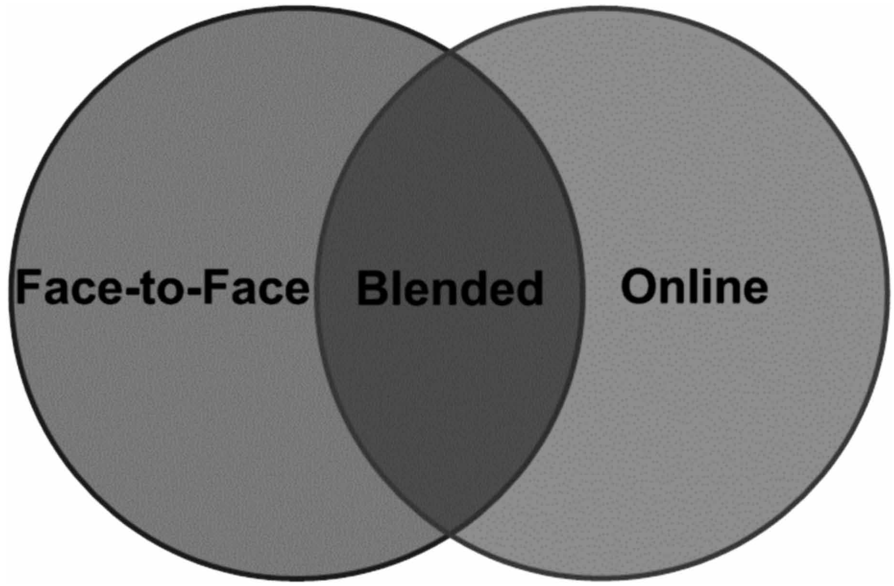
Figure 1 illustrates the fact that face-to-face learning and online learning can each exist independently, or they can be combined to form blended learning, which incorporates elements from both of the two other categories. In the broadest sense, face-to-face learning involves a teacher directly, delivering content to a student who is physically present at the same location at the time of delivery; online learning involves the student remotely obtaining content over the Internet, either concurrently or on a time-delayed basis; and blended learning involves an integration of elements from both face-to-face learning and online learning.

The three basic forms of learning are defined with examples in the following paragraphs and a table collecting and summarizing these definitions is included at the end of this section.

Face-to-Face Learning

Historically, learning has been delivered directly from an instructor to a student on a basis that is quite literally “face-to-face.” Face-to-face teaching is sometimes referred to as the “brick and mortar” or the “traditional learning” model. In this chapter, the term face-to-face learning is defined as education in which a student learns in a *formal educational* program, at a *central* location and *with an instructor*.

Figure 1. Forms of learning



Face-to-face learning includes two major subcategories: *traditional* face-to-face learning, where content is delivered or led by the instructor and *technology-rich* face-to-face learning, where the instructor uses or manages technology to enhance or augment content delivery. Most public schools in the United States still deliver content in the *traditional* face-to-face format. Increasingly, *technology-rich* learning is being implemented where schools use digital textbooks, devices, lesson plans, and the like while a teacher is physically present and directly delivers content and instruction to the student.

Online Learning

With the increasing availability of the Internet and high-speed connections, a second important form of learning has emerged. This form is referred to as online learning and is defined as education in which a student learns in an educational program, through student-controlled Internet delivery of content and instruction. Online learning further breaks down into two major subcategories: *formal online learning*, where the educational program is structured and accredited; and, *informal online learning*, where the educational program is unstructured. Florida Virtual School is an example of a program that offers *formal online learning*. An example of *informal online learning* would be the use of educational games or specialty lessons to provide enhanced learning or tutoring for students.

Blended Learning

Blended learning is being adopted by an increasing number of K-12 programs and is being implemented in many different combinations of face-to-face and online learning. The term blended learning is defined in this chapter as education in which a student learns partially on a *face-to-face* basis and partially through *formal online* learning.

Table 1 combines definitions and examples to provide a definitional structure that allows for the categorization of almost any combination of current learning environments.

Hybrid Forms

The various blended learning models defined by The Clayton Christensen Institute have been further divided into a group of hybrid forms (Christensen, Horn & Staker, 2013). Christensen et al. (2013) define a hybrid as "a combination of the new, disruptive technology with the old technology and represents a sustaining innovation relative to the old technology" (p. 4). The types of "sustaining hybrid innovation" that are characterized by combining the benefits of both online learning with face-to-face learning can be found in the Station Rotation, Lab Rotation and Flipped Classroom blended learning models outlined above. In contrast, the remaining blended learning models (Flex, Self-Blend, Enriched Virtual and Individual Rotation) offer experiences that do not include the primary feature of face-to-face instruction. In fact, very little of what is known as traditional classroom learning is found in these models. Students are in control of the pace of the content and often the place in which the content is delivered (Christensen et al., 2013).

Although there are many variations on the basic learning environments summarized in Table 1, this chapter will focus only on those in which learning occurs in a *formal online* learning program, directed to K-12 students studying in the United States. The scope and coverage of this particular form of learning is depicted in Figure 2, where the face-to-face, blended and informal online learning elements are excluded from the exclusively online model.

Administrative Structures of Online Programs

Overview

There is a wide variety of online programs currently being offered to K-12 students across the United States. These programs combine several key elements into different administrative structures. Some of the factors defining these structures are based on a diagram adapted from *A Primer on Virtual Charter Schools: Mapping the Electronic Frontier* (Vanourek, 2006). These defining factors correspond to a spectrum within which different administrative structures are arrayed according to each program's comprehensiveness, grade level, governance, geographical range, funding sources, and responsibility for course fees. Any particular administrative structure may offer courses that range from a single, supplemental course to a full-time, comprehensive program. Although most programs distinguish between grade levels (elementary, middle, and high school), increasingly, the traditional boundaries between grade levels are disappearing with students allowed to take courses that match their personal attainment levels. Also disappearing are the geographical and political restrictions that have historically limited student attendance to a particular commuting distance or to a particular school district. With high speed communications, there is little difference between attending a locally produced course or one that originates several thousand miles away. In the case of online education, each of the associated administrative structures can uniquely provide for its own management and governance, funding sources, course acquisition, course delivery, assessment of fees and attendance/completion requirements (Watson et al., 2012).

One of the difficult challenges is preparing teachers for such a continuum of blended, hybrid, and online models of learning together with the various administrative structures that exist. To understand the needs of the K-12 online teacher, it is helpful to explore what is known about this particular population of educators.

K-12 Online Teacher Demographics

Overview

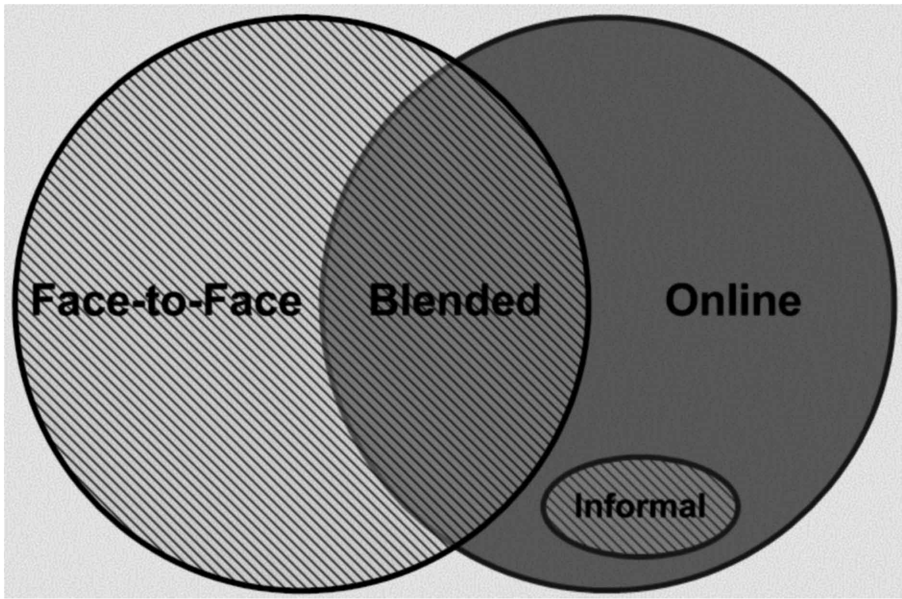
With the growth of online teaching directed to K-12 students, it is increasingly important to understand

Table 1. Types of learning environments

Types	Basic Learning Models	Sub-Categories	Definitions	Examples
Face-to-Face	*A form of education in which a student:* Learns in a formal educational program at a central location with an instructor.	Traditional	Face-to-face learning where the content is delivered or led directly by the instructor.	Most public schools in the United States
		Technology Rich	Traditional face-to-face learning where the instructor also uses or manages technology to enhance and/or augment the delivery of content.	Any school that uses digital textbooks, devices, lesson plans, or the like but still has content and instruction delivered by the teacher and not over the Internet.
Online	*A form of education in which a student:* Learns in an educational program based on student-controlled online delivery of content and instruction.	Formal	Online learning where the educational program is structured and accredited.	Florida Virtual School
		Informal	Online learning where the educational program is unstructured.	Educational games
Blended	*A form of education in which a student:* Learns in an educational program that combines both: Face-to-Face Learning and Formal Online Learning	Rotation Model	An educational program in which the student in a *particular course moves on a fixed schedule* between face-to-face learning and at least one online element.	KIPP LA Empower Academy (Station), Rocketship Education (Lab), Stillwater Area Public Schools (Flipped-Classroom) and Carpe Diem Collegiate High School and Middle School (Individual)
		Flex Model	An educational program in which the student learns on a schedule that is *individually defined and executed* with the student moving between *primarily* online learning with *varying types and degrees* of face-to-face learning.	San Francisco Flex Academy
		Self-Blend Model	An educational program in which the *student elects* to pursue at *least one formal* online course in addition to their traditional, face-to-face program.	Quakertown Community School District
		Enriched-Virtual Model	An educational program in which the student learns *almost entirely* online with *minimal* face-to-face learning within each of the courses.	Albuquerque eCADEMY

the background of the teachers involved and the extent to which they have been educated or trained on how to teach in this very different educational environment (Davis, Roblyer, Charania, Ferdig, Harms, Compton & Cho, 2007; Miller & Ribble, 2010; Archambault, 2011). There is very little research that focuses on the specific differences between online and face-to-face teaching, but there is a consensus that differences do exist (Barbour, 2012b). The online setting requires the teacher to use new forms of communication, engagement and assessment (Searson, Jones, & Wold, 2011). Certain online teaching characteristics can even vary depending on the students. For example, there is generally more instruction delivered online for older students and less for younger students (Watson, Gemin, & Coffey, 2010). Easton (2003) found that online and face-to-face teachers require similar skill sets, yet an online teacher must also manage and engage students virtually and have the skills of an instructional designer and interaction facilitator. It is important to note that there is very

Figure 2. Formal online learning (excluded areas are crosshatched)



little research available on the characteristics and preparation of K-12 online teachers, even though this teaching format represents one of the fastest expanding uses of technology in education (Means, Toyama, Murphy, Bakia, & Jones, 2010).

Personal Demographics

In 2008, Archambault conducted a nationwide survey examining the demographics of K-12 online teachers. The survey included demographic questions such as age, gender, race/ethnicity, education levels, course format and teaching role. The results of this study showed those teaching in the K-12 online setting were 77% female and 23% male. Glick (2011) also conducted a study to compare the gender distribution of online teachers as compared to traditional teachers and found only a minor difference between the online and traditional populations. Because K-12 classrooms have been historically the domain of female teachers, it would not be surprising that this dominance carried over to the online environment. Interestingly, however, Glick (2011) speculates that the proportion of female online teachers may be even higher because it accommodates an "easier integration of traditional family roles like raising children." In terms of age, the range of K-12 online teachers fell predominately in the range of 26-45 years, with 34% of these teachers being between 26 and 35 years of age and 29% within the 36 to 45 age range (Archambault & Crippen, 2009). Race and ethnicity of those who were teaching online also closely mirror the national trends observed in the case of face-to-face teachers (Glick, 2011). Archambault and Crippen (2009) found that 91% of the K-12 online teacher population was White/Caucasian, while 3% was Hispanic, 2% was Black/African American, 1% was Asian/Pacific Islander, 2% was mixed racial background, less than 1% was Native American and about 3% were self-classified as "other/prefer not to answer." During the same school year covered by Archambault's study, the National Center for Education Statistics (2008) reported the following characteristics for traditional public school teachers: 83% White, 7% Hispanic, 7% Black, 1% Asian, 1% mixed and under 1% Native American. Glick's 2011 study showed a much smaller difference in the distribution of White/Not Hispanic teachers as between the online (81.57%) and the face-to-face (83.10%) teaching environments.

Education and Experience

As part of a research series that began in 2007, Dawley et al. (2010) conducted a follow-up national survey of online teachers to identify "the unique needs and status of professional development for K-12 online teachers" (p. 7). Of the teachers responding to the survey, 99% held a teaching credential and 60% held a Master's degree or higher (Dawley et al., 2010). Archambault also looked at what certificates, if any, were held by the online teachers. Although 43 of the 596 participants reported having some additional certification, only two were for an Online Teaching Certificate (Archambault & Crippen, 2009). When examining the number of years the respondents had been teaching (both face-to-face and online), the authors found that the average participant had 14 years of teaching experience. Dawley et al. (2010) reported in the most recent *Going Virtual!* Research Series, that 73% of responding K-12 online teachers had been teaching for a total of six or more years. In a closer examination of online teaching experience, Archambault and Crippen (2009) reported that respondents had been working at their current online school for an average period of four years. The duration of online teaching experience ranged from being a first-time teacher to a teacher having 32 years of experience, some of which involved some form of distance education. As recently as 2010, Dawley et al. found that 12% of newer teachers did not have any face-to-face teaching experience before undertaking their current online teaching job. In addition, Kennedy and Archambault (2012b) found only 1.3% of surveyed university level education programs offered field experiences in online settings in an effort to train future educators how to teach online.

Teaching Assignment

There are many variables that must be considered when describing the actual functions that must be performed in the course of a K-12 online teaching assignment. Included among these variables is the geographical distribution and cultural backgrounds of students, the range of different course creation and delivery formats and technologies, the number and size of the classes taught and the grade level, and subject matter toward which the course material and teaching must be directed.

The actual course delivery format in the online K-12 setting can also vary. In some instances, courses are offered on a completely asynchronous basis, where the students are independent, self-paced and can attend the online course at any time (Barbour et al., 2012). Alternatively, the course may be offered on a synchronous basis, where the students and the instructors are all online at the same time. Courses offered on a synchronous basis tend to be the most similar to a traditional, face-to-face classroom setting (Barbour et al., 2012). Archambault and Crippen (2009) reported that 81% of the surveyed online teachers taught courses asynchronously. Stated differently, over 80% of the respondents teach in the format which is the "most dissimilar" to the traditional face-to-face environment for which they were educated and trained. There would seem to be an implicit assumption that if a teacher is competent to teach in the classroom, that competency carries over to teaching online. This apparent assumption is consistent with the fact that fewer than 2% of university education programs are preparing teachers by offering field experiences and formal courses involving the knowledge and processes one must have to successfully teach students who are separated in time and space (Kennedy & Archambault, 2012a).

In most cases, the teacher assigned to a class of students was not the person who actually created the online course (Archambault & Crippen, 2009). Forty-two percent of online teachers use texts and course materials that were created by a content provider. A slightly smaller percentage (38%) report the teacher as the primary creator of the materials used in the class they taught online (Archambault & Crippen, 2009). Queen and Lewis (2011) found that courses developed by outside organizations were used in 75% of districts that offer their students online classes.

As to the course titles and subject matter being taught online, there is not one particular subject that is being offered online to an extent that is substantially greater than other widely offered subjects. Archambault and Crippen (2009) found a fairly consistent distribution of respondents teaching in the areas of Math (14%), Science (14%), Language Arts/Reading (17%), Social Studies (14%) and Humanities (12%). Within this survey, teachers who were not teaching within one of these areas selected "Other" to indicate they were teaching a course that was not listed, such as Physical Education or Business or a more general area such as multiple subjects, special education, or a combination of classes. Twenty-eight percent of the teachers reported teaching one class, while 22% reported teaching seven or more separate groups of students (Archambault & Crippen, 2009). Finally, although the study included teachers in all grades from pre-kindergarten through twelfth grade, the large majority of the online courses were offered at the high school level.

K-12 Online Teacher Preparation

Overview

There is no question as to the pressing need for more and better prepared K-12 teachers. This need is only amplified in the emerging specialty of online teaching (Miller & Ribble, 2010). The qualities and skills that characterize successful K-12 teachers are necessary, but not sufficient to achieve an equivalent level of success when teaching students who are learning at a different place and a different time. Online teachers require skills and knowledge that traditional teachers simply do not need when dealing with students on a face-to-face basis (Davis et al., 2007). The problem is that these skills have not been properly defined, evaluated or verified through empirical research (Barbour, 2012b). Additional research is needed to develop a better understanding of the skill set that is actually required to effectively and efficiently transfer knowledge through intervening dimensions of time, space and digital technology.

It is widely, but inaccurately, perceived that the skills necessary for traditional teaching are essentially the same as those required for online teaching. In the simplest terms, it is thought that a good classroom teacher automatically will be an equally effective online teacher (Archambault, 2010). The different or additional skills thought to be necessary for teaching online have been discussed by many authors in the context of many different programs. Barbour et al. (2012) note that some of the additional elements believed necessary for online teaching may actually cause more harm than good. This is thought to occur through the introduction of what the authors refer to as "faulty methods" within teacher education programs. The question raised here is on how teachers are currently being trained to teach online, in an environment where the student and teacher are not communicating on a face-to-face basis.

Even in the context of K-12 education, it is recognized that different skills and techniques are required to teach at the K through 8 grade levels as compared to the 9 through 12 grade levels. These differences are dictated by the fact that the two groups are characterized by materially different students in terms of age, experience, knowledge, discipline, learning skills and socialization. Likewise, but for different reasons, there are significant differences between teaching online and teaching face-to-face. These differences are dictated by the fact that the teacher and the student are physically separated from one another and both must proceed without the continual expressive interchange and feedback which has been at the heart of the student-teacher connection throughout history. Unfortunately, there is essentially no credible, research-based definition of the skills and techniques necessary to convert knowledge into learning while delivering the content through technologies that limit or preclude any real-time expressive interchange between the teacher and the student (Barbour et al., 2012). The effects of this technological barrier may be attenuated as the age of the targeted students increase and as the teaching content becomes more narrowly defined and sophisticated, but the challenges of teaching online are and will remain most pronounced at the K-12 levels.

Against this background, the narrower question is how and to what extent do educators currently learn the actual processes of and best practices for teaching online? As in the case of traditional teacher training, there are two basic ways by which new or experienced teachers can learn how to teach online. The first way is through a formal pre-service educational program and the second is through in-service training or as part of a professional development or on-the-job training program. There is a desperate need for research in both of these areas (Charania, 2010). In the following two sections, the current status of these two modes of teacher training will be reviewed in the context of an increasing need for online teachers; a need that is being driven by the widely held perception and expectation that online education will result in a K-12 system where students learn more subjects on a more efficient, effective, convenient and rewarding basis (Dillon & Tucker, 2011).

Pre-Service Training

As K-12 educational programs expand into online formats, the need for teachers who are prepared to teach in this new and different environment is also expanding. This major transition raises the foundational question "How and to what extent are teachers currently being educated and trained to teach online?" The answer to this question, as derived from the most recent literature, is summarized in this section on the status of pre-service training and the following section on the status of in-service training.

Typically, a teacher obtains certification at the K-12 level by completing a university-based course of study to obtain a Bachelor's or more advanced degree (Arizona Department of Education, 2013). These educational programs almost always include a student-teaching experience in an existing classroom environment under the supervision and guidance of an experienced teacher. Ideally, students training to become certified K-12 teachers would also receive training on the methods and principled practices involved in teaching online, that is, training that would be delivered through formal coursework and by way of a supervised online teaching practicum (Compton, Davis, & Mackey, 2009). The fact is, most experienced classroom teachers have received no formal training in online teaching because they were certified before online learning became possible or even marginally implemented (Archambault, 2011). The literature indicates that only a small number of those certified since the 1990s have been exposed to this form of teacher training, simply because no such training was included in the curriculum. This lack of available training in the case of teachers having over 10 years of experience is understandable. What is surprising, however, is that only 1.3% of pre-service teachers in formal education programs are even offered a field experience that involves teaching online, let alone formal course work (Kennedy & Archambault, 2012b).

New teachers, who are well-prepared to teach in a traditional face-to-face setting, are not prepared to teach online. Because the demand for K-12 online teachers exceeds even the demand for classroom teachers, the first teaching opportunity offered to a new graduate may be in the online environment for which they probably will not be adequately prepared (Archambault, 2011). Dawley et al. (2010) conducted a national survey of those teaching online and reported that of the most recently hired online teachers, 12% had never taught in a face-to-face classroom, let alone online.

To equip new K-12 teachers with the skills necessary to be effective online, teacher preparation programs must include classes in the emerging techniques, strategies and technologies for teaching at a distance, along with field experiences that allow the teacher to apply these methods in a practical setting. Zeichner (2010) noted the traditional importance of closely integrating coursework with field placement and training. This is equally important in the process of training teachers to effectively educate students online. For example, it would be ideal to provide a teacher-in-training with not only coursework including instructional design, new technologies, online pedagogy and communication techniques, but also to provide a real experience in the preparation and delivery of online classes intended for the K-12 learners (Kennedy, Cavanaugh & Dawson, 2013).

Barbour (2012a) suggests that the only difference between a traditional, face-to-face field experience and an online field experience is some form of initial technical training. An "orientation" of this type would expose pre-service teachers to the different online tools available and increase their general comfort level with the online environment itself. However, this kind of introduction alone cannot provide a meaningful understanding of the complex psychological, engagement, discipline and feedback challenges that uniquely characterize online teaching.

Unfortunately, teacher education programs face several barriers that limit the expansion of their curriculum to include courses involving methods for creating and delivering educational content online. Often there are misconceptions about the career prospects for teaching online. Pre-service teachers have a widespread belief that an increase in online courses will lead to fewer positions for traditional teachers (Compton, Davis, & Correia, 2010). In addition, pre-service teachers may never have taken, let alone created, a high-quality online course (Compton et al., 2010). For this reason, they may have the perception that online courses are inferior to face-to-face classroom presentations (Barbour & Unger, 2009; Miller & Ribble, 2010). An increasing number of states are now making it a high school graduation requirement that all students complete at least one online course (Watson et al., 2012). With an increasing number of those studying to be teachers do have at least some experience in online courses (Kennedy et al., 2013). Unfortunately, these early experiences online may have been modeled on poor teaching methods or lack any meaningful interaction or may demonstrate ineffective instructional design (Kennedy et al., 2013).

University faculty members can impede the offering of new courses specifically directed to the process of teaching online. Numerous reasons have been given for their reluctance to teach online courses, including a burdensome increase in workload, problems with changes in the instructor's role, lack of institutional support, a perceived sacrifice of class quality and negative reactions by colleagues (Miller & Ribble, 2010). The modeling of quality online teaching in a teacher training program is crucial to teaching these skills (Compton et al., 2010). However, it is difficult to change or supplement teaching methods because educators tend to teach the way they themselves were taught (Miller & Ribble, 2010; Barbour, 2012b). Jo Wagner, a teacher, mentor and instructional program manager at the Florida Virtual School, writes "... the first year of teaching online is similar in many ways to the first year of teaching in the traditional classroom; however, there are many new skills to learn" (Wagner et al., 2012, p. 39).

Kennedy and Archambault (2012a) found that some teacher education program personnel perceived that their pre-service teachers were being prepared to teach online simply because part of their teacher education program is delivered online. These pre-service teachers may have experienced an online environment, but they did so only as a student and not as a teacher. It is one thing to watch a good teacher; it is something else to become one.

Some teacher training programs seek to facilitate the process of online teaching by providing informative websites and instructional specialists to aid faculty members in setting up online classes (Miller & Ribble, 2010). Such efforts can be part of an overall program, but taken alone, are simply inadequate. It is imperative that colleges of education adjust their curriculum and requirements to meet the growing needs of teachers entering the workforce today. Searson et al. (2011) stress the importance for universities and colleges to re-evaluate their teacher education programs to ensure they include the skills that are really needed to teach online. The first step is to define what these skills are, and equally important, to confirm the effectiveness of these skills through empirical testing. Even after these skills are identified and validated, it is still necessary to define the best way to teach the skills and provide training on the implementation of the skills within the context of K-12 education (Barbour, 2012b).

One response to inconsistency among teacher education programs has been to provide a set of standards for those involved in training teachers. In 2011, the International Association for K-12 Online Learning (iNACOL) revised their 2008 online teaching standards to include eleven standards outlining the skills needed to teach online (iNACOL, 2011). These standards have been widely adopted by organizations to train and evaluate online teachers. However, Barbour (2012b) indicates that these standards are not based on research, have not been verified, and "provide little systematic guidance for teaching online" (p. 505). If there are to be standards for training and ultimately for certification of online teachers, then the underlying skills required must not only be defined, they must also be empirically shown to produce measurable learning outcomes in the targeted online students.

It should not be surprising that there are very few existing models of teacher education programs which prepare K-12 teachers to teach online, given the insufficient and inconsistent identification of what skills are even needed to teach online, compounded by the lack of research in support of the standards that have been suggested (Barbour et al., 2012). Examining and comparing the few models that are available and encouraging the implementation and testing of new models should ultimately lead to more consistent and coherent pre-service training programs from which more rigorous standards can emerge (Kennedy & Archambault, 2012b).

Online education and training programs for pre-service teachers can benefit from cooperative ventures between universities and K-12 online programs (Barbour et al., 2012). Kennedy and Archambault (2012b) examined existing teacher education program models across the United States. Almost 79% of the programs reported that they did not include any form of pre-service field experience in online teaching while half (49%) felt that they should offer such field experiences.

Two research-based initiatives of pre-service teacher education programs that do include elements of online teaching are the Teacher Education Goes Into Virtual Schooling (TEGIVS) project at Iowa State University and partnerships between Florida Virtual School (FLVS) and several Florida universities (Barbour et al., 2012). The relevant characteristics of these programs are summarized in the following section.

Teacher Education Goes Into Virtual Schooling (TEGIVS)

Iowa State University's Center for Technology in Learning and Teaching, along with three other universities, have addressed the demand for prepared K-12 online teachers by incorporating new elements into their teacher training program. To provide a meaningful introduction to the potential for online learning, an online seminar was added to the existing pre-service teaching class and an online field experience was offered early in the teacher training curriculum (Compton et al., 2010). This project sought to orient pre-service teachers to the online teacher's role of Designer, Teacher and Facilitator and to model effective online teaching practices (Davis et al., 2007).

Florida Virtual School (FLVS)

A second example of a program that involves preparing pre-service teachers to teach virtually is found at the Florida Virtual School (FLVS). Because FLVS has been successful in their K-12 online courses, it is an ideal laboratory for training teachers and allowing opportunities for pre-service teachers to experience this growing setting (Barbour et al., 2012). Partnerships between FLVS and several Florida universities have been formed to offer field experiences in K-12 online courses. These internships are offered year-round through the FLVS and typically last two semesters. The program through the University of Central Florida offers two student-teaching internships that last seven weeks, during the first semester. Pre-service teachers have the option to complete one of these internships in a virtual setting. Regardless of which type of internship was completed in the first semester, during the second semester, the students have the choice between a 14-week student-teaching experience either in a face-to-face classroom or an online version (Barbour, 2012b).

Over the years, the FLVS internship experience for pre-service teachers has evolved to include more mentoring support. Once the university candidates are fingerprinted and background checked, they are placed with a specified subject area, state-certified teacher (Wagner et al., 2012).

Kennedy (2010) studied the virtual field experiences of three volunteer pre-service teachers placed at the FLVS through the University of Florida. While these pre-service teachers were assigned to an online teacher for a four-week period along with created activities for this experience, they were not simultaneously enrolled in a corresponding course at the university. Kennedy et al. (2013) suggest offering a related course that might include reflection on pre-service teachers' past online experiences would alleviate some misconceptions. Although this online field experience gave the pre-service teachers a clearer picture of what virtual schools can offer K-12 students, they felt that it was too short and hard to stay motivated since it was voluntary (Kennedy et al., 2013). Currently, the FLVS is looking into working with additional Florida universities, as well as universities in other states, to offer virtual field experiences (Barbour, 2012b).

In-Service Training

As shown in the preceding sections, there are few examples of universities that offer courses and field experiences that meaningfully prepare pre-service teachers to successfully function in the online environment. Accordingly, what training is available to teachers is derived from in-service training (Barbour, 2012b). As Dawley et al. (2010) discovered, 94% of online teachers received their related teacher training from the online school that employed them and only 30% learned from teacher education programs at a university. Surprisingly, there was no training at all given to 25% of first-year online teachers. Many virtual schools, such as the Virtual High School Global Consortium, not only offer courses in online pedagogy, they require such training be taken by all newly hired teachers prior to teaching online (Barbour, 2012b).

The Florida Virtual School (FLVS) has trained new online teachers since the beginning but their training has evolved over the years to include more mentoring. The mentors are given fewer students and mentor less than 10 new teachers at a time. The new teachers complete an orientation and receive eight follow-up calls from their mentors, which are allocated on the basis of content area (Wagner et al., 2012).

The Georgia Virtual School (GaVS) is another example of an online school that has developed teacher training and mentoring for their teachers. Their training program is divided into four different parts, in which mentoring is included as an integral component. For newly hired teachers there is a New Instructor Preparation Course, which meets once a week for 14 weeks. Because not all newly hired GaVS teachers have experience teaching in an online environment, this course is designed to help them become more familiar with this format. The content, discussions, and assessments are delivered online and the same late policies enforced on future students are modeled and expected by the new hires. During the last four weeks of this course, the new hire is assigned to a mentoring teacher and acts as a student teacher in a live class. The next phase of the training, called "Just-In-Time training," allows the teacher to be in charge of up to five students while still working with a mentor. Even veteran faculty is offered mentoring opportunities by enrolling in a colleague's class as a "Visiting Educator." There are several other mentoring programs for current, full-time teachers that include support in attending conferences to Leadership Track opportunities for those interested. There are also mentoring options for those seeking an Online Teaching Endorsement or Graduate Certificate which require field experience (Cozart, 2012).

A growing trend to receiving training in online teaching is by obtaining a graduate certificate in Online Teaching. Although many of these certificates are not specifically geared toward K-12 online learning, several of the programs do include options for focus in this area. For example, the state of Georgia allows current teachers to add an online teaching endorsement by completing the graduate certificate program at either Georgia State University (Georgia State University, 2013) or Valdosta State University (Valdosta State University, 2013). Both of these certificate programs focus specifically on teaching K-12 online. Arizona State University also offers a graduate certificate in online teaching for grades K-12. The 15 required credit hours of graduate coursework includes an online teaching practicum. This certificate program focuses on instructional strategies and best practices for teaching online, along with emerging technologies used in the field (Arizona State University, 2013). Other graduate certificates, such as the one offered by the University of Wisconsin-Stout (University of Wisconsin-Stout, 2012), is designed to prepare teachers to teach online and even meets the prerequisite to teach online in that state. Because some virtual schools, such as Virtual High School Global Consortium (VHS), already have partnerships with universities and offer courses to prepare teaching online, these courses can lead to graduate credit and even a graduate certificate in Online Teaching and Learning. Another important course that VHS offers is a field experience where the teacher is paired with a current online teacher (Barbour et al., 2012).

Another option for in-service teachers to become more knowledgeable in the online environment would be to obtain a Continuing Education Certificate in Online Teaching. There are two universities in California (California State University, East Bay and University of California – Irvine) that offer this type of certificate. However, these continuing education programs are not as long as typical university courses and do not necessarily lead to degrees, as it is with the graduate certificates (Barbour et al., 2012).

On top of the standard teaching certificate required by all states to teach, several states are taking the next step and requiring an additional online teaching endorsement in order to teach in these environments (Kennedy et al., 2013). The training for these endorsements usually covers primarily how to use online tools, online course design and delivery, and less on pedagogy, since the participants already have a teaching certificate. Georgia, the first state to offer an online teaching endorsement, has three participating universities offering endorsements that all require a field experience.

An initiative for an online teaching endorsement was passed in Idaho in 2011, which also requires the teacher to hold a teaching certificate before beginning the program (Archambault, DeBruler, & Freidhoff, 2014). Barbour et al. (2012) argue that the training offered in these online teaching endorsement programs would even benefit the teacher in the traditional classroom.

A Disconnect between Training and Teaching

A careful review of the literature suggests a significant disconnect between (a) growing expectations for the expansion of cost-effective online education at the K-12 levels and (b) the manner and extent to which teachers are being prepared to function in this new educational paradigm. Most current studies, dating back over five years, indicate that very few university-based education programs offer formal courses or clinical programs directed to the methods and best practices required for successfully conveying knowledge to online K-12 students (Compton et al., 2009). Training, if any, has mostly been through in-service mechanisms such as self-teaching, on-the-job training, and mentoring. The current literature also indicates a need for research into and the empirical validation of those teaching methods and practices that will produce optimal results for K-12 students (Charania, 2010; Searson et al., 2011; Barbour, 2012b).

SOLUTIONS AND RECOMMENDATIONS

There is an urgent need to find out what K-12 teaching techniques actually produce effective learning at a distance and to validate these techniques through empirical testing and analysis. When effective online teaching techniques (including the definition of skills, strategies, methodology, psychology, etc.) have been defined, the underlying research can provide a meaningful basis for defining real educational standards.

With empirically tested and proven standards in place, it will be possible to develop courses that incorporate the best practices for effective online K-12 classrooms. In addition to their training in online teaching, pre-service teachers should have the opportunity to implement and practice what they have learned by way of an internship, mentorship, or student teaching experience in an online or virtual classroom. Current virtual teachers should be given the opportunity to attend workshops, orientations, discussions, ongoing experimentation and testing along with mentorships to better prepare them for the virtual classroom. In addition, colleges of education and virtual schools must become more consistent and adjust to meet the changing needs of teachers entering the profession, while assuring that these teachers understand and can capably implement educationally sound, empirically-proven teaching techniques.

FUTURE RESEARCH DIRECTIONS

As noted above, the single most critical research to be conducted involves the development and empirical testing of virtual teaching practices. In addition, once standards are developed, research is needed on the best way to implement those standards in a college of education and separately for in-service training programs for current teachers.

The recent iNACOL report Partnering for Success: A 21st Century Model for Teacher Preparation (Kennedy & Archambault, 2013) takes a closer look at several teacher education programs that have partnered with virtual schools to offer teacher training on how to best teach K-12 learners online. The various authors in the report present a range of suggestions for future research in this area. In the Forward to the report, Susan Patrick, President and CEO of iNACOL, discusses the importance of "modernizing" teacher education programs and states, "No teacher should start their career with anything less than complete confidence that they have been effectively prepared for Day One" (Patrick, 2013, p. 4).

In addition to proposing online student-teaching experiences at Wayne State University, a Graduate Certificate Program in Online Teaching is also available. Barbour (2013) shares how the materials being incorporated into the Graduate Certificate in Online Teaching courses at Wayne State University are all research-based and many of the courses are also a perfect setting for additional research studies.

As part of the discussion of the partnership between the University of Central Florida and the Florida Virtual School, the authors offer suggestions in order to build a stronger teacher preparation program and prepare teachers for online classrooms. One such suggestion is the creation of a "research-based screening tool that would help select candidates who would be most successful in online K-12 environments" (Hynes, Zugelder, & Zajac, 2013, p.36). Further research is also needed to determine successful online teaching methods and the most efficient way of transferring those methods to pre-service teachers.

In the conclusion of the report, Archambault (2013) stresses the importance of the use of consistent guidelines, standards, resources and skills within pre-service teacher training to guarantee consistency across all teacher training programs. Further research is also crucial in creating high-quality and effective professional development for in-service K-12 online teachers.

As to the need for further research, it is clear from the literature that the adoption of online coursework at the K-12 level is advancing at a pace that far exceeds the progress of research into how best to create and present this coursework and, equally important, how to actually train teachers to succeed in this new environment, where the student separated from the teacher in both space and time.

CONCLUSION

There are enthusiastic expectations that online courses and programs will enhance the quality, efficiency, and effectiveness of K-12 education. Clearly, the number and coverage of K-12 online courses is rapidly expanding in the schools. However, the hope and excitement that surrounds these new programs may mask an underlying deficiency in how and the extent to which K-12 teachers are being educated and trained in the complexities of conveying knowledge over time and space, especially to young students who have yet to develop their own method and discipline for learning.

There is little research on the level of experience held by K-12 online teachers or how they were prepared to work in the online environment (Archambault, 2011). Much of the current research is focused on the students' online experience or the quality of the online program itself (Rice, 2006), rather than on the teacher's education and training in the process of effective online teaching at the K-12 level.

With the growth of elementary and secondary online education, there will be a continued and expanding demand for properly educated and competent teachers in this area. Training for educators at the K-12 level has historically been provided through colleges of education housed within a university setting. If these programs do not expand to include content on online teaching methodologies, many newly certified teachers will find themselves working in an environment for which they are simply unprepared (Archambault, 2011).

KEY TERMS AND DEFINITIONS

Blended Learning: Education in which a student learns partially on a face-to-face basis and partially through formal online learning.

Consortium Structure: A cooperative group of educational entities that share in the creation, distribution and operational costs associated with courses that benefit their students.

District Structures: District-level online programs that can include a single district that produces and offers online programs for its own students or multiple districts that work together to produce programs for common use within their combined districts.

Face-to-Face Learning: Education in which a student learns in a formal educational program, at a central location and with an instructor.

Online Learning: Education in which a student learns in an educational program, through student-controlled Internet delivery of content and instruction.

Post-Secondary Structure: University-based online programs designed for K-12 students and offered through post-secondary institutions.

State-Level Structure: Online schools that are sanctioned and governed pursuant to the same legislative initiatives that extend to all public schools.

This work was previously published in Exploring the Effectiveness of Online Education in K-12 Environments edited by Tina L. Heafner, Richard Hartshorne, and Teresa Petty, pages 169-190, copyright year 2015 by Information Science Reference (an imprint of IGI Global).

Chapter 80
Challenges and Opportunities in the First Year of a 1:1 iPad Initiative in a High-Poverty, Highly Diverse Urban High School

Gayle Y. Thieman
Portland State University, USA

ABSTRACT

The digital divide between technology-mediated instruction for students in low versus high socio-economic schools is a serious equity issue with repercussions for student learning. While there is a growing body of research on blended learning and 1:1 mobile devices, there seems to be little research on the potential of iPads to reduce disparity of access and impact student learning in high poverty schools. This chapter reports first year results of a 1:1 iPad project on teachers' attitudes and experiences and on high school students' technology access and use. Using iPads resulted in blended learning opportunities for some but not all students. Those who had an individually assigned iPad to use at school and home reported significantly higher satisfaction and proficiency with technology. These students also reported significantly greater use of online iPad applications and technology activities for instruction both during class and outside of school.

INTRODUCTION

The digital divide between technology-mediated instruction for students in low versus high socio-economic schools is a serious equity issue with repercussions for student learning. While there is a growing body of research on blended learning and on 1:1 mobile devices, including the iPad in K-12 schools, there seems to be little research on the potential to reduce disparity of access and impact student learning in high poverty schools.

The purpose of this chapter is to investigate the degree to which a 1:1 iPad initiative in a high-poverty, diverse high school reduces the disparity

DOI: 10.4018/978-1-4666-8246-7.ch080

of technology access, provides opportunity for blended learning, and improves student achievement. The author is working with an urban high school in the Pacific Northwest in a multi-year, mixed-method study of how students access and use individual iPads for learning and the resulting impact on these students' attendance, behavior, and academic achievement. This chapter focuses on two of the research questions: What is the impact of the 1:1 iPad project on teachers' attitudes and experiences with instructional uses of iPads? What is the impact of the 1:1 iPad project on students' access, skills and experiences, and use of technology?

THEORETICAL FRAMEWORK

The National Education Technology Plan (U.S. Department of Education, 2010), calls on teachers to "leverage [technology] to provide engaging and powerful learning experiences and content, as well as resources and assessments that measure student achievement in more complete, authentic, and meaningful ways" (p. ix). Despite near universal access to high-speed Internet connections in most public school classrooms (NCES, 2006), the digital divide between the instructional opportunities for students in low and high socio-economic status (SES) classrooms remains. DeWitt (2007) found the curriculum and technology taught by teachers in higher SES schools was more intellectually rigorous and provided more opportunity for creativity and higher-order thinking skills than curriculum in lower SES schools. He concluded, "[Students'] social class appears to influence teacher beliefs about the implementation of instructional uses of computers" (p.300). More recently, Boser (2013) reported "students from high-poverty backgrounds were far less likely to have rigorous learning opportunities when it comes to technology" (p.2). Similarly, Talley (2007) noted that searching, summarizing, and evaluating complex information on the Internet is more challenging than navigating social media. He cautioned: "Ignoring the literacy demands of new technologies may have especially dire consequences for children in disadvantaged homes and schools" (p. 315).

There seems to be little research on how iPads can reduce the digital divide in high-quality technology instruction and access experienced by low income, racially and linguistically diverse students. The New Media Consortium Horizon Report: 2013 K-12 Edition (Johnson, et al., 2013) forecasts mobile-learning as a "near-term horizon" technology to have a large impact and mainstream use in K-12 education within the next twelve months. The report also cites the importance of access to these devices as the equalizer for low-income students.

More research is also needed on the potential of technology and its measureable impact on K-12 student learning. According to recent federal guidelines (U.S. Department of Education, 2010), the ultimate result of technology integration must be an increase in student achievement. Three meta-analyses of published articles on mobile learning provide an overview of research findings in the last decade. Pollara and Broussard (2011) reviewed 11 studies published between 2005 and 2011 and reported that the benefits of using mobile devices included increased student achievement, productivity, motivation, and engagement.

Wu et al. (2012) conducted a meta-analysis and synthesized 164 studies from 2003-2010. They found that mobile phones and PDAs were the most widely used mobile devices, noted in 75% of the studies. Over half of the studies evaluated the effects of mobile learning, and the majority indicated positive outcomes. However, while over half of the studies examined mobile learning in higher education, research in elementary and secondary schools represented only ¼ of the studies. This is not surprising as K-12 schools have been slow to embrace mobile learning and until recently restricted students' use of mobile phones.

Most recently, Liu et al. (2014) reviewed 63 studies of mobile learning in K-12 schools from

2007 to present. The authors concluded that existing research was primarily exploratory and focused on understanding the educational affordance of using mobile devices in instructional practices. Most of the studies were conducted on a small scale with a single class. The majority of the schools were located in Asia with only seven schools in the United States. Slightly over half of the articles focused on mobile learning in elementary schools while only 1/5 reported mobile learning in high schools. Liu and colleagues (2014) also noted that mobile phones and PDAs were most often studied. Researchers examined student perceptions of technology, participation, and engagement and described learning outcomes. Nine of the 13 articles that compared the effectiveness of mobile learning to traditional learning showed positive learning gains for students who used mobile technology compared to students without mobile access. The authors concluded, the "ability to access content and communication with peers and teachers at any time proved to be an important benefit of using mobile devices" (p.13).

Among the articles in the Liu et al. (2014) meta-analysis, several are especially pertinent to this chapter. In an experimental study, Brown (2009) found that using mobile phones to pre-teach vocabulary significantly improved ninth grade students' reading comprehension and motivation over students who received traditional instruction. Hwang and Chen (2012) reported that when English Learner students used PDAs, they increased their English language practice and improved language acquisition. The school-provided mobile devices extended learning from the school to the home and resulted in positive outcomes. Kalloo and Mohan (2011) found that using a mobile learning math application on their smart phones resulted in high school students' improved math performance. Ferrer, Belvis and Palmes (2011) found that lower SES students benefitted more than higher SES students from 1:1 tablet PC's in terms of achievement, and the technology helped to reduce socio-economic inequalities among the elementary students.

Several articles examined the impact of using mobile learning to increase student and teacher communication. Hung, Lin and Hwang (2010) found that when instructors provided individualized feedback and support for students while they used PDAs in guided and independent science field observations, students' skills improved. Rau, Gao and Wu (2008) reported the positive effects of instant messaging on student-teacher relationships and high school students' motivation.

Despite the accelerating purchase of iPads for use in K-12 schools (Kaufman, 2012), there has been little scholarship on the effectiveness of iPads for learning and teaching (Government of Alberta Minister of Education, 2011). Norris, Hossain and Solloway (2012) examined 1:1 laptop initiatives and reported that when computing devices are used as "essential" curriculum tools, student achievement increased; however, when the devices are "supplemental" there is no impact on student learning. However, most of the research on 1:1 iPad initiatives in K-12 education focuses on teacher reports of instructional applications of iPads and student reports of engagement and satisfaction (NAACE, 2012; Reid & Ostashewski, 2011; Virginia Department of Education, 2011). According to a recent large study of 1:1 initiatives in 19 European countries, "only a very few identified improved learning outcomes as a project rationale" (Balanskat et al., 2013, p. 19).

Recently, Lundy (2013) conducted an experimental study comparing the use of digital and print texts in high school social studies classrooms and found that use of the digital text with an iPad supported high poverty students' technological fluency and creation of more sophisticated learning products. The iPads also provided differentiation for multiple learning styles, a more supportive reading experience and supported increased student engagement for racially diverse students.

METHODOLOGY AND DATA SOURCES

The Technology Immersion Pilot (TIP) is a multi-year, mixed-method study involving concurrent and interactive qualitative and quantitative data (Creswell and Plano Clark, 2011) on the impact of providing a 1:1 mobile device (iPad) to each ninth and tenth grade student in a high poverty, urban high school. "Nearly 80% of the students qualify for free and reduced lunch, 30% meet the federal definition of homeless, 68% are from an identified minority group, and only 37% are completing the necessary credits for graduation" (District, 2010, p.5). The TIP is designed to improve the quality of and access to technology tools and resources, which are essential to the curriculum and may result in greater student achievement.

The district technology initiative is situated within the context of blended learning. Staker and Horn (2012) define blended learning as "a formal education program in which a student learns at least in part through online delivery of content and instruction with some element of student control over time, place, path, and/or pace and at least in part at a supervised brick-and-mortar location away from home" (p.2). This chapter describes a high school that uses a "station-rotation model" of blended learning (pp. 8-9). Within an individual class period students are directed by the teacher to use iPads to complete a variety of online activities; at other times during the class period students are engaged in small group or whole class instruction without the iPads.

Sample and Data Collection Procedures

The sample for the research study includes all 426 students who were enrolled in ninth and tenth grade in the 2012-2013 academic year. Detailed demographics are included in Table 2. The qualitative data sources include classroom observation notes (Appendix 1) and a teacher focus group (Appendix 2). The quantitative data sources include student technology skills and experience surveys conducted at the beginning and end of the school year (Appendix 3); student technology use surveys conducted in spring (Appendix 4); a teacher survey (Appendix 5), and district confidential data for ninth and tenth grade students enrolled in 2012-13. These data include identification number, demographics, ELL/home language status, special education status, attendance rates, discipline records, standardized assessment results, GPA and high school credits in core academic subjects.

During the 2011-2012 academic year, the author observed iPad training for the teachers, assisted the district instructional technology department in refining the evaluation parameters for the grant, helped develop the student and teacher surveys, and created the focus group and classroom observation protocols. During the 2012-2013 academic year, the author conducted nine classroom observations of student use of iPads, facilitated a focus group with seven classroom teachers and began preliminary data analysis of student technology experience and use surveys and teacher surveys.

High school technology staff administered a survey of technology experience, skills, and attitudes to each ninth and tenth grade student at the beginning and end of the 2012-2013 school year (Appendix 3). Beginning in January, 2013, the high school teachers were encouraged to have students complete a brief online survey of their iPad use at the end of each class when iPads were used for instruction (Appendix 4). District technology staff administered a teacher survey in fall, 2012 (Appendix 5).

Data Analysis Procedures

The first research question investigates the impact of the 1:1 iPad project on teachers' attitudes and experiences with instructional uses of iPads. Teachers completed an anonymous survey in fall, 2012, about their familiarity with the iPad and their attitudes toward integrating technology as well as their frequency of technology use and observation of student behavior when using technology in the classroom. Classroom observations and a teacher focus group provided additional data. Descriptive and correlational analysis was used to discover statistical relationships in the survey data, and classroom observation and teacher focus group notes were examined for possible confirmation of the teacher survey findings.

The second research question examines the impact of the 1:1 iPad project on students' access, skills and experiences, and use of technology. Three data sets helped to answer this question. The first is assignment of a Take Home iPad (THP) that could be used by the student throughout the school day and at home. In order to have a THP the student and a parent/guardian had to sign a technology consent form and pay a $40 insurance fee. Students who did not have a THP could use an iPad or laptop in the classroom, when directed to do so by the teacher. Chi square analysis was conducted to determine if there were significant differences by gender, race, ethnicity, home language, and identified academic needs between the two groups: those who had a THP and those who did not.

The second component of this research question focused on students' responses to the technology skills and experiences survey (Appendix 3). Responses were reported on a four point Likert scale. The survey included self-report of overall proficiency and satisfaction with use of the iPad. Student experiences included questions on the helpfulness and ease in using the iPad for academic tasks at school and the frequency of iPad use at school and at home for various tasks.

The author hypothesized students who were assigned a Take Home iPad (THP) and could use it throughout the school day and at home would report greater satisfaction, proficiency, frequency and ease of use and helpfulness of the iPad than students who could only use technology in the classroom when prompted by the teacher. A t test was used to compare the means for the two groups to determine if the differences in technology skills and experiences between students who had a THP and those who did not were statistically significant.

The third component of this research question focused on students' responses to the technology use survey (Appendix 4). The researcher created an index of the number of reported technology uses including types of applications and purposes of iPad uses from the surveys. For each student who completed one or more technology use surveys, the total number of applications (e.g., Web Browser, Educreations) was combined with the total number of purposes (e.g. created multimedia presentation, did research) to create a numerical index of Technology Use. There were 30 different applications that students could report and 14 different purposes for using the iPad in class with a possible index ranging from 0-44. The author hypothesized that students who were assigned a Take Home iPad would report greater use of iPads in their classes, including more applications and a greater variety of purposes. A t test was used to compare the means for the two groups to determine if the differences in technology use reported by students who have a THP and those who do not were statistically significant.

PRELIMINARY FINDINGS

Impact of the 1:1 iPad Project on Teachers' Attitudes and Experiences with iPads

In early fall, 2012, teachers were asked to complete a survey (Appendix 5) about their attitudes and experiences with iPads in the classroom. The survey was conducted when most of the iPads were still assigned to a classroom cart, not to individual students. A total of 38 teachers completed the survey (75% response rate) representing math, science, English, social studies, ESL, special

Table 1. Student response to technology by teacher attribute (N= 38)

Student Response	Teacher Attribute	Chi-Square	*p*-value
Student Engagement	Subject Area	x^2 (18) = 47.41	<.001
Behavior Problems	Confidence	x^2 (6) = 13.74	<.05
Higher Order Thinking	Confidence	x^2 (6) = 14.19	<.05
Student Writing	Confidence	x^2 (9) = 20.47	<.05
Student Writing	Frequency of Tech Integration	x^2 (9)= 17.25	<.05

needs, and other subjects. Two-thirds of the teachers reporting being familiar or very familiar with iPads, while 72% reported feeling comfortable or very comfortable integrating technology into their classrooms. Interestingly, while 62% felt they had received enough professional development to use the iPads in their classroom, 84% wanted additional training.

The majority of teachers (77%) reported they integrated technology into their lessons either once a week or two to three times a week while 20% reported they integrated technology daily. However, the survey question did not specify if technology was being used by the teacher or the students or both.

The survey also asked teachers to rate student behavior, engagement, writing, and higher order thinking when students used technology in their classes. Overall, the majority of teachers (87%) reported behavior problems decreased or there was no behavior change when students used technology. Over 90% of the teachers reported that student engagement increased when students used technology. However, only about ½ of the teachers (53%) reported student writing increased when students used technology, and still fewer (46%) reported student higher order thinking increased when students used technology.

A chi square test indicated that teacher responses differed significantly by subject area when reporting student engagement with technology (Table 1). ESL/SPED, math, and science teachers reported higher student engagement when using technology than teachers of English, social studies, or other subjects. However, there were no other significant differences by subject area.

There were significant associations between teachers' comfort with integrating technology in the classroom and their report of student behavior, higher order thinking, and student writing when using technology (Table 1). Teachers who were most comfortable integrating technology reported student behavior problems decreased when their students used technology. Similarly teachers who were most comfortable integrating technology also reported student higher order thinking increased while teachers who were less comfortable reported no change in student higher order thinking. Finally, teachers who were most comfortable integrating technology also reported student writing increased when using technology. Not surprisingly, teachers also reported student writing increased when they integrated technology more frequently.

Seven teachers responded to the invitation to participate in a focus group in April, 2013 (Appendix 2) representing English, ESL, math, science, and social studies. Five of the teachers had served on the technology cadre that year and were considered by the technology coach to be early technology adopters who had explored and used iPads in a variety of ways with their students. Key ideas from the taped, transcribed discussion focused on strengths and limitations of the iPad project, effects of the iPads on student behavior and attendance, the need to reduce the disparity of student access, and increase technology professional development.

Teachers were enthusiastic about the variety of applications which engage students in new ways and allow students to proceed at their own pace and self-differentiate. For example one teacher reported: "Some students are finding ways to engage in the content in a way that is better for them." The iPads also supported organization of student materials and resources, promoted communication between teachers and students, and enhanced formative feedback during class.

Limitations of the iPads focused on three areas: access, technology training for students, and professional development for teachers. Teachers were frustrated by the inability to implement systems they had suggested to ensure every student would have a personal iPad. Also the high school student population has a higher than average turn-over rate, and teachers were concerned about the lack of technology instruction for students, especially those who entered the school midyear They suggested a weekly orientation for new students with the technology staff to set up the iPad and provide basic instruction.

Recognizing that the learning curve for teachers and students is steep, teachers were concerned about the lack of agreement on common applications to be used school-wide. Teachers recommended increasing technology professional development to twice a month, focusing on a few iPad apps that everyone would learn with substantial time to practice using an app after it was introduced. One teacher whose students used iPads frequently commented, "I get the impression that the administration thinks we have a training and then it's solved. They don't understand the complexity of using the iPads."

Teachers noted there was less distracting behavior and fewer side conversations, but some students were still off task with iPads. Teachers definitely needed to incorporate appropriate iPad use into classroom management routines. They also acknowledged, "Part of our job is to teach kids to be successful with technology." There were minimal effects on student attendance: "Kids who were able to take an iPad home have family support and good attendance. Kids who miss a lot of class don't have a Take Home iPad."

Overall teachers viewed the iPads as a positive enhancement. "Students are coming to [school] for iPads; they are a sustainability device." Noting that the high school had multiple reforms that year (new humanities curriculum, diversity, technology), they recommended a sustained focus on instructional strategies using iPad applications. "Systemic reform takes three years; we need two more years of sustained effort."

Classroom observations (Appendix 1) in spring were used to confirm the teacher survey and focus group data. Seven teachers responded to the request to observe their classes in English, social studies, science, math, and ESL. During all nine observations students used iPads for at least part of a class period. In general, most students were on task the majority of the time, although this varied with the classroom management skills of the teacher.

Students accessed teacher websites (Weebly, Schoology, Edmodo) for instruction, resources, and learning tasks. Frequently students used Google docs to write essays and Google forms to respond to quizzes and took notes with Notability. They also used their iPads to watch podcasts or videos and scanned QR codes to access online references. Students used some subject-specific applications such as Geometers Sketchpad.

Those students who had individually assigned iPads (THP) could and, according to teacher comments, did continue to work on assignments at home. They frequently used their iPads to look up definitions and search for information during class.

Several teachers used the application Doctopus to push out assignments to students and to review and comment on their work. Teachers also used Explain Everything and Educreations to support lectures. Most of these applications were modeled in the iPad training the previous year and during monthly technology cadre professional development. The only class that used the iPad for drill and practice was the ESL class for newcomer immigrant students who did not speak English and were using the Quizlet App to support vocabulary development. These students also used Raz-Kids to access e-books and improve reading comprehension.

In some classes there were missed opportunities to incorporate iPads. For example students were asked to create a graphic organizer about the main themes of a novel on paper, rather than using a drawing application. In many classes students wrote notes in their own paper journals rather than on iPads because the majority of the students did not have their own THP.

Impact of the 1:1 iPad Project on Students' Access, Attitudes, and Experiences with Technology

The original intent of the project (District, 2010) was for every ninth and tenth grade student to have a personally assigned iPad that could be used at school and at home. Given the delay in implementing check-out procedures at the beginning of the 2012-13 school year and the requirements for allowing students to take an iPad home, only 40% of the students (171) were assigned a Take Home iPad (THP) by April, 2013. The remaining 60% of students had the opportunity to use an iPad on a cart in their humanities classrooms and in some math and science classrooms. However, students could not take these iPads out of the assigned classroom to use in other classes or at home. The unintended consequence of the iPad distribution procedures was that students' opportunities for blended and online learning were limited. Staff acknowledged the initial roll-out was problematic. During the spring focus group teachers commented: "We were supposed to have the iPads the first six weeks." "We lost momentum because kids didn't get their iPads right away."

Inequity of Assignment to iPads by Disaggregated Groups

Disaggregated data on iPad assignment by student grade level, gender, race, ethnicity, first language, academic needs, and GPA indicated some differences in iPad access across categories. Table 2 reports Chi Square analysis of disaggregated iPad assignment data during the 2012-2013 school year. There was a significant association between grade level and iPad assignment. Tenth graders were somewhat less likely to be assigned a Take Home iPad (THP) than ninth graders. There was also a significant association between race and iPad assignment. In general, white students were more likely to be assigned a THP than non-white students. While there was not a significant association between students who had an IEP or were identified TAG and their iPad assignment, there was a small significant association between ESL services and iPad assignment. Students who received ESL services were somewhat more likely to be assigned a THP compared to those who were not receiving ESL services. In the focus group interview an ESL teacher commented: "For my sheltered class it has helped some of them because otherwise they would never have access to an iPad. They carry that iPad around and it is amazing. We use the iPads almost every day."

There was also a significant association between identification as an Academic Priority student and iPad assignment. Students thus identified were less likely to be assigned a THP compared to students who were not so identified. While the district did not provide free/reduced lunch data on individual students due to FERPA regulations, Academic Priority has been considered a proxy for low income. In 2010 the district established the Academic Priority Zone to support elementary and secondary students with the greatest needs to help close the achievement gap for race and poverty. The high school in this study is included in the Academic Priority Zone because in prior years the school failed to make adequate yearly

Table 2. Assignment of Take Home iPads (THP) by student category (N= 426)

Student Category	THP	No THP	Chi-Square	*p*-value

Academic Priority				
Yes	88 (35%)	164 (65%)		
No	83 (48%)	92 (52%)	χ^2 (1) = 7.0	<.01
GPA Fall 2012				
0-.99	6 (21%)	22 (76%)		
1-1.99	26 (24%)	81 (76%)		
2-2.99	73 (48%)	80 (52%)		
3-3.99	54 (46%)	63 (54%)		
4.0	1 2 (67%)	6 (33%)	χ^2 (4) = 25.86	< .001

progress and a high percentage of the students (nearly 80%) qualified for free/discounted meals.

Finally there was a strongly significant association between students' GPA at the end of fall semester and their iPad assignment. Students with a GPA of 2.00-3.99 were twice as likely as those with lower GPA's to be assigned a THP, and students with a 4.0 GPA were three times more likely as those with GPA's below 2.00 to have a THP. A t-test of individual students' GPA and iPad assignment confirmed these results. Thus an unintended consequence of the iPad distribution was the inequity of opportunity to participate in online learning both during and after the school day.

In the focus group teachers commented that the large percentage of students who did not have a take home iPad (THP) was a limitation of the project. One teacher noted: "Kids who do have an iPad checked out can use Notability; they can really make it their own. It's more complex for the students without an iPad assigned to take home." Another teacher commented: "There are fundamental shifts out there, but the problem is not all our kids have them [iPads]. I have 15 or 16 for the department in my room. It needs to be the student's iPad and take ownership of it."

Differences in Student Technology Attitudes and Frequency of Use

When students were assigned an iPad, they were to complete an online survey (Appendix 3) regarding their access, satisfaction, proficiency, and experience with technology. The survey was intended to serve as a pre-post assessment each year of the project. However, the initial survey was not administered to every student at the beginning and end of the year as planned. The fall survey was completed by 243 students (57% response rate), but only 106 students (25% response rate) completed the spring survey. The difference in response rates was due to lack of staff/faculty support for administering the online surveys during class time in the spring. Survey results suggested differences between students who were assigned a take home iPad (THP) and those who could only use an iPad or laptop in the classroom when assigned by the teacher.

Of 298 individual students who responded to the survey in fall and/or spring, 81% reported access to a home computer, 84% reported Internet access at home; while 78% reported wireless Internet access at home. These statistics were somewhat higher than the district technology staff had previously researched (personal communication, July 17, 2013). Chi square analysis revealed no significant association between the type of iPad assignment (THP) and students' access to technology at home.

However, there were significant associations between THP assignment and students' technology experiences (Table 3). Students who were assigned a THP were more satisfied with using the technology than those who did not have a THP. Similarly, students with a THP also reported a higher level of proficiency with technology than those who did not.

There was a highly significant association between THP assignment and frequency of use. Students who had a THP reported more frequent use of the iPads at school. In the classroom observations, the author noted that students who had a THP used the iPad to access information for group projects and to complete homework in other classes when the rest of the class was not using the iPads on a cart. Since only the ninth and tenth grade humanities classes and a few math and science classrooms had iPad carts, students who had a THP were at an advantage. These students could benefit from the opportunity to access digital content and instruction online even if there were no iPads or laptops available in the classroom.

Note. 243 students took the online survey in fall 2012 representing 57% of the ninth and tenth grade students. Due to problems with survey administration only 106 students took the online

survey in spring 2013 representing 25% of the ninth and tenth grade students.

Differences in Student Report of Usefulness of the iPad

Table 4 summarizes students' report of the degree to which the iPad was helpful in completing academic tasks. Preliminary survey results suggest significant differences between the fall and spring administration for students with a THP and those without.

In the fall, students' responses about the iPad's helpfulness for academic tasks did not differ significantly between those who had a THP and those who could only use an iPad in the classroom. However, by spring there was a significant association between iPad access and helpfulness for the following academic tasks: homework, writing assignments, communication and collaboration, organizing school work, and staying motivated and engaged. Students who had a THP reported a significantly higher mean score for the iPad's helpfulness for these academic tasks. However, there was not a significant association in the

iPad Helpful to Access Information					
No THP Fall	140	3.50	.67	.06	
THP Fall	103	3.58	.63	.06	t(241)= -9.68 p=.33
No THP Spring	68	3.23	.77	.09	
THP Spring	38	3.50	.65	.11	t(104)= -1.79 p=.08

Note. 243 students took the online survey in fall 2012 representing 57% of the ninth and tenth grade students. Due to problems with survey administration only 106 students took the online survey in spring 2013 representing 25% of the ninth and tenth grade students.

spring between iPad access and helpfulness for doing research and accessing information. In the classroom observations the author noted these online activities were most frequently completed at school.

Differences in iPad Use in School

Table 5 summarizes the frequency of iPad use in school on the student technology use survey (Appendix 4) from January to May, 2013. Over 550 student technology use surveys were completed by 204 individual students, representing 48% of the ninth and tenth grade students in the sample. A *t* test indicated a statistically significant difference between students who had a THP and those who did not. The mean score for total number of technology applications reported by students with a THP was double the mean score for students without a THP. Similarly, the mean score for technology activities by students with a THP was almost twice that of students without a THP. Also, the mean Technology Use score for students with a THP was twice that of students who did not have a THP. The survey results clearly indicate that students who had a THP had a significantly greater opportunity to benefit from blended and online learning opportunities.

Students reported using eleven different iPad applications. The top four were web browser; presentation tools, e.g., Educreate, Explain Everything and Slide Shark; Google tools; and learning management systems, e.g., Schoology and Edmodo. Students also reported using note taking applications such as Notability and assessment applications, e.g., Socrative and Quizlet.

Students reported 15 purposes for using the iPad applications. Doing research and using references was reported most frequently, followed by reading, writing, taking notes, and producing media, e.g. taking digital photos and videos. Students also reported creating multimedia presentations, listening to music and playing games, working on collaborative projects, and to a lesser extent watching videos. Students reported using their iPads to solve math or science problems or communicate by email least often.

In 2012-2013, students from a minority of teachers accounted for the majority of technology use surveys. Of the 559 surveys completed, six out of 22 teachers whose students completed the survey accounted for 79% of the surveys. Two of the teachers taught ESL, one each taught science, math, social studies and English. Students were most likely to report using iPads in one science teacher's class, but not in other science teachers' classes. This

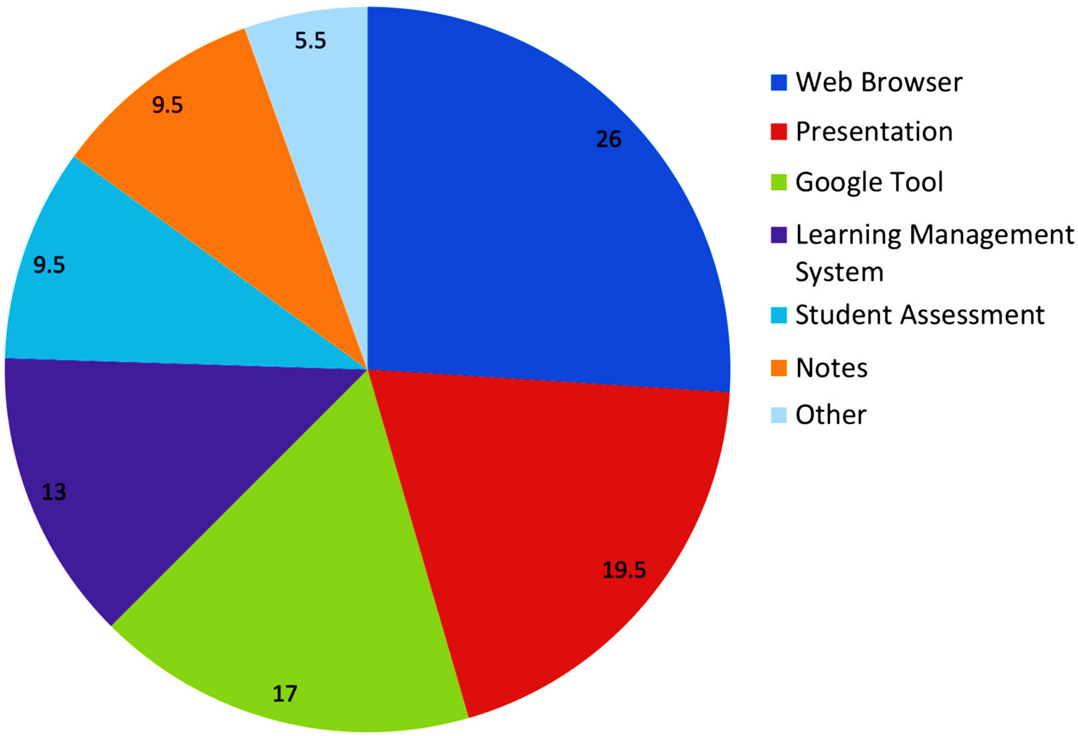
Figure 1. iPad applications by percent



science teacher was a member of the technology cadre and the most enthusiastic proponent of iPads as instructional tools. Students were also more likely to report using iPads in their ESL classes and in one of the math teacher's classes. These teachers were also members of the technology cadre.

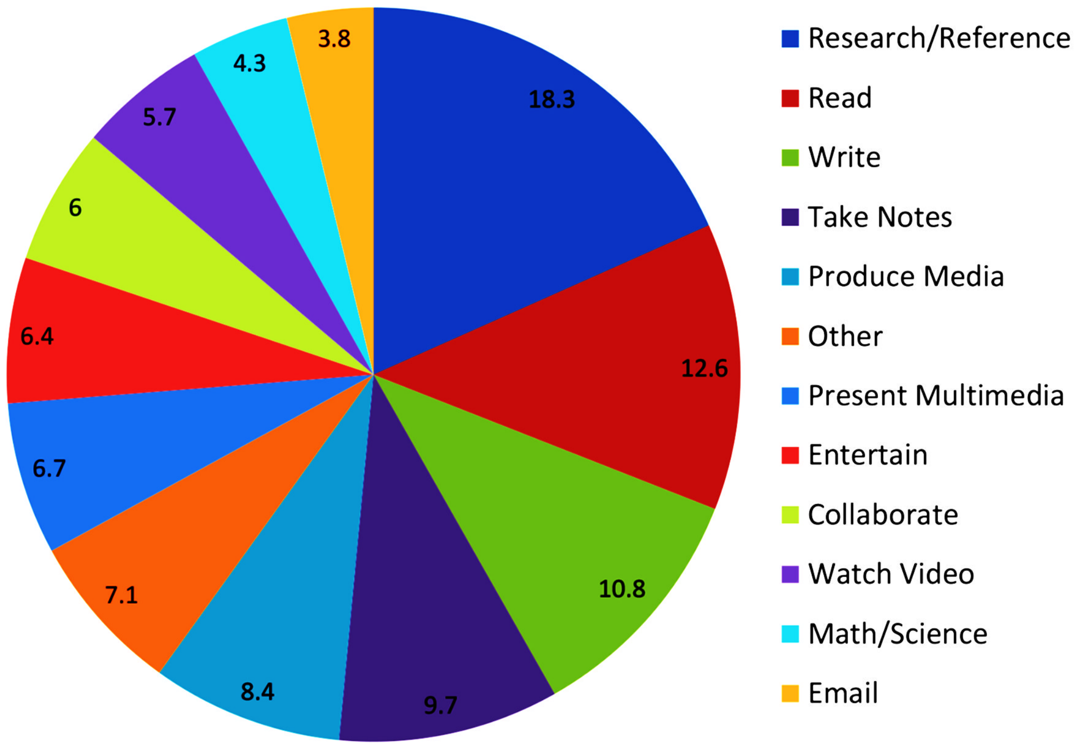
Differences in iPad Use Outside of school

Table 6 summarizes students' report of the frequency of iPad use outside of school. There were significant differences in students' responses between the fall, 2012 and spring, 2013 surveys. On seven of the eight indicators, there were no significant differences in the fall between students who had a THP and those who used an iPad from the classroom cart. However, the fall survey does indicate a small significant association for using the iPad outside school for social media.

On the spring, 2013 survey, there was a significant association between iPad access and all eight indicators. Students who had a THP reported significantly higher use of the iPad outside of school for doing homework, communicating and collaborating, creating videos and presentations, accessing information, watching videos, playing games, listening to music, and using social media than did students who could only use the iPad on a classroom cart.

Overall, 29% of the students who completed the technology experience survey reported they used their iPads (or laptops) at home to do homework 2-3 times/week while another 18% reported they used technology to do homework every day. There was a difference between students who had a THP and could use the iPad at home versus those who could only use an iPad at school. In general, students with a THP reported using iPads to do homework more often; 47% reported 2-3 times a

Figure 2. Uses of the iPad by percent



week, and another 34% reported using an iPad to do homework every day. However, only 18% of students without a THP reported using technology to do homework 2-3 times per week and only 10% reported using technology to do homework daily. Thus the opportunities for online learning were limited for students without a THP.

DISCUSSION

Opportunities Provided by 1:1 iPad Project

In the first year of the project, the 1:1 iPad initiative resulted in blended learning opportunities for some, but not all students. Classroom observations, the teacher focus group, and student surveys indicated that in some classrooms students were engaged in a variety of online activities. Moreover, the 40% of students who had an individual THP could choose when and where to complete assignments and also to extend their learning. According to Liu et al. (2014) expanding learning opportunities beyond the schoolhouse and school day is one of the key benefits of mobile devices. However, the iPad distribution significantly limited expanded online learning opportunities for students who did not have a Take Home iPad. Thus a key affordance of mobile devices was underutilized.

Student surveys confirmed that students used iPads most often to research information, read, write, take notes, and produce media. A key feature of blended learning is that "what the students learn online informs what they learn face to face" (Staker & Horn, 2012). In a 90-minute class period students often received direct instruction, collaborated with peers in a discussion or problem-solving activity and used iPads to support

Note. 243 students took the online survey in fall 2012 representing 57% of the ninth and tenth grade students. Due to problems with survey administration only 106 students took the online survey in spring 2013 representing 25% of the ninth and tenth grade students.

and differentiate their learning through online instruction. Students accessed teacher webpages to view short informational videos and were able to work at their own pace. They could follow links for definitions and more detailed information, highlight and take notes in the online texts.

The opportunity to extend learning time was especially important for English Learners. One of the ESL teachers emphasized the importance of newcomer immigrant students being able to access the teacher's website and resources from home. "Students with a THP and Internet have 24/7 access to continue learning even when I'm not around. Students access class material from home or after school programs, and often choose to review old material in addition to practicing new material." Even after one student left the high school, she still logged on to the teacher's website and continued to improve her English skills. Her teacher commented, "iPads provide a way for students to access everything and open up the world for them." The iPads also improved teacher/student communication, particularly when teachers provided individual feedback online either during class or after the school day. This is a key benefit of mobile devices in a blended learning environment.

Challenges for the iPad Project

Both the district and high school staff intended for the 1:1 iPad project to improve the quality of technology tools and reduce the disparities in technology access and instruction among low-income students by providing every ninth and tenth grade student an individual iPad. However, THP distribution significantly varied by grade level, race, and academic ability, i.e., designation as an Academic Priority student or GPA.

The importance of this digital divide in access was clearly shown in the student surveys when students with a THP reported significantly higher satisfaction and proficiency with technology than those who did not. Students with a THP also reported significantly greater use of iPad applications for a higher number of technology activities in school and a significantly higher use of the iPad outside of school for academic purposes.

In order for students to benefit from online learning, each must have a mobile device. While this seems obvious, the district underestimated the challenge of ensuring that every student would have an individually assigned iPad. Initial communication with families focused on the financial and legal obligations associated with the iPads but did not emphasize the benefits of the iPads to support student online learning during and after school.

While the majority of teachers reported they were familiar with iPads, and felt comfortable integrating technology into their classrooms, and did so at least weekly, student technology use surveys painted a different picture. The majority of these surveys were completed in six teachers' classrooms; many of these teachers were considered to be early adopters of technology and some were members of the technology cadre that provided professional development to their colleagues. One caveat to this finding is the student technology use surveys were voluntary, and classroom observations indicated that sometimes students used their iPads regularly but were not asked to complete the survey by their teachers.

The teacher focus group clarified another challenge. Given the delay in implementing check-out procedures and the requirements for students to have a THP, only 40% of eligible ninth and tenth graders were assigned an individual iPad. One teacher's comment represented the focus group concern: "If I spend hours developing an activity, and the kid doesn't have an iPad and doesn't even know how to email it to me. All these things play into why we are using technology as a notebook or a presentation." Previous research (Norris, Hossain & Solloway, 2012) suggests that 1:1 devices need to be used as essential curriculum tools rather than supplemental devices in order to impact student learning. In the first year of the project, instructional use of iPads varied considerably across the school.

The need for more technology professional development was a common refrain and substantiated previous findings with technology adoptions (Johnson, et al., 2013).

All too often, when schools mandate the use of a specific technology, teachers are left without the tools (and often skills) to effectively integrate the new capabilities into their teaching methods. The results are that the new investments are underutilized, not used at all, or used in a way that mimics an old process….(p.9)

During the year prior to iPad distribution teachers were given release time with paid substitutes to attend workshops on iPad use presented by Apple certified trainers and by state technology cadre members and district staff. In the first year of iPad distribution to students, the high school technology cadre teachers provided technology instruction in monthly after school department meetings. However, teachers seemed to have a strong desire for more professional development with iPads. Teaching in a blended environment with part of each class period devoted to online content and instruction takes a great deal of time to plan and create lessons and the development of new instructional skills for most teachers.

RECOMMENDATIONS FOR PRACTICE

At a discussion in April, 2013, faculty shared their vision of the opportunities the 1:1 iPad project could provide students.

It [educational technology] can give students and the communities they belong to a voice… They will learn how to use it to address their own academic, professional, and civic needs. This is cultural capital that students from more privileged families take for granted…It gives ALL students access to the tools they will need to be successful in college and the work force, not just the students who have access to technology at home.

Given these goals and the significant differences in access, attitudes, and experiences of students who were assigned an iPad to take home (THP) versus those who could only use an iPad on the classroom cart, it seems imperative for the high school to change the way in which iPads are distributed. Teachers insisted that from a social justice perspective, all students should have the opportunity for a THP. However, given the challenging conditions some of the students faced, e.g., homelessness and dire poverty, not every student was able to take an iPad home. For those students (estimated by teachers at less than 50), arrangements could be made for students to check their iPad in and out each day so it could be available during school. The consequence of not changing the iPad assignment process is to perpetuate the digital divide that limits the academic opportunities and technological affordances of the 1:1 iPad initiative.

Furthermore, instructional use of iPads needs to be an essential curriculum tool that enables students to learn on a daily basis in ways that are not well supported through traditional instruction. The teacher focus group and limited classroom observations suggest that in the first year of implementation, only a few teachers substantively integrated iPads into daily instructional practice at the high school. Research on technology innovation and implementation (Ensminger & Surry, 2008; ISTE, 2012) emphasizes the need for positive administrative expectations, supervision, and support at all levels; expectations that all students will have equitable access to the technology; and ongoing professional development for teachers in using the technology as an integral tool for student learning.

This research focuses on an issue of digital equity that has not yet been studied in depth with 1:1 iPads. Many of the schools and districts that have purchased 1:1 mobile devices for students to take home are private schools or public schools that serve upper middle class students. This case study looks in depth at students' access, attitudes and experiences and use of iPads to support online learning in a high-poverty, highly diverse, urban high school. Analysis of student achievement data is continuing in the second year of the project with a more in-depth look at the types of online experiences students are having.

The author wishes to acknowledge the contributions of Dr. Tatiana M. Cevallos at George Fox University who assisted with data preparation and analysis as a doctoral student.

KEY TERMS AND DEFINITIONS

1:1: The provision of a technological tool such as a tablet computer, laptop, or iPad to each individual student rather than providing a lab or classroom cart where students share the technology.

Blended Learning: An educational experience that provides students a combination of independent online content and instruction and supervised classroom based learning.

Digital Divide: Refers to the gap between students who have access to instructional technology, such as computers and iPads, and the Internet both at school and at home versus those who do not.

English as a Second Language: Frequently abbreviated as ESL, this term refers to an educational program for students who are learning English as a second language.

iPad Apps: Software applications specifically designed for the iPad. As of October, 2013, there were almost ½ million iPad apps; about 65,000 apps were designed for education.

iPad: A type of tablet computer created by Apple, Inc. that uses the IOS operating system with a multi-touch screen, virtual keyboard, and built-in wireless connectivity.

Mobile Learning: Learning that takes place anytime and anywhere that the user has a personal electronic device such as an iPad that is portable and can access the Internet.

This work was previously published in Exploring the Effectiveness of Online Education in K-12 Environments edited by Tina L. Heafner, Richard Hartshorne, and Teresa Petty, pages 250-279, copyright year 2015 by Information Science Reference (an imprint of IGI Global).

APPENDIX 2. HIGH SCHOOL TEACHER FOCUS GROUP PROTOCOL

The purpose of our discussion is to share your experiences using the iPads with your students and your judgment of the impact of the technology on your students' engagement and learning.
Review Informed Consent Procedures.
Technology Cadre Focus Group Questions April, 2013:

1. In general, what have been the strengths of the iPad project so far?
2. What have been the limitations or frustrations of the iPad project so far?
3. What are some ways your students have used the iPads that seemed to engage them the most?
4. What are some ways your students have used the iPads that seemed to have a positive impact on their learning?
5. To what extent has student use of the iPads noticeably affected student behavior in class?
6. To what extent has student use of the iPads noticeably affected student attendance in class?
7. To what extent has the 1:1 iPad project helped to reduce disparities in access to technology for your students?
8. To what extent has student use of the iPads affected the opportunity to individualize or differentiate instruction for your students?
9. If there is one thing this high school could do differently with the iPad project, what would it be?

APPENDIX 3. ONLINE STUDENT TECHNOLOGY SKILLS AND EXPERIENCES SURVEY

High school staff asked students to follow a link on their iPad to complete the electronic survey when they received their personal iPad.

What is your student ID number? _____________

What grade are you in?

- __9th
- __10th

What type of 1:1 technology have you been assigned?

- __iPad,

Please rate your overall proficiency with use of the iPad:

1 Low to 4 High

Do you have a home computer?

- __Yes
- __No

Do you have internet at home?

- __Yes
- __No

Please rate your overall satisfaction with use of the [iPad] technology?

1 Low to 4 High

What were the strengths of using the iPad?____

What were the challenges of using the iPad? ____

How often have you used your iPad during school?

- __in no classes
- __in 1-2 classes a week
- __in 3-5 classes a week
- __in every class during the week

For the next set of questions the choices were:

- __not helpful
- __somewhat helpful
- __helpful
- __very helpful

How helpful is your iPad in doing the following: homework?

How helpful is your iPad in doing the following: writing assignments?

How helpful is your iPad in doing the following: communicating and collaborating?

How helpful is your iPad in doing the following: organizing schoolwork?

How helpful is your iPad in doing the following: doing research?

How helpful is your iPad in doing the following: accessing information?

How helpful is your iPad in doing the following: staying motivated and engaged?

For the next set of questions the choices were:

- __very hard to use
- __hard to use

__easy to use
__very easy to use
How easy is it to use your iPad for the following: turning in homework?
How easy is it to use your iPad for the following: writing assignments
How easy is it to use your iPad for the following: creating content
How easy is it to use your iPad for the following: installing my own apps
How easy is it to use your iPad for the following: adding my own music
How easy is it to use your iPad for the following: taking care of the device
How easy is it to use your iPad for the following: communicate (IM,email, video chat, blog)
How easy is it to use your iPad for the following: connecting wirelessly at school
Any other comments:
For the next set of questions the choices were:
__never
__once a week
__2-3 times a week
__every day
How often do you use the iPad outside of school to? Do homework
How often do you use the iPad outside of school? Communicate (IM,email, video chat, blog)
How often do you use the iPad outside of school? Create videos, presentations, or projects
How often do you use the iPad outside of school? Find information
How often do you use the iPad outside of school? Watch videos
How often do you use the iPad outside of school? Play games
How often do you use the iPad outside of school? Listen to music
How often do you use the iPad outside of school? Use social media (Facebook, Twitter, etc.

APPENDIX 4. STUDENT IPAD USE SURVEY

High school staff asked students to follow a link on their iPad to complete the electronic survey.
Student Number:
Class Name:
Period:
1
2
3
4
5
6
7
8
After School
Which iPad Apps did you use during this period? If you don't know the name of the App ask your teacher:
__3D Game Lab

__30 Hands
__Adobe Reader
__ATT Scanner
__Bookabi
__Class Website
__Dragon Dictation
__Dropbox
__Edmodo
__Educreations
__Email
__Explain Everything
__Google Drive
__Google Maps
__Google Translate
__Haiku Deck
__iBooks
__ITunesU
__Logger Pro
__County Library
__Notability
__Pandora
__Quizlet
__Schoology
__Show Me
__Slideshark
__Socrative
__Synergy
__WebBroser
__Youtube

How did you use the iPad?

__Created multimedia presentation
__Did research
__Took photos
__Recorded audio or video
__Worked on a writing project
__Read
__Solved math or science problems
__Watched videos
__Collaborated on a project with others
__Communicated via email
__Listened to music
__Played games
__Took notes
__Used reference tools (e.g., dictionary, thesaurus)
__Other:

APPENDIX 5. TEACHER IPAD SURVEY

This survey is for administrators and the project team to track the amount of time iPads are used in the classroom. District staff asked teachers to follow a link on their iPad to complete the electronic survey.
What grade(s) do you teach? (Check all that apply)
___9th ____10th ____11th ____12th ___Other
What subject do you primarily teach?
___arts ___ESL ___language arts ___math ___pe/health
___science ___social studies ___Special Ed ___world languages
Rate your familiarity with the iPad
1. unfamiliar 2. somewhat familiar 3. familiar 4. very familiar
How do you feel about integrating technology in your classroom?
1. very apprehensive 2. apprehensive 3. comfortable 4.very comfortable
How frequently do you integrate technology into your lessons?
1. never 2. once a week 3. 2-3 times/week 4. every day
How much have your technology skills improved in the last year?
1. not improved 2. improved a little 3. improved somewhat 4. improved a lot
When students use technology in my class I observe
Compared to when not using technology,
___decreases ___no change ___increase a little ___increases a lot
student engagement
student writing
student higher order thinking
behavior problems
Do you feel you've received enough professional development to use the iPad in the classroom?
___yes ___no
Do you want additional training in integrating and using the technology in your classroom?
___yes ___no
Which apps do you use most in your class?
Please provide any other feedback regarding using the iPad in the classroom.

Chapter 81
E-Learning:
A Means to Increase Learner Involvement in Research

Marie de Beer
Durban University of Technology, South Africa

Roger B. Mason
Durban University of Technology and Institute of Systems Science, South Africa

ABSTRACT

This paper investigates a method for increasing the involvement of marketing fourth year learners in academic research, by encouraging greater participation in, and commitment to, their research project in the Applied Marketing IV subject. It is assumed that greater involvement will result in a greater pass rate. The main reasons for this lack of interest were found to be a sense of incompetence and a lack of resources which were the main objectives of a research project. These objectives were addressed by using learner centered methodologies with the research method Action Research. This research method with the slow resolution of problems was used together with a teaching methodology whose objectives supported the resolution of the learners' inadequacies. Formative assessment was used at the start of the measuring of the learners' progress and was found useful with its quick and positive feedback in supporting the learners' confidence. An eClassroom was structured for the implementation of the Applied Marketing IV course. It was designed in such a way that it facilitated the learners' use of the more commonly used devices such as surfing the web, email and Internet over and above the chosen course material. Although it was not possible to complete the main intervention of the project it was possible to use the participants' experiences in the navigation of the course material in the eClassroom, to further develop future follow-up courses.

INTRODUCTION

Numerous activities and interventions are being implemented in the Durban University of Technology (DUT) in general and in the Department of Marketing in particular to achieve the goal of increased throughput. One of these initiatives is to "promote learning through … research …"

DOI: 10.4018/978-1-4666-8246-7.ch081

via a strategic objective "to create conditions conducive to research" (Academic Plan Working Document, 2006: 24).

DUT throughput and graduation rates are below national benchmarks of 75% of learners finishing a degree or diploma in minimum time. Considerable pressure is being placed on Universities to improve such throughput rates, while at the same time maintaining acceptable quality levels. The DUT academic plan refers to a higher order intellectual skills associated with holding a Higher Education qualification through knowledge, skills and attitudes associated with their field of specialisation and general and transferable (life) skills (Academic Plan Working Document, 2006: 18).

Learners in the Department of Marketing are introduced to academic research via a subject called Applied Marketing IV in the Bachelor of Technology: Marketing degree. They have to design and implement a full research project, culminating in a mini dissertation. This is important training for those intending to progress to the masters level, but is also important training in more general research and decision making for those who will not follow an academic career, but will move into the business world. Unfortunately, the outcomes of this subject are not at the level that we would prefer. Too many learners 'drop out' of the course. Reasons for this seem to be the fact that they see research as very difficult, because some of the concepts that they have to apply are complex and new to them. The result is that learners do not see research as something they are capable of doing, do not become involved sufficiently, fall behind in the work and therefore become depressed, demoralised and give up.

This paper sets out to examine this problem, trying to 'unpack' it in more detail, to recommend a technique for resolving it, and to review an attempt made at implementing such a recommendation and the implementation problems experienced.

THEORETICAL FRAMEWORK

This research was based on the concepts of knowledge management and learning organisations, which can contribute to educational change and transformation (van der Westhuizen, 2002). Using this approach assists educators to achieve what Kraak (2004) refers to as increased responsiveness to the needs of the community (including business) and to the country's socio-economic needs (growth and technology). This is necessary because of the increase in market pressure on education, especially for greater access and an increase in adult learners (Sehoole, 2004), which places tremendous pressure on the less experienced lecturer. However, appropriate learning and teaching approaches could alleviate this undue stress. An examination of the learning and teaching styles and approaches together with the use of electronic classrooms supported by blended learning based on authentic learning will clarify basic elements of the theoretical framework.

Learning and Teaching Styles and Approaches

As an adjunct to this inexperience and increasing pressure, different learners have different learning styles and therefore respond differently to the standard face-to-face teaching method. Therefore, using only one approach to resolve the above problem may not be optimal. Whatever teaching method is selected, it should be a method that caters for different learning styles and for the satisfaction of the learners.

Electronic Classrooms

The traditional face-to-face mode of lecturing and learning could be replaced by electronic classrooms in order to absorb the undue pressure on staff. Marc Rosenberg (2001) maintains that such classrooms are generally the home of electronic learning (eLearning) facilitated by, and through the use of internet technologies which provide a series of solutions that increase knowledge and performance. He goes on to say that it should be networked, be computer based, with standard internet technology and focus on the broadest view of learning. In support of this, Allison Rossett (2001) considers that eLearning belongs to Technology-Based Training which are delivered "partially or entirely through electronic hardware, software or both".

Welch (2010) found that "there are benefits to e-learning including both a reduction in travel expenses and a reduction in delivery times. There is usually a time saving of around 40% over the traditional classroom training".

Blended Learning

It has been found that face-to-face teaching alone has been inadequate. This would also apply to the other approaches of teaching and learning. The different individual learning and teaching styles, together with the sense of incompetence by the learners and the lack of resources imply that a blended learning approach could be used for this study. Blended learning involves several different, but linked, strategies, in addition to classrooms, to deliver the teaching to learners (Rossett, Douglis & Frazee, 2003), such as, "collaboration software, Web-based courses, EPSS, and knowledge management practices. Blended learning also is used to describe learning that mixes various event-based activities, including face-to-face classrooms, live e-learning, and self-paced learning" (Valiathan, 2002). This latter, event-based approach, is a method currently being used, taught and researched at DUT, and thus seems appropriate for the problem defined above.

It has been found by Salamonson and Lantz (2005 (in Torrisi-Steele & Drew (2013)) that hybrid face-to-face and blended learning fulfilled the basic requirements of learners. They felt that learners satisfaction was influenced by 'individual student differences relating to learning needs, experience of the tutor, and nature of the material covered, and the mix of blended learning and face-to-face interaction".

There are, however, other advantages for using blended learning as well. For instance Sitzman and Ely (2009) found some evidence that this type of blended solution increased learning by an average of 11% for both procedural and declarative knowledge.

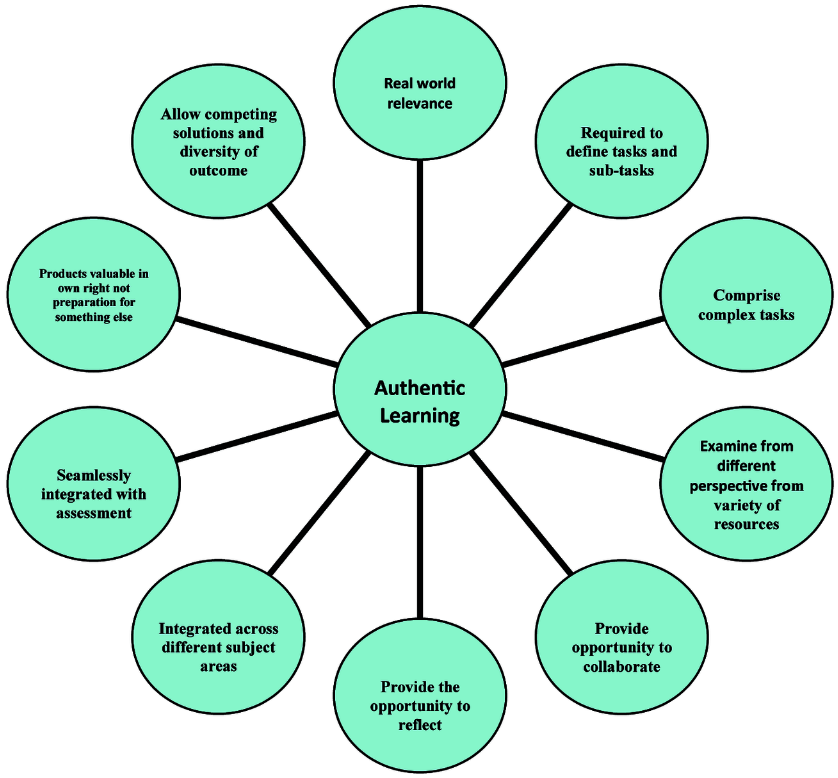
Authentic Learning

Authentic learning, which involves real application of knowledge, skills and practices in a context where they have real consequences and results, appear to have all the elements required to address the problem of generating increased responsiveness to the communal and socio-economic needs of the country (Herrington et al., 2004). It is also held by Revington (n.d.) that for authentic learning "the emphasis is mainly on the quality of process and innovation". He maintains that "The emphasis isn't about understanding teacher speak and regurgitating content just for a unit test, it's about developing a set of culminating skills sets, within a realistic timeline, using self-motivated inquiry methods to create a useful product to be shared by a specific audience".

The ten characteristics, of the authentic activities of the principles of authentic learning according to Herrington et al (2004) are applicable to most research studies (Figure 1). The majority of these characteristics are inherent in the activities of the current study.

Since an authentic learning approach underscores the requirements of this research, the relevant methodology for implementing it should encapsulate the very practical, self-expressive and integrated mode required.

Figure 1. The ten characteristics of authentic learning Source: Herrington et al (2004:11)

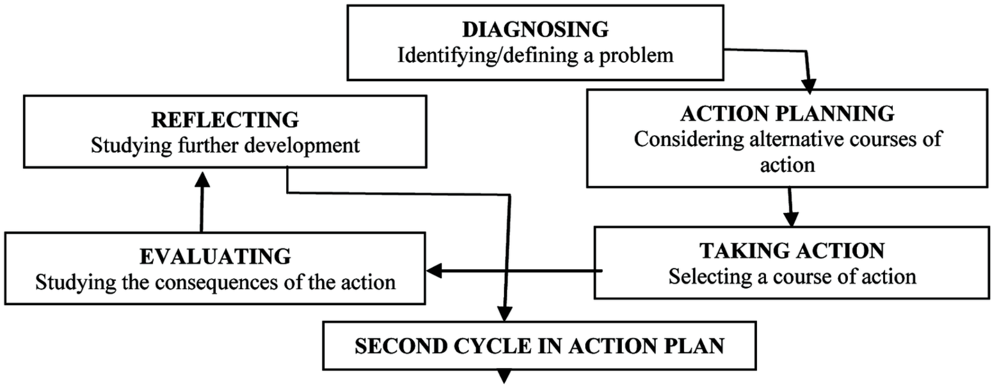


UNPACKING THE PROBLEM

As a generalisation in an academic environment, those learners who regularly attend face-to-face classes complete their subjects successfully – it is very unusual to fail if lectures are attended and all the required work is submitted. However, where learners do not attend face-to-face classes they seem to fall behind and do not get emotionally and intellectually involved in their research projects. Why does this happen? A possible reason could be belief that research is too difficult, too advanced and because the concepts are complex and new to them, with the research topics falling outside their interest area, it is inevitable that this would lead to a belief that they are not capable of doing research. It is, however, necessary to try to understand why they might develop these attitudes! The underlying causes could be two-fold:

- **A sense of incompetence as a result of:**
  - Their lack literacy and numeracy skills, which make them question their abilities.
  - Their general sense of inferiority, possibly due to previous disadvantages, inferior schooling, and difficulties in coping with diploma level studies.
- **Lack of resources:**
  - They do not have the resources to purchase the text book required and so are not able to read adequately on the subject.
  - Access to computer laboratories to do Internet searches for literature and to do data entry and analysis are inadequate on campus, which may discourage learners.
  - There are insufficient mentoring and lecturing facilities.

Figure 2. Action research model (Source: Adapted from O'Brien (1998: 5))



Based on the above analysis of the content and context of the problem, the following question can be posed:

What kind of lecturing and teaching styles and approaches, and relevant facilities for it would encourage learners to participate actively in research projects?

Revisiting the theoretical framework it can be resolved that the answer to this question lies within the ambit of the selection of an appropriate learning and teaching style approach under the umbrella of blended learning using authentic learning principles.

METHODOLOGY

Research Method: Action Research

The method chosen to research for a solution to the learners not participating actively in research projects is that of action research, which involves identifying a problem, applying a possible solution to resolve the problem, reflecting on the success of the action, and then improving on the previous application should the problem not be solved. It involves studying the problem systematically and being suitably informed by theory. A simple model of the action learning cycle, as adapted from O'Brien (1998) portrays the basic research method (See Figure 2).

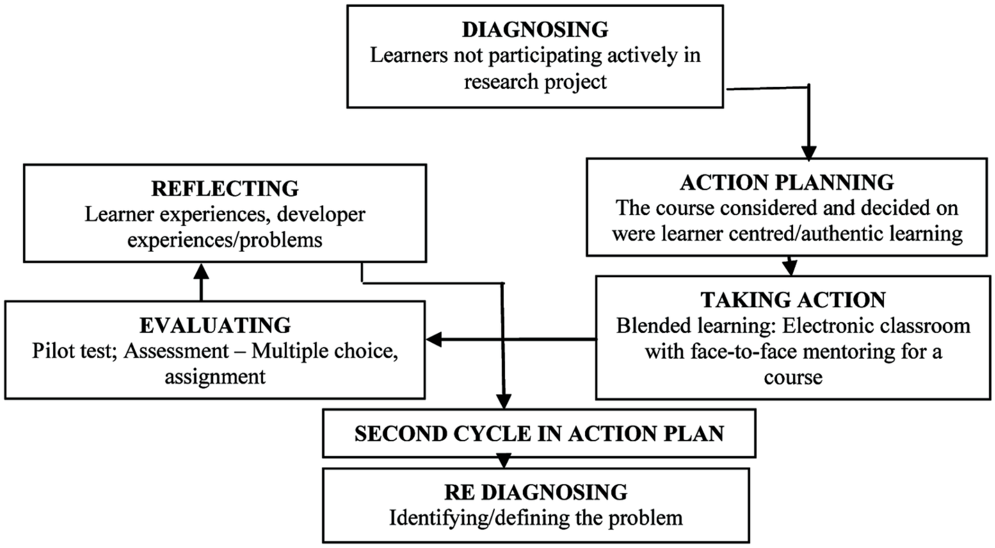
The implementation of the research study follows the basic steps of the action research model (See Figure 3).

The systematic approach of action research, which results in an almost slow resolution of the problem, will be ideally suited for those learners with a sense of incompetence. It will allow them to prove themselves in stages.

Content and Offering Approach of the Proposed Application

The course upon which this study was based and intended for was Applied Marketing IV for the fourth year B Tech: Marketing degree, which involved a reasonably complex research study, culminating in a mini dissertation. For this, the learner was required to identify a research topic, develop, implement and report on their real life research. The class was comprised of 60 learners, both full time and part time, many of whom are working. Currently the teaching methodology involves a traditional classroom lecture every three weeks, interspersed with one-on-one mentoring. The problems experienced for this traditional approach are:

Figure 3. Implementation of action research model (Source: Adapted from O'Brien (1998: 5))



- **Lack of Resources:** Considering there is only two staff allocated, this becomes very time consuming, as some learners can be very demanding. This endorses the serious lack of staff.
- **Repetition:** Another problem is that, at least 50% of what is said in one-on-one sessions is the same for every session. This repetition aggravates the shortage of staff.
- **Excessive Reliance on Input from Lecturer:** This is all individual work and learners, therefore, rely excessively on personal input from the lecturer, thereby exhibiting a serious sense of incompetence and insecurity.
- **New and Foreign Concepts:** The concepts and details of academic research is new and foreign to many learners. Not only does this bear evidence to the complexity of the study but also to the sense of incompetence and insecurity by the learners as already identified.

Based on the problems experienced it is clear that the course will have to also teach researching skills, as well as having to address attitudes about self-learning and working independently, and not just doing what the lecturer tells them. This supports Barr and Tagg's (1995) opinion that there is a paradigm shift away from teaching to an emphasis on learning which has encouraged power to be moved from the teacher to the learner. It also appears, therefore, that all three of Valiathan's (2002) skill-driven learning, attitude-driven learning and competency-driven models will need to be considered in developing the course. This landscape is ideally suited for those learners who need support in this.

Objectives of Teaching Methodology to Be Used

The objectives of the teaching methodology that was to be used were to:

- Cultivate a sense of independence in the learners and encourage them to do the tasks or subtasks needed and in the process examine the task from different perspectives using a variety of resources. This could also lead to opportunities to collabo-

rate with other learners and experts and to reflect on their work.
- Alleviate the gaps caused by the shortage of material, equipment, guidance and mentoring.
- Ensure that different aspects of the problem, subjects and disciplines could be facilitated by the use of electronic facilities such as eClassroom, eLearning and other web based technologies during and after normal lecturing times.
- Include independent assessment and evaluation techniques for the project to ensure objectivity and a high standard of the delivered product and, in the process, allow for competing solutions and diversity of outcomes.
- Through follow-ups and personal attention maintain contact with learners and thereby assist in reducing the 'drop out' rate.

The main objectives of the research namely; addressing the sense of incompetence of the learners and the lack of resources are very appropriately covered by these objectives of the teaching methodology.

The blended learning approach was felt to be ideal for the new course, as on-line learning provides access to knowledge areas such as databases and communication in the various disciplines, over and above the guidance for the specific task on hand. Also the dissemination of information and the handling of information dissemination to groups are greatly enhanced. Nevertheless, it was found that the face-to-face approach is decidedly better for one-to-one relationships and encouraging learner discussions.

It was therefore envisaged to continue with the traditional classroom lectures every third week for the face-to-face contact, which involved the explanation of new material (research steps) and handling problems of a more general nature. Concurrently, on-line learning could be introduced to provide the learners with all the detailed knowledge obtained over the internet that they require. This was also an ideal opportunity to expose the learners to electronic one-on-one discussions between lecturer and learners, and between learners themselves via discussion groups and /or e-mail. In addition where possible the electronic media could be used to fill in the gaps caused by the shortage of material, equipment, guidance and mentoring.

Submission of assessments was on-line, as was the feedback. Learners were able to post their assessments in advance and ask for comment from other learners prior to their final submissions. The problem of course was ensuring that they did not copy from each other! However, since each research topic was different blatant copying was not feasible.

Proposed Assessment of Application

Two assessment methods were used for the research exercise - multiple choice quizzes and an assignment:

- **Multiple Choice Quiz (MCQ):** Since the learners had to acquire the basic principles of research as one of the objectives in the development of the course, an MCQ was chosen to assess their knowledge of the basics, such as the different types of research, sampling methods and procedures, as some statistical procedures. According to Wiggins (2004) good assessment requires standards, feedback and evaluation. The MCQ does most of this by specifying what is correct and how many 'correct' answers are needed to 'pass', i.e. the standards; it provides feedback by giving the results immediate and explaining why the correct answers are in fact correct. This quick, positive feedback encourages involvement and learner participation and the growth of confidence
- **Assignment:** The assignment on the other hand, takes the form of the research pro-

posal that the learners have to develop, based on their basic research methodology knowledge and their choice of research problem. This assessment was intended to test their understanding of their basic research methodology knowledge and to test their ability to apply it in a practical situation. In other words, the outcome it assesses is the ability to design a research proposal based on sound research methodology.

Since these assignments were to be individually and manually graded, they would provide a good opportunity for feedback and evaluation (Wiggins, 2004). The evaluation and measuring facilities of the e-classroom was available and could be used by the learners whenever they wanted to grade themselves. This self-testing and the presence of positive feedback again encourage learners to engage with the material. In addition, the speed of the e-classrooms feedback also encourages engagement.

A further advantage of this type of assignment is that it is authentic (Herrington et al., 2004), as it is a real life research proposal. Furthermore, over and above the e-Learning evaluation (written) on the script and personal (verbal) feedback are also given, as well as positive, supportive evaluation. As such the evaluations provide a strong motivational role and diagnostic information to help the learner improve their proposal and confidence – this means it has both a formative and a summative role (CSHE, 2002), and thus playing a major role in ensuring that the leaner improves on previous efforts and becomes more assertive.

In summary, these two assessments offset each other's weaknesses, e.g. objective/ subjective, recall/application and speed of marking, and together provide the motivational drive to ensure learners continue to engage with the subject.

INTERVENTION

Electronic Classroom

In order to implement the action learning project, an electronic classroom was designed; it included content, assessment, survey and discussion tools. The structure of the classroom is illustrated in Figure 4.

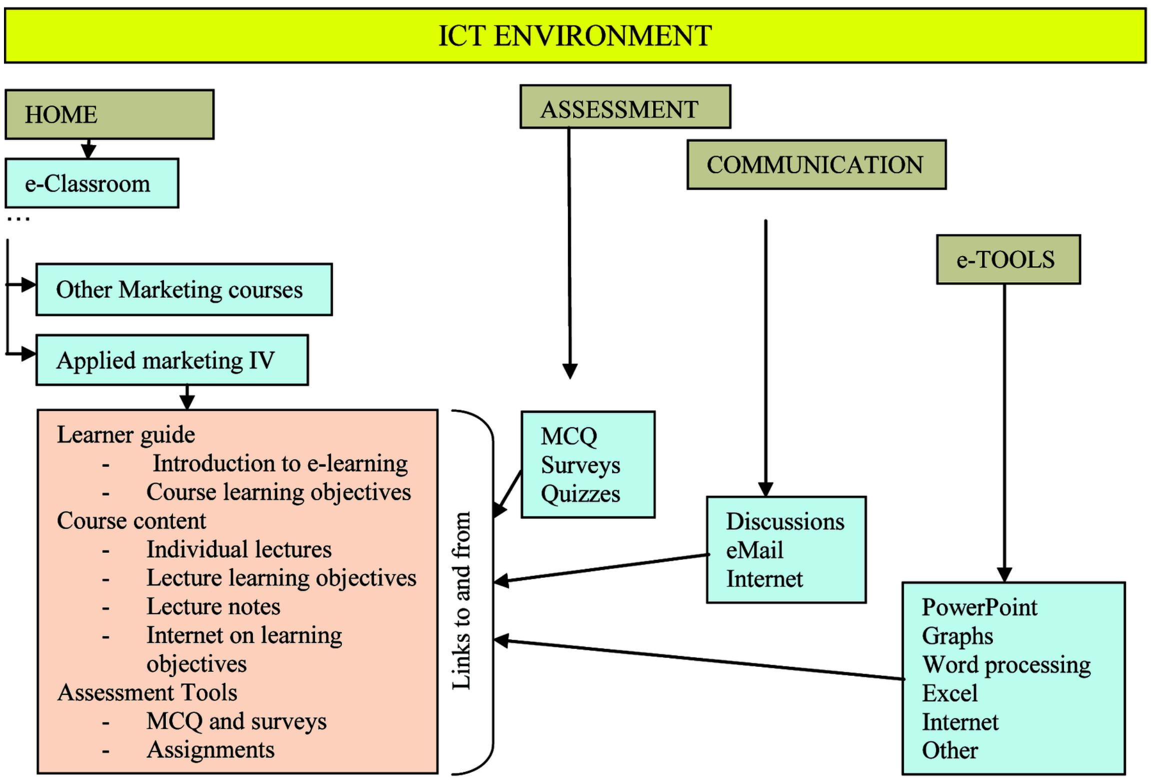
The long term intention of the electronic classroom was to cover all aspects of the research process, providing complete notes, guidelines, and instructions on the page This was done in order to enable learners to have all the material needed to fully engage with the research project, without necessarily having to acquire this information from face-to-face contact. Face-to-face contact was intended to be purely for handling problems, explaining aspects that the learner does not understand and providing individual guidance which was very important for the weaker learner.

Course Content Section of Electronic Classroom

The content section of the classroom included:

- **A Learner's Guide for the Subject:** This included an introduction to the eLearning process for the course as well as more detailed information on the course and of the assignments.
- **A Number of Individual Lectures:** Learners would use this if they have missed a face-to-face lecture, to print out notes, or to revise the lesson
- **Each Lecture Included:**
  a. Learning objectives of the lecture
  b. Lecture notes
  c. Links to:
  d. Formative assessment exercises
  e. PowerPoint slides for the lecture
  f. Internet sites of interest and relevance to the particular lecture

Figure 4. Structure of Applied Marketing IV e-Classroom



In addition to the lecture material, the site has links to various other websites of interest which can stimulate the learner's curiosity, leading them to become involved with other research web sites. Since "surfing the web" is an accepted activity of learners, this should encourage the learners to access more research web sites.

Assessment Section of the Electronic Classroom

The assessment section of the classroom included a formative assignment to assess the learners' abilities to use the electronic classroom and a survey to assess the learners' abilities to use the electronic classroom. An example of an on-line assignment is given in Figure 5.

Wanting to know how well you are doing is a natural emotion! Such self-test assignments appeal to this emotion, enabling learners to find out how well they are doing. Learners can thus be expected to take the formative assessment on a regular basis, thereby repeatedly engaging with the e-classroom and in the process develop their confidence and become more assertive.

Discussion Tool of the Electronic Classroom

A discussion tool was also included to enable learners to respond to the lecturer, and to each other, about the work and the assignment. The introductory discussion message is shown in Figure 6. Due to Blogging having become a major communication method for learners, this discus-

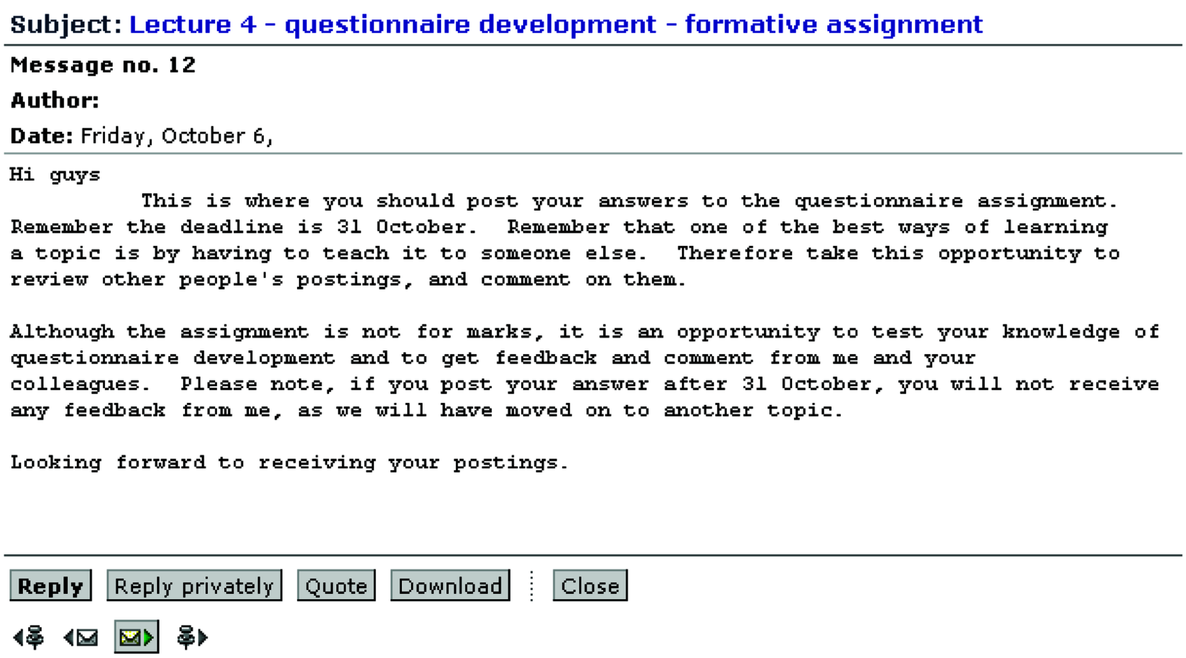
Figure 6. Introductory discussion message



Subject: Lecture 4 - questionnaire development - formative assignment

Message no. 12

Author:

Date: Friday, October 6,

Hi guys

This is where you should post your answers to the questionnaire assignment. Remember the deadline is 31 October. Remember that one of the best ways of learning a topic is by having to teach it to someone else. Therefore take this opportunity to review other people's postings, and comment on them.

Although the assignment is not for marks, it is an opportunity to test your knowledge of questionnaire development and to get feedback and comment from me and your colleagues. Please note, if you post your answer after 31 October, you will not receive any feedback from me, as we will have moved on to another topic.

Looking forward to receiving your postings.

sion falls within the realm of the learners' normal communication methods. It will also help to ensure learners engage with the e-classroom regularly.

Parameters for Development of Electronic Classroom

Based on the fact that learners have different styles (Felder & Soloman, 1999), the e-classroom was developed with the following principles in mind:

- Material should be presented in words and presented in pictures/diagrams.
- Use should be made of colour, especially, colour coding.
- Although material should be presented sequentially, each module should be stand-alone so that 'global' learners can jump around according to their interests.
- Contents outlines should be provided so that 'sequential' learners will have a 'road

map' to follow, while 'global' learners will use it to get an overview of material to be covered.

- Practical activities and assessments should be included for 'sensors', while learning and understanding the theoretical concepts should be included for 'intuitors'.
- The above mentioned will also be helpful for 'sensors' and 'intuitors'. In addition, some degree of group work should be included for 'active' learners, while individually thinking through a problem and providing a 'plan' could be helpful for 'reflective' learners.

The first parameter above has not been adequately incorporated into the e-classroom, because of time and skill constraints, but the second to fifth points have been, to a greater or lesser extent. As the classroom is developed, more visual material will be included .

PILOT TEST

As part of the development process, and in line with the principles of action learning, the online classroom was tested with four participants familiar with the subject.

All four were asked to complete the Lecture 4 assignment as per the following instructions:

Open Internet Explorer to DUT webpage
Click on Online Learning Centre in left hand menu bar
Click on logo just above Login
Enter your user ID (provided separately)
Tab to next box and enter your password (provided separately)
Click on Log In button
Click on 'Training' link
Click on Assessment link at bottom of page
Click on Assignments logo
Click on Lecture 4 Assignment 1 Questionnaire design link
Now follow the instructions on this and subsequent pages to which you are led.
Once you have completed and posted the assignment:
Please go back to the assessment page, click on quizzes/surveys, then click on "L4 questionnaire feedback" and do the survey on this exercise - it is very short! Don't forget to click on the Submit button to send it
Now please post a message to me via the discussion tool, ie instead of clicking on assessment on the front page, click on Communication, then on Discussion, then on questionnaire, then on Lecture 4 - questionnaire, read the message, click on Reply, type your response in the message box, and then click Post.

The results and findings of the pilot testing of the electronic classroom are further reviewed under Pilot review of the eClassroom, under Reflections on the Project.

REFLECTIONS ON THE PROJECT

The outcome of the study up to this point will be reviewed. This will include the review of the eClassroom development for the aptitude of the learners' abilities and the outcome of the pilot study of the e-classroom, the program design experiences in the development of the classroom, its implementation and the challenges faced. Recommendation regarding changes to the programme is also made and this includes improvements to the e-classroom, the infrastructure, and the context of the course.

Review of the eClassroom Development for the Aptitude of Learners Abilities

The research question for this research project "What kind of lecturing and teaching styles and approaches, and relevant facilities, would encourage learners to participate actively in research projects?" was based on what was identified as the plausible reasons why learners do not adequately support the eClassroom concept. These reasons were mainly a 'sense of incompetence' and the 'lack of resources' such as textbooks, lecturers, computer laboratories, and mentoring and lecturing facilities.

The eClassroom proposed by this project makes provision for these inadequacies as follows:

- The research method used was Action Research which systematically studies the problem to identify possible solutions.
- The course to be designed had to satisfy the problems experienced by the traditional approach for the lack of resources and the excessive reliance on input from the lecturer and to facilitate the understanding of new and foreign concepts.

This attention to the main reasons of noncompliance by the learners concerning eClasrooms was further supported by the main objectives of the teaching methodology to be used. The main features of this methodology are directed at the upliftment and support of the learner concerning their independence and alleviating the evident gaps caused by insufficient resources. It is further necessary to identify the possible use of electronic facilities and to ensure that the learners could apply independent assessment evaluation and assessment techniques for their work. Above all to ensure that contact is maintained with the learners.

Right through the course the contact with the learner played an important and active role where the lecture material is designed in such a manner that it stimulates the learner's curiosity and facilitating their other pastimes and hobbies such as 'surfing the web'. To facilitate their sense of incompetence, formative testing takes the foreground and is used to test the learner's abilities to use the electronic classroom before proceeding with the course. The fact that learners have different styles is taken into consideration and provision is made for this in the principles laid down and parameters set for the development of the eClassroom.

PILOT REVIEW OF THE eCLASSROOM

Most of the participants were able to adequately access the relevant aspects of the classroom, complete the assignment and post their responses. However, the assignments were not completed in the detail required, but since the main intention was to test the user-friendliness of the classroom, and not to test their knowledge of the content of the lesson, this was not a problem.

There were, nevertheless, certain procedural problems. For example, one participant somehow submitted the wrong file for his assignment, and a second participant was incensed at his low grading, 4 out of 10, missing the point that it was a formative assignment.

On reflecting on the process the following responses were received:

- Navigation through the classroom was relatively easy and logical.
- This navigation would improve with daily usage.
- The approach was found to be novel and created interest and enthusiasm.
- Generally positive about the electronic classroom concept.

PROGRAMME DESIGN AND IMPLEMENTATION EXPERIENCES

On reflecting on this action learning project, the problems could be grouped into those related to developing the classroom, its implementation and the challenges it experienced.

Developing the Classroom

In beginning the project, it was intended to develop the classroom in a stepwise method, staying one step ahead of the class in terms of the subject content, and thus developing the entire on-line classroom during the year from scratch. The first problem arose when it was not possible to gain enough knowledge, quickly enough, to be able to design the first few lessons by the time they were needed by the learners. By the time the skills to develop a 'lesson' were gained, the academic year was already well under way and the action research problem had thus fallen behind. This meant that the first e-lesson would be about the third or fourth actual lesson, with the previous lessons having been handled in the traditional face-to-face situations. This also did not work because by the time this lesson was developed, the learners had completed the relevant work and were moving on to the next step in the research process. In summary, the skills and the time available to dedicate to the classroom development were insufficient.

Implementation of the eClassroom

A further problem experienced was the fact that this was such a large class (60 learners) which lead to the realisation that it would be difficult to find a computer laboratory able to accommodate the entire class, available in the evening to train the learners in how to use the e-classroom. Such training was essential as was shown by the difficulties the respondents of the pilot study had in getting started on their assignment. Although they could navigate the classroom well enough, they needed a lot of guidance and written instructions on how to get started.

Main Obstacle Experienced

Probably the biggest problem experienced was the lack of time available to dedicate to personal learning and practice of the web learning platform, webpage development and development of the subject materials and assessments in order to be suitable for an electronic classroom. This was because of an excessive workload in our department which resulted from taking on numerous new and in-experienced staff, granting two senior staff members long leave, and preparation for a departmental evaluation. Personal obligations also took a strain with assessor training, extra masters supervisions, and the presentation and publication of three international papers. This abnormally high work load meant there was little extra time to devote to the e-classroom.

RECOMMENDED CHANGES TO THE PROGRAMME

In order to successfully and fully implement the electronic classroom, a number of changes and improvements to the programme, the infrastructure and the context of the course will need to be made.

Improvements to Electronic Classroom

The entire classroom must be completely conceptualised and designed before the course starts. This will allow the lecturers to know exactly what will be covered, when and where in the electronic classroom. The actual 'programming' and creation of each of the lesson pages do not all have to be completed in advance, but they must be ready at least two lessons ahead, i.e. six weeks ahead. This will allow for any developmental difficulties, last minute testing or inclusion of additional material. This process will also allow feedback and additions by other lecturers who might be able to use the classroom (e.g. Applied Promotions IV).

In addition, because different people have different learning styles the classroom should be designed to allow for these different styles. Unfortunately, due to the time pressures and skill limitations, it was not possible to include all the required techniques for catering for different learning styles. In a full electronic classroom, the design must allow for the different learning styles ('active' versus 'reflective', and 'sensing' versus 'intuitive') (Felder & Soloman, 1999).

Improvements to Infrastructure

When the new version of the Learning Management System is implemented it appears as if this will minimise some of the problems or potential problems that have been experienced. For example, it will make the use of the electronic classroom much easier for the learner and will simplify navigating around the whole programme – the easier the programme is to use, the more likely the learners will take up regular use. Further, the new version will be less complicated to navigate for the web designer, facilitator and lecturer as many of the more long-winded ways of doing things have changed. This will enable the development of skills to be quicker and happen more regularly. Better skills and trouble free progress development will help to ensure that the development programme of 'six weeks ahead' can be maintained. Furthermore, any time saved here can be allocated to more innovative and creative web and classroom design.

Another infrastructural issue that will need to be addressed is that of Internet access. Without easy access all the learners cannot be expected to become fully involved. Currently they have access to an adequate Internet computer laboratory, which is in the process of being upgraded. This, together, with access via library computers and personal home computers should be sufficient. In addition, Internet connections, with a computer and a digital projector, in the physical classroom, will enable the lecturer to continually use the electronic classroom in face-to-face situations, thereby training the learners in the e-classroom's use and encouraging them and motivating them about it.

Improvements to Context of the Course

It was found that the development of such a programme in isolation is problematic and is not recommended. Working as part of a team of lecturers, the members have the benefit of providing motivational support, as well as spreading the workload. As far as possible a team of at least two lecturers should work on implementing such an electronic classroom. It will, therefore, be necessary to arrange for at least one more marketing lecturer to participate in the e-learning programme next year. Furthermore, it would help if the department made a commitment to move towards a more modern (i.e. ICT based) teaching environment. However, this cannot realistically be expected until the university itself makes a declaration, and implements effectively, such as:

The University…is at the forefront of new learning technologies (University of Wolverhampton, 2005a).

ICT (Information and Communication Technology) used in exciting and innovative ways to provide lifelong learners with global access to information, learning and support. Information systems that are seamlessly linked to learning support systems, that are enjoyable to use and which enable management" (University of Wolverhampton, 2005b).

SUMMARY

This paper set out to investigate, through an action learning approach, a method for increasing the involvement of marketing fourth year learners in academic research, by encouraging greater participation in, and commitment to, in their research project in the Applied Marketing IV subject. This lack of interest of the learners stem from a sense of incompetence and a lack of resources and these were addressed in the research project.

The research tools to be used were carefully selected in order to ensure that the project is learner centered and make provision for the support of the weaker learner by boosting their confidence and complement the lack of resources. This started with Action research, which was felt to be most suitable with the slow resolution of problems, and followed by the teaching methodology that was employed. The objectives of the teaching methodology supported those of the research. It was also possible to use a formative assessment method at the start of the program, which with its quick and positive feedback supported the learners' involvement and participation in the eClassroom. This eClassroom was structured in such a way that the learners also had access to the more commonly used electronic devices such as surfing the web, email and the Internet over and above the chosen course material.

Although it was not possible to complete the main intervention, because of unexpected large volumes of learners and underestimating the time required for the development of the course, it was found that the learners were able to navigate the main features of the eClassroom and it was possible to use their experiences to further develop the follow-up course.

It is true that an action research is never really completed. There are numerous actions that still need to be implemented in a second cycle of the action research process. The conclusion that is of particular interest in this paper, is that an electronic classroom, well designed, could make a significant contribution to encouraging learners to become more involved and participating in their research projects. Such greater involvement, participation and commitment would undoubtedly result in a greater pass rate, and therefore a greater throughput rate. Thus, an electronic classroom could make a significant contribution to the university's key goal, and at the same time improve the financial standing of the university.

Finally, no empirical research has yet been done with the actual learners, and that is the next major step. In other words, it is recommended that a study be undertaken of learners' attitudes and opinions of the electronic classroom approach as part of an action learning study. Furthermore, a study comparing such attitudes and opinions to the learners' actual pass marks and throughput rates would provide stronger empirical support for the conclusion drawn, namely that an electronic classroom, as part of a blended learning approach, would improve pass rates and thus throughput.

ACKNOWLEDGMENT

With gratitude and thanks to Mari Pete and Nirmi Ziegler for their help in preparing this paper, and the four colleagues who acted as the 'dummy learners'.

Chapter 82
To Flip Or Not To Flip? That's *Not* The Question: Exploring Flipped Instruction in Technology Supported Language Learning Environments

Joy Egbert
Washington State University, USA

David Herman
Washington State University, USA

Aichia Chang
Washington State University, USA

ABSTRACT

Although the literature on flipped instruction to date appears to be relatively atheoretical, the benefits listed in the flipped literature fit well with theories of optimal learning environments (e.g., Egbert, Hanson-Smith, & Chao, 2007) and student engagement (Lin, 2012, and others). This conceptual paper links flipped instruction to these two models and then briefly describes an ESL teacher education course that involves U.S. pre-service teachers learning Chinese online as part of a flipped classroom. The paper concludes by suggesting how flipped instruction might work in other CALL contexts and related issues.

INTRODUCTION

Much has been written lately about the "new" method of "flipped" instruction and its potential to revolutionize instruction across disciplines (see, for example, Bates & Galloway, 2012; Bergmann & Sams, 2012). However, not much on this topic appears in the CALL literature. Such ideas need to be explored and assessed, and effective uses of technology to support student learning must be constantly updated and shared. Therefore, this paper explores flipped instruction in CALL classrooms. The purposes of this conceptual paper are: 1) establishing a theoretical basis for

DOI: 10.4018/978-1-4666-8246-7.ch082

flipped instruction by relating it to two models, one of conditions for optimal language learning environments (Egbert, Chao, & Hanson-Smith, 2007) and the other of task engagement (Lin, 2012), and 2) briefly describing and assessing an ESL teacher education course that involves U.S. pre-service teachers learning a foreign language online as part of a flipped classroom. To conclude this paper, we suggest how flipped instruction might work in other CALL contexts and related issues. With this work we hope to initiate discussion and research on flipped instruction as part of the CALL repertoire.

Defining Flipped Instruction

Like many terms that come into the education lexicon and are taken up in a variety of contexts, flipped instruction does not yet have a set definition that is used across media. In U.S. settings from K-adult classrooms and in disciplines as distinct as math and history, strategies for flipping that appear similar have even been given different names. For example, Eric Mazur of Harvard found that computer-aided instruction allowed him to "coach" instead of "lecture"; he called his model *peer instruction* (Mazur, 1991). Baker (2000) coined the term "classroom flip" in the late 1990s when describing his strategy of presenting course content on a course management system, allowing opportunities for active learning during class time. Similarly, Lage, Piatt, and Treglia (2000) introduced *inverted instruction*, a strategy which allowed them to differentiate instruction through the use of computer-based lectures and student-centered class time.

Regardless of what it is called and how it is implemented, the overall purpose of flipped instruction is to change classroom dynamics by using technology to present direct instruction outside of class. This frees the instructor and class time for more interactive tasks and additional scaffolding, including team work, individual conferences with the teacher, group and class discussions, and even reiteration of the content where needed (Bergmann & Sams, 2012; Baker, 2000; Kim, Byun, & Lee, 2012; Lage, Platt, & Treglia, 2000). In part, the idea is to give students some control over class content by providing ways for them to direct the pacing of the material, to provide multiple modes for students who learn in different ways, and to allow students to decide what and how they need to learn. Adherents explain that instructors can

Flip [instruction] so that students watch and listen to your lectures for homework, and then use your precious class-time for what previously, often, was done in homework: tackling difficult problems, working in groups, researching, collaborating, crafting, and creating. Classrooms become laboratories or studios, and yet content delivery is preserved. (Martin, 2011)

The way this has been traditionally interpreted in schools, entire K-12 districts, and higher education classrooms, is generally that students watch instructional content videos outside of class and then work on problems in class. The Khan Academy (http://www.khanacademy.org/), one of the most commonly used websites for instructional videos, exemplifies this approach. It provides videos in math, science, and humanities areas that are supported by self-placement quizzes and discussion posts. A Ted Talk by the founder, Salman Khan, explains the philosophy and workings of the online Academy (see it online at http://www.ted.com/talks/salman_khan_let_s_use_video_to_reinvent_education.html). Overall, the goal of flipped instruction is to engage and support students to achieve.

COMPONENTS OF FLIPPED INSTRUCTION

Anecdotal reports and classroom videos regarding flipped instruction abound on the Internet. From these reports, the main components that comprise a flipped classroom include the following.

Outside of Class

Videos, which take the place of in-class direct instruction, are the central component of this approach. Students are required to watch (or listen) at home to teacher-created or premade videos (from sites such as YouTube) and come to class prepared to work with the concepts they studied. To help students prepare, some instructors require students to take notes on the videos (e.g., Bergmann & Sams, 2012), while others suggest that students come to class with questions in hand (Chin, 2002).

A second component that some instructors implement is a learning management system (LMS). The LMS, in the form of an educational wiki or system such as Angel or Blackboard, is used for many different reasons, such as housing web links for the above-mentioned instructional videos, providing handouts and other guidance for students, supplying a place for students to post their questions and/or discuss content, and for sharing assignments.

Additional materials are sometimes included as part of the out-of-class materials. For example, some teachers provide course texts, web sites, and other resources.

In Class

During class time, the component most commonly noted in the flipped literature is discussion, whether in small groups or as a whole class. Time is also spent solving problems (Bergmann & Sams, 2012), working on task processes, and collaborating in different ways. In some flipped classrooms, the teacher works with small groups or individuals for just-in-time lessons or remediation, re-teaching concepts as needed (Bergmann & Sams, 2012; Lage, Platt, & Treglia, 2000; Strayer, 2007).

In the traditional version of a flipped classroom, students follow the same basic schedule and move forward as a group, while in the "mastery" version (Bergmann & Sams, 2012), students move through course materials and work toward specific goals at their own pace, advancing as they demonstrate mastery of the content.

Theory and Research for Flipped Instruction

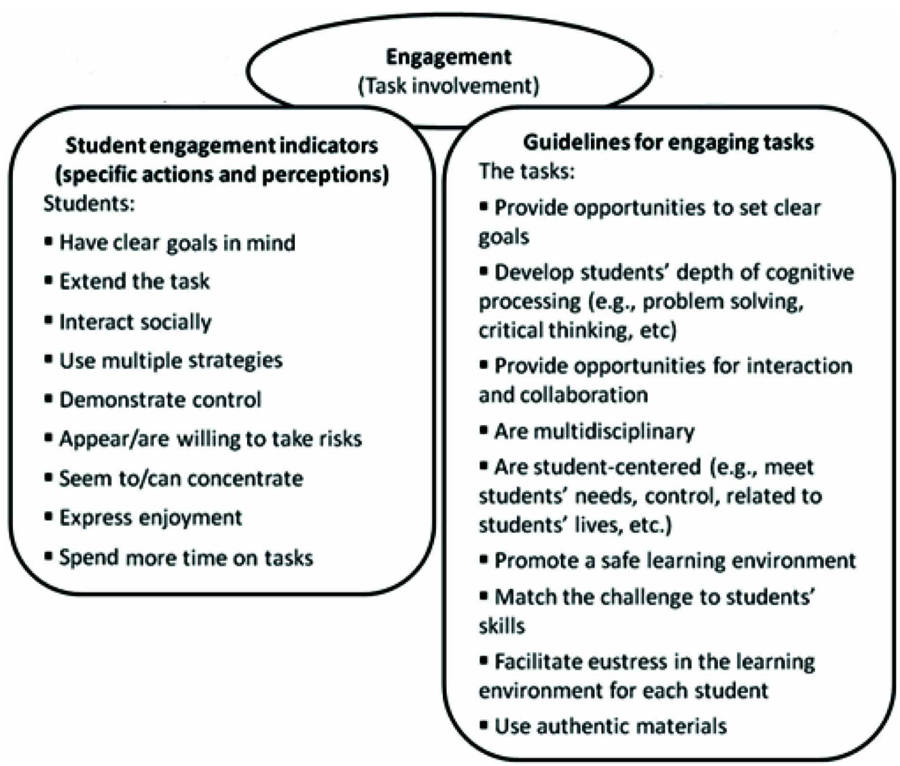
Although the literature on flipped instruction to date appears to be relatively atheoretical, the benefits listed in the flipped literature fit well with theories of optimal learning environments (e.g., Egbert, Hanson-Smith, & Chao, 2007) and student engagement (Lin, 2012, and others). For example, based on research in literature including computer-assisted language learning, educational technology, teacher education, and theories of pedagogy, Egbert, Hanson-Smith, and Chao (2007), based on a review of the literature, proposed 8 conditions for optimal technology-supported learning environments. These conditions are shown in Table 1, next to some of the techniques for flipped instruction noted in the literature that meet each condition.

Table 1 shows that there is definitely theoretical grounding for the flipped instructional strategy, as each of the eight conditions of optimal learning environments is addressed in some way by the strategies for flipped instruction. Similarly, the environment conditions and flipped strategies are in accord with many of the guidelines and indicators in Lin's (2012) task engagement model, shown in Figure 1. According to Lin (2012), engagement sustains students' focus on learning activities and tasks.

Table 1. Links between theory and flipped instruction

Learning Environment Condition	Flipped Instruction Strategy
1. Learners have opportunities to interact and negotiate meaning.	Teacher as tutor; focus on discussions where students interact and negotiate meaning
2. Learners interact in the target language with an authentic audience.	Increased student-student and teacher-student interaction about important questions
3. Learners are involved in authentic tasks.	Activities are meaningful to students; connects to students by using technologies that students use outside of school
4. Learners are exposed to and encouraged to produce varied and creative language.	Multiple information sources for exposure to content and language, resources are multimodal and multimedia; creative activities lead to a variety of outputs
5. Learners have enough time and feedback.	Just-in-time feedback in class while doing tasks, immediate feedback online, more time in class to work deeply with content
6. Learners are guided to attend mindfully to the learning process.	A focus on learning, not just behaving in a "school" way; just-in-time instruction that supports mindfulness
7. Learners work in an atmosphere with an ideal stress/anxiety level.	Learners choose where and when to participate in the direct instruction; learners control the pace of their learning to reduce anxiety
8. Learner autonomy is supported.	Self-pacing of direct instruction; students have choices of readings, resources, and projects

Figure 1. Model of task engagement adapted from Lin (2012)



Flipped instruction can promote task engagement because students have opportunities to receive more help from teachers and peers than in traditional teacher-centered classrooms and to focus on authentic tasks. This might help to create eustress in the learning environment, in which interaction and collaboration are paramount. Moreover, multimodal tasks and multimedia are provided in the flipped classroom to meet individual needs; this is important to matching task challenge to student abilities and supporting students in taking risks. In other words, the links among these theoretical models and strategies means that flipped instruction may help to create optimal learning environments and engaging tasks.

Although there appears to be a reasonable assumption that flipped instruction should support learning, that assumption has yet to be tested. Aside from the plethora of anecdotes available online, little empirical research has been carried out on flipped classrooms to date, and that which has relies almost entirely on student satisfaction and other self-report data (see, for example, Bergmann & Sams, 2012; Foertsch, Moses, Strikeweda, & Litzkow, 2002; Strayer, 2007; Kim, Byun, & Lee, 2012; Lage, Platt, & Treglia, 2000; Mazur, 1991). In general, these results show that students in flipped contexts value having some autonomy in working through the direct instruction and appreciate extra focus on understanding during class time. Although many of the reports promote flipped instruction as a panacea, others (e.g., Foertsch, et al, 2002; Lage, Platt, & Treglia, 2000; Strayer, 2007) note that students who are more dependent on peers and teachers and those who do not work well independently may find the flipped model to be more challenging. Of course, as with any instructional strategy, how it is implemented will affect the outcomes.

FLIPPED INSTRUCTION IN CALL

Flipped instruction has been implemented in a variety of higher education settings, including courses such as Introduction to Physics (Mazur, 1991), graphics design (Baker, 2000), Principles of Microeconomics (Lage, Platt, & Treglia, 2000), engineering (Foertsch, et al, 2002), educational technology (Shimamoto, 2012), and Introduction to Statistics (Strayer, 2007). As flipped instruction models increase in popularity, an increasing number of instructors of varying disciplines are exploring this strategy as a part of their own classroom instruction. However, as noted above, there is little research in general on this model and, more specifically, there is a noticeable absence of work exploring flipped instruction in the field of language learning. There may be several reasons for this scarcity: a lack of awareness of this instructional method within the language education community, limited technical support for language teachers, an emphasis on creative language use that is hard to support with flipped instruction, programs that follow rigid curricula.

Regardless of the reasons for this shortage of published works exploring flipped instruction in the language classroom, extant research and anecdotes appear to support the notion that the language classroom may be a good fit for flipped instruction. This is because the flipped instruction models innately contain elements of optimal language learning environments and task engagement. As can be seen in Table and Figure 1 above, the strategies for flipped learning naturally align with research-based evidence of ideal language learning environments. Based on the presence of these connections, the question arises as to whether or not the flipped model would indeed be beneficial when implemented in the language classroom. This line of questioning leads us to begin exploring flipped instruction strategies through the development and description of a Mandarin Chinese language course following the flipped model.

Description of a Flipped CALL Classroom

As part of a three-credit flipped ELL methods course for undergraduate elementary education majors at a university in the U.S. Pacific Northwest, a set of Chinese language lessons in 7 one-week units was developed. The purpose of these lessons was not only to gain elementary proficiency in Mandarin but also to help the teacher education students learn about and empathize with language learners and apply insights they gained to their teaching. Over four semesters, more than 200 teacher education students participated in the flipped Chinese instruction.

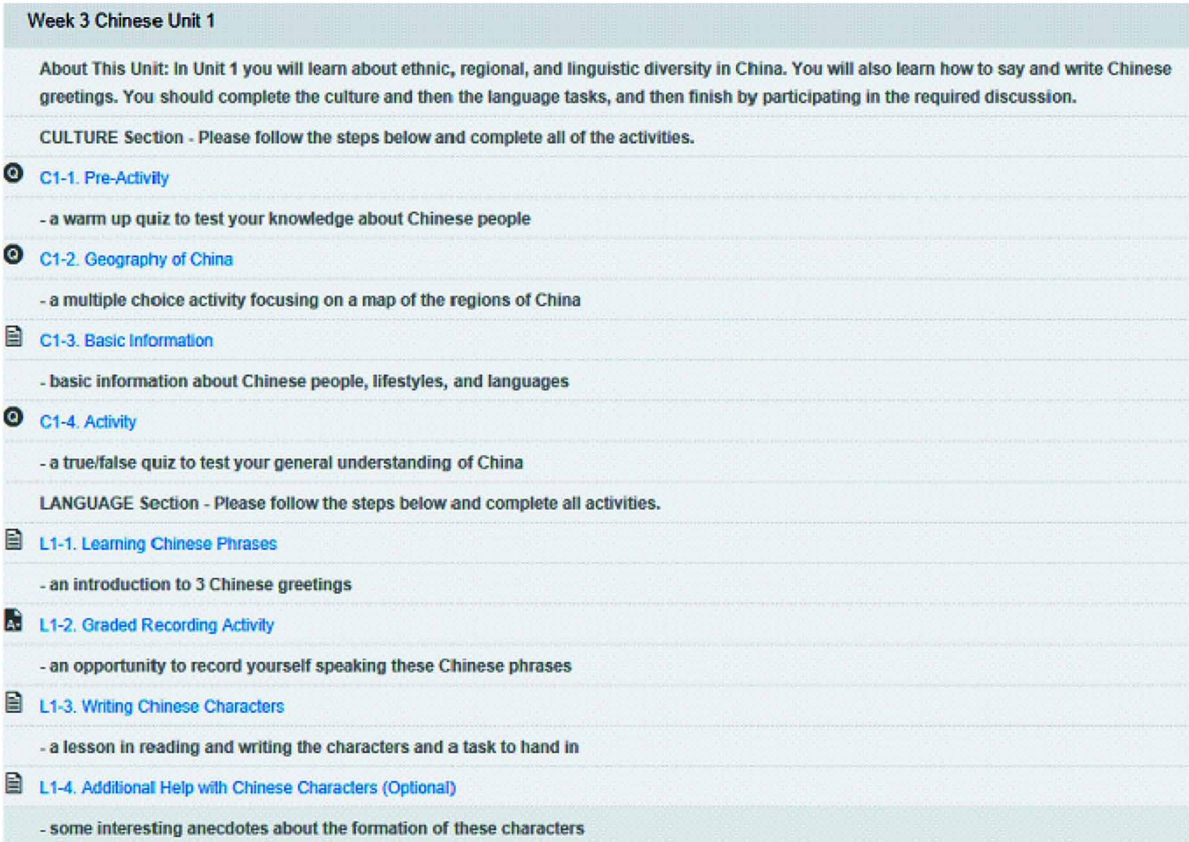
The Chinese lessons were designed based on the optimal language learning conditions noted in Table 1 and on principles for engagement, incorporating flipped instruction strategies. In this flipped classroom students completed most of the direct instruction aspects of the Chinese course – vocabulary, writing, speaking, listening – outside of the classroom. In a regular teacher-centered language classroom, the direct instruction is provided in class by the instructor. In the flipped classroom, all direct instruction was expected to be completed before the start of class; in other words, students were to listen to the character pronunciations, watch the culture videos, read, and review the writing for the week before they came to class. This allowed for the designated class time to be used for discussion, review, and practice of the language and concepts learned that week. Because they had class time for review and practice, students were able to receive immediate feedback in areas in which they were struggling, and their successes could be reinforced.

The Chinese lessons were created in Moodle, a popular LMS. Overall there were 7 units, which each included language, culture, and discussion sections. The course was designed for students to complete one unit per week for each of the 7 units; the content for the first unit of the course is shown in Figure 2. The same types of tasks are repeated in the other units.

In the language section, students experienced Mandarin language learning by completing different language learning activities that involved listening to, reading, speaking and writing Chinese words and phrases. Students used a recorder to record specific words and could click graphics and other information to help them understand the characters. Each unit also contained a section on a particular aspect of Chinese culture. For example, unit 3 introduced the education system in China and compared it to the American system. In each culture section, students completed an online pre-activity to activate background knowledge on the unit theme. For example, the screen shot in Figure 3 shows a pre-activity in a unit on the diversity of China in which students were to mark which of nine different pictures showed a Chinese person. Students then used videos and readings to learn about cultural issues that related to the given week's theme, followed by a brief online quiz testing their understanding. At the end of each unit, students responded in an online discussion forum to a scenario that related to the unit theme. Students responded based on their developing understanding of Chinese culture, incorporating knowledge from the ELL methods part of the course and other courses from their teacher education program.

Because there was not an effective technology we could find that could evaluate students' Chinese character writing, students turned in their writing to the Chinese lesson facilitator--a native Mandarin-speaking graduate student-- who graded it in class and returned it to students. Students could then ask any questions they had about their writing during breaks in class activities or after class. Also, if they had questions about the Chinese culture or language activities, they sent

Figure 2. Contents of Unit 1 of the Chinese mini-course

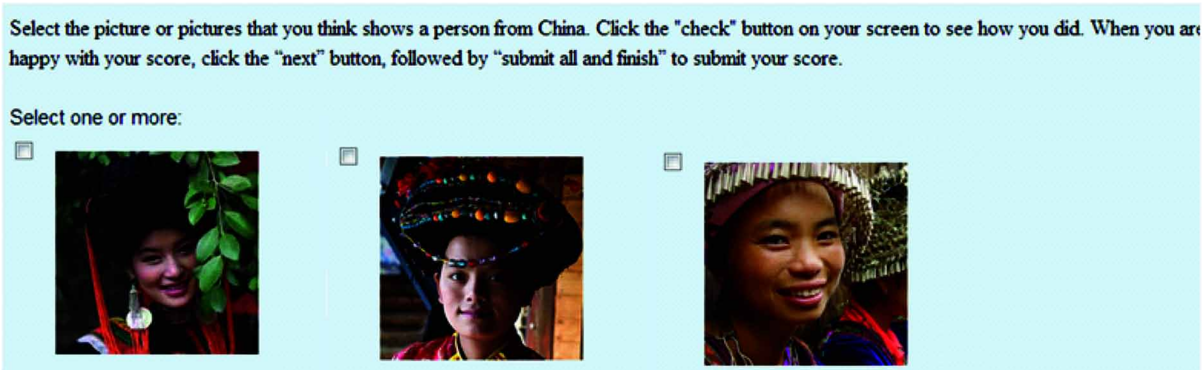


messages to the facilitator via the Moodle or email; they could also ask questions in class. In class, a native Chinese speaker reviewed the vocabulary. While reviewing the vocabulary, students could repeat after the instructor and work with peers for pronunciation practice. Then, if students had not finished their weekly vocabulary recording before class, they could record their audio with the facilitator's help. The facilitator also discussed culture issues with the students.

Students were obviously not expected to become fluent in Mandarin Chinese language and culture within 7 weeks, but, upon the completion of the final module, students were able to hold basic, classroom oriented conversations in the target language. They were able to make connections between American and Chinese perspectives on education and learning, and they began considering how these connections might be applied to ELLs of different cultural backgrounds, beyond Chinese. The inclusion of the flipped strategies seemed to make this goal a possibility, as almost all of the students in the course noted that they had learned something useful. For example, one student commented

I have learned valuable lessons through learning a second language that I would not have learned if I were just to read about it in a textbook. I have learned that it can be very frustrating as a student who wants to do well but simply does not understand the material.

Figure 3. Part of a pre-activity from the Chinese Moodle, "Select the picture or pictures that you think shows a person from China"



Videos of pronunciation could be watched over and over, and some students commented in this way:

I found the videos very helpful when learning the phrases and recording them. I felt that I put a lot of effort into trying to pronounce the phrases correctly in my recordings...

However, not all students were pleased with having the direct instruction outside of class. One student noted that

The Moodle was not beneficial to all learning styles.

Students also liked the overview in class, noting that

it allowed me to find the correct pronunciation of a word in person rather than using the YouTube clips in Moodle, which sometimes did not help.

While several students made comments such as

I felt like doing moodle weekly was a great way to start learning Chinese, but practicing it only once a week didn't allow anything to sink in.

A number of students commented that since they could spend as much (or as little) time as they wanted with the online direct instruction piece, they did not get as much from it as they would if they were forced by a face to face instructor to spend more time. In addition, although some of the students claimed that all of the language pieces needed to be face to face, none of the students complained about the cultural information and activities being online (with a brief discussion of them in class).

CONCLUSION

The idea of pursuing flipped instruction in this course is that increased engagement by teacher education students may lead to more effective learning for all their future students, including their English language learners (ELLs) and others at-risk (Green, 2011; Lin, 2012). In addition, by approaching the inclusion of a language learning component into an ELL methods course for undergraduate teaching majors by implementing elements of flipped instruction, we found that we were able to accomplish things that would otherwise be unattainable. Language learning takes time and commitment, especially when considering the learning of Mandarin Chinese by native speakers of English. Due to the time constraints of the ELL methods course and the wide array of content to be covered, including a language-learning component may otherwise have been impossible, at least on the level presented here. Through the use of the Moodle and flipped strategies, the students had opportunities to be involved with authentic language learning materials in the form of audio, text, video, and graphics. Students were able to discuss topics outside of class via the online discussion board, and they were able to learn and practice at times they deemed appropriate rather than being restricted by in-class time restraints.

Much like the learners in Strayer (2007), who struggled with the change in pedagogy, the teacher education students in the Chinese language flip had varied experiences in this use of CALL. Though some felt interested and excited about the Mandarin course and the presentation of its materials, others struggled with particular aspects, such as technical compatibility or the amount of 'homework' they were expected to complete. Some students expressed a desire to move more of the course content to the in-class portion of the course. It is apparent that flipped instruction will not necessarily work for all students in the same way, any more than any other teaching strategy. However, this incorporation certainly changes the traditional language learning classroom, and there are some clear benefits.

Implications of Flipping in CALL Classrooms

As outlined above, the flipped model may have some benefits for language learning, and it can also help students acquire technology skills in a fully integrated way that they might otherwise not use or be exposed to in class, such as using recording software, instructional video, learning management systems, etc. It can also allow time for course activities that might otherwise be forced out due to time constraints in a traditional student-centered classroom.

The exploration of the flipped instruction model suggests that much of the idea behind flipped instruction is not new, and teachers who have worked for years to create student-centered language classrooms should find this apparent. What sets the flipped model apart from traditional student-centered instruction is the incorporation of technology that supports the resource-rich, teacher-as-guide strategies that many teachers already use to engage their students in optimal learning environments.

Overall, our experiences over four semesters have led us to believe that it is not about whether the classroom is flipped or not, but whether the flip meets the needs of the target students.

Because it appears to be theoretically sound in general does not mean that it should be implemented just because the technology is available. Every field has different needs, and it is unclear as of yet if this teaching strategy will meet the needs of the CALL classroom; future exploration may help us to decide.

Chapter 83
The Future of Curriculum Development in Distance Education

Figen Kılıc
Mersin University, Turkey

ABSTRACT

Today, extremely fast developments take place in science and technology. These changes and developments reflect upon all systems and give rise to changes in some concepts and processes. Lifelong learning is one of the concepts affected by these changes. Educational institutions are considered to be responsible for spreading knowledge through e-learning, virtual university, Web-based education, distance education, which offer professional development. Therefore, distance education institutions have an important place in the education system of the future. However, innovations and developments have to be followed closely and operationally used for adaptation to the education system of the future within the distance education system as well. A scientific and realistic way of adapting to these developments is possible only if program development efforts are constant. Looking from this framework, teaching design, internationalization, entrepreneurship have given rise to differentiation in the program development of distance education. This is explored in this chapter.

INTRODUCTION

With rapid advance of information and technology in today's world, learning-teaching environments, methods and techniques have begun to differ. Learning is an inherently social activity and requires a well arranged, strong content. Learning experiences can be possible not only through content but also online communities and networks. Besides, difference in space and time, rapid increase in population and differing needs of the increasing population, rapid change in the knowledge learnt are among the realities of today. Therefore curriculum development efforts are advanced in line with these new developments and curriculum development concept has started to be frequently used in the distance education practices. Program development studies are processes which continue constantly and have an interaction between the items. Thus, it can be

DOI: 10.4018/978-1-4666-8246-7.ch083

said that program development process is a study addressing those principles and activities utilized in order to realize the objectives covered by the program in a sound, effective and realistic manner in a manner that has been put into practice (Varış, 1996). Since there is a positive correlation between realization of the education objectives designed and carrying out the education activities within scope of a program, elements that affect the result should be considered within wholeness of a system and should be developed consistently with one another in order for changes in behavior expected by way of education to take place (Sezgin, 2000). Practices in the distance education which began with learning by mail and continued with radio, video conference, teleconference, computer and Internet use have changed with the advances and developments in the advances and developments at mass communication means. On other words, education programs will constantly renew themselves and develop.

This part has focused on how program development studies can be shaped within framework of lifelong learning under the light of the new knowledge and technological developments.

BACKGROUND

Lifelong Learning and Reflections on Life

Rapid change in information and technology causes individuals to feel the need for lifelong learning, and to meet such needs, they need to have certain knowledge, skills and attitudes within "lifelong learning" skills. European Commission (2007) describes such knowledge, skills and attitudes as "proficiency of communication in mother tongue," "proficiency of communication in foreign languages," "basic competencies in mathematical thinking and science and technology, " "digital competence," " proficiency of learning to learn, " " awareness of becoming a social citizen " as well as "cultural consciousness and adequacy of expression " . When looking separately at these skills specified within framework of lifelong learning, ability to orally express the emotions, views and facts in the mother tongue and ability to use the language effectively at the social and cultural environments from a linguistic point of view is defined as proficiency of communication at the mother tongue (Candy,2003) while proficiency of communication at the foreign languages describes ability to express the emotions, views and facts in a foreign language verbally and in writing, ability to use the language in the social and cultural environments effectively and have the ability of intercultural perception skill (Bruce, 1999). It is also specified that mathematical thinking and digital competence is effective use of data communication technologies, effective use of computer in acquisition, production, evaluation, presentation of the knowledge, communicating via Internet; competence of learning to learn is individuals' taking on responsibility of learning and ability of realizing their self-learning ; consciousness of being a social citizen is realizing one's responsibility, entrepreneurship is putting the ideas into practice, taking risks, cultural consciousness and expression proficiency is explanation of emotions, views and ideas related to a group of media including music, painting, literature and visual arts (Wain, 2000; Walters and Walters, 2001). When looking from the perspective of definitions made, attitudes, behaviors and views expected from the individuals within scope of the lifelong education competencies clearly indicate clues as to what might be expected from the education system. Also, especially education of individuals who can think critically, solve problems, make independent decisions, work cooperatively, can be creative and learn all life long is considered important from functions of education. When looking from this framework, educational institutions are considered to be responsible for spreading the knowledge through means such as e-learning, virtual university, Web based education, *distance* *education* which offer professional development. Also, as suggested by Çakın (1998), education institutions should be places where objective is making students to acquire skill of questioning, becoming creative and constant learning, not an institution where existing knowledge is transferred to students through a rigid discipline. In such case, education programs based on *lifelong learning* skills is required (Romuald, 2004; Viscent, 2006 akt. Budak, 2009). Those individuals who are within *lifelong learning* process may be willing to use a flexible and constant education method. Traditional education model may be insufficient in creating a constant professional and/or non-professional learning program aimed at development of the individuals. Acquisition of knowledge for one time only within traditional education system, concentration on knowledge learnt from the books, nadequacy of the communication and information technologies, negative perception against learning due to obsession about success, failure to pay attention to individual differences may be cited among the inadequacy of the traditional education models .

It is observed that, at the national level, institutions offering *lifelong learning* opportunity operate at different names such as widespread education, adult education, external education, on-the-job education, and apprenticeship education. Recently, it is likely to add e-learning which is frequently discussed and partially applied to such list (Budak, 2009). Because problems such as distance, place and time inconsistency might appear in the vocational and/or non-vocational learning process of target audience. Clear and external learning method may be utilized in order to get rid of the problems that arise. In this context, components of lifelong learning may be determined as formal learning, informal learning and unofficial learning. Formal Learning is a type of learning where institutions are structured from perspective of learning targets, time and learning support and documented as a result. Meeting learning requirements of the institutions at every phase of life through traditional methods may not be possible. Because there may be obstacles before participation of individuals in education process. Therefore, it may be necessary to offer more flexible structures to the individuals in order for formal learning method to be possible. The said flexibility may be formed through open learning opportunities. Also, external learning opportunities may prevent the obstacles within learning process of the individuals. Therefore open and external learning facilities need to be put into practice before one can speak about formal learning method. To sum up, change requires *lifelong learning* and lifelong learning requires open and external learning. However, there is one issue we constantly focus on, that is, science and technology constantly advances and education institutions should enable the individuals to keep up with such advances and they should educate new generation individuals and keep them equipped with certain skills.

What Should Education of Future Be Like?

Basic objective of education is transferring the culture, values and traditions of the society as well as knowledge accumulation to the next generations. In an era of information, change of old values and standards is inevitable. When looking from this perspective, it is possible to make some assumptions about how education of future should look like. Educationists, economists and futurists are closely interested in this issue. In his article entitled "Future of Education," Futurist Thomas Frey (2010) from Da Vinci institute discussed this issue under 8 main titles; also, Anderson (2010) expressed his opinion on this matter through his blog. Many different comments can be found in the local and international press in connection with this matter. Below there is a discussion about what awaits us, the educationists, in the future by taking the foregoing information as the starting point.

1. **Changing Classes:** Face to face is an important element of learning. Classroom environment is extremely important form this perspective. However, multiple-communication media occupy an important place in people's lives and personal careers. In future life, business, entertainment and education will be intertwined. Therefore, school time understanding will be replaced by a more flexible time, in other words, education environments that are part of the life for 24 hours in seven days of week will be required. Today, external education is seen as a new door opened for those students who failed to complete their education due to some reasons and are willing for a second chance (Koustourakis et al. 2008). Owing to new applications using the space and time more flexibly, *distance education* which is in the process of handling face to face communication with blended learning is a precursor of a new era that will shed light upon several problems. Learning environments developing in connection with technology give rise to expectations about Web based learning and a rise in quality of education (Grant and Cheon, 2007).

   Changes are expected not only the class environments but also in the physical structure of the schools. Schools will offer "Computer Assisted Education" and ensure that "Web Libraries" are widespread. It seems that education at virtual classes which have been introduced but will take a longer time for spreading will cause a change in the concept of school. Support duties fulfilled by the courses and private tutors is observed to be fulfilled by the newcomer online websites. Besides, some learning method obstacles encountered by the students at the Web based teaching and traditional teaching over the computer networks will be eradicated and a more original education environment will come into being. As suggested by Kısakürek (2011), at a study conducted by the economist magazine with a sample of 289 persons, 2/3 of the participants state that technological innovations will affect teaching methods within the next 5 years.
2. **Changes in Sectors:** In today's education system, firms offering transportation service, firms producing school uniforms, catering companies and even contractor companies will be needed less and less. Consumption of stationery materials will drop and education software will grow in number (Şaşmaz, 2013). The course books used currently are quite thick. The printed course materials will also disappear. Since the 19th century, course books are used in order to cover the course content. Therefore, they need to be updated constantly. New technologies will offer browser-based content instead of course books (http://www.davinciinstitute.com/papers/). Further, owing to close relations of school-university-industry, establishment of schools educating their own personnel and workforce is seen likely. For instance, IBM will open its online school that will train its own personnel.
3. **Transition from Teaching to Learning:** Technological innovations affect the teaching and learning styles. Sophisticated teaching – management systems, benefits of cooperating with various research partners in the world are some of the benefits derived from changed forms of education institutions among others (http://www.nmc.org/pdf/Future-of-Higher-Ed-(NMC).pdf Also, traditional classes concentrate on "memory" and "knowledge". New education approaches, however, seek for an answer to the question "how can we handle the multi-dimensional problems?" by using the new technologies. One of them is the individualization of teaching. *Distance education* enables the individual to get educated in line with one's own targets and one's

own pace (Holmberg, 1996). According to Wedemeyer, *distance education* consists of four components such as teacher, student, e-learning system and content. Learning takes place as a result of students activities and it is important that content is accessible within framework of the student (Akt: Gülbahar, 2009, 54). *Distance education* is the natural result of the societal transformation, yet it must get rid of its limitedness so that it can be effective in teaching and is long lasting. It should achieve this objective by conducting studies aimed at solving the problem of lack of "eye contact based interaction" which is the most important feature of the face to face education (Gokool-Ramdoo, 2008). These studies may be possible if connection of the student with the learning environment and teaching materials is strengthened. Development of lifelong education understanding built on the basis of constructivist approach and social networks, rapid change and spread of knowledge has prepared a foundation for formation of this theory. According to principles of the social constructivist theory (Bronack et al. 2006);

- Learning is participative,
- Information is social:
- Activities shared improve the learning,
- A beneficial information base appears through effective sharing with the others,
- Students develop their practices according to society they live in.

According to the theory of connectionism developed based on these principles, basic variables affecting the persons and institutions today include societal changes, technological developments, globalization;, rapid spread of information and centralization (Doğan, 2011). Connectionism that affects the *distance education* understanding with the opinion reading as "learning takes place in the process of combining the knowledge sources " focuses on importance of generation of complete, up-to-date and sharing information (Anderson and Dron, 2011). Also, students of the new era will have to educated within a system where they will study and learn on their own. Students will have to find, use and generate the information, when necessary. Learning will take place by doing and experiencing, experiments will take place through simulations at many courses and artistic trips be organized for the art classes. For instance, virtual tours to museum of modern arts located in New York may be organized when students are learning about the modern painters. We will become capable of learning things by practicing which we cannot learn by experiencing through other means.

4. **Qualifications of the Students Educated will Change:** The student must the person who is learning constantly and renewing oneself because information evolves constantly. The student will improve his researching features, and will have to have a critical thinking ability in order to find the correct piece of information among the tons of information. Critical perspective will improve, and learning will become hyper individualized owing to the students who are able to decide when they will learn what (http://www.davinciinstitute.com/papers/). Also, business life and academic cooperation will increasingly become a part of the university life. Institutions must employ advanced technologies in order to increase their partnership and collaborations (Kısakürek, 2011). Therefore, individuals with *lifelong learning* skills will have to be raised so that well-trained workforce can be recruited by the institutes and institutions.

As can be seen here, several changes are expected to take place in the new generation education. Of course, these cannot be expected to take place in a very short time. However, as a requirement of the new information and technology era, infrastructure, technical equipment, understanding and programs have to be customized to this approach. In such case, development of *distance education* programs, one of the most widespread examples of the new generation education understanding, is needed. Below a discussion about future of program development studies in *distance education* can be found.

MAIN FOCUS OF THE CHAPTER

As an alternative to the traditional campus based structure, distance education becomes effective as an education approach rapidly developing within the new world order owing to its technology based course structure. A major part of society and educationists approach to *distance education* and evaluation of programs offering *distance education* with an increasing interest. The most important reason of this is improving quality of the *distance education* program (Kaya, 2002).

Increased interest and requirement for *distance education* in the world has paved the way for *distance education* programs at several universities. Through the historical process, these studies are currently at the stage of adaptation and development, and *program development* studies are ongoing. Although *distance education* is at the stage of crawling, it is seen as an education model and attracts attention (Boon et al. 2005). Number of programs offering *distance education* is being increased at several universities in order to meet the increasing demand for *distance education* without conducting program assessment and development studies. At this point, the following question comes to one's mind: Is the education quality increasing in parallel to the quantitative increase in *distance education* programs? Juran defines the concept of quality as "suitability for use" (Aktaran: Ensari, 2003: 1). Does *distance education* meet the expectations in this regard? In order to answer these questions, current status of the *distance education* programs needs be studied.

How Do Education Programs Adapt to Education of Future?

Rapid changes in knowledge and technology change the world order and education programs adapt themselves to such changes, and offer extensive opportunities to the individuals within scope of *lifelong learning* concept. Therefore, given the dimensions comprising the structure of the education programs which are constantly in interaction with one another, evaluation and development of each dimension will differ in line with the developing knowledge and technology. Since *distance education* practices have increased today, several dimensions such as general objectives, who will receive the program, time, learning space, content and arrangement, method, social activity and communication which are dimensions of the education programs have been affected by these dimensions (Kılıç, 2011). Objective of schools is educating the group, not the individual and accordingly, education programs have been established with curriculum. Therefore, education programs need to adapt themselves to the new societal order of today. Each school must renew the education programs in order to educate the workforce required by the information and technology era. This study discusses what can happen with regards to the changing processes of the *curriculum development* studies at *distance education* applications.

It is known that education programs have several interconnected dimensions which require them to be assessed and developed separately and together. These are:

- Objective and function of the institution where program is to be developed;
- General objectives of the program;
- Who will receive the program;
- When program will be given;
- Teaching space;
- Learning field;
- Gains;
- Determination of introduction behaviors;
- Content and activities;
- Criteria to be applied in selection of lecturer;
- Time, detailed timing;
- Strategy, method and techniques;
- Teaching objectives to be used;
- Support activities;
- Social activities;
- Cost /benefit;
- Assessment; and
- Development program (Varış, 1996).

When looking at the nature of *distance education*, changes in these processes are inevitable.

When looking at the basic theories affecting the *distance education*, we encounter "Autonomy and Independence Theory" paying attention to individualization of the education, "Industrialization Theory" focusing on the issue of arranging the teaching structure in order not to lose learner centers structure and "Interaction Communication Theory " which defends that *distance education* understanding containing emotions like possession, cooperation and empathy can be effective and "Adult Education" which combines these three theories and connects the *distance education* with the target audience (Andragogy) . General thought of *distance education* is offering education service to each demanding student regardless of the time and space restriction and not discriminating against the students. Target audience of the *distance education* is generally composed of adult students (Ghani et al. 2008) and basic features of adult learning need to be used when preparing the *distance education* programs, and adults are ready to learn (Okçabol, 2006:53). An adult who is ready to learn develops self-learning by directing himself. Such feature of the adults is one of the basic elements of the *distance education*. Besides, detection of the features of the learner in the *distance education* is caused by the "learner centers" structure of it. APA (1997) groups the principles of the learner centered approach under four titles:

- **Cognitive and Supra-Cognitive Factors:** Nature, targets of learning process are structuring of information, strategic thinking, thinking about thinking and learning context (culture, technology and environmental factors).
- **Motivating and Emotional Factors:** Emotional effects on learning, internal motivation in education are effects of motivation on learning effort.
- **Developmental and Social Factors:** Effects of physical, mental, emotional and social development and interpersonal communication on learning.
- **Factors Based on Individual Differences:** Effects on learning which arise out of individual differences.

Such features of the learners are very important in order for *distance education* to achieve its targets. Therefore, in line with the basic principles of the adult education and learner centered structure, importance should be attached to arrangement of *distance education* programs which are satisfactory from communication perspective, interesting, increasing motivation, containing elements-examples from life, are professional career oriented and care for criteria of putting into practice and are learner oriented .

Apart from the said features of one education program, some other principles need to be taken into consideration. These principles are important in ensuring that education and teaching objectives are realized and students are motivated for the programs. Ragan (2009) lists the principles of an effective *distance education* as follows:

- Show and teach;
- Apply activity oriented course management strategies;
- Base the course activities on the examples;
- Plan lack of plan;
- Ask for feedback;
- Think without writing (before starting the dialogue);
- Advance the developments shown with support;
- Safety and confidentiality;
- Keep quality important; and
- Provide open (Internet) connection.

Given the foregoing features, precautions have to be taken against the limitedness of *distance education* such as lack of face to face education, failure to establish eye contact which appears as problems (Hawkins et al. 2011). Today, second life applications introduced by many universities seem to make students feel like they are in a classroom and eradicate limitedness of the *distance education*. Potential users of the Second Life platform where *lifelong learning* activities can be effectively carried out and individual learning can take place are primarily *distance educationists* (Salmon, 2009). Learning may be rendered more efficient with course contents developed by taking into consideration suitable learning and communication principles. In this way, platform configured by using advanced technology tools within framework of *distance education* methods may offer chance of practice to the learners with a content where interest of learner is kept constant and live. Correct adaptation of the practices to the mass oriented virtual technologies may increase the social communication and interaction oriented educational use of the platform in a positive way (Canberk, 2011). Second Life which is an exact reflection of the real world brings distance learners together at a social platform. Similarly, it is important to offer room simulation practices and interactive designs in the teaching design. Video tape records, e-mails, audio conference systems, video conference systems and Web pages are the methods frequently used at the Web based education. Multimedia technologies chosen by the lecturers for different learning environments are used as learning-teaching tool; simulations, analogies, vivid footage and high quality sounds render learning status realistic and may help learner to learn by discovering (Sezgin, 2009). In other words, arrangement, design of Web pages, presentation, continuity and function of information can be possible by choosing and using the same in accordance with the objectives and gains of the program (Kılıç, 2011). Since the teaching variables such as assuring active participation in the education environment through arrangement of the content at the education environment, learner and teacher being at the same environment, feedback, correction, clue, repetition and emphasis can be used through the process, arrangement of e-learning environments by keeping quality, safety and confidentiality at the top plays an important role in terms of keeping the learner motivated.

Education environment where information transfer comes into being and student interacts with the subject have gained different meanings through *distance education* and have turned into materials that can be chosen depending on preference of users owing to computer software . It is possible to share the information with students at the learning environment through applications such as e-books, e-television, e-exercise, e-test, e-consulting, e-audio book by using digital multimedia technologies. As can be seen here, books, tests that have been traditionally used face us in the education of future in a different format. Apart from these changes that are expressed in general, and the question "what should basic elements of a *distance education* program be?" should be answered. Varış (1996) stresses out that there must be 4 basic elements of one education program. These are:

- Objectives;
- Content;
- Learning-teaching process; and
- Evaluation.

When looking at the *distance education* programs, social and support activities need to be added to the foregoing elements. It is discussed below what these elements should cover in the *distance education* program and how they should be shaped in the future.

Objectives

Objectives are composed of replies given to the question "why?" in the education program. Objectives of *distance education* should be arranged in accordance with the framework of the *distance education*. It is important to know the characteristics of the target audience. Sarwar et al. (2008) have stated that questions of which answers need to be sought in order to establish the characteristics of the learner. Of the target audience:

- Are business and living conditions suitable?
- What is their level of education?
- Why do they know about the classes included in the program?
- Do they have any experiences about *distance education*?
- What technological facilities do they have?

Detection of the foregoing characteristics stems from learner characteristics of the *distance education* applications. The fact that *distance education* is preferred mostly by the adults is, difference in their preliminary knowledge, and their ability to use the technology vary to a great extent . Now, individuals are in the *lifelong learning* process. Learners willing to gain different specializations in different fields will be in need of flexible education programs meeting their various requirements, especially in the adulthood period.

Lecturers should establish their course targets in a manner that will be meaningful for learners and in a way that they can use the same in their living spaces. Objectives should be established on a structure focusing on a clear and certain purpose (Kyrish, 2004, Murphy, E. and Rodriguez-Manzanares, 2009 Akt: Tırnovalı, 2012). This will ensure that learners will be able to internalize the objectives regardless of their age and preliminary information. One of the most important elements in determining the objectives is requirements of the society and individuals. Therefore, given the fact that we will shift to an era of specialization or a hyper- individualized era, objectives will have to be re-structured within framework of flexible and *lifelong learning* skills.

Content

Content in the *distance education* is a separate field of research. It is the most effective program element from several perspectives ranging from motivation of the student who interacts with the course objectives without an intermediary for the course and student's having the gains stipulated by the objectives (Tırnovalı, 2012). Content design differs from the face to face education due to its nature. In order to ensure that content elements used comply with the system, educationists are in the quest for effective methods (Lindeman and Varvel, 2005). One of the items educationists giving classes at the *distance education* need to pay attention to while establishing content of course is "objectives of teaching, requirements of learner, the highest frequency of use, and compliance with the learning materials suitable for the conditions of learner " (Smyth, 2005 Akt: Tırnovalı, 2012). Also, a teacher who can design content at macro and micro level and can ensure that learners access to the information contained in the content. Content contains several elements which require that knowledge be arranged in the mind. At the stage of arranging the information, content to be learnt needs to be chosen in the first place. Choosing and arranging the content is important in that it facilitates the learning (Kılıç, 2007). Explanations, examples used in the arrangement of the content, content's being either abstract or concrete are important in terms of forming a meaning. Provision of explanations within a text is concretize the information. Concrete texts are texts that contain presentation and explanation of concept and principle examples. Mayer (1989) suggests that a concrete content provided with explanations is more comprehensible than an abstract content and improves the learning outputs. Examples have an indispensable place and importance in rendering the content more comprehensible. Examples should be used in concretizing and understanding a subject. Because examples support structuring of the inductive knowledge. Students utilize the examples in structuring the information and form the main idea by combining the same with the individual experiences. Extremely abstract subjects, underlined concepts and principles are better learnt than those subjects presented in an abstract manner (Beishuizen et al., 2003). When looking from this perspective, design of content is of paramount importance in the *distance education*. Creation of interactive software along with the technologic advances, preparation of a content providing means of accessing to information in today's world where we can access to technology through a single button.

Learning-Teaching Process

Learning –teaching process is connected with how content should be transferred to the students. Education environment where information transfer comes into being and student interacts with the subject have gained different meanings through *distance education* and have turned into materials that can be chosen depending on preference of users owing to computer software . It is possible to share the information with students at the learning environment through applications such as e-books, e-television, e-exercise, e-test, e-consulting, e-audio book by using digital multimedia technologies. Designs at the learning environment where learning takes place helps information to be structured (Kılıç, 2011). Today, *distance education* uses video band records, e-mail, visual e-mail, automatic e-mail list server (Listserve), Web pages, bidirectional video and audio conference systems as well as Internet video conference system (White pine cu-seeme) (Olivet Nazarene University Information Technology, 2009). Now, these systems will have to be updated in technology of future. Therefore, systems such as Room system, Rollabout System and Desktop System will become more widespread. As suggested by Tırnovalı (2012) by referring to Shih, arrangement of learning environments such as learning based on analogy, coincidental learning, reflective learning, situation based learning and discoverer learning will be important. Based on the individualization of the teaching, learning by doing-experiencing is seen important in line with interest, expectation, pace and development level of every learner. Therefore, students will be able to carry out experiments in an interactive mode, will be able to participate in the environment through simulations, and will become more active owing to activities such as preparation of project, solving puzzle.

Students are the ones that need to be active in the learning –teaching environment. Increased importance of technology on the teaching applications ensures that group processes are spread towards not only the physical areas but also online groups, virtual though. As constructivist learning groups, power of e-mail and computer conference lies in its capacity of supporting cooperation and conversation. By using these instruments, groups may work together in resolution of problems, may discuss about their comments, and may come together at the other educational activities such as modeling and directing. During computer conference, students may interact and discuss with specialists and peers within a social arrangement process. Sharing of information through electronic media also helps processes and strategies aimed at solving the collective and individual problems to be mutually shared with the other online student. Activities such as formation of questions, summarization of content and explanation of important items may be carried out effectively in online mode. E-mail, computer conference and news groups support development of the discussion communities and groups with similar interests. Online databases may help the information to be structured. Also, thousands of news networks, databases and electronic bulletin systems support the individual centered discovery of the information. What is important in structuring the information is the objective oriented behavior demonstrated by the student while researching the database. Cognitive tools, also known as mental tools, (databases, semantic networks, specialists systems, computer conference, multiple-media/hyper-media, computer programs and micro world learning environments), are the tools facilitating cognitive processing. Use of these tools by the students will ensure that their own learning and meaning formation processes are facilitated and will give rise to interactive lives.

Evaluation

Evaluation is a process of concluding about the education process and conclusion. In this process, level of student gains, detection and resolution of problems that occurred during the process are related to evaluation process. Several principles should be taken into consideration in the course of evaluation at *distance education*. Student, teacher, officials, technological materials, courses, software are important elements of evaluation. These items should be taken into consideration and continuity should be assured while carrying out an evaluation.

Throughout the evaluation process, measurement and evaluation studies related to product and process should be included. Therefore, instead of traditional measurement – evaluation tools (open ended essay and multiple choice tests), concept maps, rubrics, rating scales, portfolios, projects, tests etc.. should be used, they should ensure that students are evaluated in the process, and enable them to measure their meta-cognitive skills, creativities, entrepreneurships .

Social and Support Activities

Social and support activities cover the process when communication takes place among the community composed of students, lecturers, technical and administrative personnel and students can receive information, technology, psychological support, financial support etc . Social communication with *distance education* generally takes place through social networking sites. *Distance education* institutes are responsible for establishing media aimed at providing such type of communication. There are other media which students create tı communicate with one another apart from these official networking sites. There are differing views on at what level face to face interactions of individuals in the system should be or importance of face to face interview. Where face to face interview is not possible, isolation problems may arise within the group (Dolan, 2011). These types of activities are important in terms of students' feeling themselves as part of a group, their willingness to cooperate, realization of their teaching objectives and motivation of students. Therefore, apart from services provided via system, organizing of social environments where students can communicate face to face, utilization of applications such as second life for social and support purposes not only for courses is recommended .

SOLUTIONS AND RECOMMENDATIONS

When looking at studies conducted in connection with *distance education*, it is seen that studies used to deal with historical process to a great extent in the early 1990s, over the years spreading of *distance education* efforts, motivation of students and determination of existing situations became the main concentration. However, it is observed that, following 2000s, efforts were concentrated on teaching design in the *distance education*. More specifically, although issues such as quality of services, perception and effect on success have been frequently examined in the *distance education, curriculum development* studies are not frequently encountered in the *distance education*. Tırnovalı (2012) has created an infrastructure which will provide data for *curriculum development* studies during the thesis he prepared in Turkey. However, from a general perspective, it is a reality that studies aimed at improving *distance education* programs are so small in number and these have to be constantly updated within framework of rapidly developing knowledge and technology. When looking from such point of view, it is observed that there is a need for program evaluation studies aimed at developing *distance education* programs and experimental studies connected with the applications.

In line with recommendations by *curriculum development* specialists, it is obvious that studies as to how *distance education* programs should be updated today and in the future and what awaits the specialists will be of paramount importance. It is recommended that *curriculum development* studies be conducted from a futurist approach and assumptions and implications mentioned in the chapter should be taken into consideration.

FUTURE RESEARCH DIRECTIONS

Under the light of information discussed in this chapter, it is predicted that, in this era we have entered into hyper specialization period, part of the *curriculum development* specialists will go for *curriculum development* studies at *distance education*. In such case, carrying out of the program evaluation studies at *distance education*, adaptation to future education systems as soon as possible, and conducting scientific studies seem to be important. It is for sure that these changes taking place in the information and communication technologies may give rise to effective changes in the communities. Given the fact that learning speed will be increased by 10 folds, a rapid change in today's education –teaching periods will be inevitable. If we consider the fact that students who will step into business world in the future will have to have 10 times more knowledge and experience than what is present today, important of the studies to be conducted is increasing more and more. Rich learning experiences have become important concepts after teaching designs following digital course books; *lifelong learning* skills through technological literacy; innovations in the qualities of lecturers and internationalism and innovative teacher concept, different skills sought in the diploma during recruitment and promotions. Therefore, it is recommended that researchers focus on these concepts.

CONCLUSION

When looking at the applications in *distance education* field, it is possible to say that developments and changes have taken place in the *distance education* processes over the time. New learning approaches where learners are at the center of learning process and have a say in decision making related to learning process is one of these applications. Therefore, while designing *distance education* environments, the said new learning approaches and tendencies of learners should be taken into consideration (Görü, 2011).

To conclude, several futurist educationists agree on *the future of education*. Individualization of education, radical changes in class environments, means of accessing to knowledge and characteristics of teachers are included in these values. However, an operational process is required which is carrying out the *curriculum development* studies. Program development is an inherently long process. Therefore, process in *distance education* applications will be hard and long. Examining relationships between *curriculum items* and each item individually and revealing the whole of dynamic relations, bringing together technological developments of the era and information related to learning-teaching theories require a team that is equipped with technique and knowledge (Kılıç, 2011). Assuring effective and efficient learning at the virtual class environments where educational results derived from information laid down and technology are used together, balancing the finance, increasing participation and constant update of information gained appear to be important . When studies conducted in Turkey and world are examined, it is observed that they address the *distance education* in terms of evaluation of historical, features of teaching inputs, design of teaching and characteristics of teaching outputs . It is thought that applications will further develop and will move towards different learning environments due to reflection data gained upon applications, their levels of affecting efficiency and constant development studies.

Chapter 84
Service Science in Higher Education:
Productization of Offshore Programs in Transnational Education

Pi-Yun Chen
Shu-Te University, Taiwan

Ming-Hsiung Hsiao
Shu-Te University, Taiwan

ABSTRACT

One of the forms in service innovation for universities in Taiwan is to develop transnational education such as offshore programs where the existent programs were re-innovated by providing new service processes including improved delivery or distribution methods. This study examined how the universities adopted this form of innovation and examined how they productize their offshore programs, corresponding to the four productization practices: specifying, tangibilizing, systemizing and standardizing, in terms of program design, curriculum design, teaching and learning, assessment, and administration. By these productization practices, students and partner universities can have a clearer picture and better understanding of the programs, and the host universities can cut down the administration cost and achieve better efficiency and cost-benefit. This study can be seen as a pioneering study which applies the service science philosophy to redefine higher education and reformulate the process of the service innovation such as offshore program implementation by the productization practices.

1. INTRODUCTION

Service science was coined by U.S. Council on Competitiveness in 2004, emphasizing the importance of the integration among human resources, investment and infrastructure, especially in innovative business process design, organization and management in the service sector (Hidaka, 2006). This idea was further elaborated by IBM who proposed the term 'SSME (service science, management, and engineering)' as an interdisciplinary approach to the study, design, and implementation

DOI: 10.4018/978-1-4666-8246-7.ch084

of a service system (Paulson, 2006; Al-Badarneh, et al., 2013). Service science is a new discipline to innovate services and service systems with scientific methodology (Kim, 2009). According to Paton and McLaughlin (2008), 'service science is an emerging discipline that aims to combine fundamental science and engineering theories, models and applications with facets of the management field, particularly knowledge, supply chain and change management, in order to enhance and advance service innovation'.

Service science is emerging as a new and exciting paradigm in response to the world's shift from a manufacturing to a service economy (Zhang, et al., 2012). Although service science is interdisciplinary, in the field of education, higher education in particular, no literature has been found to investigate how service science is applied to the education sector. The main reason for this may be that 'education' or 'higher education' is not seen as a 'product', nor a 'service'. Traditionally, there are two main goals for a university to achieve: to create knowledge by research and to disseminate knowledge by education. That means 'knowledge' is the most important product/service for higher education which provides the context for all learning, and is the primary focus of individual courses. In some cases, higher vocational education for example, such a knowledge creation and dissemination can also be referred to the skill training.

A basic question is who are the customers of higher education? According to Kanji and Tambi (1999), customers of higher education can be divided into different groups of actors such as current students, potential students, employees, employers, government and industry. Reavill (1998) identified twelve stakeholders, including students and employers, who contribute to or benefit from higher education. Actually, literature has revealed that students and employers are the most important stakeholders in higher education and are the primary customers for a university, in that universities provide students with 'knowledge' and employers with 'educated students'.

Then what is the production process in higher education, or, to be more specific, how universities turn their input into output? In the field of education, Jauch and Orwig (1997) proposed two educational models describing such a production process in higher education: the teaching model and learning model. In the teaching model, teachers act on students to "transmit" knowledge (production process) and turn the students (input) into educated persons (output), while in the learning model, the learners interact with "guide" and educational materials (production process), and turn students (learners), with the aid of faculty and educational material (input) into educated persons (output). However, doing education is different from manufacturing product after all. Applying the principles and philosophies in the manufacturing industry or even in the service industry to the education one can be ill suited.

This study tries to examine how universities apply the principles and philosophies in the industries to higher education, especially when a new philosophy, service science, emerges as a scientific discipline which seeks to bring together knowledge from diverse areas to improve the organization's operations, performance, and innovation. In Taiwan, most universities are facing the challenge in the shortage of domestic students and are making every efforts to seek out for the possible sources of students from mainland China and other Asian countries. One of the opportunities is to develop transnational education such as offshore programs where the existent programs were re-innovated by providing new service processes which involve significant changes in the roles of staff, faculty, technology, strategic partners, and/or students.

The purpose of this study, therefore, is to examine how universities in Taiwan adopted this form of process innovation in the development of their transnational education, and how they adopt the 'service science' philosophy to productize their offshore programs in order to achieve better cost-benefit in management. The remainder of the paper is organized as follows. In the next section, it discusses the logic, principles, and philosophies in service science by reviewing some relevant literature. It is followed by a section describing how the service science philosophies can be applied to higher education. In section four, it discusses how universities in Taiwan develop their transnational education as a form of service innovation. Finally, it gives a summary and draws the conclusions in section five.

2. LOGIC, PRINCIPLES, AND PHILOSOPHIES IN SERVICE SCIENCE

2.1. Service-Dominant vs. Goods-Dominant Logic

In service science, Lusch et al. (2008) suggested that an emerging logic of value creation and exchange called service-dominant logic (S-D logic) is a more robust framework than the traditional goods-dominant logic (G-D logic) to achieve a service-centered conceptual foundation. According to Lusch et al. (2008), one of the primary tenet of S-D logic is ‘an understanding of value as a collaborative process between providers and customers, rather than what producers create and subsequently deliver to customers’. S-D logic reminds business to recognize that customers are co-creators of their own value, so the strategic role of any business must be to support its customers’ value creating processes (Ballantyne, et al., 2011).

S-D logic was not originally proposed as a new theory but as a ‘counter paradigmatic’ challenge to the G-D logic of marketing (Vargo & Lusch, 2008). Traditionally, G-D logic is to maximize profit through the efficient production and distribution of goods which is, mostly, standardized, produced away from the market, and inventoried till demanded. S-D logic, on the other hand, emphasizes the role of customers who are recognized as an active co-creator of knowledge and service value (Novani & Kijima, 2012). Even so, however, the ultimate goal of S-D logic is still to maximize profit, which is done through the creation of the customer value.

Although Vargo and Lusch (2008) proposed such a new logic, Wright and Russell (2012) still raised some philosophical challenges to the S-D logic paradigm. In the study discussing the appropriateness and effectiveness of the S-D logic compared to other logics and its operational measurement, Sweeney (2007) also reported some challenges and difficulties in operationalizing the S-D logic. In a sense, we agree that intangible processes, skills, knowledge and abilities emphasized by the S-D logic are more difficult to imitate and can create more customer value. However, since all these benefits are difficult to measure, it also implies more risks and is more difficult to realize.

2.2. Service Innovation

According to Grönroos (1992), there are four basis characteristics of services which differentiate services from goods: intangibility, inseparability, heterogeneity and perishability. First, traditionally services have the intangible nature which make it distinctive from physical products (or goods). Second, in most cases, services are produced and consumed at the same time, or inseparably, where customers participate in the service production process. Third, services involve a considerable amount of human activity and rarely adhere to a predefined process (Bouwman & Fielt, 2008). Compared with physical products which generally rely on modern production lines to ensure that they are produced consistently in quality, services are highly variable in quality; i.e., with high heterogeneity, as they depend on who provides them as well as when and where they are provided (Liu & Wei, 2003). Finally, because services cannot be stored or inventoried, if there are not sufficient resources available to support customers’ demand for services, they will leave dissatisfied. These characteristics of services make it difficult for the staff in the service industry to describe or present their 'product/service' precisely for their customers.

The concept of innovation was first emphasized by Schumpeter (1934) by arguing that innovation can create wealth through fulfilment of customer needs. Schumpeter (1934) also reported that innovation covered five different types: new products, new methods of production, new sources of supply, exploration of new markets and new ways to organize business. In more recent literature, innovation is widely recognized as those going beyond the product or service itself, and beyond the organization and market. Today, innovation also emphasizes the supporting role information and communication platforms and architectures play in the entire supply chains. As Dominguez-Péry, et al. (2013) defined, innovation can be seen as the combination of creativity and implementation, and can be related to changes in various dimensions.

For service innovation, Yen, et al. (2012) defined it as the practices to create value for customers, and other business stakeholders such as employees, business owners, and partners, through new and/or improved service offerings, service processes, and service business models. In the past, the focus of innovation has especially been on technology-driven innovation in the manufacturing sector. Later, as the service sector became so important that service quality was emphasized across all sectors, service innovation began to receive intense attention. Nowadays, the focus is increasingly on the complexity and multidimensionality of modern services and manufacturing (Bouwman & Fielt, 2008).

Riddle (2008) proposed that there are three different types of service innovation from the view of supply chain management (SCM): (1) Changes to the service itself, or what is being offered to the customers; an innovative service/product that did not exist before is a typical case. (2) Changes to the service delivery process, or how the service is being provided; a new online channel for selling an existent product/service sold offline before is a typical case. (3) Changes to the organizational and managerial structure, or how service provision is supported; an ERP implementation which improves the efficiency of operations and/or customer satisfaction without any changes in the service itself or the delivery process is a good example.

Service innovation emphasizes the importance of innovation in service, where service is nowadays seen as the fundamental basis for exchange where all the value of products, including tangible goods and intangible services, is created through the 'service' that is provided for customers (Vargo & Lusch, 2004). Many physical products, such as video games, which are homogeneous in quality, are purchased actually for intangible benefits, such as entertainment, which are heterogeneous depending on users' experiences and perception. Such a philosophy can also be applicable to higher education, where students receive lecturing, teaching material, and learning environment with homogeneity in quality, but heterogeneous in their perception and learning outcomes.

2.3. Productization vs. Servitization

In the field of service science, the 'productization of the services', a counterpart of the 'servitization of the products', is often used to associate tangible features with intangible service offerings. For example, providing customers with brochure makes the service more "real"; establishing a fixed price reduces the risk of runaway costs; identifying the actual names of people who will do the work adds credibility (Radford, 2004). According to Jaakkola (2011), productization is used to translate the abstract service and its creation into concrete exchangeable objects and controllable processes through a series of productization practices including specifying, tangibilizing, systemizing and standardizing.

'Servitization' of the products coined by Vandermerwe and Rada (1988), on the other hand, is widely recognized as the process of creating value by adding services to products. Now service offerings have been extended over time to include more value added service propositions like training, system integration and consulting, and even offering customized solutions to customers. A key feature of servitization strategies is the strong customer centricity where customers are not just provided with products but with more tailored "solutions" (Baines, et al., 2009). The primary objectives of servitization are to satisfy customer needs, enhance the firm's performance, and achieve competitive advantages (Marks, et al., 2011). However, servitization generally brings about higher cost. If all these positive sides of servitization cannot be turned into monetary profits properly, then servitization can generate severe risks and raise significant challenges for product companies.

Nowadays, it is generally agreed that manufacturing industry needs 'servitization' to make their products more customized to meet different consumers' needs, while service industry needs 'productization' to make their services more standardized to help consumers understand the services. For higher education institutions such as universities which mainly deliver knowledge and provide educated students, a productization of knowledge delivery to help students understand it and a productization of educated students to help employers understand the manpower seem necessary.

3. SERVICE SCIENCE IN HIGHER EDUCATION

Most principles and philosophies in the management field are developed for either the service or product industry. Jauch and Orwig (1997) claimed that the implementation of Total Quality Management (TQM), which is widely adopted in the industries for quality management, into the academic function of teaching in higher education is so problematical that it should not be adopted into the academic activities of higher education settings. Although this argument was later critically challenged by Mullin and Wilson (1998), and still many authors argue that the principles of TQM can definitely contribute to the improvement of education (Sindwani, et al., 2011), it is still generally believed that higher education in itself has its unique characteristics in nature which are different from service and product (Agrawal & Sharma, 2014).

What a university provides for their customers is not easy to define. It provides students with knowledge and employers with educated students and/or skilled manpower. Both 'knowledge' and 'educated/skilled manpower' are intangible, inseparable in production and consumption, heterogeneous with high variation in quality, and cannot be inventoried. In this regard, higher education seems more like 'service' than 'product', and should have more S-D logic than G-D logic. To attract students to join the universities and employers to hire the educated students, therefore, universities should make efforts to 'productize' their services; i.e., higher education, for their customers to better understand them.

As Mullin and Wilson (1998) reviewed, the current higher education system has been defined as a reputational and resources model, and as the course-credit-completion model as well, based on assumptions intended to make administration easier, not to improve learning effectiveness. Mullin and Wilson (1998) also compared the differences between the course-credit-completion "quantity model" and an alternative continuous process improvement "quality model" on eleven criteria: (1) organizational principle, (2)involvement, (3)content knowledge, (4)curriculum, (5) co-curricular learning, (6)assessment, (7)teaching methods, (8)feedback, (9)faculty responsibility,

Table 1. Productization of higher education

Criteria	Productization (Specifying, Tangibilizing, Systemizing, and/or Standardizing)
(1) Organizational principle	Explicitly define the student basic abilities for each disciplines (***Specifying***).
(2) Involvement	Mechanism systematically provides information and feedback from various constituencies. Faculty, students, alumni, and employers participate in curriculum design (***Specifying***).
(3) Content knowledge	Content knowledge takes different forms to exhibit; e.g., certificates, skill competition (***Tangibilizing***).
(4) Curriculum	Curriculum is the "end," as well as the 'means" for the learning process. Syllabus is clearly defined and published, mostly online (***Tangibilizing***).
(5) Co-curricular learning	Out-of-class activities are taken for skill development (***Specifying***).
(6) Assessment	With the aid of the administrative information system, assessment of students' learning performance and professors' teaching quality are critically evaluated by unified criteria (***Standardizing***), and can be made systematically throughout, not only at end of, the learning process (***Systemizing***).
(7) Teaching methods	Professors teach with the aid of online resources, and communicate with students by email or other forms of ICT (Tangibilizing). Students are able to be more active than passive in communications (***Tangibilizing***).
(8) Feedback	Administrative information system provides systematic mechanism for effective use of students' feedback (***Systemizing***).
(9) Faculty responsibility	Faculty responsibility is for the courses taught and meet the standard by the universities (***Standardizing***).
(10) Faculty development	Faculty development and scholarly activity are separate products of faculty effort, clearly defined by rules (***Specifying***).
(11) System input and outputs	Inputs are number of Ph.D., faculty to student ratios, etc. Output measured by percentage of students graduated (***Tangibilizing***).

(10)faculty development, and (11)system input ad outputs.

In a sense, all these models can be seen as a productization mechanism trying to specify, tangibilize, systemize and standardize the 'higher education'. Today, the universities in Taiwan take even more strict measures to 'productize' the higher education, and a large part of the productization is done by resort to ICT (information and communication technologies). Table 1 illustrates some idea about the productization mechanism in higher education according to the eleven criteria from Mullin and Wilson (1998) corresponding to the four productization practices: specifying, tangibilizing, systemizing and standardizing.

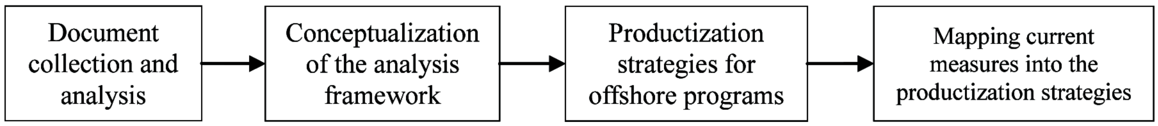
4. AN TRANSNATIONAL EXPANSION FOR SERVICE INNOVATION

4.1. Methodology

This study adopts the documentary research method by using the outside sources from the Ministry of Education (MOE), Taiwan, to conceptualize our analysis framework and derive the analysis results. Most of our documents come from MOE, the official supervisory authority for universities' offshore programs in Taiwan, and from a number of universities who are considered successful in the development and implementation of offshore programs.

Based on MOE's regulation and universities' administration on offshore programs, we first built an analysis framework where the primary process for the development and implementation of offshore programs was extracted and conceptualized.

Figure 1. Research procedures



Second, by reviewing literature on service science, we derived some important strategies which can be adopted by universities to productize their offshore programs. Third, from what have done currently for the management of offshore programs by the universities in Taiwan, we mapped their measures taken into the corresponding strategies with respect to each steps in the development process. Figure 1 summarizes and illustrates our research procedures described above.

4.2. Transnational Education and Offshore Programs in Taiwan

Transnational education refers to those programs and courses "in which the learners are located in a county that is different from where the awarding institution is based" (UNESCO, 2007). Along with the recent innovations in information and communication technologies, the international mobility of programs and institutions on a large scale since 1990s has become a special phenomenon while student mobility is continuing to grow in international higher education. As a form of academic mobility and market driven educational activity, many have found that transnational education is following the same pattern as international student mobility where highly developed nations, such as the major English speaking countries, the UK, USA and Australia, are still the primary and key providers of the transnational education service.

The innovative nature of transnational education is manifested not only in the breakthrough in the philosophy, strategic development plan and institutional operations, but also in the cooperation models between the institutions across the nations and the emergence of new delivery modes of transnational programs. According to Alam et al. (2012), there are five popular modes widely used in transnational education: (1) branch campus, (2) franchising or partnership, (3) articulation or twinning, (4) distance or virtual education, and (5) study abroad. Distance education and branch campus are operated with more autonomy and independence of the awarding institutions, whereas partner-supported delivery requires various levels of involvement of local partners who provide a range of services for the implementation of transnational programs.

Transnational higher education is observed to have grown significantly in various forms, including offshore and branch campus in other countries and collaborative degree programs with universities and business enterprises abroad. Arguably, the UK and Australia are the two countries that have moved to exploit the international demand for educational service through the pursuit of a variety of strategies for program delivery (Poole, 2001).

The 'partner-supported delivery' mode is the one worth mentioning in this study. Under this mode, a provider from the offering country authorizes a partner in other country to deliver its courses and programs. Despite being considered more cost-effective, this mode poses some financial and reputation risks due to local partner's financial and other shortcomings (Alam et al., 2012). Partner-supported delivery depends more heavily on partnership with various kinds of service that often include face-to-face teaching, physical facilities and administrative support locally (McBurnie & Ziguras, 2007). An offshore program is often adopted as a form of cooperation in this mode that refers to the arrangement in which a local education provider is authorized

Table 2. Number of students registered in offshore programs in Taiwan

Year	Vietnam	Malaysia	Other Nations	Total
2007	62 (65.3%)	17 (17.9%)	16 (16.8%)	95 (100%)
2008	202 (77.7%)	46 (17.7%)	12 (4.6%)	260 (100%)
2009	348 (82.7%)	34 (8.1%)	39 (9.2%)	421 (100%)
2010	591 (93.4%)	28 (4.4%)	14 (2.2%)	633 (100%)
2011	583 (92.5%)	47 (7.5%)	0 (0.0%)	630 (100%)
2012	536 (90.7%)	47 (8.0%)	8 (1.3%)	591 (100%)
Total	2,322 (88.3%)	219 (8.3%)	89 (3.4%)	2,630 (100%)

Source: MOE, http://www.edu.tw/statistics/index.aspx

to offer the foreign courses and training under the conditions set out by individual contract.

From the perspective of service science, developing 'offshore programs' can be seen as a form of service innovation which enables universities to reshape their current programs and export them to other countries for new customers. This appears to be more critical in the context of Taiwan as many universities, public or private alike, have been facing serious shortage of student recruitments resulting from the decreasing birth rate since late 1990s, in addition to the reduction of government subsidies to universities. Many universities in Taiwan have adopted this form of innovation and have implemented offshore programs in some Asian countries such as Vietnam and Malaysia.

Table 2 shows that the number of students registered in offshore programs in Taiwan has risen for the past few years, where those of Vietnam and Malaysia account for more than 90%. By developing offshore programs, the transnational education of the universities in Taiwan is not only an approach or a path to internationalization, but also a survival solution for their sustainability.

4.3. Productization of Offshore Programs

Productization is very important for offshore programs to be successful. Due to the barriers arising from distance, and the differences in culture, and social and educational system between host universities and partner universities, it is not easy for students and partner universities to fully understand the offshore programs which they are going to participate in. By specifying, tangibilizing, systemizing, and/or standardizing the programs, students and partner universities can have a clearer picture and better understanding of them. For the host universities, productization also enables them to cut down the administration cost and achieve better efficiency and cost-benefit, which are crucial for the host universities' survival under adverse circumstances in the competitive higher education market.

Table 3 illustrates some productization measures that host universities generally take to implement their offshore programs, which corresponds to the four productization practices: specifying, tangibilizing, systemizing and standardizing, according to the program implementation process which mainly includes procedures such as: (1) program design, (2)curriculum design, (3)teaching and learning. (4)assessment, and (5)administrative support. In 'program design', the host universities need to decide what programs should be exported to or be implemented in other countries with the support from partner universities. To achieve cost-benefit, programs are mostly duplicates of those existent on home campus of the host universities, a form of standardization. By standardization, the programs can be implemented repeatedly by

Table 3. Productization of offshore programs

Process	Productization (Specifying, Tangibilizing, Systemizing, and/or Standardizing)
(1) Program design	• Programs are mostly duplicate of those existent on home campus of the host universities, and can be implemented repeatedly by cooperating with different partner universities in the same countries (***Standardizing***).
(2) Curriculum design	• Curriculum can be reproduced and be transplanted to other programs by cooperating with different partner universities in the same countries (***Standardizing***). Syllabus is clearly defined and published, mostly online on the website (***Tangibilizing***).
(3) Teaching and learning	• Professors teach with the aid of online resources, and communicate with students by email or online chatting through universities' e-learning website (***Tangibilizing***). Students are able to be more active than passive in communications (***Tangibilizing***).
(4) Assessment	• With the aid of the administrative information system, assessment of students' learning performance and professors' teaching quality are critically evaluated by unified criteria (***Standardizing***), and can be made systematically throughout, not only at end of, the learning process (***Systemizing***).
(5) Administrative support	• Administrative information system provides systematic mechanism for the program administration (***Systemizing***). Through the system, offshore students can also access and edit their personal e-portfolio with visible information on their studying records (***Tangibilizing***).

cooperating with different partner universities in the same countries. As is widely known, the MBA program is the most popular one which has been implemented offshore.

In 'curriculum design', the curriculum in offshore programs is designed by customization according to the needs of the offshore students, in consideration of possible support from partner universities. Once the curriculum is decided, it can be reproduced and be transferred to the programs by cooperating with different partner universities in the same countries, which is a form of standardization. However, to overcome the barriers arising from distance, language, and culture, syllabus is often clearly defined and published online on the website to make it as tangible as possible. In 'teaching and learning', professors are encouraged to teach with the aid of online resources, and to communicate with students by email or online chatting through universities' e-learning website. By applying these ICTs, students are able to be more active than passive in communications with each other, and with professors as well. In other words, the host universities generally make their efforts to tangibilize the communications between professors and students, in terms of teaching and learning.

In 'assessment', with the aid of the administrative information system in universities, the assessment of students' learning performance and professors' teaching quality are critically evaluated by unified criteria, which is a form of standardization. Moreover, the assessment can be made systematically throughout, not only at the end of, the learning process. Finally, in 'administrative support', universities' administrative information system provides systematic mechanism for the administration of offshore programs. Through the system, offshore students can also access and edit their personal e-portfolio which provides visible information on their studying records throughout the studying years.

5. CONCLUSION

In the context of Taiwan, transnational education is seen as a great opportunity in seeking for alternative source of students as well as financial support. Even with the encouraging policy by the government, however, going international for many universities in Taiwan is actually seen as a survival measure in Taiwan where low birth rate has given pressure on institutional subsistence.

Within such a context, it is important for universities in Taiwan, a non-English speaking country without colonial background nor international initiatives at its establishment, to find their ways to develop transnational education which has long been dominated by Western universities. Therefore, how universities in Taiwan could formulate their own strategies, equip themselves with the needed capabilities to be an education service provider, and then gain their cost-benefit is worth exploring.

This study examined how universities in Taiwan adopted the form of process innovation in the development of their transnational education and examined how the universities productize their offshore programs in terms of program design, curriculum design, teaching and learning, assessment, and administration. For the management of offshore programs, productization is very important process to achieve better efficiency and cost-benefit. The differences between the host universities and the partner universities in educational and social system generally cause difficulties in program management. By specifying, tangibilizing, systemizing, and/or standardizing the programs, students and partner universities can have a clearer picture and better understanding of them and the host universities can cut down the administration cost and achieve better efficiency and cost-benefit.

Service science is an emerging discipline that aims to combine fundamental science and engineering theories, models and applications to enhance and advance service innovation (Paton & McLaughlin, 2008). Most of its principles and philosophies, however, are developed for either the service or product industry. For higher education, no past research has been found to apply the principles and philosophies in service science to this field. This study is considered a pioneering work which applies the service science philosophy to redefine higher education and reformulate the process of the service innovation such as offshore program implementation by productization practices. This becomes the major contributions of this study.

The success of offshore program implementation, however, is subject to many factors other than the program itself. As a non-English speaking country like Taiwan, the language (English) ability of teaching faculty and administrative staff can be an obstacle to the program success. Moreover, the difference in culture and social system between the host universities and the partner universities, and between the teaching faculty and students, often cause unexpected communication problems. How universities overcome all these obstacles to achieve better success remains to be further explored.

Chapter 85
Librarian without Building in an E-Learning Environment:
Needed Skills, Challenges, and Solutions

Jerome Idiegbeyan-Ose
Covenant University – Canaan Land, Nigeria

Ugwunwa Chinyere Esse
Covenant University – Canaan Land, Nigeria

ABSTRACT

This chapter discusses e-learning, its advantages and challenges, the concept of a librarian without a building, and the characteristics and skills of a librarian without a building in an e-learning environment. The chapter empirically looks at the need for an e-librarian in an e-learning environment, the needed skills for such a librarian, and their challenges. Possible solutions to identify challenges are also discussed. The survey method was used for the study; the questionnaire was designed and administered to 138 librarians from Academic libraries in the six geo-political zones of Nigeria. 127 questionnaires were returned and used for analysis. The study reveals that there is a great need for e-librarians in e-learning environments, and that the librarians must possess such skills as high computer literacy, ability to learn fast, teach, and evaluate others. It was also discovered that e-librarians are faced with technical, administrative, financial, and capacity building challenges. Based on these, the authors recommend that e-librarians should be supported at all levels; they should be ready to develop themselves, strive at all cost to acquire more knowledge and skills in order to stand the changing nature of their job. It is also recommended that government agencies that accredit programmes at tertiary institutions should make sure that any institution that offers e-learning must also have a well organized e-library, and a well trained e-librarian must man the library. The study concludes that e-library and e-librarian without building must be recognized and empowered as part of the e-teaching and learning processes.

INTRODUCTION

Education is the bedrock of any nation. No nation can develop without proper and effective educational systems. Libraries from the ancient time to present day are always part of any educational system. No educational system can be effective without library as supporting instrument. With the advent of Information and Communication Technologies in education, E- learning platforms have been created to provide students with the opportunity to continue their education and career development without the rigidity and rigorous life of the school system. The creation of the E-learning platforms has placed additional roles on the library and the librarian whose responsibility will now include rendering services to the E-learners. Thus the concept of E- library, Virtual library, and E- librarian, librarian without building come to place.

In the last few decades, the world has gone through significant change in terms of advancements in technology and the information exchange. These advancements in information and communication technology have led to e-learning becoming a focus of global attention. E-learning", in simple terms, is Electronic Learning or any learning facilitated by electronic means which would include computer-based training (CBT) with modules, CD-ROM training, web-enabled, and Internet learning. Advent of E-learning has provided students with an opportunity to continue their education or personal pursue and career development without the rigidity and rigorous life of the school environment. This online format of Learning, offers the students a great deal of flexibility in terms of when they study, how they study, and how quickly they cover and master any given material.

OBJECTIVES OF THE STUDY

The objectives of the study are to find out:

1. Whether there is need for E- Librarian in an E- Learning environment.
2. The skills that would be needed by librarian in an E- Learning environment.
3. The challenges of E-librarian in an E-Learning environment.
4. Prefer solution to the challenges.

BACKGROUND

Over the years, there have been conflicts in the definitions of E-Learning; some authors have explicitly defined e-learning, others have implied a specific definition, but these definitions have materialize, some through conflicting views of other definitions, and some just by simply comparing defining characteristics with other existing terms. Ellis (2004) disagrees with authors like Nichols (2003) who defined e-Learning as strictly gaining access to knowledge using technological tools that are web-based, web-distributed, or web-capable. Ellis believes that e-Learning does not only cover content and instructional methods delivered via CD-ROM, the Internet or an Intranet. Tavangarian, D., Leypold, M. E., Nolting, K., Roser, M., & Voigt, D. (2004), stated that e- Learning is not only procedural but also shows some transformation of an individual's experience into the individual's knowledge through the knowledge construction process. Ellis (2004) and Triacca, L., Bolchini, D., Botturi, L., & Inversini, A. (2004) believe that some level of interactivity needs to be included to make the definition truly applicable in describing the learning experience, even though Triacca et al. (2004) added that e- Learning was a type of online learning. However, some authors have made reference to other terms such as online course/learning, web-based learning, web-based training, learning objects or distance learning believing that the terms can be used synonymously (Dringus & Cohen, 2005; Khan, 2001; Triacca et al., 2004; Wagner, 2001). Clark & Mayer, (2003), states that E-learning can be defined as instruction delivered via a computer that is intended to promote learning.

E-learning is a term that means something different to almost everyone who uses it. Some use it to refer to packaged content pieces and others to technical infrastructures. Some think only of asynchronous self-study while others realize e-learning can encompass synchronous learning and collaboration. Almost all also agree that E-Learning is an effective method that should be blended into current learning mix. So what is e-learning? According to Marc Rosenberg (2001) "E-Learning refers to the use of internet technologies to deliver a broad array of solutions that enhance knowledge and performance. It is based on three fundamental criteria:

- E-Learning is networked; which makes it capable of instant updating, storage / retrieval, distribution and sharing of instruction or information.
- It is delivered to the end user via a computer using a standard internet technology.
- It focuses on the broadest view of learning – learning solutions that go beyond the traditional paradigms of training.

In this context, we will consider E-learning as the use of new multimedia technologies and the internet to improve the quality of learning by facilitating access to resources and services as well as remote exchange and collaboration. E-learning is an umbrella that covers learning almost anytime, anywhere on a computer, connected to a network. E-learning isn't expected to replace the known conventional methods of training which is the classroom teaching; it is expected to create an augmented learning environment where technology is used to deliver a combination of teaching techniques and also aiming to maximize the participation and learning process of the individual.

Education is an important component of life because it equips us with all that is needed to make our dreams come true. One of the most promising paradigms for education is e-learning. It is commonly referred to the intentional use of networked information and communications technology (ICT) in teaching and learning. Some other terms are also used to describe this mode of teaching and learning including online learning, virtual learning, distributed learning, network and web-based learning. Since the last decade, there is a growing interest in e-learning from several directions. The growth of E-learning is directly related to the increasing access to ICT, as well as its decreasing cost. The capacity of ICT to support multimedia resource-based learning and teaching is also relevant to the growing interest in e-learning. Growing numbers of teachers are increasingly using ICT to support their teaching. Educational organizations see advantages in making their programs accessible via a range of distributed locations, including on campus, home and other community learning or resource centres. With ICT, the dream of learning anywhere and at anytime has become true. Gray Harriman (2010) states that there are different types of E-Learning resources:

- **Online Learning:** This is learning that takes place via the Web and may include text, graphics, animation, audio, video, discussion boards, e-mail, and testing. Online learning is typically "on demand" and self-directed but may include synchronous chat, web based teleconferencing (audio graphics), or similar technology.
- **Distance Learning:** This is learning that takes place when the instructor and the learner are not in the same physical location. It can also take place if the instructor and the learner are in the same location but not at the same time. Today distance learning is carried out via a number of media ranging from postal mail to teleconferencing or the Internet. "Distance Learning" (learner focus) and "distance education"

(instructor focus) are often used as interchangeable terms.

- **Blended Learning:** This combines online with face-to-face learning. The goal of blended learning is to provide the most efficient and effective instruction experience by combining delivery modalities. The term "blended learning" is used to describe a solution that combines several different delivery methods, such as collaboration software, Web-based courses, Electronic performance support systems (EPSS), and knowledge management practices. Blended learning also is used to describe learning that mixes various event based activities, including face-to-face classrooms, live E-Learning, and self-paced instruction.
- **M-Learning:** The term M-Learning or Mobile Learning refers to the use of handheld devices such as PDAs, mobile phones, laptops and any other handheld information technology device that can be used in teaching and learning.

We are all familiar with classroom-based learning which is face-to-face group learning led by an Instructor/Teacher. In E-learning environments, learners interact with learning materials, their instructors and other learners from various locations and often at various times using networked communication technology gadgets. So by its nature, E -learning offers significant flexibility as to when and how learning occurs. E-learning can include independent, facilitated, or collaborative approaches to learning. Independent learning refers to each individual learner completing learning activities or modules on their own, in their own environment, on their own schedule. The learner is independent of an instructor/teacher and the other learners. This does not mean that the learner does not have access to other resources such as an instructor/teacher, but the learner is in control of whether they contact them, when they contact them, and for what. E-learning intersects numerous fields of thought and practice such as training and education, learning and knowledge and technology. It is essentially the computer and network-enabled transfer of skills and knowledge, which include applications and processes such as Web-based learning, computer-based learning, virtual education opportunities and digital collaboration. E-learning can therefore be categorized into two main groups: synchronous and asynchronous. With synchronous e-learning, students can be involved in a course that meets online with the faculty member through streaming audio and video at a predetermined time. With asynchronous learning, a student can participate in the learning activities at the most suitable time for him or her but this also means that the faculty member will not be available for immediate replies.

SYNCHRONOUS E-LEARNING

Synchronous training is a real-time method of e-Learning with live interaction between the instructors and the students. It is called such because students have to log in at a specified time and the classes will be held for a specified period of time. Lessons can take the form of single sessions to several sessions over a few years. Synchronous training is the e-Learning method that is nearest to classroom-style learning as students can raise their 'electronic hands', view a common blackboard and interact with each other. Synchronized training sessions are usually held in AV conferencing media, websites or internet telephony media Synchronous learning comes to the rescue of students facing geographical barriers, by aiding face to face interactions with the instructor. It has been observed that most learners find it difficult to learn without real time conversation with either the instructor or peers. This interaction, combined with access to web based courseware, augments comprehension. But, an in-depth look at the process reveals that synchronous learning has only been able to remove the physical barriers without actually adding much value to the traditional classroom based training. It supports all the learning methods that conventional learning hails, only with an added advantage of a wider student base.

ASYNCHRONOUS E-LEARNING

Asynchronous learning is learning that takes place independent of time and space. Learners are able to interact with course materials and with each other at a time of their choice. A discussion thread is an example of an asynchronous learning. One learner can post a thought, and hours (or days) later, another learner can comment on the posting. Asynchronous learning gives E-learning much of its appeal. Traditionally, students needed to be physically present to engage in learning with other students. Now, learners can engage each other when it is most convenient and a knowledge trail of discussions is left. In synchronous learning, the discussion vanishes (unless it is recorded and indexed) but asynchronously, students that are trailing behind in course work still receive the benefit of being able to read discussion posts. Asynchronous learning frees E-learning from the requirements of time and space. This is perhaps the most revolutionary aspect of e-learning. Learners across different time zones and different continents can now participate in the same courses. Content can be explored and discussed in great depth -allowing learners the time to reflect and formulate thoughtful responses. Asynchronous tools like email and discussion forums have transformed how people communicate and share knowledge.

Asynchronous training may include computer-based training, using CD-ROMs and more frequently web-based training (in which a trainee logs into an online training system with a user name and password to begin an interactive course). The course can be easily updated, is accessible from anywhere and can be used with all kinds of computer systems. This type of training is most suitable to structured content-questions that have right and wrong answers. The content may vary according to circumstances. An example of structured content would be a series of steps to be followed in formatting a document in a particular computer program. The asynchronous environment is most appropriate for those who learn best by thinking about content on their own, and who can structure their time to accommodate instruction.

E-LEARNING TOOLS

Virtual Learning Environments/Learning Management Systems: These are web applications that run on a server and are accessed via a web browser (Internet Explorer, Firefox, Safari, etc.) They are designed to assist with the delivery and organization of courses. They often contain discussion forums, chat areas, areas for delivering content, tests, quizzes and grade books. Courses can be delivered entirely online but by and large, courses are ‘blended’; traditional lectures and seminars supported and enhanced by use of a Virtual Learning Environments.

Virtual Learning Environments generally have two ways of being viewed; as a student or as a teacher/instructor. The student view shows the courses the student is enrolled in and all the relevant material for those courses. The teacher/instructor view allows materials to be created, added and edited. Teachers/Instructors don’t need to know about web design in order to use a Virtual Learning Environments as they include all the features required in one relatively easy to use package.

Blackboard Learning Technology: This helps you make learning more effective in and beyond the traditional walls. Breathing life into educational content, bringing efficiency to day-to-day tasks, empowering instructors with tools to engage every learner, motivating them on the devices they rely on, promoting collaboration and streamlining processes.

Moodle is a course management system (CMS): A software package designed to help educators create quality online courses and manage learner outcomes. Moodle is Open Source software, which means you are free to download it, use it, modify it and even distribute it. Moodle has features that allow it to scale to very large deployments and hundreds of thousands of students. Many institutions use it as their platform to conduct fully online courses, while some use it simply to augment face-to-face courses (known as blended learning). It has been discovered that many of Moodle users love to use the activity modules (such as forums, databases and wikis) to build richly collaborative communities of learning around their subject matter (in the social constructionist tradition), while others prefer to use Moodle as a way to deliver content to students and assess learning using assignments or quizzes.

ADVANTAGES OF E-LEARNING

E-learning is beneficial to education, organizations and to all types of learners. It is affordable, saves time, and produces measurable results. E-learning is more cost effective than traditional learning because less time and money is spent travelling. Since e-learning can be done in any geographic location and there are no travel expenses, this type of learning is much less costly than doing learning at a traditional class room. Flexibility is a major benefit of e-learning. E-learning has the advantage of taking class anytime anywhere.

Education is available when and where it is needed. E-learning can be done at the office, at home, on the road, 24 hours a day, and seven days a week. . E-learning also has measurable assessments which can be created so that both the teachers and students will know what the students have learned, when they've completed courses, and how they have performed. E-learning accommodates different types of learning styles. Students have the advantage of learning at their own pace. Students can also learn through a variety of activities that apply to the many different learning styles available. Learners can fit E-learning into their busy schedule. If they hold a job, they can still be working with e-learning. If the learner needs to do the learning at night, the option is available. Learners can sit in their home and do the learning if they so desire. E-learning encourages students to peruse through information by using hyperlinks and sites on the worldwide Web. Students are able to find information relevant to their personal situations and interest.

E-learning allows students to select learning materials that meet their level of knowledge, interest and what they need to know to perform more effectively in an activity. E-learning is more focused on the learner and it is more interesting for the learner because it is information that they want to learn. E-learning is flexible and can be customized to meet the individual needs of the learners'; learning helps students develop knowledge of the Internet. This knowledge will help learners throughout their careers.

E-learning encourages students to take personal responsibility for their own learning. When learners succeed, it builds self-knowledge and self-confidence in them. Educators and Universities really benefit from E-learning. Students enjoy having the opportunity to learn at their own pace, on their own time, and have it less costly.

PROBLEMS OF E-LEARNING

For the student, several disadvantages exist in the virtual classroom. According to Burbles (2004) there are "hidden barriers to access" of a virtual classroom to students; there are limitations to making an online course accessible to all. Some communication tools may not suit some students; for example, the streaming of audio cannot be heard by a hearing impaired student and thus this tool is not accessible to all. Another disadvantage of the virtual classroom is that it can only be successful if the communication tools used in the classroom are "in the student's possession, accessible to the student (and) operable by the student" (Lehmann, 2004). Although synchronous communication tools are usually perceived as an advantage because of their similarity to communication in the traditional classroom, they can also be a disadvantage. This is because they consist of real-time, text-based communication in which responses are often "out of sequence" as a consequence of varying typing abilities among students (Fetterman, D., 1998). Students must have adequate typing skills and communication skills as the majority of learning is text-based and self-paced, and if they are used to being in a structured, scheduled environment, they will be disadvantaged and most likely get confused and fall behind.

Teachers are not as readily available in the virtual classroom as they are in the traditional classroom, therefore students who usually need continual support of the teacher may feel isolated. The fact that there are technological requirements to enable full participation in the virtual classroom is also another disadvantage to students. For example, if the student does not have a high bandwidth and adequate computer memory needed to access the internet and hence the virtual classroom as well as download course material, they will be disadvantaged. Also, the technological dependence of the virtual classroom can be a disadvantage if there is an internet connection failure or a similar technological problem that prevents students to complete a task. If there is no "back up plan" in the case of a technological hindrance, students will miss out on the learning activity that was scheduled.

Difficulties with software: The disadvantage of E-learning is the managing of computer files, software compatibility and learning new software, including e-Learning. For learners with beginner-level computer skills, it can sometimes seem complex to keep their computer files organized. The lesson points you to download a file which the learner does and later he or she may not find the file. The file is downloaded to the folder the computer automatically opens to, rather than a folder chosen by the learner. This file may be lost or misplaced to the learner without good computer organizational skills. In our institution, the students have the requisite level of working with the computers and the software platform, which they acquire in a first course in the discipline of Informatics.

High motivation: E-Learning also requires time to complete especially those with assignments and interactive collaborations. This means that students have to be highly motivated and responsible because all the work they do is on their own. Learners with low motivation may not complete modules.

Isolation: Another disadvantage of E-learning is that students may feel isolated and unsupported while learning. Instructions are not always available to help the learner so learners need to have discipline to work independently without assistance. E-Learners may also become bored with no interaction. It needs to be stressed that blended learning is not just a mixture of strategies and technologies, but a holistic didactical method that combines "the effectiveness and socialization opportunities of the classroom with the technologically enhanced active learning possibilities of the online environment, rather than ratio of delivery modalities" (Dziuban, Hartman, Moskal, 2004). By applying blended learning, we overcome some proven disadvantages for both form of education - distance e-learning and traditional class room learning. All collaborative learning theory contends that human interaction is a vital ingredient to learning. Consideration of this is particularly crucial when designing e-learning, realizing the potential for the medium to isolate learners. With well-delivered synchronous distance education, and technology like message boards, chats, e-mail, and tele-conferencing, this potential drawback is reduced.

However, E-learning detractors still argue that the magical classroom bond between teacher and student, and among the students themselves, cannot be replicated through communications technology. Kruse (2004) outlined the following ways in which e-learning may not excel over other methods of training:

- Technology issues of the learners are most commonly technophobia and unavailability of required technologies.
- Portability of training has become strength of e-learning with the proliferation of network linking points, notebook computers, PDAs, and mobile phones, but still does not rival that of printed workbooks or reference material.
- Reduced social and cultural interaction can be a drawback. The impersonality, suppression of communication mechanisms such as body language, and elimination of peer-to-peer learning that are part of this potential disadvantage are lessening with advances in communications technologies.

CONTEMPORARY TRENDS IN E-LEARNING AND WHAT IT AFFORDS

The growing interest in e-learning seems to be coming from several directions. These include Educational institutions that have traditionally offered distance education programs either in a single, dual setting. They see the incorporation of online learning in their repertoire as a logical extension of their distance education activities.

The growth of e-learning is directly related to the increasing access to information and communications technology, as well as its decreasing cost. The capacity of information and communications technology to support multimedia resource-based learning and teaching is also relevant to the growing interest in e-learning. Growing numbers of teachers are increasingly using information and communications technology to support their teaching. The contemporary student population (often called the "Net Generation", or "Millennials") who have grown up using information and communications technology also expect to see it being used in their educational experiences (Brown, J. S., Collins, A., & Duguid, P. (2005).).

A key attribute of information and communications technology is its ability to enable flexible access to information and resources. Flexible access refers to access and use of information and resources at a time, place and pace that are suitable and convenient to individual learners rather than the teacher and/or the educational institution. Access to information and communication technologies offers a range of possibilities for capturing and delivering all types of subject matter content to learners and teachers in distributed educational settings. This means access to subject matter content and learning resources via networked information and communications technologies across a range of settings such as conventional classrooms, workplaces, homes, and various forms of community centers (Dede, 2000).

Contemporary educational institutions, including conventional distance education providers, often pride themselves in being able to meet the learning needs of their students and staff at a time, place and pace that are most convenient to them. They have been able to do this with the help of information and communications technologies which afford learners access to up-to- date information as and when they need them, and also the opportunity to discuss this information with their peers and teachers at their convenience. This is becoming increasingly affordable and palatable with a wide range of software applications and computer conferencing technologies for collaborative inquiry among students and asynchronous discussion. These applications enable learners and teachers to engage in synchronous as well as asynchronous interaction across space, time, and pace.

CONCEPT OF LIBRARIAN WITHOUT BUILDING

The concept of Librarian without building is not new in the 21st century libraries. The dawn of this century witnessed a dramatic change in the information profession. The beginning of this century witnessed revolution in the library environment. The concept of digital, virtual, electronic, library, library without wall/building and so on, had made it important for librarians to be in charge of these libraries. Hence we now have the concept digital librarian, virtual librarian, electronic librarian, librarian without wall or building and so on.

Libraries are changing from traditional librarianship with books, journals, catalogue cabinet with cards, shelves loaded with books to E-libraries with e-books and e-journals, OPAC database and so on. So also librarians are changing and adding more value from traditional librarianship to E-librarianship/librarian without building. With the advent of new fields of study and the emergence of virtual learning (E- Learning), there are additional demands for libraries and librarians. Faculty scholarship and student's learning will suffer in an e-learning environment without e-learning librarian (Digital Librarian/ virtual librarian/ Librarian without building).

All over the world, E-learning has become integral feature of higher education, and no educational system can succeed without library; it is always said that library is the heart of any institution. Therefore for an E-learning system to survive, there must be functional E- library and for any E- library to function, there must be an E- librarian (Librarian without building) manning it. Rowley (1998) cited Oppenheim (1997) who described library without building as an organized and managed collection of information in a variety of media in digital format. The materials are organized and managed for the benefit of actual and potential user population. Trolley (1995) posits that library without building or electronic library is the vision of librarians, publishers, technology experts and researchers on how users can have access to information anytime anywhere.

Pujar and Kamat (2009) explained that E-Librarians support access to crucial resources in an E- learning environment. The E- Librarian organizes online tools to provide metadata for online materials for the E- learners, and E-teachers in the following areas: E- resources, content management, Digital library/ Institutional Repository, Courseware, Digital/ Virtual Reference Services, Electronic Discussion Forums, and so on. Librarian can provide access to various services to the E-Learners and E- teachers in an E-learning environment. E-Librarians make access and use of e-resources easier and faster because of the traditional skills which the librarian had acquired. Such skills include ability to select, acquire, organize, disseminate and preserve the right information materials for the right user. Livonen (2005) opined that the E-librarian makes easy and fast access to electronic resources for E-Learning environment.

Gunn (2002) explained that E-libraries are designed to support the information needs of their communities (E-learners and teachers). They offer resources from many sources and in many formats to the E-learners and E-teachers. They make information resources available to the users anytime and anywhere there is an internet Connection. Nfila,(2013) opines that Digital Librarian/ E-librarian is also linked to e-learning; they provide technology based information and services to enable the E- teachers and E-learners to access relevant information and services anywhere, anytime as well as provide empowerment for innovative and lifelong teaching and learning . This enables the e- learners and e- teachers to undertake learning and research at their convenient.

CHARACTERISTICS AND SKILLS OF LIBRARIAN WITHOUT BUILDING IN AN E- LEARNING ENVIRONMENT

E- Learning as earlier defined is a process of using technology to deliver learning and training programme. Such technology includes computers, internet, intranet, wireless, CD-ROM and so on. It implies web-based learning, computer based learning, virtual learning, virtual classroom. It is the delivery of content via internet, intranet/extranet (LAN/WAN). It implies any learning that utilizes a network (LAN/WAN) for delivery, interaction and facilitation. In order for the virtual Librarian (V L) or Librarian without building (LWB) to assist patrons in making the most of innovations in an e-learning environment, he or she keep one step or more ahead in the knowledge and uses of online materials.

The librarian without building in an e-learning environment must have some understanding of the operation of personal computer (PC), this will help him to cope in a situation where there are technical problems while in the middle of reference or research project, librarian without building must have understanding on how to troubleshoot and also how to solve the most common and occurring problems. He must have knowledge of the working of a PC, such as PC repair, hardware and software installation and maintenance. He must also have understanding of computer networking. The bottom line is that the virtual librarian or librarian without building must be multi-skilled. Traditional librarianship skills are needed, technical skills are needed, managerial skills are also needed if he she must succeed in an e-learning environment and in this information age. The librarian without building must have all the knowledge and skills required to practice as a professional librarian; in addition, he must have knowledge of HTML/XML, library software and applications, license and contract negotiation, knowledge of electronic academic publishing, knowledge of copyright, knowledge of TCP/IP, Z39.50, Library 2.0, catalogue 2.0.

He must have the drive to learn and continue learning. Clearly he will be facing a career that is full of challenges and surprises. The combination of all these skills which are very necessary in the running of a virtual Library is what will determine the success or failure of the Virtual Librarian. These skills will help the Virtual Librarian or librarian without building in an e-learning environment to enjoy a long and rewarding career. Librarians that will manage the library without building must be very educated, experienced, intelligent and resourceful. Somvir, (2010) is of the view that librarians in the 21st century must train and retrain themselves and should stop having in mind that their employer has the full responsibility of training and retraining them. They must keep on updating their knowledge and skills in order to meet up with the challenges of the E learning environment. These librarians are technology application leaders who work with other members of the information management team to make information accessible to users. Hashim and Mokhtar (2012) explained that librarian without building in the 21st century libraries in an E- learning environment are knowledge based practitioners who use research as a foundation for their own professional practice.

CARL(2010) listed the following as the competences that is required of the librarian that will manage the 21st century libraries .

- Expert knowledge of the content of information resources.
- Excellent instruction and support for library and information service users.
- Appropriate information technology to acquire, organize and disseminate information.
- Skills to evaluate the outcome of information use and conduct research related to the solution of information management problems.
- Effective communication skills.

These librarians are also expected to be engaged in the exploration and implementation of new technologies needed to match with the present patrons, most of whom have become technologically savvy in the use of ICT. They must possess high level of information literacy skills, as well as knowledge of the principles and techniques of effective reference services. Librarians without building in an E- learning environment must be knowledgeable in integrated library system (ILS) web technologies such as web 2.0, twitter, face book, my space, OPAC 2.0 etc. They must also have knowledge of data management.

A librarian without building that will function in an E- Learning environment must function as a dynamic filter, who filters and take up the role of balancing the information need and use of the E- learners. Therefore, librarian without building must embrace continuous learning, not only of technology but also new ways of providing effective and efficient services to the E- Learners and E- Teachers. Such librarians must contextualized the library where he/she work and the type of work that needs to be done. (Chu, Felix T. 2003)

STATEMENT OF THE PROBLEM

The advent of ICTs in Education that led to the Introduction of E-learning, E-teaching and E-Education has brought on board the concept of E-Library, E-Librarians or Library without building. This is because education and libraries are always together; no education system can achieve its aims and objectives without libraries as partners. This is because libraries are the heart of the education systems; they provide information resources that support the teaching and learning process and they provide the resources that support the instruction curriculum. The problem now is that, with the introduction of ICTs in education, teaching and Libraries, there are additional tasks that are required from the librarians without building in order for them to function in an e-learning environment. Then, what are the skills and knowledge that will be required from them and how can they acquire the needed skills and knowledge to support the E-learning system, these are some of the problems this chapter attempts to address.

Research Questions.

Is there need for E-librarian without building in an E-Learning Environment?

1. What are the needed skills by Librarian without building in an E-Learning environment?
2. What are the challenges of librarian without building in an E-Learning environment?
3. What are the solutions to the challenges of Librarian without building in an E-Learning environment?

METHODOLOGY

Survey research design was used for this study. Questionnaire was the instrument for data collection; the questionnaire was designed and administered to 138 librarians in Nigerian academic libraries. Random sampling method was used and 23 questionnaires were administered in each of the six geo-political zones in Nigeria (University libraries, Polytechnic Libraries and Colleges of education libraries). Out of the 138 questionnaires administered, 127 was returned and found useable and were used for data analysis and this represents 92.0% response rate. The data were analyzed using frequency, percentages and tables methods.

Table 1 shows the different institutions which the respondents are affiliated to. From the above table, it can be deduced that 69 respondents representing 54.3% are from universities, 35 respondents representing 27.6% are from polytechnics, while 23 respondents representing 18.1% are from colleges of education.

Table 2 above shows the respondents responses as to whether their institutions offer E-Learning.

From the table, the data reveals that 127 (100%) that is all the respondents agreed that their institution offer E-Learning.

The Table 3 above provides information as to whether or not the institutions under study have E- Libraries for their E- Learners. From the data in the table above, it can be summarized that all the institutions investigated for this research work had E- Library for their learners as all the respondents 127 (100%) responded in the affirmative.

Table 4 above shows the respondents opinion as to whether there is need for E- Librarian in an E- Learning environment. The results shows that 118 (92.9%) of the respondents strongly agree that there is need for E- Librarian in an E- Learning environment, in the same way, 9 (07.1%) of the respondents also agree with the assertion that there is need for E- Librarian in an E- Learning environment. It is interesting to know that no respondent disagree with the statement.

Table 5 above summarized the respondents view regarding the skills needed by librarian without building in an E- Learning environment. 127 (100%), that is, all the respondents agreed that high computer knowledge and skills are needed for a librarian to function in an E- Learning environment, in the same way, 123 (96.7%) of the respondents posit that knowledge of various data bases is required for the librarian to function in an E- Learning environment. Also, all the respondents 127 (100%) are of the view that for any librarian to function in an E- Learning environment, the librarian must be multi- skilled, that is, he or she must have various skills. More also, 127 (100%), all the respondents believed that for a librarian to function in an E-Learning environment, such a librarian must be highly intelligent. 96 (75.6%) of the respondents are of the opinion that ability to learn very fast is another skill that is required by a librarian to function in an E- Learning environment. In the same way, 83 (65.4%) of the respondents stated that good communication skill is essential for librarian in an E-Learning environment. In relation to evaluation skill, all the respondents 127 (100%) agreed that evaluation skill is need for any librarian to function in an E- Learning environment. While 122 (96.1%) of the respondents are of the opinion that ability to teach others is a requirement for a librarian in an E- Learning environment.

Table 6 above reveals the challenges that librarian without building in an E- learning environment faces. 118 (92.9%) of the respondents stated that technical and administrative issues are parts of the challenges that librarian without building faces. 122 (96.1%) of the respondents are of the view that finance is a major challenge that librarian without building faces, 114 (89.8%) agreed that adapting to change is a serious challenge faced by librarian without building in an E- Learning environment. All the respondents 127 (100%) are of the opinion

Table 1. Affiliation of respondents

Affiliation of Respondents	Frequency	Percentage
University	69	54.3%
Polytechnic	35	27.6%
College of Education	23	18.1%
Total	127	100%

Table 2. Does your institution offer e-learning

Does Your Institution Offer E-Learning	Frequency	Percentage
Yes	127	100%
No	Nil	Nil
Total	127	100%

Table 3. Does your institution have e- library for e- learners

Does your Institution have E- Library for E- Learners	Frequency	Percentage
Yes	127	100%
No	Nil	Nil
Total	127	100%

Table 4. There is need for e- librarian in an e- learning environment?

There is Need for E-Librarian in an E- Learning Environment?	Frequency	Percentage
Strongly Agree	118	92.9%
Agree	9	07.1%
Un- Decided	Nil	Nil
Disagree	Nil	Nil
Strongly Disagree	Nil	Nil
Total	127	100%

Table 5. Skills needed by librarian without building to functions in an e- learning environment

Skills Needed by E-Librarian to Functions in an E-Learning Environment	Frequency	Percentage
High Computer Knowledge and Skills	127	100%
Knowledge of various Databases	123	96.7%
Multi Skilled	127	100%
Highly Intelligent	127	100%
Ability to learn very fast	96	75.6%
Good communication skills	83	65.4%
Evaluation skills	127	100%
Ability to teach others	122	96.1%

that capacity building is a major challenge facing librarian without building; also, 124 (97.6%) of the respondents believe that bottlenecks from vendors are parts of the challenges that librarian without building faces. While all the respondents again 127 (100%) agreed that the issue of copyright is a serious challenge to librarian without building in an E- Learning environment.

Table 7 above presented the possible solution to the challenges to librarian without building in an E- learning environment. 124 (97.6%) of the respondents suggested that the parent institutions should support the library in all aspects. Also, 127 (100%), that is all the respondents suggested that adequate financial support should be given to the librarian without building in an E- Learning environment. In the same way, all the respondents 127 (100%) are of the view that capacity building in terms of training and retraining of the librarian without building is another way of achieving the goal of librarian without building in an E- Learning environment. 121 (95.3%) of the respondents suggested that the various institutions should have their policies on copyright. Also, 127 (100%), that is all the respondents suggested that librarian without building in an E- Learning environment should be ready to learn, continue learning and willing to teach others.

DISCUSSION OF FINDINGS

This study revealed that all the institutions that participated in this survey provide E- Learning platforms and the different institutions have different names for the programme, such as dis-

Table 6. Challenges of librarian without building in an e- learning environment

Challenges of Librarian without building in an E- Learning Environment	Frequency	Percentage
Technical and administrative issues	118	92.9%
Financial Challenges	122	96.1%
Adapting to Change	114	89.8%
Capacity Building	127	100%
Vendors issues	124	97.6%
Copyright issues	127	100%

Table 7. Solutions to the challenges

: Solutions to the challenges	Frequency	Percentage
Institution management should support the library	124	97.6%
Adequate finance should be release for E-Library development	127	100%
Adequate capacity building for Librarian without building	127	100%
There should be institutional policies on copyright	121	95.3%
Librarian Without Building should be ready to learn and teach others	127	100%

tance learning, open learning, Open University, distance education, continue education and so on. The research work also found out that all the institutions that were involved in this research work have E- Libraries for their E- Learners. It is interesting to know that 118 (92.9%) of the respondents strongly agreed that there is need for E- Librarian in an E- Learning environment. The study also discovered that for E- Librarian to function in an E- Learning environment there is need for such librarian to build up skills and knowledge. The required skill and knowledge include high computer literacy. The E- librarian must not be computer phobic; he/she must have high knowledge of various data bases and their functionalities.

The E- librarian must be multi- skilled. He must possess the ability to do different tasks. He/she must be highly intelligent and must be above average intelligence. He/she must be able to learn very fast and teach others as well. Such a librarian must have good communication skills and must be knowledgeable in evaluation of information resources and services. The study also discovered that there are some challenges that the E- Librarian faces such as administrative and technical challenges, financial challenge, change challenge, capacity building, copyright and vendors' challenges. The study also proffered solutions to the challenges - there should be institutional support for the development of E- Library, capacity building should be intensified for E- Librarian, there should be institutional policies on copyright, E- Librarian (Librarian without building) should be ready to go the extra mile to learn and also teach others.

RECOMMENDATIONS

Information and communication Technologies have changed the educational system for better, and these changes had also imparted the library because libraries are always associated with education and development. It is therefore recommended that librarians should strive to acquire more knowledge and skills so as to stand the changing nature of their job. It is also recommended that government agencies that accredit programmes at tertiary institutions should make sure that any institution that offers E- learning must also have well organized E- library and a well trained E- librarian must be employed to manage the E- library.

This chapter also recommends that librarians should try as much as possible to attend conferences and workshops both locally and internationally, where they can acquire these new skills and knowledge that are required of them to function effectively in an E- learning environment. Training should also be organized for librarians by the various professional bodies. In most countries there are professional associations and bodies that train and equip members with necessary skills. In Nigeria for example, the Nigeria Library Association and the Librarian Registration Council of Nigeria should take it as a point of duty to organized training for librarians at a subsidized cost. At the international scene, the West Africa Library Associations (WALA), the International Federation of Library Associations (IFLA) and many others should also do same to equipped librarians for the task ahead. The study also recommends that there should be institutional support for the development of E- Library; capacity building should be intensified for E- Librarians and the parent institutions should try as much as possible to bear the cost of training, so that they can catch up with the advancements in technology. There should be institutional policies on copyright.

The E- Librarian (Librarian without building) should be ready to go extra mile to learn and also teach others. They should not rely solely on the institution to train them because E- Librarians in this age must be competent enough to handle challenges of the E-Learning Environment.

FUTURE RESEARCH DIRECTIONS

The authors recommends that further research should be carried out to investigate the relationship between E- Librarian, (librarian without building), E- Teacher and the E- Learners in an E- Learning environment. This has become important because the three actors (E- Librarian, E- Teacher, and the E- Learners) are the major components of E- Learning. The success or failure of the E-Learning system depends to a very great extent on the cordial relationship between them. Also, it is recommended that another study should be carried out to investigate the choice of librarian as regards working as a professional librarian in a traditional library system or working as an E-librarian in an E- Learning environment and the study should find out the reasons librarians prefer working as professionals in a traditional library system or as an E – Librarian in an E- Learning environment.

CONCLUSION

The introduction of Information and Communication Technologies (ICTs) in education has brought on board new methods of teaching and learning. These new method of teaching and learning has also brought on board new library, new librarian, and new roles for the librarian. Therefore, the librarian without building in this new learning environment must acquire new skills required to fit into the changing world of modern day educational system. E- learning as a learning platform has empowered so many individuals, organizations, as well as nations at one point or the other. E- Library and E- librarian or library without building must be recognized and empowered as part of the learning process because the success of any E- learner greatly depends on the E- teachers, E- libraries and the E- librarians or the librarians without building in an E- Learning environment must strive at all cost to acquire new knowledge and skills they must not rely soly on their parent organizations such training and retraining, and must continue to upgrade that knowledge and skills through capacity building, through seminars and work shop, through short and long term training in order to remain relevant in this present digital age.

There is hope for librarian without building in an E-learning environment; if they can develop themselves and know how to fly their onions, this is true because E-learning cannot function effective without E-library and E-Librarians (Librarian without building) in charge of the library just as the traditional educational system cannot survive without library attached to the institution to support the teaching, learning and Research process of their parent organization.

Wilen-Daugenti, T. (2009)..edu — Technology and learning environments in higher

KEY TERMS AND DEFINITIONS

21st Century Librarian: 21st century librarians refer to those librarians that provide services to both face and faceless patrons. Their services enable the users to access the present day virtual libraries without necessarily coming in contact with the librarians. The 21st century Librarians makes use of technologies in performing their day to day duties.

21st Century Libraries: the 21st century library is a collection of units of document in both prints and digital the resources are spread everywhere, accessible always, anytime and anywhere with the aid of Information and Communication Technologies. It is a type of library where individuals and groups such as authors, publishers, vendors and readers are linked through hyperlink technology across the global electronic network to relate in different ways.

Academic Libraries: These are libraries that are established in institutions of higher learning, such as Universities, Polytechnics and colleges of Education. They are to such the curriculum of their parent organization, in terms of teaching learning and research activities of their parent organization.

E-Learners: A student that uses e-learning to gain education.

E-Learning: Web-based training (WBT), also known as elearning and on-line learning, is training that resides on a server or host computer that is connected to the World Wide Web.

E-Library/Library without Building: It can be refers to as an electronic or online library where users can have access to information resources electronically over the net. This type of library provides 24 hours online access to digital resources to users.

Virtual Learning Environment: A virtual learning environment (VLE) is a set of teaching and learning tools designed to enhance a student's learning experience by including computers and the Internet in the learning process.

Chapter 86
Trends of Blended Learning in K-12 Schools:
Challenges and Possibilities

Alex Kumi-Yeboah
Dalton State College, USA

Patriann Smith
University of Illinois – Urbana-Champaign, USA

ABSTRACT

Blended learning is a well-known and successful instructional model used in higher education and K-12 schools (International Association for K-12 Online Learning, 2012; Watson, 2012). It is estimated that about 37 percent of school districts in the United States had students enrolled in technology-supported distance education courses during the 2004/2005 school year (Zandberg & Lewis, 2008). An increased student population, coupled with the need to reduce educational costs, has led to a high demand for virtual instruction (Watson, 2010). Blended learning is a hybrid of traditional face-to-face and online learning in which instruction occurs through both classroom and online formats, with the online component being a natural extension of traditional classroom learning (Colis & Moonen, 2001). As such, the process may involve a combination of instructional technology formats (e.g., videotape, CD-ROM, Web-based training, film) and face-to-face instructor-led instruction (Driscoll, 2002). Despite its hybrid nature and the potential it holds for transforming classroom instruction, to date, little research exists that examines trends in blended learning and the challenges and possibilities of utilizing this method of instructional delivery at the K-12 level. Further, even less is known about best practices in K-12 blended learning and instruction (Ferdig et al., 2009). Given these considerations, in this chapter, the authors first explore trends in blended learning in K-12 schools. Subsequently, they examine the benefits and challenges of K-12 blended learning. In the final phases of the chapter, the authors highlight possible solutions to the challenges, discuss recommendation, and identify directions for future research.

INTRODUCTION

Recent yearly costs and budget deficits have made it difficult for many school districts to purchase and supply textbooks to students. In 26 states, K-12 schools in the United States received less state funding in the 2012-13 school year than they did last year, and in 35 states, school funding now stands below the levels of that observed in 2008. In support of these statistics, reports indicate that 35 states currently receive less funding per student than they did five years ago. And, as an example of the increase in costs for school funding, Florida's school funding demonstrated an increase of approximately $273 per pupil in 2013 despite reduction in funding to the state at a rate of $569 per-pupil over the past four years, 2008-2012 (U.S. Census Bureau, 2010).

As a result of these shifts in school and state funding, resources such as "Open Educational Resources" (OER) have emerged as a pathway for the delivery of engaging, customized, and up-to-date content at a faster and more cost effective rate. However, with the increasing population of students in K-12 schools, as well as the shortage of teachers, certain courses remain unavailable in schools. As an instructional model that allows students to enroll in courses or recover course credits from missed or failed classes (Watson et al., 2012), blended learning provides a feasible alternative.

Blended-learning involves integration of various event-based activities, such as face-to-face classrooms, live e-learning, and self-paced learning (2003). Given the flexibility involved, the International Association for K-12 Online Learning (iNACOL, 2012) estimates that more than 1.5 million students in K-12 schools took one or more online courses in 2010 (Wicks, 2010). Moreover, in the year 2012, 31 states including Washington, DC had instituted statewide full-time online schools at the K-12 level (Watson et al., 2012). Further, states such as Alabama, Florida, and Michigan offered full or part-time online delivery options to students in grades K-12 (see Tables 1 & 2).

With the rapid increase in student and teacher access to the Internet over the past ten years, blended-learning as an instructional model has become a more reasonable option for K-12 schools. For instance, in 2009, 97% of teachers had one or

Table 2. Number of States with Statewide Online Learning Options in the United States

more computers located in the classroom every day and 54% were allowed to bring computers into the classroom. In fact, daily Internet access was available for 93% of the computers located in the classroom and the ratio of students to computers in the classroom was 5.3 to 1 (National Center for Education Statistics, 2009). Such availability has not only increased teachers' ability to cater to the needs of a larger number of students while maintaining the quality of learning outcomes (Riel & Polin, 2004), but has also held potential for greater accessibility to course content and instruction.

Given the potential of blended learning as an instructional tool, in this chapter, we first provide background information concerning blended learning, and then explore the current trend of this instructional model in K-12 schools. Through examination of the benefits and challenges of K-12 blended learning, we subsequently highlight possible solutions to challenges, and make recommendations for future research.

BACKGROUND

Blended learning involves the use of instructional tools such as multimedia and virtual Internet resources, classroom websites, Course Management Systems, and synchronous and asynchronous discussions. These tools are necessary to help implement and develop a successful blended learning program in K-12 schools (Rovai & Jordan, 2004). In blended learning, instruction may occur in online and offline settings (Singh, 2001). In the online setting, instruction occurs using the Internet. In the offline setting, instruction occurs in a traditional, face-to-face classroom between the teacher and students. No matter the setting, the percentage of time and types of activities utilized by students in either online or offline environments depends largely on the nature of the course and the instructor's preference (Wingard, 2004). Invariably, instructor preference may also determine to varying degrees, whether learning is structured or unstructured.

In structured blended-learning environments, the instructor has the ability to track the frequency of student participation and progress towards course completion. Structured environments also provide the instructor with access to online assessments of student learning, as well as communication with students through email. Structured environments may therefore appear favorable for students who learn better on their own rather than in traditional face-to-face classroom settings (Singh, 2001). Unstructured online environments are informal and involve synchronous and asynchronous discussions and email correspondence. Such environments provide students with the opportunity to control some of their learning experiences, as well as the freedom to interact and collaborate with peers without the instructor's constant face-to-face monitoring (Hoyle, 2003).

As is generally the case with instructional delivery methods, both structured and unstructured environments prove advantageous for some but challenging for others.

Troha (2003) notes:

the intent of blended learning is to enhance learning by combining the best of both worlds such as face-to-face and online courses that appear to lend themselves to self-study online. Such elements tend to include easy-to-interpret, straightforward *information that is relatively easy for the (student) to accurately grasp on his/her own. (p. 49)*

To maximize the advantages of this method, four main principles of blended learning have been proposed:

1. A thoughtful integration of face-to-face and fully online instructional components.
2. Innovative use of technology.
3. Reconceptualization of the learning paradigm.
4. Sustained assessment and evaluation of blended learning (Carman, 2005; Martyn, 2003).

The first principle maximizes the benefits of the learning environment and addresses diverse students' needs and preferences. The second principle, based on the innovative use of technology, requires the application of technology in pedagogically appropriate ways and the use of technological tools for the creation and maintenance of socially-situated and highly interactive learning environments (Vaughan, 2007). The third principle offers a reconceptualization of the learning paradigm through its incorporation of novel pedagogical and learning theories (e.g., student-centered, social constructivism), thereby allowing for development of new understandings and knowledge generated through students' social interactions with groups of peers (e.g., active author of content, self-paced learner) and teachers (e.g., mentors, coaches) (Dziuban, Moskal, & Hartman, 2004). The fourth principle of blended learning focuses on ensuring educational quality (Graham, 2006).

Through the provision of such guidelines, which highlight the affordances of online and face-to-face teaching integration for students in K-12 schools, teachers are empowered to undertake the design of innovative ways of teaching and managing students in K-12 blended classroom settings. Yet, design constitutes only one element of successful blended-learning instructional implementation.

Adherence to "best practices" identified in relation to this instructional method is another significant consideration. Oakes and Casewit (2003) highlighted five best practices to be considered when planning blended learning, namely:

1. Create a structured core curriculum of learning activities that are taught using a variety of instructional methods.
2. Support an environment in which students can learn smaller parts and work their way up to more complex ideas.
3. Create a classroom in which students can learn informally.
4. Provide technological support and for students.
5. Provide an easy to use environment.

Similarly, Schmidt (2002) recognized the following as indispensable components of blended learning:

1. **Administration:** Which involves the organization of the syllabus, increases teacher productivity/efficiency, distributing/collecting material, and scheduling duties.
2. **Assessment:** Which involves the ability to providing feedback, tracking student progress, and testing opportunities.
3. **Content Delivery:** That comprises communicating content through different learning styles, using multimedia, incorporating learning activities, using the Internet for the acquisition of knowledge.
4. **Community Component:** That involves building the classroom community through synchronous/threaded chats, providing office/help hours to communicate online.

Alternatively, Rovai and Jordan (2004) approached blended-learning from the perspective of course design, observing its operation along a continuum from "fully face-to-face" to "fully online learning environments" (p.14). From this perspective, blended learning is categorized as follows:

1. The use of Multimedia and Virtual Internet Resources in the classroom. Examples include the use of videos, virtual field trips, and interactive websites.
2. The use of Classroom Websites in the classroom.
3. The use of Course Management Systems. Examples include the use of Moodle, WebCT and Blackboard.
4. The use of Synchronous and Asynchronous Discussions in the classroom. Examples of resources available include Yahoo Groups, TappedIn, Blogs, and Elluminate (Rovai & Jordan, 2004).

Each approach provides a reasonable entry point from which to consider blended-learning. As reflected by these conceptions, of considerable importance are the learning environment, curriculum of learning activities, assessment, organization, technology support, and the use of Course Management Systems such as Moodle, Blackboard and WebCT. Though certain conceptions favor an emphasis on implementation, and others a focus on design, successful implementation will require K-12 teachers to consider the needs of students within the classroom in determining how the elements will be modified to meet the needs of students with whom they interact.

PEDAGOGY OF BLENDED LEARNING IN K-12 SCHOOLS

The preponderance of blended learning beyond K-12 levels is not surprising, as successful e-learning instruction with young children requires a significant degree of adaptation. Yet, this adaptation is crucial, and as Scott (2003) observes, elementary students "should not be excluded from the virtual learning world simply because of their age and developmental levels" (Scott, 2003, p. 2). In a quasi-experimental study conducted by Rockman et al. (2007) to evaluate the effectiveness of Spanish courses offered to 463 middle school students (seventh and eighth graders) in the West Virginia Virtual School System, researchers employed a blended model of instruction that combined face-to-face and virtual instruction with Web-based activities. A three-member teacher team consisting of a certified Spanish lead teacher designed and delivered lesson plans as well as conducted weekly conversations with students. Another certified Spanish teacher, an adjunct, provided content-related feedback through e-mail and voice-mail, and graded students tests and quizzes. The third teacher, a non-Spanish certified classroom facilitator, guided students both Online and Offline to complete assignments and projects on time. In this study, the blended learning component was offered in 21 schools with inadequate resources to provide face-to-face Spanish classes for students, and face-to-face group (instruction) included seven schools with adequate resources for virtual schools, specifically in regards to language arts achievement and school size. The results indicated that students in the face-to-face instruction performed significantly higher than those receiving instruction in the online blended section of the course.

In contrast, a study conducted by O'Dwyer, Carey and Kleiman (2007) using quasi-experimental design methods to compare students' mathematics ability in a fully online Algebra class (seventh and eighth grades) with students in a traditional face-to-face instruction yielded different results. The findings from a comparison of 463 students (231 seventh and eighth graders from the treatment group, 232 seventh and eighth graders from the comparison group) indicated that students in the online program performed better than those in the traditional face-to-face classrooms.

Similar findings were observed in a study designed to examine the effectiveness of a virtual Web-based learning as compared to traditional face-to-face instruction in a science laboratory class with 113 fifth-grade students in Taiwan (Sun, Lin, & Yu, 2008). The study utilized a quasi-experimental method that included a treatment (56 students) and a controlled group (57 students) in four classrooms from two randomly sampled schools. Students in the treatment group used the virtual Web-based science lab time and conducted virtual experiments and projects with teacher supervision while students in the control group performed similar science experiments using traditional face-to-face lab equipment. Results from the study reflected a higher performance for students engaged with the virtual Web-based lab as opposed to those in the control whose experiments involved traditional lab equipment.

The contradictory results from this small subset of studies may be attributed to numerous factors. Sitzmann, Kraiger, Stewart, and Wisher (2006) supported the findings above which reflect increased performance within blended-learning environments. More specifically, the authors observed that results from many blended, online learning and traditional face-to-face learning reflect superiority of classroom-based instruction with regards to knowledge outcomes (Sitzmann et al., 2006). Yet, another significant factor to be considered in the effectiveness of this form of instruction is the construction of effective blended program designs.

In keeping with this consideration, Singh and Reed (2001) suggested the following as a framework for blended learning:

1. **Audience:** Addresses questions such as "What do the learners know and how varied is their level of knowledge? Are the learners geographically centralized or geographically dispersed? Are the learners here because they wish to be or because they have to be?"
2. **Content:** Some content lends itself well to online situations. Other content, a complex and detailed procedure for assembling a valve train, for example, may work best in face-to-face setting.
3. **Infrastructure:** Considering issues such as physical space and the limitations posed and placing instruction on-line. For instance, if students do not have access to high bandwidth connections, on-line video streaming would be a poor choice.

While Singh and Reed (2001) focused on broader concerns affecting the learning environment, Carman (2002) noted that five elements constitute the main components embedded in the design of effective blending learning procedures:

1. **Live Events:** Consist of synchronous, instructor-led events. Examples are traditional lectures, video-conferences, and synchronous chat sessions like Elluminate.
2. **Self-Paced Learning:** Includes experiences the learner completes individually on her own time such as an internet or CD-ROM based tutorial.
3. **Collaboration:** Learners communicate and create with others, e-mail, threaded discussions, and, come to think of it, this wiki are all examples.
4. **Assessment:** This includes measurements of learners' mastery of the objectives. Examples are conventional tests, quizzes, and grades, narrative feedback, portfolio evaluations.
5. **Support Materials:** These include reference material, both physical and virtual, FAQ forums, and summaries (p. 2).

As seen above, attention to both the program design and product of learning are critical if K-12 students are to demonstrate gains. For researchers to capitalize on the affordances of blended learning and capture these gains, not only is careful planning needed in collaboration with teachers, but assessment of content via varied measures would also be necessary.

BENEFITS OF BLENDED LEARNING TO K-12 STUDENTS

The affordances of blended learning for K-12 students are many. Among those highlighted here are motivation, communication, attendance and pacing, time and other benefits for at-risk students, as well as differentiation of instruction.

Blended learning allows students to become motivated in directing their own learning. Research has shown that when students participate in a "cyber-study group," they tend to out-perform students who study alone (Newlin, et al., 2002). Further, it has been the case that peer-to-peer interactions made possible through blended learning "promote collaboration among students in K-12 schools," "a collective sense of responsibility" and enables students with low levels of self-efficacy or who demonstrate an external locus of control to "receive feedback and encouragement from their study partners" (Newlin et al., 2002, p. 14).

Not only does blended-learning motivate K-12 learners, but the method also enhances both oral and written communication. As an affordance for oral and communication, Eastman and Swift (2002) noted, "communication tools like discussion boards and chat rooms can be effective in inter-team collaboration as well as in faculty-student communication" (p. 21). Moreover, communication tools such as blogging and chats have been shown to empower students, enhance the development of communications skills, and increase students' capacity to work cooperatively with one another. In online discussions, students who lack confidence to speak during class discussion or in face-to-face classroom environments frequently demonstrate confidence. In fact, teachers often become easily accessible to students through such forms of synchronous activity (Eastman & Swift, 2002).

In written communication, students are also allowed the advantage of communication via a myriad of tools. One such tool is blogging. Blogging has the potential to provide instant, online writing opportunities for an audience of thousands as well as the ability to free and revised publishing (Bull, 2003). With blogging, teachers have noticed that the "presence of an audience can increase engagement and a depth of writing" (Bull, 2003, p. 6). Blogging "forces students to become more savvy about the world around them" (Bull, 2003, p. 17) and the need to feed the interest of the audience inspires students to be clever and interesting (Toto, 2004). When used appropriately in blended-learning, blogging further empowers "students to become more analytical and critical; through actively responding to Internet materials, students can define their positions in the context of others' writings as well as outline their own perspectives on particular issues" (Oravec, 2002, p. 32).

A third advantage of blended-learning relates to attendance and pacing. In blended-learning classrooms, students have the ability to study at their own pace within a time framework. Whenever a student is absent, s/he may have ample time to access materials and/or class meetings, regardless of virtual absence from the immediate and synchronous learning environment. This opportunity serves as a tremendous help in enabling students to remain on track academically. Access to content unhindered by the challenges of physical presence proves to also be advantageous for students with prolonged sicknesses or injuries that prevent them from attending school. Through "self-study modules," as typically available through blended-learning, students can review "certain content at any time for help in understanding a concept or to work ahead for those students who learn at a faster pace" (Alvarez, 2005, p. 12). And in fact, despite observations that "the online environment is not the ideal setting for all types of learning," neither are classrooms, and therefore, it is not surprising that "many teachers and corporate trainers are concentrating their efforts on integrating internet-based technologies and classrooms to create blended learning environments" (Alvarez, 2005, p. 26).

The time afforded to learners and the possibilities allowed when these learners are at-risk are also significant considerations for blended learning in K-12 schools. Blended-learning provides authentic and structured time to allow students the opportunity to proceed at their own pace. With this instructional method, teachers can monitor students' progress and provide encouragement and support, especially to students who lag behind academically (Oblender, 2002). Research also points to an improvement in K-12 student performance with blended-learning, especially for low achieving and at-risk students. For example, the use of online activities in blended-learning provides opportunities for at-risk students at various levels of K-12 education to participate in class projects and therefore, other common issues, such as attendance, become less problematic. With the accessibility to classwork from home, and with constant assistance from peers and teachers online, blended learning may provide an added advantage over traditional face-to-face methods as follows:

1. Students in rural or small school districts where the proximity of the classroom is the main challenge to content/material can gain accessibility.
2. Home-schooled students with instruction in subjects their parents feel unable to teach can learn those subjects.
3. Handicapped or hospitalized students who cannot travel to the traditional classroom can work through the class content while receiving treatment.
4. Expelled students who are required not to attend the traditional classroom as a consequence but still can have access to material to prevent falling behind academically (Keeler, Richter, Anderson-Inman, & Ditson, 2007).

Differentiated instruction functions particularly well within blended-learning environments. According to de Gula (2004), differentiated instruction involves "custom-designing instruction based on student needs" (p. 11). Teachers in blended-learning environments are well-positioned to successfully differentiate based on students' needed because teachers have the chance to respond to all students through e-mails, voice-mails, chats, blogs, and other online tools for academic help at any particular time and within various spaces. Not only can instruction be differentiated, but teachers can also meet students' individualized needs (Archambault et al., 2010; Christensen & Horn, 2008; Waldeck, 2008; Watson & Gemin, 2008) through multiple mechanisms that provide immediate formative feedback about a student's performance (Dennen, 2005; Rice et al., 2008). Wingard (2005) further highlighted the probability for increased student-instructor interaction and student preparation in the class or course.

In considering the content-oriented skills afforded to learners via this method, Prichard and O'Hara (2011) observed:

Environments that support linking graphics, sound and video elements in addition to text elements ... provide students with multiple opportunities for language production, task engagement and academic vocabulary development. Not only can various language development needs be addressed simultaneously by promoting the use of visually engaging and language rich technologies, the ability to use these environments encompasses many of the technology skills students need as they graduate from high schools and work toward future careers." (p.19)

Singh (2003) agreed that a combination of different delivery modes in blended learning helps to balance out and optimize the development and deployment of costs and time. Though online content can be expensive to produce, integration of online and mentoring sessions with self-paced materials such as text assignments and PowerPoint presentations can be effective.

Through this portrayal of the affordances of blended learning, teachers in K-12 schools can recognize the opportunities for teachers and students to design, plan, organize, and implement possible learning goals and objectives for a particular subject or discipline in order to achieve academic success. More specifically, for at-risk K-12 learners, teachers are provided with the tool of blended learning as an alternative that minimizes the obstacles faced in relation to access and academic support via traditional methods of instruction.

CHALLENGES OF BLENDED LEARNING IN K-12 SCHOOLS

The design and implementation of blended-learning are not without their challenges. Among the factors that may hinder the implementation or delivery of blended instruction are platform availability, administrative challenges, lack of finance, cost of delivery, tuition costs, lack of training, issues related to policy, and student access (Watson, 2010). Though many platforms are available for implementation of blended-learning in higher education, certain open source sites like Moodle or other Course Management Systems are inappropriate for elementary students. As Russo (2001) noted, "younger students may not have the study skills, reading abilities and self-discipline without the guidance of the teacher in the classroom" (p. 4). This issue is therefore one which continues to be addressed.

Administrative challenges further compound the problem, in that, lack of awareness, policy-making decisions, re-designing courses and/or programs, faculty preparedness, and quality assurance contribute to a lack of school capacity for successful implementation of blended-learning (Cook, Owston, & Garrison, 2004). Invariably, the majority of K-12 school administrators lack the requisite skills in managing Web-based instruction as well as implementing effective online programs for students, and, understandably, lack of awareness about blended and/or online learning on the part of some state legislatures tend to have prolonged policies that affect the design and implementation of successful programs on blended learning in K-12 schools (Cook, Owston, & Garrison, 2004). Despite training received on the use of technology by K-12 teachers and the pedagogy of teaching in blended learning programs, only an alarming 12% of new teachers in the K-12 schools reportedly received university training related to online education (Dawley, Rice, & Hinck, 2010).

Reports from Project Tomorrow (2010) indicated that only a small percentage of pre-service teachers at the K-12 level reported that they did not receive any form of training about teaching in online environments. Yet, iNACOL statistics suggest that many states still struggle in developing and implementing policies in online/blended learning in K-12 schools. This may be the case because in many states, online/blended learning programs are guided and overseen by rules and regulations created for traditional schools (Watson, 2010). And despite the tendency to identify the need for technological expertise as a necessity in these systems, a lack of adequately qualified instructional technology staff to manage, develop, design and train teachers in K-12 schools continues to be a major challenge challenges for implementation in the 21st century (Project Tomorrow, 2010).

From the student perspective, the challenge of equal access to the online component of blended instruction for all students remains a significant concern (Watson, 2012). For students with greater access to the Internet, there is a reasonable advantage. And for those who do not have access to the computer and/or Internet or have limited access as a result of parents' inability to afford this amenity on a consistent basis, challenges arise either from their inability to enroll and become active participants in courses, or from the lack of constant access, which decreases the likelihood of their familiarity and effectiveness in the use of online tools. It is not surprising, therefore, that for students in inner-city and rural areas, access to computers and Internet have been described as a major obstacle to online/blended learning in K-12 schools (Watson, 2012). Notwithstanding, research shows that online learning models do not significantly meet the needs of all students (Barbour & Reeves, 2009; Keeler et al., 2007; Rice, 2006), and this is understandable, given the fact that, for students in K-12 schools, adeptness with Internet navigation, technical aptitude, independent learning skills, and or adult supervision tend to be necessary if these learners are to fully engage in learning via online methods (Davis, 2011; Sturgis et al. 2010; Watson & Gemin, 2008).

SOLUTIONS AND RECOMMENDATIONS

Evidently, the possibilities and affordances of blended-learning could inform its substantive growth in K-12 schools over the next few years. With budget deficits and increasing student populations in the K-12 school systems, blended/online learning appears to be a promising alternative. Not only does blended-learning in K-12 schools possess the capacity to transform the delivery of instruction by providing equal access to quality education, but it also appears to be an avenue through which 21st century technological skills can be developed and maintained. The possibilities offered to access content, extend learning, receive support, and to engage in authentic activities with engaging audiences are also characteristics that may prove beneficial to young learners.

To this end, the need for collaboration of colleges of education in various universities with school districts in the expansion of blended learning in K-12 schools is a laudable goal. Among the more pressing issues would be the training of pre-service and in-service teachers concerning the design, development, and delivery of effective instruction using blended learning course management modules (Project Tomorrow, 2010). Through collaboration, K-12 schools may also reduce the discrepancies of standards among states, establishing common national competency standards for digital-age teachers as a means of easing state-to-state reciprocity (Resta & Carroll, 2010).

Another significant barrier to be addressed is funding. Availability should be prioritized at the state or national levels for K-12 schools. Already, recent legislative measures reflect initiatives and therefore to provide high-speed digital infrastructure to 99% of American students within the next five years to provide Internet access to approximately all schools in the United States. If these measures are implemented, administrators could expect to focus on funding avenues, which ensure the preparation of teachers to effectively utilize online tools to achieve the goals of blended-learning. Funding sources may take the form of grants or financial resources. Through investment in such measures, not only will schools be better positioned to increasingly meet the needs of learners in the 21st century, but they are also expected to significantly reduce costs per student in traditional school systems. In Georgia, the State Budget Task Force in Georgia has confirmed that the state could save about $4.5 million if one percent of students in the state enrolled in at least two or more blended learning courses (Alliance for Excellent Education, 2010). Such trends reflect the financial possibilities for K-12 schools should blended learning be adopted.

Despite attention to such critical issues, the goal for blended-learning in schools may continue to experience considerable inhibition, given that many policy makers and state legislators remain uninformed about the benefits, challenges, trends and future growth of this instructional model in K-12 schools. The burden is therefore upon administrators and educators in the school systems, as well as advocates of blended-learning, both within and beyond higher education, to inform policy makers and other organizations involved in promoting state and federal policies that affect technology in K-12 schools.

FUTURE RESEARCH DIRECTIONS

The predicted growth of blended learning in K-12 schools across U.S is unprecedented. In 2000, it was estimated that approximately 45,000 K-12 students took an online/blended learning course. This trend has continued such that in 2009, about three million K-12 students were enrolled in the various blended learning courses in the United States (iNACOL, 2010). As a result of this, it could be deduced that blended learning has the potential to transform America's education system by serving as the backbone of a system that offers more personalized learning approaches for all students (Watson, 2010).

Future investigation could be conducted to compare the costs of blended, online and face-to-face instruction in K-12 schools (Staker, 2011; Watson, 2010). This may assist in satisfying the concerns of individuals who express fears about the use of online and blended education at the K-12 level. Furthermore, an investigation into the perception of K-12 teachers, administrators and educators about blended learning as compared to fully online instruction is warranted. It is important that research be continually conducted to demonstrate the extent to which students' performance in fully online learning and blended learning compares to that of traditional face-to-face classes.

In order for blended learning to be successful, K-12 teachers will need the requisite skills to deliver and manage blended/online pedagogy. It is important for teachers to understand how to use the technological tools, manage the use of instructional resources or course materials, professionally interact with students and parents, and guide students in the safe and ethical use of technology.

As school systems begin to develop and implement blended/online instructions, there are questions that need to be addressed, such as the availability of technology, access to Internet, quality teachers to teach online, and student safety to name a few. It is possible that districts with adequate funds would have a significant advantage in acquiring the needed resources, a distinct contrast to increasingly cash-strapped districts, which would encounter severe challenges in dealing with issues such as student to computer ratios. In situations like these, small school districts with financial obstacles could seek help from business corporations through grants, which may provide some additional funding for computers and other technological tools for students. At the macro-level, state legislatures could also enact new policies on the use of technology in K-12 schools as a way to promote K-12 blended/online education for districts with financial problems.

Christensen, Horn, and Johnson (2008) projected that by 2019, almost 50% of high school courses will be offered using online/blended learning modalities. This argument was based on increasing teacher shortages in critical subject areas such as Mathematics, Special education, Science, and English Language, the bleak budgets at the state and local levels, as well as the growing pressure to increase graduate rates would all continue to contribute to the major challenges facing schools. Irrespective of the challenges identified, blended learning remains a viable option that continues to "open the learning door" for many students to succeed regardless of their diverse learning needs. And, with the growth and increased accessibility of technological tools such as computers, iPads, netbooks, podcasts, educator apps, Apex learning, Black board, and free Web 2.0 tools, the online component of blended learning courses will become more feasible option for K-12 students.

CONCLUSION

Blended-learning has been demonstrated as a holistic didactical method, integrating "the effectiveness and socialization opportunities of the classroom with the technologically enhanced active learning possibilities of the online environment rather than ratio of delivery modalities" (Dziuban, Hartman, & Moskal, 2004, p. 36). With the increased demand of student population at the K-12 level and with the advancement of the common core curriculum, school systems which find alternative methods to provide instruction that is engaging and motivating to the students who are already "technologically connected" will face challenges. However, through collaboration around design and implementation, administrators, policy makers, and educators may identify a starting point for implementing and extending blended learning models, which provide access to both online and traditional face-to-face instruction in K-12 schools.

KEY TERMS AND DEFINITIONS

Asynchronous: Distance learning instructional tool where students can learn the same content (pre-recorded lecture, notes posted online, web-based simulation) at different times. It could be an existing or occurring at the same time. The online learning resources used to support asynchronous learning include email, threaded conferencing systems, chats, blogs, online discussion boards, and wikis.

Blended Learning: A form of distance learning that combines different forms of instructional technology (e.g., videotape, CD-ROM, Web-based learning, e-mail, telephone, & chats, blogging) with traditional face-to-face instructor-led instruction depending on availability, access, and resources in the context of location, time and space.

Course Management Systems: Consists of tools that enable an academic instructor or teacher to create online or blended learning course content, teaching and management of that course on the Web without having to handle Hypertext Markup Language or other programming languages. Examples include (Blackboard, Angel, Sakai, Oncourse, and Moodle).

Instructional Technology: Instructional technology consists of the design, development, utilization, management, and delivery of instruction either through media, electronic, print and other technology (computers, audiovisuals and equipment) as well as the evaluation of instruction for learners.

Online Learning: Is a type of learning where access to learning experiences occurs through the use of technology. Online learning can be "Fully or wholly" online or can be described as learning in reference to technology medium or context with which it is used.

Synchronous: Is a distance-learning environment where content of delivery happen at the same time for everyone, but can be online using (Web conferencing or IM chats or offline). It could also be face-to-face instruction, where learners and teachers are all in the same place at the same time.

Traditional Face-to-Face Instruction: Is a form of instruction that requires teachers and students to single location (classroom) with a fixed amount of time for interaction between instructor and students at a specified time in a particular place and time (classroom).

This work was previously published in Practical Applications and Experiences in K-20 Blended Learning Environments edited by Lydia Kyei-Blankson and Esther Ntuli, pages 1-17, copyright year 2014 by Information Science Reference (an imprint of IGI Global).
